**Example:**

```
osfinger: Fedora-19
```

**Would become:**

```
fedora_19.yaml
```

**Nested dictionaries**

In order to create nested dictionaries as output you can use double dot "." as a delimiter. You can change this using ``pepa\_delimiter`` we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

**Example:**

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1
network..dns..search:
  - example.com
```

**Would become:**

```
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

**Operators**

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

| Operator    | Description                                      |
|-------------|--|
| merge()     | Merge list or hash                               |
| unset()     | Unset key  |
| immutable() | Set the key as immutable, so it can't be changed |
| imerge()    | Set immutable and merge                          |
| iunset()    | Set immutable and unset                          |

**Example:**

```
network..dns..search..merge():
  - foobar.com
  - dummy.nl
```

```
owner..immutable(): Operations
host..printers..unset():
```

## Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

## Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

**File Example: host/validation/network.yaml**

```
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
  type: string
  regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$
```

```
network.interfaces.{{ interface }}.netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}
```

### 14.10.25 salt.pillar.pillar\_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

#### Configuring the LDAP ext\_pillar

The basic configuration is part of the master configuration.

```
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

---

**Note:** When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the `salt-master` process will attempt to parse its content.

---

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

## Configuring the LDAP searches

The file is processed using *Salt's Renderers* <renderers> which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the ``id`` grain which is verified through the minion's key/cert.

## Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- **filtering for:**
  - members of the group `it-admins`
  - objects with `objectclass=user`
- returning the data of users (`mode: map`), where each user is a dictionary containing the configured string or list attributes.

### Configuration:

```
salt-users:
  server: ldap.company.tld
  port: 389
  tls: true
  dn: 'dc=company,dc=tld'
  binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw: bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode: map
  dn: 'ou=users,dc=company,dc=tld'
  filter: '(&(memberof=cn=it-
→admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
  attrs:
    - cn
    - displayName
    - givenName
    - sn
  lists:
    - memberOf

**Result:**
```

```
salt-users:
  - cn: cn=johndoe,ou=users,dc=company,dc=tld
    displayName: John Doe
    givenName: John
    sn: Doe
    memberOf:
      - cn=it-admins,ou=groups,dc=company,dc=tld
      - cn=team01,ou=groups,dc=company
  - cn: cn=janedoe,ou=users,dc=company,dc=tld
```

```
displayName: Jane Doe
givenName: Jane
sn: Doe
memberOf:
  - cn=it-admins,ou=groups,dc=company,dc=tld
  - cn=team02,ou=groups,dc=company
```

### List Mode

TODO: see also `_result_to_dict()` documentation

`salt.pillar.pillar_ldap.ext_pillar` (*minion\_id, pillar, config\_file*)  
Execute LDAP searches and return the aggregated data

### 14.10.26 salt.pillar.puppet

Execute an unmodified `puppet_node_classifier` and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.puppet.ext_pillar` (*minion\_id, pillar, command*)  
Execute an unmodified `puppet_node_classifier` and read the output as YAML

### 14.10.27 salt.pillar.reclass\_adapter

Use the `reclass` database as a Pillar source

This `ext_pillar` plugin provides access to the `reclass` database, such that Pillar data for a specific minion are fetched using `reclass`.

You can find more information about `reclass` at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHON-PATH environment variable, or by setting the configuration option, like in the example above.

```
salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)
```

Obtain the Pillar data from reclass for the given minion\_id.

## 14.10.28 salt.pillar.redismod

### Read pillar data from a Redis backend

New in version 2014.7.0.

#### depends

- redis Python module (on master)

### Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

### Configuring the Redis ext\_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

```
salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)
```

Grabs external pillar data based on configured function

```
salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)
```

Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar\_key is not set.

**pillar\_key** Pillar key to return data into

```
salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')
```

Looks for key in redis matching minion\_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

**pillar\_key** Pillar key to return data into

## 14.10.29 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
- s3:
  bucket: my.fancy.pillar.bucket
  keyid: KASKFJWAKJASJKDAJKSD
  key: ksladfdLKDALSFKSD93q032sdDasdfasdfsadkf
  multiple_env: False
  environment: base
  prefix: somewhere/overthere
  verify_ssl: True
  service_url: s3.amazonaws.com
  kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
  s3_cache_expire: 30
  s3_sync_on_update: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a `'subdirectory'` of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in `ext_pillar` for each environment rather than specifying `multiple_env`. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
                          location=None, multiple_env=False, environment='base', pre-
                          fix='', service_url=None, kms_keyid=None, s3_cache_expire=30,
                          s3_sync_on_update=True)
```

Execute a command and read the output as YAML

### 14.10.30 salt.pillar.sql\_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext\_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

**maturity** new

**platform** all

#### Theory of sql\_base ext\_pillar

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys ``query`` and ``depth`` as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

#### Configuring a sql\_base ext\_pillar

The sql\_base ext\_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake `sql\_base` adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
  - sql_base:
    - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
  - sql_base:
    main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```

ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    2

```

Or as a mapping

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    depth: 2

```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {'b': b, 'c': c, 'd': d}}
- With depth 2: {a: {b: {'c': c, 'd': d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
    ↪minion_id != %s"
    depth: 2
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    depth: 2
  ignore_null: True

```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string `'1,3'` will result in:

```

a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
  ^      ^

```

These columns define list grouping

```

{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4 }
  ]}
]}

```

```

    ]
  }
}]

```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

### More complete example for MySQL (to also show configuration)

```

mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

#### class `salt.pillar.sql_base.SqlBaseExtPillar`

This class receives and processes the database rows in a database agnostic way.

##### **enter\_root**(*root*)

Set `self.focus` for kwarg queries

##### **extract\_queries**(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

##### **fetch**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries, merge and return as a dict.

##### **process\_fields**(*field\_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

##### **process\_results**(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

### 14.10.31 `salt.pillar.sqlcipher` module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the `pysqlcipher` Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the `sql_base` `ext_pillar` for SQLCipher.

**maturity** new  
**depends** `pysqlcipher` (for py2) or `pysqlcipher3` (for py3)  
**platform** all

### Configuring the `sqlcipher` `ext_pillar`

Use the `'sqlcipher'` key under `ext_pillar` for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:  
  database: /var/lib/salt/pillar-sqlcipher.db  
  pass: strong_pass_phrase  
  timeout: 5.0
```

### Complete example

```
sqlcipher:  
  database: '/var/lib/salt/pillar-sqlcipher.db'  
  pass: strong_pass_phrase  
  timeout: 5.0  
  
ext_pillar:  
  - sqlcipher:  
    fromdb:  
      query: 'SELECT col1,col2,col3,col4,col5,col6,col7  
             FROM some_random_table  
             WHERE minion_pattern LIKE ?'  
    depth: 5  
    as_list: True  
    with_lists: [1,3]
```

`class salt.pillar.sqlcipher.SQLCipherExtPillar`

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

### 14.10.32 `salt.pillar.sqlite3` module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

sqlite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLite3.

**platform** all

### Configuring the sqlite3 ext\_pillar

Use the `sqlite3` key under ext\_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

### Legacy Compatibility

SQLite3 database connection configuration previously had keys under pillar.

```
pillar.sqlite3.database: /var/lib/salt/pillar.db
pillar.sqlite3.timeout: 5.0
```

This has been deprecated in 2016.3.0 and will be removed in Salt Nitrogen.

### Complete Example

```
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

#### class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext\_pillar(*minion\_id*, *pillar*, \*args, \*\*kwargs)

Execute queries against SQLite3, merge and return as a dict

### 14.10.33 salt.pillar.stack

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

`PillarStack` is a custom saltstack `ext_pillar` which was inspired by `varstack` but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbnet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- all these rendered files are then parsed as `yaml`
- then all `yaml` dicts are merged in order with support for the following merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`
- `stack` config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

## Installation

`PillarStack` is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override `PillarStack` with a more recent one, follow the installation procedure below.

Installing the `PillarStack ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

## Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure `PillarStack` in 3 different ways:

### Single config file

This is the simplest option, you just need to set the path to your single `PillarStack` config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

### List of config files

You can also provide a list of config files:

```
ext_pillar:
  - stack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

## Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- stack:
  pillar:environment:
    dev: /path/to/dev/stack.cfg
    prod: /path/to/prod/stack.cfg
  grains:custom:grain:
    value:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
  opts:custom:opt:
    value: /path/to/stack0.cfg
```

### PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

The path of these yaml files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of yaml files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
|-- config.cfg
|-- core.yml
```

### Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by `PillarStack`. So `PillarStack.ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__ : <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### `merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

#### `merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

#### `remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

#### `overwrite` strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

| stack  | yaml_data  | stack (after merge)  |
|--|--|--|
| <pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre> | <pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre> | <pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre> |

Then you can select a custom merging strategy using the `__` key in a dict:

| stack  | yaml_data  | stack (after merge)  |
|--|--|--|
| <pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre> | <pre>users:   __: merge-last   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>  | <pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre> |
| <pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre> | <pre>users:   __: merge-first   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre> | <pre>users:   tom:     uid: 500     roles:       - developer       - sysadmin   mat:     uid: 1001   root:     uid: 0</pre>  |
| <pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre> | <pre>users:   __: remove   tom:   mat:</pre>   | <pre>users:   root:     uid: 0</pre>   |
| <pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre> | <pre>users:   __: overwrite   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>   | <pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>                                     |

You can also select a custom merging strategy using a `__` object in a list:

| stack                          | yaml_data                                  | stack (after merge)                  |
|--------------------------------|--|--------------------------------------|
| <pre>users: - tom - root</pre> | <pre>users: - __: merge-last - mat</pre>   | <pre>users: - tom - root - mat</pre> |
| <pre>users: - tom - root</pre> | <pre>users: - __: merge-first - mat</pre>  | <pre>users: - mat - tom - root</pre> |
| <pre>users: - tom - root</pre> | <pre>users: - __: remove - mat - tom</pre> | <pre>users: - root</pre>             |
| <pre>users: - tom - root</pre> | <pre>users: - __: overwrite - mat</pre>    | <pre>users: - mat</pre>              |

#### 14.10.34 salt.pillar.svn\_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo
- svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

`class salt.pillar.svn_pillar.SvnPillar` (*branch, repo\_location, root, opts*)  
Deal with the remote SVN repository for Pillar

`pillar_dir()`  
Returns the directory of the pillars (repo cache + branch + root)

`salt.pillar.svn_pillar.ext_pillar` (*minion\_id, pillar, repo\_string*)  
Execute a command and read the output as YAML

### 14.10.35 salt.pillar.varstack\_pillar

Use `Varstack` data as a Pillar source

#### Configuring Varstack

Using `varstack` in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
- varstack: /etc/varstack.yaml
```

`Varstack` will then use `/etc/varstack.yaml` to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of `varstack` on how this file is evaluated.

`salt.pillar.varstack_pillar.ext_pillar` (*minion\_id, pillar, conf*)  
Parse `varstack` data and return the result

### 14.10.36 salt.pillar.vault module

Vault Pillar Module

`maintainer` SaltStack  
`maturity` New  
`platform` all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

The `vault` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myvault:
  vault.host: 127.0.0.1
  vault.port: 8200
  vault.scheme: http # Optional; default is https
  vault.token: 012356789abcdef # Required, unless set in environment
```

`vault.host` refers to the host that is hosting vault and `vault.port` refers to the port on that host. A vault token is also required. It may be set statically, as above, or as an environment variable:

```
$ export VAULT_TOKEN=0123456789abcdef
```

After the profile is created, configure the external pillar system to use it. A path must also be specified so that vault knows where to look.

```
ext_pillar:
  - vault: my_vault_config path=secret/salt
```

Using these configuration profiles, multiple vault sources may also be used:

```
ext_pillar:
  - vault: my_vault_config
  - vault: my_other_vault_config
```

`salt.pillar.vault.ext_pillar` (*minion\_id*, *pillar*, *conf*)  
Check vault for all data

### 14.10.37 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar` (*hyper\_id*, *pillar*, *name*, *key*)  
Accept the key for the VM on the hyper, if authorized.

## 14.11 proxy modules

|                    |   |
|--------------------|---|
| <i>chronos</i>     | Chronos   |
| <i>cisconso</i>    | Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). |
| <i>esxi</i>        | Proxy Minion interface module for managing VMware ESXi hosts.   |
| <i>fx2</i>         | Dell FX2 chassis  |
| <i>junos</i>       | Interface with a Junos device via proxy-minion.   |
| <i>marathon</i>    | Marathon  |
| <i>napalm</i>      | NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support   |
| <i>nxos</i>        | Proxy Minion for Cisco NX OS Switches   |
| <i>philips_hue</i> | Philips HUE lamps module for proxy.   |
| <i>rest_sample</i> | This is a simple proxy-minion designed to connect to and communicate with   |
| <i>ssh_sample</i>  | This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.            |

### 14.11.1 salt.proxy.chronos module

#### Chronos

Proxy minion for managing a Chronos cluster.

#### Dependencies

- *chronos execution module (salt.modules.chronos)*

## Pillar

The chronos proxy configuration requires a `base_url` property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init`(*opts*)  
Perform any needed setup.

`salt.proxy.chronos.ping`()  
Is the chronos api responding?

`salt.proxy.chronos.shutdown`(*opts*)  
For this proxy shutdown is a no-op

### 14.11.2 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

#### Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform

- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
- Fortinet
- Nominum DCS
- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

**codeauthor** *Anthony Shaw* <[anthony.shaw@dimensiondata.com](mailto:anthony.shaw@dimensiondata.com)>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

## Dependencies

- pynso Python module

## PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

## Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
  proxytype: ciscoconsole
  host: <ip or dns name of host>
  port: 8080
  use_ssl: false
  username: <username>
  password: password
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `ciscoconsole`.

### host

The location, or IP/dns, of the Cisco NSO API host. Required.

### username

The username used to login to the Cisco NSO host, such as `admin`. Required.

### passwords

The password for the given user. Required.

### use\_ssl

Whether to use HTTPS messaging to speak to the API.

### port

The port that the Cisco NSO API is running on, 8080 by default

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisco host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

**salt.proxy.ciscoconso.apply\_rollback**(*datastore*, *name*)

Apply a system rollback

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

**salt.proxy.ciscoconso.get\_data**(*datastore*, *path*)

Get the configuration of the device tree at the given path

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list of str OR tuple) -- The device path, a list of element names in order, comma separated

**Returns** The network configuration at that tree

**Return type** dict

```
salt cisco-nso ciscoconso.get_data devices
```

**salt.proxy.ciscoconso.get\_rollback**(*name*)

Get the backup of stored a configuration rollback

**Parameters** **name** (str) -- Typically an ID of the backup

**Return type** str

**Returns** the contents of the rollback snapshot

**salt.proxy.ciscoconso.get\_rollbacks**()

Get a list of stored configuration rollbacks

**salt.proxy.ciscoconso.grains**()

Get the grains from the proxy device.

**salt.proxy.ciscoconso.ping**()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

`salt.proxy.cisconso.set_data_value(datastore, path, data)`

Get a data entry in a datastore

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) -- The new value at the given path

**Return type** bool

**Returns** True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 14.11.3 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply `ESXi`) hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's ``Proxy Minion`` functionality enables you to designate another machine to host a minion process that ``proxies`` communication from the Salt Master. The master does not know nor care that the target is not a ``real`` Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

#### Dependencies

- pyVmomi Python Module
- ESXCLI

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

## Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
  passwords:
    - first_password
    - second_password
    - third_password
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

## host

The location, or ip/dns, of the ESXi host. Required.

---

### username

The username used to login to the ESXi host, such as `root`. Required.

### passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

---

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

### protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is `443`.

### Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *`salt.modules.vsphere`* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in *`salt.modules.vsphere`* instead of *`salt.modules.esxi`*.

## States

Associated states are thoroughly documented in *`salt.states.esxi`*. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the *`salt.modules.vsphere`* module. Passes the return through from the `vsphere` module.

**cmd** The command to call inside `salt.modules.vsphere`

**args** Arguments that need to be passed to that command.

**kwargs** Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

**salt.proxy.esxi.init**(*opts*)

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

**salt.proxy.esxi.ping**()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt esxi-host test.ping
```

**salt.proxy.esxi.shutdown**()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 14.11.4 salt.proxy.fx2

### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

### Dependencies

- *iDRAC Remote execution module (salt.modules.dracr)*
- *Chassis command shim (salt.modules.chassis)*
- *Dell Chassis States (salt.states.dellchassis)*
- Dell's racadm command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply ``chassis``, ``CMC``, or ``FX2``) chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's ``Proxy Minion`` functionality enables you to designate another machine to host a minion process that ``proxies`` communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar toplevel file that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
```

```
passwords:
- first_password
- second_password
- third_password
proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of ``I no longer know what the password is!!!''. To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

### salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *salt.modules.dracr* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs *racadm* against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of *racadm* is installed, and that host would reach out over the network and communicate with the chassis.

*Chassis.cmd* acts as a ``shim" between the execution module and the proxy. It's first parameter is always the function from *salt.modules.dracr* to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in *salt.modules.dracr* instead of *salt.modules.chassis*.

## States

Associated states are thoroughly documented in *salt.states.dellchassis*. Look there to find an example structure for pillar as well as an example *.sls* file for standing up a Dell Chassis from scratch.

**salt.proxy.fx2.admin\_password()**

Return the `admin_password` in the `DETAILS` dictionary, or `'calvin'` (the Dell default) if there is none present

**salt.proxy.fx2.admin\_username()**

Return the `admin_username` in the `DETAILS` dictionary, or `root` if there is none present

**salt.proxy.fx2.chconfig(*cmd*, \**args*, \*\**kwargs*)**

This function is called by the *salt.modules.chassis.cmd* shim. It then calls whatever is passed in *cmd* inside the *salt.modules.dracr* module.

### Parameters

- **cmd** -- The command to call inside *salt.modules.dracr*
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

**Returns** Passthrough the return from the *dracr* module.

**salt.proxy.fx2.find\_credentials()**

Cycle through all the possible credentials and return the first one that works

**salt.proxy.fx2.grains()**

Get the grains from the proxied device

**salt.proxy.fx2.grains\_refresh()**

Refresh the grains from the proxied device

**salt.proxy.fx2.init(*opts*)**

This function gets called when the proxy starts up. We check *opts* to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

**Returns** Returns False if the chassis didn't respond, True otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 14.11.5 salt.proxy.junos

Interface with a Junos device via proxy-minion.

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 14.11.6 salt.proxy.marathon module

#### Marathon

Proxy minion for managing a Marathon cluster.

#### Dependencies

- *marathon execution module (salt.modules.marathon)*

#### Pillar

The marathon proxy configuration requires a `'base_url'` property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`

Perform any needed setup.

`salt.proxy.marathon.ping()`

Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`

For this proxy shutdown is a no-op

### 14.11.7 salt.proxy.napalm

#### NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

Proxy minion for managing network devices via NAPALM library.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

The `napalm` proxy module requires NAPALM library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

#### Pillar

The `napalm` proxy configuration requires four mandatory parameters in order to connect to the network device:

- **driver**: specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).
- **host**: hostname
- **username**: username to be used when connecting to the device
- **passwd**: the password needed to establish the connection
- **optional\_args**: dictionary with the optional arguments. Check the complete list of supported [optional arguments](#)

Example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
    config_format: set
```

See also:

- [NAPALM grains](#): select network devices based on their characteristics
- [NET module: network basic features](#)
- [NTP operational and configuration management module](#)
- [BGP operational and configuration management module](#)
- [Routes details](#)
- [SNMP configuration module](#)

- *Users configuration management*

New in version 2016.11.0.

`salt.proxy.napalm.call`(*method*, *\*\*params*)

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

#### Parameters

- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

#### Returns

A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback

on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'  
    **{  
        'commands': [  
            'show version',  
            'show chassis fan'  
        ]  
    })
```

`salt.proxy.napalm.fns`()

Method called by NAPALM grains module.

`salt.proxy.napalm.grains`()

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh`()

Refresh the grains.

`salt.proxy.napalm.init`(*opts*)

Opens the connection with the network device.

`salt.proxy.napalm.initialized`()

Connection finished initializing?

`salt.proxy.napalm.ping`()

Connection open successfully?

`salt.proxy.napalm.shutdown`(*opts*)

Closes connection with the device.

## 14.11.8 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

**proxytype** (REQUIRED) Use this proxy minion *nxos*

**host** (REQUIRED) ip address or hostname to connect to

**username** (REQUIRED) username to login with

**password** (REQUIRED) password to use to login with

**prompt\_name** (REQUIRED) The name in the prompt on the switch. By default, use your devices hostname.

**ssh\_args** Any extra args to use to connect to the switch.

**key\_accept** Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

---

**Note:** The option `proxy_merge_grains_in_module: True` is required to have the NXOS grains be available from the proxy minion, for the 2016.11.0 release. For Nitrogen, the setting will be True by default.

---

`salt.proxy.nxos.add_config`(*lines*)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↳operator'
```

---

**Note:** For more than one config added per command, lines should be a list.

---

`salt.proxy.nxos.check_password`(*username, password, encrypted=False*)

Check if passed password is the one assigned to user

`salt.proxy.nxos.check_role`(*username, role*)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

`salt.proxy.nxos.delete_config`(*lines*)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↳network-operator'
```

---

**Note:** For more than one config deleted per command, lines should be a list.

---

`salt.proxy.nxos.find(pattern)`

Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

---

**Note:** This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole `show_run` output.

---

`salt.proxy.nxos.get_roles(username)`

Get roles that the username is assigned from switch

`salt.proxy.nxos.get_user(username)`

Get username line from switch

`salt.proxy.nxos.grains()`

Get grains for proxy minion

`salt.proxy.nxos.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.nxos.init(opts=None)`

Required. Can be used to initialize the server connection.

`salt.proxy.nxos.ping()`

Ping the device on the other end of the connection

`salt.proxy.nxos.remove_user(username)`

Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

`salt.proxy.nxos.replace(old_value, new_value, full_match=False)`

Replace string or full line matches in switch's running config

If `full_match` is set to `True`, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

`salt.proxy.nxos.sendline(command)`

Run command through switch's cli

`salt.proxy.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256')`

Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
  password='$5$2fWw02vK$7.Hr3Y1tMNHuhywQQ3nf0d.gAPHgs3S0BYYdGT3E.A' \
  encrypted=True
```

`salt.proxy.nxos.set_role(username, role)`

Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

`salt.proxy.nxos.show_run()`

Shortcut to run *show run* on switch

```
salt '*' nxos.cmd show_run
```

`salt.proxy.nxos.show_ver()`  
Shortcut to run `show ver` on switch

```
salt '*' nxos.cmd show_ver
```

`salt.proxy.nxos.shutdown(opts)`  
Disconnect

`salt.proxy.nxos.system_info()`  
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

`salt.proxy.nxos.unset_role(username, role)`  
Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

### 14.11.9 salt.proxy.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

`class salt.proxy.philips_hue.Const`  
Constants for the lamp operations.

`salt.proxy.philips_hue.call_alert(*args, **kwargs)`  
Lamp alert

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

`salt.proxy.philips_hue.call_blink(*args, **kwargs)`  
Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

`salt.proxy.philips_hue.call_brightness(*args, **kwargs)`  
Set an effect to the lamp.

Arguments:

- value**: 0~255 brightness of the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- transition**: Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

`salt.proxy.philips_hue.call_color(*args, **kwargs)`

Set a color to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- transition**: Transition 0~200.

Advanced:

- gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

`salt.proxy.philips_hue.call_effect(*args, **kwargs)`

Set an effect to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- type**: Type of the effect. Possible values are ``none" or ``colorloop". Default ``none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

`salt.proxy.philips_hue.call_lights(*args, **kwargs)`

Get info about all available lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- id**: Specifies a device ID. Only one device at a time.
- title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- value**: 150~500.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

`salt.proxy.philips_hue.init(cnf)`

Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`

Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`

Shuts down the service.

### 14.11.10 salt.proxy.rest\_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion\\_rest\\_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

**salt.proxy.rest\_sample.grains()**

Get the grains from the proxied device

**salt.proxy.rest\_sample.grains\_refresh()**

Refresh the grains from the proxied device

**salt.proxy.rest\_sample.id(*opts*)**

Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

**salt.proxy.rest\_sample.initialized()**

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

**salt.proxy.rest\_sample.package\_install(*name*, *\*\*kwargs*)**

Install a ``package" on the REST server

**salt.proxy.rest\_sample.package\_list()**

List ``packages" installed on the REST server

**salt.proxy.rest\_sample.package\_remove(*name*)**

Remove a ``package" on the REST server

**salt.proxy.rest\_sample.package\_status(*name*)**

Check the installation status of a package on the REST server

**salt.proxy.rest\_sample.ping()**

Is the REST server up?

**salt.proxy.rest\_sample.service\_list()**

List ``services" on the REST server

**salt.proxy.rest\_sample.service\_restart(*name*)**

Restart a ``service" on the REST server

**salt.proxy.rest\_sample.service\_start(*name*)**

Start a ``service" on the REST server

**salt.proxy.rest\_sample.service\_status(*name*)**

Check if a service is running on the REST server

**salt.proxy.rest\_sample.service\_stop(*name*)**

Stop a ``service" on the REST server

**salt.proxy.rest\_sample.shutdown(*opts*)**

For this proxy shutdown is a no-op

**salt.proxy.rest\_sample.test\_from\_state()**

Test function so we have something to call from a state :return:

**salt.proxy.rest\_sample.uptodate(*name*)**

Call the REST endpoint to see if the packages on the ``server" are up to date.

### 14.11.11 salt.proxy.ssh\_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python

stack to run a minion.

`salt.proxy.ssh_sample.grains()`

Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`

Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`

Install a ``package" on the ssh server

`salt.proxy.ssh_sample.package_list()`

List ``packages" by executing a command via ssh This function is called in response to the salt command  
`..code-block::bash salt target_minion pkg.list_pkgs`

`salt.proxy.ssh_sample.package_remove(name)`

Remove a ``package" on the ssh server

`salt.proxy.ssh_sample.parse(out)`

Extract json from out.

**Parameter** out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`

Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`

Start a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`

Restart a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`

Start a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`

Stop a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`

Disconnect

## 14.12 queue modules

`pgjsonb_queue`

New in version 2016.3.0.

Continued on next page

Table 14.12 -- continued from previous page

*sqlite\_queue*

New in version 2014.7.0.

### 14.12.1 salt.queues.pgjsonb\_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

**depends** python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.pass: 'salt'
queue.pgjsonb.db: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
  id SERIAL PRIMARY KEY,
  data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'
  ↳ backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

```
salt.queues.pgjsonb_queue.delete(queue, items)
    Delete an item or items from a queue

salt.queues.pgjsonb_queue.insert(queue, items)
    Add an item or items to a queue

salt.queues.pgjsonb_queue.list_items(queue)
    List contents of a queue

salt.queues.pgjsonb_queue.list_length(queue)
    Provide the number of items in a queue

salt.queues.pgjsonb_queue.list_queues()
    Return a list of Salt Queues on the Salt Master

salt.queues.pgjsonb_queue.pop(queue, quantity=1)
    Pop one or more or all items from the queue return them.
```

### 14.12.2 salt.queues.sqlite\_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

```
salt.queues.sqlite_queue.delete(queue, items)
    Delete an item or items from a queue

salt.queues.sqlite_queue.insert(queue, items)
    Add an item or items to a queue

salt.queues.sqlite_queue.list_items(queue)
    List contents of a queue

salt.queues.sqlite_queue.list_length(queue)
    Provide the number of items in a queue

salt.queues.sqlite_queue.list_queues()
    Return a list of Salt Queues on the Salt Master

salt.queues.sqlite_queue.pop(queue, quantity=1)
    Pop one or more or all items from the queue return them.
```

## 14.13 roster modules

|                     |  |
|---------------------|--|
| <i>ansible</i>      | Read in an Ansible inventory file or script                                    |
| <i>cache</i>        | Use the minion cache on the master to derive IP addresses based on minion ID.  |
| <i>cloud</i>        | Use the cloud cache on the master to derive IPv4 addresses based on minion ID. |
| <i>clustershell</i> | This roster resolves hostname in a pdsh/clustershell style.                    |
| <i>flat</i>         | Read in the roster from a flat file using the renderer system                  |
| <i>range</i>        | This roster resolves targets from a range server.                              |
| <i>scan</i>         | Scan a netmask or ipaddr for open ssh ports                                    |

### 14.13.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
→port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
→ansible_ssh_pass='password'

[computers:children]
desktop
```

```
servers

[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh all test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh desktop test.ping
home:
  True
[~]# salt-ssh computers test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 22
      },
      "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 23
      }
    }
  }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

Any of the [groups] or direct hostnames will return. The `all` is special, and returns everything.

**class salt.roster.ansible.Inventory**(tgt, tgt\_type='glob', inventory\_file='/etc/salt/roster')  
 Matcher for static inventory files

**class salt.roster.ansible.Script**(tgt, tgt\_type='glob', inventory\_file='/etc/salt/roster')  
 Matcher for Inventory scripts

**salt.roster.ansible.targets**(tgt, tgt\_type='glob', \*\*kwargs)  
 Return the targets from the ansible inventory\_file Default: /etc/salt/roster

### 14.13.2 salt.roster.cache

Use the minion cache on the master to derive IP addresses based on minion ID.

Currently only contains logic to return an IPv4 address; does not handle IPv6, or authentication (passwords, keys, etc).

It is possible to configure this roster to prefer a particular type of IP over another. To configure the order, set the roster\_order in the master config file. The default for this is:

```
roster_order:
- public
- private
- local
```

**salt.roster.cache.extract\_ipv4**(roster\_order, ipv4)  
 Extract the preferred IP address from the ipv4 grain

**salt.roster.cache.targets**(tgt, tgt\_type='glob', \*\*kwargs)  
 Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 14.13.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at /etc/salt/cloud. For example, add the following:

```
ssh_username: my_user
sudo: True
```

**salt.roster.cloud.extract\_ipv4**(roster\_order, ipv4)  
 Extract the preferred IP address from the ipv4 grain

**salt.roster.cloud.targets**(tgt, tgt\_type='glob', \*\*kwargs)  
 Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 14.13.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

**depends** clustershell, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
Return the targets

### 14.13.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

`class salt.roster.flat.RosterMatcher` (*raw*, *tgt*, *tgt\_type*, *ipv='ipv4'*)  
Matcher for the roster data structure

`get_data` (*minion*)  
Return the configured ip

`ret_glob_minions` ()  
Return minions that match via glob

`ret_list_minions` ()  
Return minions that match via list

`ret_nodegroup_minions` ()  
Return minions which match the special list-only groups defined by `ssh_list_nodegroups`

`ret_pcre_minions` ()  
Return minions that match via pcre

`ret_range_minions` ()  
Return minions that are returned by a range query

`targets` ()  
Execute the correct *tgt\_type* routine and return

`salt.roster.flat.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
Return the targets from the flat yaml file, checks opts for location but defaults to `/etc/salt/roster`

### 14.13.6 salt.roster.range module

This roster resolves targets from a range server.

**depends** seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

`salt.roster.range.targets` (*tgt*, *tgt\_type='range'*, *\*\*kwargs*)  
Return the targets from a range query

### 14.13.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

`class salt.roster.scan.RosterMatcher(tgt, tgt_type)`

Matcher for the roster data structure

`targets()`

Return ip addrs based on netmask, sitting in the ``glob" spot because it is the default

`salt.roster.scan.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

## 14.14 runner modules

|                    |   |
|--------------------|---|
| <i>asam</i>        | Novell ASAM Runner  |
| <i>auth</i>        | Authentication runner for creating, deleting, and managing eauth tokens.      |
| <i>cache</i>       | Return cached data from minions   |
| <i>cloud</i>       | The Salt Cloud Runner   |
| <i>ddns</i>        | Dynamic DNS Runner  |
| <i>doc</i>         | A runner module to collect and display the inline documentation from the      |
| <i>drac</i>        | Manage Dell DRAC from the Master  |
| <i>error</i>       | Error generator to enable integration testing of salt runner error handling   |
| <i>event</i>       | Module for sending events using the runner system.                            |
| <i>f5</i>          | Runner to provide F5 Load Balancer functionality                              |
| <i>fileservers</i> | Directly manage the Salt fileserver plugins                                   |
| <i>git_pillar</i>  | Runner module to directly manage the git external pillar                      |
| <i>http</i>        | Module for making various web calls.  |
| <i>jobs</i>        | A convenience system to manage jobs, both active and already run              |
| <i>launchd</i>     | Manage launchd plist files  |
| <i>lxc</i>         | Control Linux Containers via Salt   |
| <i>manage</i>      | General management functions for salt, tools like seeing what hosts are up    |
| <i>mine</i>        | A runner to access data from the salt mine                                    |
| <i>nacl</i>        | This runner helps create encrypted passwords that can be included in pillars. |
| <i>network</i>     | Network tools to run from the Master  |
| <i>pagerduty</i>   | Runner Module for Firing Events via PagerDuty                                 |
| <i>pillar</i>      | Functions to interact with the pillar compiler on the master                  |
| <i>pkg</i>         | Package helper functions using <code>salt.modules.pkg</code>                  |
| <i>queue</i>       | General management and processing of queues.                                  |
| <i>reactor</i>     | A convenience system to manage reactors                                       |
| <i>salt</i>        | New in version 2016.11.0.   |
| <i>saltutil</i>    | Sync custom types to the Master   |

Continued on next page

Table 14.14 -- continued from previous page

|                      |   |
|----------------------|---|
| <i>sdb</i>           | Runner for setting and querying data via the sdb API on the master                                    |
| <i>smartos_vmadm</i> | Runner for SmartOS minions control vmadm  |
| <i>search</i>        | Runner frontend to search system  |
| <i>spacewalk</i>     | Spacewalk Runner  |
| <i>ssh</i>           | A Runner module interface on top of the salt-ssh Python API.  |
| <i>state</i>         | Execute orchestration functions   |
| <i>survey</i>        | A general map/reduce style salt runner for aggregating results returned by several different minions. |
| <i>test</i>          | This runner is used only for test purposes and servers no production purpose                          |
| <i>thin</i>          | The thin runner is used to manage the salt thin systems.  |
| <i>virt</i>          | Control virtual machines via Salt   |
| <i>vistara</i>       | Vistara Runner  |
| <i>winrepo</i>       | Runner to manage Windows software repo  |

### 14.14.1 salt.runners.asam

#### Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

**Note:** Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.add_platform`(*name*, *platform\_set*, *server\_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.list_platform_sets`(*server\_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.list_platforms`(*server\_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.remove_platform`(*name, server\_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

### 14.14.2 salt.runners.auth module

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.del_token`(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.mk_token`(*\*\*load*)

Create an eauth token using provided credentials

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856
```

### 14.14.3 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all`(*tgt=None, expr\_form='glob'*)

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock`(*role, remote=None, \*\*kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git\_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

---

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a role of `gitfs` is equivalent to running `salt-run file-server.clear_lock backend=git`.

---

**role** Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

**type** [`update`,`checkout`] The types of lock to clear. Can be `update`, `checkout`, or both of

et (either comma-separated or as a Python list).

New in version 2015.8.8.

CLI Example:

```
salt-run cache.clear_git_lock git_pillar
```

`salt.runners.cache.clear_grains` (*tgt=None, expr\_form='glob'*)

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine` (*tgt=None, expr\_form='glob'*)

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func` (*tgt=None, expr\_form='glob', clear\_mine\_func\_flag=None*)

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, expr\_form='glob'*)

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.grains` (*tgt=None, expr\_form='glob', \*\*kwargs*)

Return cached grains of the targeted minions

CLI Example:

```
salt-run cache.grains
```

`salt.runners.cache.mine` (*tgt=None, expr\_form='glob', \*\*kwargs*)

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar` (*tgt=None, expr\_form='glob', \*\*kwargs*)

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

#### 14.14.4 salt.runners.cloud

##### The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

**salt.runners.cloud.action**(*func=None, cloudmap=None, instances=None, provider=None, instance=None, \*\*kwargs*)  
Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

**salt.runners.cloud.create**(*provider, instances, opts=None, \*\*kwargs*)  
Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance           image=ami-1624987f size=
↳ 't1.micro' ssh_username=ec2-user                       securitygroup=default delvol_on_
↳ destroy=True
```

**salt.runners.cloud.destroy**(*instances*)  
Destroy the named vm(s)

**salt.runners.cloud.full\_query**(*query\_type='list\_nodes\_full'*)  
List all available cloud provider data

**salt.runners.cloud.list\_images**(*provider='all'*)  
List cloud provider images for the given providers

**salt.runners.cloud.list\_locations**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.list\_sizes**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.map\_run**(*path, \*\*kwargs*)  
Execute a salt cloud map file

**salt.runners.cloud.profile**(*prof=None, instances=None, opts=None, \*\*kwargs*)  
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

**salt.runners.cloud.query**(*query\_type='list\_nodes'*)  
List cloud provider data for all providers

**salt.runners.cloud.select\_query**(*query\_type='list\_nodes\_select'*)  
List selected nodes

## 14.14.5 salt.runners.ddns

### Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

**salt.runners.ddns.add\_host**(*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.create**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.delete**(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳0.0.1 5 A
```

**salt.runners.ddns.delete\_host**(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳keyring 10.0.0.1 5
```

**salt.runners.ddns.update**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

---

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

---

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

#### 14.14.6 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

**salt.runners.doc.execution()**

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

**salt.runners.doc.runner()**

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

**salt.runners.doc.wheel()**

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

#### 14.14.7 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

**salt.runners.drac.poweroff** (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

**salt.runners.drac.poweron** (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

**salt.runners.drac.pxe** (*hostname*, *timeout=20*, *username=None*, *password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.reboot` (*hostname, timeout=20, username=None, password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.version` (*hostname, timeout=20, username=None, password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

### 14.14.8 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.error` (*name=None, message=''*)

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

### 14.14.9 salt.runners.event module

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.send` (*tag, data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

#### Parameters

- **tag** -- the tag to send with the event
- **data** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
      baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

#### 14.14.10 salt.runners.f5

Runner to provide F5 Load Balancer functionality

##### depends

- pycontrol Python module

**configuration** In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

`salt.runners.f5.add_pool_member` (*lb, name, port, pool\_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

`salt.runners.f5.check_member_pool`(*lb, member, pool\_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

`salt.runners.f5.check_pool`(*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

`salt.runners.f5.check_virtualserver`(*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

`salt.runners.f5.create_pool`(*lb, name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

`salt.runners.f5.create_vs`(*lb, name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

#### 14.14.11 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.clear_cache`(*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git, hg, svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the backend argument.

**backend** Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.clear_file_list_cache` (*saltenv=None, backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

**saltenv** By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

**backend** Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

**Note:** In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
```

```
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.clear_lock`(*backend=None, remote=None*)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, *hg*, *svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

**backend** Only clear the update lock for the specified backend(s).

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a **remote** value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.dir_list`(*saltenv='base', backend=None*)

Return a list of directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list`(*saltenv='base', backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

---

**Note:** Some backends (such as `git` and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

---

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.envs(backend=None, sources=False)`

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.file_list(saltenv='base', backend=None)`

Return a list of files from the salt fileserver

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.lock(backend=None, remote=None)`

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (`git`, `hg`, `svn`).

---

**Note:** This will only operate on enabled backends (those configured in `fileserver_backend`).

---

**backend** Only set the update lock for the specified backend(s).

**remote** If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list` (*saltenv='base', backend=None*)

Return a list of symlinked files and dirs

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update` (*backend=None*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=['roots','git']`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

### 14.14.12 salt.runners.git\_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update` (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *new git\_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git\_pillar remotes. The return data has also changed. For releases 2015.8.3 and earlier, there is no value returned. Starting with 2015.8.4, the return data is a dictionary. If using the *old git\_pillar configuration schema*, then the dictionary values will be True if the update completed without error, and False if an error occurred. If using the *new git\_pillar configuration schema*, the values will be True only if new commits were fetched, and False if there were errors or no new commits were fetched.

Fetch one or all configured `git_pillar` remotes.

---

**Note:** This will *not* fast-forward the `git_pillar` cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches `git_pillar` repos roughly every 60 seconds (or whatever `loop_interval` is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

---

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos (2015.8.4 and later)
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

### 14.14.13 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query` (*url*, *output=True*, *\*\*kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST          params='key1=val1&
↳key2=val2'
salt-run http.query http://somelink.com/ method=POST          data='<xml>
↳somecontent</xml>'
```

`salt.runners.http.update_ca_bundle` (*target=None*, *source=None*, *merge\_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

#### 14.14.14 salt.runners.jobs

A convenience system to manage jobs, both active and already run

**salt.runners.jobs.active** (*display\_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

**salt.runners.jobs.exit\_success** (*jid, ext\_source=None*)

Check if a job has been executed and exit successfully

**jid** The jid to look up.

**ext\_source** The external job cache to use. Default: *None*.

CLI Example: .. code-block:: bash

```
salt-run jobs.exit_success 20160520145827701627
```

**salt.runners.jobs.last\_run** (*ext\_source=None, outputter=None, metadata=None, function=None, target=None, display\_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

**salt.runners.jobs.list\_job** (*jid, ext\_source=None, display\_progress=False*)

List a specific job given by its jid

**ext\_source** If provided, specifies which external job cache to use.

**display\_progress** [False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

**salt.runners.jobs.list\_jobs** (*ext\_source=None, outputter=None, search\_metadata=None, search\_function=None, search\_target=None, start\_time=None, end\_time=None, display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source** If provided, specifies which external job cache to use.

**FILTER OPTIONS**

---

**Note:** If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

**search\_metadata** Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata={'foo': "bar", "baz": "qux"}
```

**search\_function** Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=["test.*", "pkg.install"]
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

**search\_target** Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target=["db*", "myminion"]
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

**start\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

**end\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↳ metadata={'bar': "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:
↳ 00'
```

**salt.runners.jobs.list\_jobs\_filter**(*count*, *filter\_find\_job=True*, *ext\_source=None*, *outputter=None*, *display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source** The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

**salt.runners.jobs.lookup\_jid**(*jid*, *ext\_source=None*, *returned=True*, *missing=False*, *display\_progress=False*)

Return the printout from a previously executed job

**jid** The jid to look up.

**ext\_source** The external job cache to use. Default: *None*.

**returned** [True] If True, include the minions that did return from the command.

New in version 2015.8.0.

**missing** [False] If True, include the minions that did *not* return from the command.

**display\_progress** [False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

`salt.runners.jobs.print_job(jid, ext_source=None)`

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

### 14.14.15 salt.runners.launchd

Manage launchd plist files

`salt.runners.launchd.write_launchd_plist(program)`

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

### 14.14.16 salt.runners.lxc

Control Linux Containers via Salt

**depends** lxc execution module

`salt.runners.lxc.cloud_init(names, host=None, quiet=False, **kwargs)`

Wrapper for using lxc.init in saltcloud compatibility mode

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion to start the container on. Required.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead

`salt.runners.lxc.find_guest(name, quiet=False, path=None)`

Returns the host for a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

`salt.runners.lxc.find_guests(names, path=None)`

Return a dict of hosts and named guests

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

`salt.runners.lxc.freeze(name, quiet=False, path=None)`

Freeze the named container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

`salt.runners.lxc.info`(*name*, *quiet=False*, *path=None*)

Returns information about a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

`salt.runners.lxc.init`(*names*, *host=None*, *saltcloud\_mode=False*, *quiet=False*, *\*\*kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
    [template=lxc_template_name] [clone=original name] \
    [profile=lxc_profile] [network_profile=network_profile] \
    [nic=network_profile] [nic_opts=nic_opts] \
    [start=(true|false)] [seed=(true|false)] \
    [install=(true|false)] [config=minion_config] \
    [snapshot=(true|false)]
```

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion on which to initialize the container (**required**)

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead See `lxc.init_interface` module documentation

**cpuset** cgroups cpuset.

**cpushare** cgroups cpu shares.

**memory** cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**template** Name of LXC template on which to base this container

**clone** Clone this container from an existing container

**profile** A LXC profile (defined in config or pillar).

**network\_profile** Network profile to use for the container

New in version 2015.5.2.

**nic** Deprecated since version 2015.5.0: Use `network_profile` instead

**nic\_opts** Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329"}}
```

**start** Start the newly created container.

**seed** Seed the container with the minion config and autosign its key. Default: true

**install** If salt-minion is not already installed, install it. Default: true

**config** Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.list`(*host=None*, *quiet=False*, *path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.purge` (*name*, *delete\_key=True*, *quiet=False*, *path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.start` (*name*, *quiet=False*, *path=None*)

Start the named container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.stop` (*name*, *quiet=False*, *path=None*)

Stop the named container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.unfreeze` (*name*, *quiet=False*, *path=None*)

Unfreeze the named container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

### 14.14.17 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.alived` (*subset=None*, *show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.allowed` (*subset=None*, *show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

```
salt.runners.manage.bootstrap(version='develop', script=None, hosts='', root_user=False,
                              script_args='', roster='flat', ssh_user=None, ssh_password=None,
                              ssh_priv_key=None, tmp_dir='/tmp/.bootstrap',
                              http_backend='tornado')
```

Bootstrap minions with salt-bootstrap

**version** [develop] Git tag of version to install

**script** [https://bootstrap.saltstack.com] URL containing the script to execute

**hosts** Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

**root\_user** [False] Prepend root@ to each host. Default changed in Salt 2016.11.0 from True to False.

Changed in version 2016.11.0.

Deprecated since version 2016.11.0.

**script\_args** Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

**roster** [flat] The roster to use for Salt SSH. More information about roster files can be found in [Salt's Roster Documentation](#).

A full list of roster types, see the [builtin roster modules](#) documentation.

New in version 2016.11.0.

**ssh\_user** If user isn't found in the roster, a default SSH user can be set here. Keep in mind that ssh\_user will not override the roster user value if it is already defined.

New in version 2016.11.0.

**ssh\_password** If passwd isn't found in the roster, a default SSH password can be set here. Keep in mind that ssh\_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

**ssh\_privkey** If priv isn't found in the roster, a default SSH private key can be set here. Keep in mind that ssh\_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

**tmp\_dir** [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have <uuid4> appended to it. For example: /tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/

New in version 2016.11.0.

**http\_backend** [tornado] The backend library to use to download the script. If you need to use a file:/// URL, then you should set this to urllib2.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script=
↳ 'https://bootstrap.saltstack.com/develop'
salt-run manage.bootstrap hosts='ec2-user@host1,ec2-user@host2' root_
↳ user=False
```

```
salt.runners.manage.bootstrap_psexec(hosts='', master=None, version=None, arch='win32', in-
staller_url=None, username=None, password=None)
```

Bootstrap Windows minions via PsExec.

**hosts** Comma separated list of hosts to deploy the Windows Salt minion.  
**master** Address of the Salt master passed as an argument to the installer.  
**version** Point release of installer to download. Defaults to the most recent.  
**arch** Architecture of installer to download. Defaults to win32.  
**installer\_url** URL of minion installer executable. Defaults to the latest version from <https://repo.saltstack.com/windows/>.  
**username** Optional user name for login on remote computer.  
**password** Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.  
 CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↳ 'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↳ exampledomain/salt-installer.exe'
```

**salt.runners.manage.down**(*removekeys=False, tgt='\*', expr\_form='glob'*)  
 Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" expr_form="nodegroup"
```

**salt.runners.manage.get\_stats**(*estate=None, stack='road'*)  
 Print the stack stats  
**estate** [None] The name of the target estate. Master stats would be requested by default  
**stack** ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.  
 CLI Example:

```
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

**salt.runners.manage.joined**(*subset=None, show\_ipv4=False*)  
 New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.  
**show\_ipv4** [False] Also show the IP address each minion is connecting from.  
 CLI Example:

```
salt-run manage.joined
```

**salt.runners.manage.key\_regen**()  
 This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.lane_stats` (*estate=None*)

Print the estate manor lane stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.lane_stats [estate=alpha_minion]
```

`salt.runners.manage.list_not_state` (*subset=None, show\_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

**state** [ `available` ] Show minions being in specific state that is one of `available`, `joined`, `allowed`, `alived` or `reaped`.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.list_state` (*subset=None, show\_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

**state** [ `available` ] Show minions being in specific state that is one of `available`, `joined`, `allowed`, `alived` or `reaped`.

CLI Example:

```
salt-run manage.list_state
```

`salt.runners.manage.not_alived` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alived
```

`salt.runners.manage.not_allowed` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

`salt.runners.manage.not_joined` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

`salt.runners.manage.not_present` (*subset=None, show\_ipv4=False*)

New in version 2015.5.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

`salt.runners.manage.not_reaped` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.present` (*subset=None, show\_ipv4=False*)

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.reaped` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.road_stats` (*estate=None*)

Print the estate road stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.road_stats [estate=alpha_minion]
```

`salt.runners.manage.safe_accept` (*target*, *expr\_form='glob'*)

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 expr_form=list
```

`salt.runners.manage.status` (*output=True*, *tgt='\**, *expr\_form='glob'*, *timeout=None*,  
*gather\_job\_timeout=None*)

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status timeout=5 gather_job_timeout=10
salt-run manage.status tgt="webservers" expr_form="nodegroup"
```

`salt.runners.manage.up` (*tgt='\**, *expr\_form='glob'*, *timeout=None*, *gather\_job\_timeout=None*)

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up timeout=5 gather_job_timeout=10
salt-run manage.up tgt="webservers" expr_form="nodegroup"
```

`salt.runners.manage.versions` ()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

#### 14.14.18 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get` (*tgt*, *fun*, *tgt\_type='glob'*)

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

#### 14.14.19 salt.runners.nacl

This runner helps create encrypted passwords that can be included in pillars.

**depends** libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

The following configurations can be defined in the master config so your users can create encrypted passwords using the runner nacl:

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
  key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
  keyfile: /root/.nacl
```

Now with the config in the master you can use the runner nacl like:

```
salt-run nacl.enc 'data'
```

`salt.runners.nacl.dec`(*data*, *\*\*kwargs*)

Takes a key generated from `nacl.keygen` and decrypt some data.

CLI Examples:

```
salt-run nacl.dec pEXHQm6cuaF7A=
salt-run nacl.dec data='pEXHQm6cuaF7A=' keyfile=/root/.nacl
salt-run nacl.dec data='pEXHQm6cuaF7A=' key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

`salt.runners.nacl.enc`(*data*, *\*\*kwargs*)

Takes a key generated from `nacl.keygen` and encrypt some data.

CLI Examples:

```
salt-run nacl.enc datatoenc
salt-run nacl.enc datatoenc keyfile=/root/.nacl
salt-run nacl.enc datatoenc key='cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

`salt.runners.nacl.keygen`(*keyfile=None*)

Use libnacl to generate a private key

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen keyfile=/root/.nacl
salt-run --out=newline_values_only nacl.keygen > /root/.nacl
```

#### 14.14.20 salt.runners.network

Network tools to run from the Master

`salt.runners.network.wol`(*mac*, *bcast='255.255.255.255'*, *destport=9*)

Send a ``Magic Packet'' to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

`salt.runners.network.wolllist`(*maclist*, *bcast='255.255.255.255'*, *destport=9*)

Send a ``Magic Packet'' to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wollist '/path/to/maclist'
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
```

### 14.14.21 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the master config.

For example:

```
my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rFWf2214
  pagerduty.subdomain: mysubdomain
```

**salt.runners.pagerduty.create\_event** (*service\_key=None, description=None, details=None, incident\_key=None, profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>
  ↳profile=my-pagerduty-account
```

The following parameters are required:

**service\_key** This key can be found by using `pagerduty.list_services`.

**description** This is a short description of the event.

**details** This can be a more detailed description of the event.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

**salt.runners.pagerduty.list\_escalation\_policies** (*profile=None, api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

**salt.runners.pagerduty.list\_incidents** (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt-run pagerduty.list_incidents my-pagerduty-account
```

**salt.runners.pagerduty.list\_maintenance\_windows** (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

**salt.runners.pagerduty.list\_policies** (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies
my-pagerduty-account
```

`salt.runners.pagerduty.list_schedules` (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt-run pagerduty.list_schedules my-pagerduty-account
```

`salt.runners.pagerduty.list_services` (*profile=None, api\_key=None*)

List services belonging to this account

CLI Example:

```
salt-run pagerduty.list_services my-pagerduty-account
```

`salt.runners.pagerduty.list_users` (*profile=None, api\_key=None*)

List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows` (*profile=None, api\_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

### 14.14.22 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.show_pillar` (*minion='\*', \*\*kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `*`.

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for `dev` pillar environment:

```
salt-run pillar.show_pillar 'saltenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.show_top` (*minion=None, saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

### 14.14.23 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.list_upgrades` (*jid, style='group', outputter='nested', ext\_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

### 14.14.24 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included `sqlite3` queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process\_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process\_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process\_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

`salt.runners.queue.delete` (*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["'item1', 'item2', 'item3'"]
```

`salt.runners.queue.insert` (*queue, items, backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.list_items(queue, backend='sqlite')`

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.list_length(queue, backend='sqlite')`

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.list_queues(backend='sqlite')`

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.pop(queue, quantity=1, backend='sqlite')`

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.process_queue(queue, quantity=1, backend='sqlite')`

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

#### 14.14.25 salt.runners.reactor

A convenience system to manage reactors

`salt.runners.reactor.add(event, reactors, saltenv='base', test=None)`

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↪'
```

`salt.runners.reactor.delete` (*event*, *saltenv*='base', *test*=None)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.list` (*saltenv*='base', *test*=None)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

### 14.14.26 salt.runners.salt

New in version 2016.11.0.

This runner makes Salt's execution modules available on the salt master. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd` (*fun*, *\*args*, *\*\*kwargs*)

Execute *fun* with the given *args* and *kwargs*. Parameter *fun* should be the string *name* of the execution module to call.

Note that execution modules will be *loaded every time* this function is called.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

### 14.14.27 salt.runners.saltutil

Sync custom types to the Master

New in version 2016.3.0.

`salt.runners.saltutil.sync_all` (*saltenv*='base')

Sync all custom types

*saltenv* [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_all
```

`salt.runners.saltutil.sync_engines` (*saltenv='base'*)

Sync engines from `salt://_engines` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_engines
```

`salt.runners.saltutil.sync_grains` (*saltenv='base'*)

Sync grains modules from `salt://_grains` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_grains
```

`salt.runners.saltutil.sync_modules` (*saltenv='base'*)

Sync execution modules from `salt://_modules` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_modules
```

`salt.runners.saltutil.sync_output` (*saltenv='base'*)

Sync output modules from `salt://_output` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_output
```

`salt.runners.saltutil.sync_pillar` (*saltenv='base'*)

Sync pillar modules from `salt://_pillar` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_pillar
```

`salt.runners.saltutil.sync_proxymodules` (*saltenv='base'*)

Sync proxy modules from `salt://_proxy` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_proxy
```

`salt.runners.saltutil.sync_queues` (*saltenv='base'*)

Sync queue modules from `salt://_queues` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_queues
```

**salt.runners.saltutil.sync\_renderers** (*saltenv='base'*)

Sync renderer modules from `salt://_renderers` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_renderers
```

**salt.runners.saltutil.sync\_returners** (*saltenv='base'*)

Sync returner modules from `salt://_returners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_returners
```

**salt.runners.saltutil.sync\_runners** (*saltenv='base'*)

Sync runners from `salt://_runners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_runners
```

**salt.runners.saltutil.sync\_states** (*saltenv='base'*)

Sync state modules from `salt://_states` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_states
```

**salt.runners.saltutil.sync\_tops** (*saltenv='base'*)

New in version 2016.3.7,2016.11.4,Nitrogen.

Sync `master_tops` modules from `salt://_tops` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

**salt.runners.saltutil.sync\_utils** (*saltenv='base'*)

New in version 2016.11.0.

Sync `utils` modules from `salt://_utils` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv='base'*)

Sync wheel modules from `salt://_wheel` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_wheel
```

#### 14.14.28 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.set` (*uri, value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

#### 14.14.29 salt.runners.smartos\_vmadm module

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.get` (*search, one=True*)

Return information for vms

**search** [string] filter vms, see the execution module.

**one** [boolean] return only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.is_running` (*search*)

Return true if vm is running

**search** [string] filter vms, see the execution module.

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

---

**Note:** If multiple vms are matched, the result will be true if ALL vms are running

---

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

**salt.runners.smartos\_vmadm.list** (*search=None, verbose=False*)

List all vms

**search** [string] filter vms, see the execution module

**verbose** [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

**salt.runners.smartos\_vmadm.nodes** (*verbose=False*)

List all compute nodes

**verbose** [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

**salt.runners.smartos\_vmadm.reboot** (*search, one=True, force=False*)

Reboot one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] reboot only one vm

**force** [boolean] force reboot, faster but no graceful shutdown

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

**salt.runners.smartos\_vmadm.start** (*search, one=True*)

Start one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] start only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.stop` (*search*, *one=True*)

Stop one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] stop only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

### 14.14.30 salt.runners.search

Runner frontend to search system

`salt.runners.search.query` (*term*)

Query the search system

CLI Example:

```
salt-run search.query foo
```

### 14.14.31 salt.runners.spacewalk

#### Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com
  username: "testuser"
  password: "verybadpass"
  spacewalk02.domain.com
  username: "testuser"
  password: "verybadpass"
```

---

**Note:** Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

---

`salt.runners.spacewalk.unregister` (*name*, *server\_url*)

To unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

### 14.14.32 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd` (*tgt*, *fun*, *arg=()*, *timeout=None*, *expr\_form='glob'*, *kwarg=None*)

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

A wrapper around the `SSHClient.cmd` method.

### 14.14.33 salt.runners.state

Execute orchestration functions

`salt.runners.state.event` (*tagmatch='\**, *count=-1*, *quiet=False*, *sock\_dir=None*, *pretty=False*, *node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

#### Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \
  salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \
  salt 'jerry' state.highstate
```

```
# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\  
    salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\  
    salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
    echo $data | jq --color-output .
done
```

See also:

See <https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh> for an example of usage within a shell script.

`salt.runners.state.orchestrate` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *orchestration\_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

`salt.runners.state.orchestrate_high` (*data*, *test*=None, *queue*=False, *pillar*=None, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
      {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
    stage_two:
      {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
        require: [{salt: stage_one}],
      }]},
  }'
```

`salt.runners.state.orchestrate_single` (*fun*, *name*, *test*=None, *queue*=False, *pillar*=None, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

### 14.14.34 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *``some of these things are not like the others...''* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff(*args, **kwargs)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the *``diffs''* as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the *``differences of files''*)

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash(*args, **kwargs)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an *``outlier''* minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

### 14.14.35 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

`salt.runners.test.sleep(s_time=10)`

Sleep t seconds, then return True

`salt.runners.test.stdout_print()`

Print 'foo' and return 'bar'

`salt.runners.test.stream()`

Return True

### 14.14.36 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.generate_min(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

### 14.14.37 salt.runners.virt

Control virtual machines via Salt

`salt.runners.virt.force_off(name)`

Force power down the named virtual machine

`salt.runners.virt.host_info(host=None)`

Return information about the host connected to this master

**salt.runners.virt.init**(*name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable\_vnc=False*)

This routine is used to create a new virtual machine. This routine takes a number of options to determine what the newly created virtual machine will look like.

**name** The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

**cpu** The number of cpus to allocate to this new virtual machine.

**mem** The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

**image** The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

**hypervisor** The hypervisor to use for the new virtual machine. Default is 'kvm'.

**host** The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

**seed** Set to False to prevent Salt from seeding the new virtual machine.

**nic** The nic profile to use, defaults to the 'default' nic profile which assumes a single network interface per VM associated with the 'br0' bridge on the master.

**install** Set to False to prevent Salt from installing a minion on the new VM before it spins up.

**disk** The disk profile to use

**saltenv** The Salt environment to use

**salt.runners.virt.list**(*host=None, quiet=False, hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

**salt.runners.virt.migrate**(*name, target=''*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

**salt.runners.virt.next\_host**()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math to determine the most 'available' next host.

**salt.runners.virt.pause**(*name*)

Pause the named VM

**salt.runners.virt.purge**(*name, delete\_key=True*)

Destroy the named VM

**salt.runners.virt.query**(*host=None, quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

**salt.runners.virt.reset**(*name*)

Force power down and restart an existing VM

**salt.runners.virt.resume**(*name*)

Resume a paused VM

**salt.runners.virt.start**(*name*)

Start a named virtual machine

**salt.runners.virt.vm\_info**(*name, quiet=False*)

Return the information on the named VM

### 14.14.38 salt.runners.vistara module

Vistara Runner

Runner to interact with the Vistara (<http://www.vistarait.com/>) REST API

**codeauthor** Brad Thurber <[brad.thurber@gmail.com](mailto:brad.thurber@gmail.com)>

To use this runner, the Vistara `client_id` and Vistara `oauth2 client_key` and `client_secret` must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

**salt.runners.vistara.delete\_device** (*name*, *safety\_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, `delete_device` will only perform the delete if a single host is returned. Set `safety_on=False` to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

#### 14.14.39 salt.runners.winrepo

Runner to manage Windows software repo

**salt.runners.winrepo.genrepo** (*opts=None*, *fire\_event=True*)

Generate `winrepo_cache`file based on `sls` files in the `winrepo_dir`

**opts** Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

**fire\_event** [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

**salt.runners.winrepo.update\_git\_repos** (*opts=None*, *clean=False*, *masterless=False*)

Checkout git repos containing Windows Software Package Definitions

**opts** Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

**clean** [False] Clean repo `cachedirs` which are not configured under `winrepo_remotes`.

**Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

## 14.15 sdb modules

|                         |   |
|-------------------------|---|
| <code>confidant</code>  | An SDB module for getting credentials from confidant. |
| <code>consul</code>     | Consul sdb Module                                     |
| <code>couchdb</code>    | CouchDB sdb Module                                    |
| <code>env</code>        | Environment sdb Module                                |
| <code>etcd_db</code>    | etcd Database Module                                  |
| <code>keyring_db</code> | Keyring Database Module                               |
| <code>memcached</code>  | Memcached sdb Module                                  |
| <code>rest</code>       | Generic REST API SDB Module                           |
| <code>sqlite3</code>    | SQLite sdb Module                                     |
| <code>vault</code>      | Vault SDB Module                                      |

### 14.15.1 salt.sdb.confidant

An SDB module for getting credentials from confidant.

#### Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

**depends** confidant-common, confidant-client

#### Module Documentation

`salt.sdb.confidant.get`(*key*, *profile=None*)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get `sdb://confidant/credentials`
```

Valid keys are: `credentials`, `credentials_metadata`, `result`. `credentials` returns a dict of joined `credential_pairs`, `credentials_metadata` returns a dict of metadata relevant to the credentials mapped to the confidant service, and `result` returns a bool that can be used to determine if the `sdm` call succeeded or failed to fetch credentials from confidant (or from local cache). If `result` is false, the data in `credentials` or `credentials_metadata` can't be trusted.

### 14.15.2 salt.sdb.consul module

Consul sdb Module

**maintainer** SaltStack

**maturity** New

**platform** all

This module allows access to Consul using an `sdm://` URI

Like all `sdm` modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

The `driver` refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

`sdm.consul.get_conn(profile)`

Return a client object for accessing consul

### 14.15.3 salt.sdb.couchdb

CouchDB sdb Module

**maintainer** SaltStack

**maturity** New

**depends** python2-couchdb

**platform** all

This allow interaction between Salt and a CouchDB [[couchdb.apache.org](http://couchdb.apache.org)] database. It uses salt's `sdm` system to allow for inserts and retrievals using the `sdm://` prefix in salt configuration files.

To use the couchbase `sdm` module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an `sdm://` URI such as the following:

```
password: sdm://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

`salt.sdb.couchdb.get(key, profile=None)`  
Get a value from couchdb by id

`salt.sdb.couchdb.set(key, value, profile=None)`  
Set a key/value pair in couchdb

#### 14.15.4 salt.sdb.env module

Environment sdb Module

**maintainer** SaltStack

**maturity** New

**depends** None

**platform** all

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:
  driver: env
```

#### WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named `compute` (and have `osenv` defined). The example below will look for the salt cloud config key `compute_name` in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

`salt.sdb.env.get(key, profile=None)`  
Get a value

`salt.sdb.env.set`(*key*, *value*, *profile=None*)  
Set a key/value pair

### 14.15.5 salt.sdb.etcd\_db

etcd Database Module

**maintainer** SaltStack  
**maturity** New  
**depends** python-etcd  
**platform** all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:  
  driver: etcd  
  etcd.host: 127.0.0.1  
  etcd.port: 4001
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.delete`(*key*, *service=None*, *profile=None*)  
Get a value from the etcd service

`salt.sdb.etcd_db.get`(*key*, *service=None*, *profile=None*)  
Get a value from the etcd service

`salt.sdb.etcd_db.set`(*key*, *value*, *service=None*, *profile=None*)  
Set a key/value pair in the etcd service

### 14.15.6 salt.sdb.keyring\_db

Keyring Database Module

**maintainer** SaltStack  
**maturity** New  
**depends** keyring  
**platform** all

This module allows access to the keyring package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the ``Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The `keyczar` backend does not

seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

`salt.sdb.keyring_db.get(key, service=None, profile=None)`  
Get a value from a keyring service

`salt.sdb.keyring_db.set(key, value, service=None, profile=None)`  
Set a key/value pair in a keyring service

### 14.15.7 salt.sdb.memcached

Memcached sdb Module

**maintainer** SaltStack

**maturity** New

**depends** python-memcached

**platform** all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

`salt.sdb.memcached.get(key, profile=None)`  
Get a value from memcached

`salt.sdb.memcached.set`(*key*, *value*, *profile=None*)  
Set a key/value pair in memcached

### 14.15.8 salt.sdb.rest module

Generic REST API SDB Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:  
  driver: rest  
  urls:  
    url: https://api.github.com/  
  keys:  
    url: https://api.github.com/users/{{user}}/keys  
  backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:  
  driver: rest  
  user_data:  
    url: https://api.example.com/users/  
  params:  
    user: myuser
```

`salt.sdb.rest.get`(*key*, *service=None*, *profile=None*)  
Get a value from the REST interface

`salt.sdb.rest.query`(*key*, *value=None*, *service=None*, *profile=None*)  
Get a value from the REST interface

`salt.sdb.rest.set`(*key, value, service=None, profile=None*)  
Set a key/value pair in the REST interface

### 14.15.9 salt.sdb.sqlite3

SQLite sdb Module

**maintainer** SaltStack  
**maturity** New  
**platform** all

This module allows access to sqlite3 using an `sdb://` URI

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the sqlite3 module, `database` refers to the sqlite3 database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

#### Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

`salt.sdb.sqlite3.get`(*key, profile=None*)  
Get a value from sqlite3

`salt.sdb.sqlite3.set`(*key, value, profile=None*)  
Set a key/value pair in sqlite3

### 14.15.10 salt.sdb.vault module

Vault SDB Module

**maintainer** SaltStack  
**maturity** New  
**platform** all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myvault:
  driver: vault
  vault.host: 127.0.0.1
  vault.port: 8200
```

```
vault.scheme: http # Optional; default is https
vault.token: 012356789abcdef # Required, unless set in environment
```

The driver refers to the `vault` module, `vault.host` refers to the host that is hosting vault and `vault.port` refers to the port on that host. A vault token is also required. It may be set statically, as above, or as an environment variable:

```
$ export VAULT_TOKEN=0123456789abcdef
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords?mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

`salt.sdb.vault.get(key, profile=None)`

Get a value from the vault service

`salt.sdb.vault.set(key, value, profile=None)`

Set a key/value pair in the vault service

## 14.16 serializer modules

|                           |  |
|---------------------------|--|
| <code>configparser</code> | <code>salt.serializers.configparser</code> |
| <code>json</code>         | <code>salt.serializers.json</code>         |
| <code>msgpack</code>      | <code>salt.serializers.msgpack</code>      |
| <code>python</code>       | <code>salt.serializers.python</code>       |
| <code>yaml</code>         | <code>salt.serializers.yaml</code>         |
| <code>yamlex</code>       | <code>salt.serializers.yamlex</code>       |

### 14.16.1 salt.serializers.configparser module

#### `salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

`salt.serializers.configparser.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

#### Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

`salt.serializers.configparser.serialize(obj, **options)`

Serialize Python data to a configparser formatted string or file.

#### Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

### 14.16.2 salt.serializers.json

#### salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

##### Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`

Serialize Python data to JSON.

##### Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

### 14.16.3 salt.serializers.msgpack

#### salt.serializers.msgpack

Implements MsgPack serializer.

`salt.serializers.msgpack.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

##### Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

`salt.serializers.msgpack.serialize(obj, **options)`

Serialize Python data to MsgPack.

##### Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

### 14.16.4 salt.serializers.python module

#### salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.serialize(obj, **options)`  
Serialize Python data to a Python string representation (via `pprint.format`)

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to `pprint.format`

### 14.16.5 salt.serializers.yaml

#### `salt.serializers.yaml`

Implements YAML serializer.

Underneath, it is based on `pyyaml` and use the `safe dumper` and `loader`. It also use C bindings if they are available.

`salt.serializers.yaml.deserialize(stream_or_string, **options)`  
Deserialize any string of stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower `yaml` module.

`salt.serializers.yaml.serialize(obj, **options)`  
Serialize Python data to YAML.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower `yaml` module.

### 14.16.6 salt.serializers.yamlex

#### `salt.serializers.yamlex`

YAMLEX is a format that allows for things like `sls` files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies `omap` for any dict like. - it implies that string like data are `str`, not `unicode` - ...

For example, the file `states.sls` has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an `OrderedDict`

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex `__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

## Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 14.17 state modules

|                                  |  |
|----------------------------------|--|
| <i>acme</i>                      | ACME / Let's Encrypt certificate management state  |
| <i>alias</i>                     | Configuration of email aliases   |
| <i>alternatives</i>              | Configuration of the alternatives system   |
| <i>apache</i>                    | Apache state   |
| <i>apache_conf</i>               | Manage Apache Confs  |
| <i>apache_module</i>             | Manage Apache Modules  |
| <i>apache_site</i>               | Manage Apache Sites  |
| <i>aptpkg</i>                    | Package management operations specific to APT- and DEB-based systems                     |
| <i>archive</i>                   | Extract an archive   |
| <i>artifactory</i>               | This state downloads artifacts from artifactory.   |
| <i>at</i>                        | Configuration disposable regularly scheduled tasks for at.                               |
| <i>augeas</i>                    | Configuration management using Augeas  |
| <i>aws_sqs</i>                   | Manage SQS Queues  |
| <i>beacon</i>                    | Management of the Salt beacons   |
| <i>bigip</i>                     | A state module designed to enforce load-balancing configurations for F5 Big-IP entities. |
| <i>blockdev</i>                  | Management of Block Devices  |
| <i>boto_apigateway</i>           | Manage Apigateway Rest APIs  |
| <i>boto_asg</i>                  | Manage Autoscale Groups  |
| <i>boto_cfn</i>                  | Connection module for Amazon Cloud Formation   |
| <i>boto_cloudtrail</i>           | Manage CloudTrail Objects  |
| <i>boto_cloudwatch_alarm</i>     | Manage Cloudwatch alarms   |
| <i>boto_cloudwatch_event</i>     | Manage CloudTrail Objects  |
| <i>boto_cognitoidentity</i>      | Manage CognitoIdentity Functions   |
| <i>boto_datapipeline</i>         | Manage Data Pipelines  |
| <i>boto_dynamodb</i>             | Manage DynamoDB Tables   |
| <i>boto_ec2</i>                  | Manage EC2   |
| <i>boto_elasticache</i>          | Manage Elasticache   |
| <i>boto_elasticsearch_domain</i> | Manage Elasticsearch Domains   |
| <i>boto_elb</i>                  | Manage ELBs  |
| <i>boto_iam</i>                  | Manage IAM objects   |
| <i>boto_iam_role</i>             | Manage IAM roles   |
| <i>boto_iot</i>                  | Manage IoT Objects   |
| <i>boto_kms</i>                  | Manage KMS keys, key policies and grants.  |
| <i>boto_lambda</i>               | Manage Lambda Functions  |
| <i>boto_lc</i>                   | Manage Launch Configurations   |
| <i>boto_rds</i>                  | Manage RDSs  |
| <i>boto_route53</i>              | Manage Route53 records   |
| <i>boto_s3_bucket</i>            | Manage S3 Buckets  |
| <i>boto_secgroup</i>             | Manage Security Groups   |
| <i>boto_sns</i>                  | Manage SNS Topics  |

Continued on next page

Table 14.17 -- continued from previous page

|                                     |  |
|-------------------------------------|--|
| <i>boto_sqs</i>                     | Manage SQS Queues  |
| <i>boto_vpc</i>                     | Manage VPCs  |

| <i>ceph</i>                         | Manage ceph with salt.   |
| <i>chef</i>                         | Execute Chef client runs   |
| <i>chocolatey</i>                   | Manage Chocolatey package installs ..  |
| <i>chronos_job</i>                  | Configure Chronos jobs via a salt proxy.   |
| <i>cisconso</i>                     | State module for Cisco NSO Proxy minions   |
| <i>cloud</i>                        | Using states instead of maps to deploy clouds  |
| <i>cmd</i>                          | Execution of arbitrary commands  |
| <i>composer</i>                     | Installation of Composer Packages  |
| <i>cron</i>                         | Management of cron, the Unix command scheduler   |
| <i>csf</i>                          |  |
| <i>cyg</i>                          | Installation of Cygwin packages.   |
| <i>ddns</i>                         | Dynamic DNS updates  |
| <i>debconfmod</i>                   | Management of debconf selections   |
| <i>dellchassis</i>                  | Manage chassis via Salt Proxies.   |
| <i>disk</i>                         | Disk monitoring state  |
| <i>dockerio</i>                     | Manage Docker containers   |
| <i>dockerng</i>                     | Management of Docker containers  |
| <i>drac</i>                         | Management of Dell DRAC  |
| <i>elasticsearch_index</i>          | State module to manage Elasticsearch indices   |
| <i>elasticsearch_index_template</i> | State module to manage Elasticsearch index templates                                   |
| <i>environ</i>                      | Support for getting and setting the environment variables of the current salt process. |
| <i>eselect</i>                      | Management of Gentoo configuration using eselect                                       |
| <i>etcd_mod</i>                     | Manage etcd Keys   |
| <i>ethtool</i>                      | Configuration of network device  |
| <i>esxi</i>                         | Manage VMware ESXi Hosts.  |
| <i>event</i>                        | Send events through Salt's event system during state runs                              |
| <i>file</i>                         | Operations on regular files, special files, directories, and symlinks                  |
| <i>firewall</i>                     | State to check firewall configurations ..  |
| <i>firewalld</i>                    | Management of firewalld  |
| <i>gem</i>                          | Installation of Ruby modules packaged as gems  |
| <i>git</i>                          | States to manage git repositories and git configuration                                |
| <i>github</i>                       | Github User State Module   |
| <i>glance</i>                       | Managing Images in OpenStack Glance  |
| <i>glusterfs</i>                    | Manage GlusterFS pool.   |
| <i>gnomedesktop</i>                 | Configuration of the GNOME desktop   |
| <i>gpg</i>                          | Management of the GPG keychains  |
| <i>grafana</i>                      | Manage Grafana Dashboards  |
| <i>grafana_dashboard</i>            | Manage Grafana v2.0 Dashboards   |
| <i>grafana_datasource</i>           | Manage Grafana v2.0 data sources   |
| <i>grains</i>                       | Manage grains on the minion  |
| <i>group</i>                        | Management of user groups  |
| <i>hg</i>                           | Interaction with Mercurial repositories  |
| <i>hipchat</i>                      | Send a message to Hipchat  |
| <i>host</i>                         | Management of addresses and names in hosts file  |

Table 14.17 -- continued from previous page

|                            |   |
|----------------------------|---|
| <i>htpasswd</i>            | Support for htpasswd module.                                      |
| <i>http</i>                | HTTP monitoring states  |
| <i>ifttt</i>               | Trigger an event in IFTTT   |
| <i>incron</i>              | Management of incron, the inotify cron                            |
| <i>influxdb08_database</i> | Management of Influxdb 0.8 databases                              |
| <i>influxdb08_user</i>     | Management of InfluxDB 0.8 users                                  |
| <i>influxdb_database</i>   | Management of Influxdb databases                                  |
| <i>influxdb_user</i>       | Management of InfluxDB users                                      |
| <i>infoblox</i>            | states for infoblox stuff   |
| <i>ini_manage</i>          | Manage ini files  |
| <i>ipmi</i>                | Manage IPMI devices over LAN                                      |
| <i>ipset</i>               | Management of ipsets  |
| <i>iptables</i>            | Management of iptables  |
| <i>jboss7</i>              | Manage JBoss 7 Application Server via CLI interface               |
| <i>jenkins</i>             | Management of Jenkins   |
| <i>junos</i>               | State modules to interact with Junos devices.                     |
| <i>k8s</i>                 | Manage Kubernetes   |
| <i>kapacitor</i>           | Kapacitor state module.   |
| <i>keyboard</i>            | Management of keyboard layouts                                    |
| <i>keystone</i>            | Management of Keystone users                                      |
| <i>kmod</i>                | Loading and unloading of kernel modules                           |
| <i>layman</i>              | Management of Gentoo Overlays using layman                        |
| <i>ldap</i>                | Manage entries in an LDAP database                                |
| <i>libcloud_dns</i>        | Manage DNS records and zones using libcloud                       |
| <i>linux_acl</i>           | Linux File Access Control Lists                                   |
| <i>locale</i>              | Management of languages/locales                                   |
| <i>lvm</i>                 | Management of Linux logical volumes                               |
| <i>lvs_server</i>          | Management of LVS (Linux Virtual Server) Real Server              |
| <i>lvs_service</i>         | Management of LVS (Linux Virtual Server) Service                  |
| <i>lxc</i>                 | Manage Linux Containers   |
| <i>mac_assistive</i>       | Allows you to manage assistive access on macOS minions with 10.9+ |
| <i>mac_defaults</i>        | Writing/reading defaults from a macOS minion                      |
| <i>mac_keychain</i>        | Installing of certificates to the keychain                        |
| <i>mac_package</i>         | Installing of mac pkg files                                       |
| <i>mac_xattr</i>           | Allows you to manage extended attributes on files or directories  |
| <i>makeconf</i>            | Management of Gentoo make.conf                                    |
| <i>marathon_app</i>        | Configure Marathon apps via a salt proxy.                         |
| <i>mdadm</i>               | Managing software RAID with mdadm                                 |
| <i>memcached</i>           | States for Management of Memcached Keys                           |
| <i>modjk</i>               | State to control Apache modjk                                     |
| <i>modjk_worker</i>        | Manage modjk workers  |
| <i>module</i>              | Execution of Salt modules from within states                      |
| <i>mongodb_database</i>    | Management of Mongodb databases                                   |
| <i>mongodb_user</i>        | Management of Mongodb users                                       |
| <i>monit</i>               | Monit state   |
| <i>mount</i>               | Mounting of filesystems   |
| <i>mysql_database</i>      | Management of MySQL databases (schemas)                           |
| <i>mysql_grants</i>        | Management of MySQL grants (user permissions)                     |

Table 14.17 -- continued from previous page

|                                    |   |
|------------------------------------|---|
| <i>mysql_query</i>                 | Execution of MySQL queries  |
| <i>mysql_user</i>                  | Management of MySQL users   |
| <i>netntp</i>                      | Network NTP   |
| <i>netsnmp</i>                     | Network SNMP  |
| <i>netusers</i>                    | Network Users   |
| <i>network</i>                     | Configuration of network interfaces                                       |
| <i>nftables</i>                    | Management of nftables  |
| <i>npm</i>                         | Installation of NPM Packages  |
| <i>ntp</i>                         | Management of NTP servers   |
| <i>nxos</i>                        | State module for Cisco NX OS Switches Proxy minions                       |
| <i>openstack_config</i>            | Manage OpenStack configuration file settings.                             |
| <i>openvswitch_bridge</i>          | Management of Open vSwitch bridges.                                       |
| <i>openvswitch_port</i>            | Management of Open vSwitch ports.   |
| <i>pagerduty</i>                   | Create an Event in PagerDuty  |
| <i>pagerduty_escalation_policy</i> | Manage PagerDuty escalation policies.                                     |
| <i>pagerduty_schedule</i>          | Manage PagerDuty schedules.   |
| <i>pagerduty_service</i>           | Manage PagerDuty services   |
| <i>pagerduty_user</i>              | Manage PagerDuty users.   |
| <i>pcs</i>                         | Management of Pacemaker/Corosync clusters with PCS                        |
| <i>pecl</i>                        | Installation of PHP Extensions Using pecl                                 |
| <i>pip_state</i>                   | Installation of Python Packages Using pip                                 |
| <i>pkg</i>                         | Installation of packages using OS package managers such as yum or apt-get |
| <i>pkgbuild</i>                    | The pkgbuild state is the front of Salt package building backend.         |
| <i>pkgng</i>                       | Manage package remote repo using FreeBSD pkgng                            |
| <i>pkgrepo</i>                     | Management of APT/YUM package repos                                       |
| <i>portage_config</i>              | Management of Portage package configuration on Gentoo                     |
| <i>ports</i>                       | Manage software from FreeBSD ports  |
| <i>postgres_cluster</i>            | Management of PostgreSQL clusters   |
| <i>postgres_database</i>           | Management of PostgreSQL databases  |
| <i>postgres_extension</i>          | Management of PostgreSQL extensions                                       |
| <i>postgres_group</i>              | Management of PostgreSQL groups (roles)                                   |
| <i>postgres_initdb</i>             | Initialization of PostgreSQL data directory                               |
| <i>postgres_language</i>           | Management of PostgreSQL languages  |
| <i>postgres_privileges</i>         | Management of PostgreSQL Privileges                                       |
| <i>postgres_schema</i>             | Management of PostgreSQL schemas  |
| <i>postgres_tablespace</i>         | Management of PostgreSQL tablespace                                       |
| <i>postgres_user</i>               | Management of PostgreSQL users (roles)                                    |
| <i>powerpath</i>                   | Powerpath configuration support   |
| <i>probes</i>                      | Network Probes  |
| <i>process</i>                     | Process Management  |
| <i>proxy</i>                       | Allows you to manage proxy settings on minions                            |
| <i>pushover</i>                    | Send a message to PushOver  |
| <i>pyenv</i>                       | Managing python installations with pyenv                                  |
| <i>pyrax_queues</i>                | Manage Rackspace Queues   |
| <i>quota</i>                       | Management of POSIX Quotas  |
| <i>rabbitmq_cluster</i>            | Manage RabbitMQ Clusters  |
| <i>rabbitmq_plugin</i>             | Manage RabbitMQ Plugins   |
| <i>rabbitmq_policy</i>             | Manage RabbitMQ Policies  |

Table 14.17 -- continued from previous page

|                             |   |
|-----------------------------|---|
| <i>rabbitmq_user</i>        | Manage RabbitMQ Users   |
| <i>rabbitmq_vhost</i>       | Manage RabbitMQ Virtual Hosts   |
| <i>rbenv</i>                | Managing Ruby installations with rbenv                                  |
| <i>rdp</i>                  | Manage RDP Service on Windows servers                                   |
| <i>redismod</i>             | Management of Redis server  |
| <i>reg</i>                  |   |
| <i>rsync</i>                | State to synchronize files and directories with rsync.                  |
| <i>rvm</i>                  | Managing Ruby installations and gemsets with Ruby Version Manager (RVM) |
| <i>salt_proxy</i>           | Salt proxy state  |
| <i>saltmod</i>              | Control the Salt command interface                                      |
| <i>schedule</i>             | Management of the Salt scheduler  |
| <i>selinux</i>              | Management of SELinux rules   |
| <i>serverdensity_device</i> | Monitor Server with Server Density                                      |
| <i>service</i>              | Starting or restarting of services and daemons                          |
| <i>slack</i>                | Send a message to Slack   |
| <i>smartos</i>              | Management of SmartOS Standalone Compute Nodes                          |
| <i>smtp</i>                 | Sending Messages via SMTP   |
| <i>snapper</i>              | Managing implicit state and baselines using snapshots                   |
| <i>splunk</i>               | Splunk User State Module  |
| <i>splunk_search</i>        | Splunk Search State Module  |
| <i>sqlite3</i>              | Management of SQLite3 databases   |
| <i>ssh_auth</i>             | Control of entries in SSH authorized_key files                          |
| <i>ssh_known_hosts</i>      | Control of SSH known_hosts entries                                      |
| <i>stateconf</i>            | Stateconf System  |
| <i>status</i>               | Minion status monitoring  |
| <i>stormpath_account</i>    | Support for Stormpath.  |
| <i>supervisord</i>          | Interaction with the Supervisor daemon                                  |
| <i>svn</i>                  | Manage SVN repositories   |
| <i>sysctl</i>               | Configuration of the Linux kernel using sysctl                          |
| <i>syslog_ng</i>            | State module for syslog_ng  |
| <i>sysrc</i>                |   |
| <i>telemetry_alert</i>      | New in version 2016.3.0..   |
| <i>test</i>                 | Test States   |
| <i>testinframod</i>         |   |
| <i>timezone</i>             | Management of timezones   |
| <i>tls</i>                  | Enforce state for SSL/TLS   |
| <i>tomcat</i>               | Manage Apache Tomcat web applications                                   |
| <i>trafficserver</i>        | Control Apache Traffic Server   |
| <i>tuned</i>                | Interface to Red Hat tuned-adm module                                   |
| <i>uptime</i>               | Monitor Web Server with Uptime  |
| <i>user</i>                 | Management of user accounts   |
| <i>vbox_guest</i>           | VirtualBox Guest Additions installer state                              |
| <i>victorops</i>            | Create an Event in VictorOps  |
| <i>virt</i>                 | Manage virt   |
| <i>virtualenv_mod</i>       | Setup of Python virtualenv sandboxes.                                   |
| <i>win_certutil</i>         | Installing of certificates to the Windows Certificate Manager           |
| <i>win_dacl</i>             | Windows Object Access Control Lists                                     |

Table 14.17 -- continued from previous page

|                          |  |
|--------------------------|--|
| <i>win_dism</i>          | Installing of Windows features using DISM  |
| <i>win_dns_client</i>    | Module for configuring DNS Client on Windows systems                                   |
| <i>win_firewall</i>      | State for configuring Windows Firewall   |
| <i>win_iis</i>           | Microsoft IIS site management  |
| <i>win_lgpo</i>          | Manage Windows Local Group Policy  |
| <i>win_license</i>       | Installation and activation of windows licenses  |
| <i>win_network</i>       | Configuration of network interfaces on Windows hosts                                   |
| <i>win_path</i>          | Manage the Windows System PATH   |
| <i>win_pki</i>           | Microsoft certificate management via the Pki PowerShell module.                        |
| <i>win_powercfg</i>      | This module allows you to control the power settings of a windows minion via powercfg. |
| <i>win_servermanager</i> | Manage Windows features via the ServerManager powershell module                        |
| <i>win_smtp_server</i>   | Module for managing IIS SMTP server configuration on Windows servers.                  |
| <i>win_snmp</i>          | Module for managing SNMP service settings on Windows servers.                          |
| <i>win_system</i>        | Management of Windows system information   |
| <i>win_update</i>        | Management of the windows update agent   |
| <i>winrepo</i>           | Manage Windows Package Repository  |
| <i>x509</i>              | Manage X509 Certificates   |
| <i>xmpp</i>              | Sending Messages over XMPP   |

### 14.17.1 salt.states.acme module

#### ACME / Let's Encrypt certificate management state

See also the module documentation

```

reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com

```

```
- onchanges_in:
  - cmd: reload-gitlab
```

`salt.states.acme.cert` (*name*, *aliases=None*, *email=None*, *webroot=None*, *test\_cert=False*, *renew=None*, *keysize=None*, *server=None*, *owner='root'*, *group='root'*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

#### Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or full path to webroot used for authentication
- **test\_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with `server`)
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of private key
- **group** -- group of private key

### 14.17.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

`salt.states.alias.absent` (*name*)

Ensure that the named alias is absent

**name** The alias to remove

`salt.states.alias.present` (*name*, *target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

**name** The local user/address to assign an alias to

**target** The forwarding address

### 14.17.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

**salt.states.alternatives.auto**(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

**name** is the master name for this link group (e.g. pager)

**salt.states.alternatives.install**(*name, link, path, priority*)

Install new alternative for defined <name>

**name** is the master name for this link group (e.g. pager)

**link** is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

**path** is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

**priority** is an integer; options with higher numbers have higher priority in automatic mode.

**salt.states.alternatives.remove**(*name, path*)

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

**salt.states.alternatives.set**(*name, path*)

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

### 14.17.4 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
- config:
  - VirtualHost:
    this: '*:80'
    ServerName:
      - website.com
    ServerAlias:
      - www.website.com
      - dev.website.com
    ErrorLog: logs/website.com-error_log
    CustomLog: logs/website.com-access_log combined
    DocumentRoot: /var/www/vhosts/website.com
    Directory:
      this: /var/www/vhosts/website.com
    Order: Deny,Allow
    Deny from: all
    Allow from:
      - 127.0.0.1
      - 192.168.100.0/24
    Options:
      - Indexes
      - FollowSymlinks
    AllowOverride: All
```

### 14.17.5 salt.states.apache\_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

**salt.states.apache\_conf.disable**(*name*)

Ensure an Apache conf is disabled.

**Warning:** This function is deprecated and will be removed in Salt Nitrogen.

**name** Name of the Apache conf

**salt.states.apache\_conf.disabled**(*name*)

Ensure an Apache conf is disabled.

**name** Name of the Apache conf

**salt.states.apache\_conf.enable**(*name*)

Ensure an Apache conf is enabled.

**Warning:** This function is deprecated and will be removed in Salt Nitrogen.

**name** Name of the Apache conf

`salt.states.apache_conf.enabled(name)`

Ensure an Apache conf is enabled.

**name** Name of the Apache conf

### 14.17.6 salt.states.apache\_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi
```

```
Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

`salt.states.apache_module.disable(name)`

Ensure an Apache module is disabled.

Deprecated since version 2016.3.0.

**name** Name of the Apache module

`salt.states.apache_module.disabled(name)`

Ensure an Apache module is disabled.

New in version 2016.3.0.

**name** Name of the Apache module

`salt.states.apache_module.enable(name)`

Ensure an Apache module is enabled. This function is deprecated and will be removed in Salt Nitrogen. Please use the `enabled` state function instead.

Deprecated since version 2016.3.0.

**name** Name of the Apache module

`salt.states.apache_module.enabled(name)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

**name** Name of the Apache module

### 14.17.7 salt.states.apache\_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default
```

```
Disable default site:
  apache_site.disabled:
    - name: default
```

**salt.states.apache\_site.disable**(*name*)

Ensure an Apache site is disabled.

**Warning:** This function is deprecated and will be removed in Salt Nitrogen.

**name** Name of the Apache site

**salt.states.apache\_site.disabled**(*name*)

Ensure an Apache site is disabled.

**name** Name of the Apache site

**salt.states.apache\_site.enable**(*name*)

Ensure an Apache site is enabled.

**Warning:** This function is deprecated and will be removed in Salt Nitrogen.

**name** Name of the Apache site

**salt.states.apache\_site.enabled**(*name*)

Ensure an Apache site is enabled.

**name** Name of the Apache site

### 14.17.8 salt.states.aptpkg

#### Package management operations specific to APT- and DEB-based systems

**salt.states.aptpkg.held**(*name*)

Set package in 'hold' state, meaning it will not be upgraded.

**name** The name of the package, e.g., 'tmux'

### 14.17.9 salt.states.archive

Extract an archive

New in version 2014.1.0.

```
salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None,
                               source_hash_update=False, skip_verify=False, password=None,
                               options=None, list_options=None, force=False, overwrite=False,
                               clean=False, user=None, group=None, if_missing=None, keep=False,
                               trim_output=False, use_cmd_unzip=None, extract_perms=True,
                               enforce_toplevel=True, enforce_ownership_on=None,
                               archive_format=None, **kwargs)
```

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

---

#### Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - tar_options: --strip-components=1
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

#### Important: ZIP Archive Handling

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1.*archive.unzip*, which uses Python's *zipfile* module to extract ZIP files.

2.*archive.cmd\_unzip*, which uses the *unzip* CLI command to extract ZIP files.

Salt will prefer the use of *archive.cmd\_unzip* when CLI options are specified (via the *options* argument), and will otherwise prefer the *archive.unzip* function. Use of *archive.cmd\_unzip* can be forced however by setting the *use\_cmd\_unzip* argument to *True*. By contrast, setting this argument to *False* will force usage of *archive.unzip*. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When *use\_cmd\_unzip* is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- Command-line options* (only supported by *archive.cmd\_unzip*) - When the *options* argument is used, *archive.cmd\_unzip* is the only function that can be used to extract the archive. Therefore, if *use\_cmd\_unzip* is specified and set to *False*, and *options* is also set, the state will not proceed.
- Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the *zipfile* module is used to extract an archive. As of the 2016.11.0 release, *archive.unzip* (as well as this state) has an *extract\_perms* argument which, when set to *True* (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set *extract\_perms* to *False*:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

---

**Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

---

**source\_hash** Hash of source file, or file with list of hash-to-file mappings

---

**Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

---

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
```

```

- name: /var/www
- source: https://mydomain.tld/bar.tar.gz
- source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5

```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```

37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt

```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```

/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz

```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.11.0.

**source\_hash\_update** Set this to `True` if archive should be extracted if `source_hash` has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

**skip\_verify** [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

**password** For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

**options** For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the

tar/unzip implementation on the minion's OS.

New in version 2016.11.0: The `tar_options` and `zip_options` parameters have been deprecated in favor of a single argument name.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

---

**tar\_options** Deprecated since version 2016.11.0: Use `options` instead.

**zip\_options** New in version 2016.3.1.

Deprecated since version 2016.11.0: Use `options` instead.

**list\_options** For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` ``just works''. Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

**force** [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

**Warning:** Use this option *very* carefully.

New in version 2016.11.0.

**overwrite** [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean** [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

---

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

---

New in version 2016.11.1.

**user** The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**group** The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**if\_missing** If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

**keep** [False] For source archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. After extraction, these source archives will be removed unless this argument is set to `True`.

**trim\_output** [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

**use\_cmd\_unzip** [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

**extract\_perms** [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

**enforce\_toplevel** [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

**enforce\_ownership\_on** When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

---

**Note:** This path must be within the path specified by the `name` argument.

---

New in version 2016.11.0.

**archive\_format** One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument.

### Examples

1.tar with `lmza` (i.e. `xz`) compression:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
      - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
        ↪server-0.9.6p1.tar.lzma
      - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6

```

2.tar archive with flag for verbose output, and enforcement of user/group ownership:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
      - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
        ↪server-0.9.6p1.tar.gz
      - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
      - options: v
      - user: foo
      - group: foo

```

3.tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
      - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
        ↪server-0.9.6p1.tar.lzma
      - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
      - source_hash_update: True

```

### 14.17.10 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded` (*name*, *artifact*, *target\_dir*='/tmp', *target\_file*=None)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- `artifactory_url`: URL of the artifactory instance
- `repository`: Repository in artifactory
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier .. `versionadded:: 2015.8.0`
- **version: Version** One of the following: - Version to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: Artifactory username .. `versionadded:: 2015.8.0`
- `password`: Artifactory password .. `versionadded:: 2015.8.0`

**target\_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:

```

```

artifactory_url: http://artifactory.intranet.example.com/artifactory
repository: 'libs-release-local'
artifact_id: 'module'
group_id: 'com.company.module'
packaging: 'jar'
classifier: 'sources'
version: '1.0'
- target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

jboss_module_downloaded:
artifactory.downloaded:
- artifact:
  artifactory_url: http://artifactory.intranet.example.com/artifactory
  repository: 'libs-release-local'
  artifact_id: 'module'
  group_id: 'com.company.module'
  packaging: 'jar'
  classifier: 'sources'
  version: '1.0'
- target_dir: /opt/jboss7/modules/com/company/lib

```

#### 14.17.11 salt.states.at

##### Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name*, *jobid=None*, *\*\*kwargs*)

Remove a job from queue The `kwargs` can include hour. minute. day. month. year

**limit** Target range

**tag** Job's tag

**runas** Runs user-specified jobs

```

example1:
at.absent:
- limit: all

```

```

example2:
at.absent:
- limit: all
- year: 13

```

```

example3:
at.absent:
- limit: all
- tag: rose
- runas: jim

```

```

example4:
at.absent:
- limit: all
- tag: rose

```

```
- day: 13
- hour: 16
```

`salt.states.at.present` (*name*, *timespec*, *tag=None*, *user=None*, *job=None*)

Add a job to queue.

**job** Command to run.

**timespec** The `timespec` follows the format documented in the `at(1)` manpage.

**tag** Make a tag for the job.

**user** The user to run the at job

New in version 2014.1.4.

```
rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

### 14.17.12 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with `python-augeas`, causing the `augeas` module to fail to import. If the minion has the `augeas` module installed, and the state fails with a comment saying that the state is unavailable, first restart the `salt-minion` service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change` (*name*, *context=None*, *changes=None*, *lens=None*, *load\_path=None*, *\*\*kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

**name** State name

**context** A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary `augeas` path). This is used to avoid duplicating the file name for each item in the `changes` list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
```

```

- context: /files/etc/redis/redis.conf
- changes:
  - set bind 0.0.0.0
  - set maxmemory 1G

```

**changes** List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

**lens** The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

**load\_path** A list of directories that modules should be searched in. This is in addition to the standard `load_path` and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```

redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0

```

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```

redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G

```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```

redis-conf:
  augeas.change:
    - lens: redis
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0

```

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```

zabbix-service:
  augeas.change:
    - lens: services
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] zabbix-agent
      - set service-name[. = 'zabbix-agent']/#comment "Zabbix Agent service"
      - set service-name[. = 'zabbix-agent']/port 10050
      - set service-name[. = 'zabbix-agent']/protocol tcp
      - rm service-name[. = 'im-obsolete']
    - unless: grep "zabbix-agent" /etc/services

```

**Warning:** Don't forget the `unless` here, otherwise a new entry will be added every time this state is run.

### 14.17.13 salt.states.aws\_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```

myqueue:
  aws_sqs.exists:
    - region: eu-west-1

```

`salt.states.aws_sqs.absent` (*name, region, user=None, opts=False*)

Remove the named SQS queue if it exists.

**name** Name of the SQS queue.

**region** Region to remove the queue from

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

`salt.states.aws_sqs.exists` (*name, region, user=None, opts=False*)

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**region** Region to create the queue

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

### 14.17.14 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```

ps:
  beacon.present:
    - enable: False
    - salt-master: running
    - apache2: stopped

```

```
sh:
  beacon.present:

load:
  beacon.present:
    - 1m:
      - 0.0
      - 2.0
    - 5m:
      - 0.0
      - 1.5
    - 15m:
      - 0.1
      - 1.0
```

`salt.states.beacon.absent`(*name*, *\*\*kwargs*)

Ensure beacon is absent.

**name** The name of the beacon ensured absent.

`salt.states.beacon.disabled`(*name*, *\*\*kwargs*)

Disable a beacon.

**name** The name of the beacon to enable.

`salt.states.beacon.enabled`(*name*, *\*\*kwargs*)

Enable a beacon.

**name** The name of the beacon to enable.

`salt.states.beacon.present`(*name*, *\*\*kwargs*)

Ensure beacon is configured with the included beacon data.

**name** The name of the beacon ensure is configured.

### 14.17.15 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

**maturity** develop

**platform** f5\_bigip\_11.6

`salt.states.bigip.add_pool_member`(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**member** The member to add to the pool

`salt.states.bigip.create_monitor`(*hostname*, *username*, *password*, *monitor\_type*, *name*, *\*\*kwargs*)

A function to connect to a bigip device and create a monitor.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node`(*hostname, username, password, name, address*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to create

**address** The address of the node

`salt.states.bigip.create_pool`(*hostname, username, password, name, members=None, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**members** List of members to be added to the pool

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**ignore\_persisted\_weight** [enabled | disabled]

**ip\_tos\_to\_client** [pass-through | [integer]]

**ip\_tos\_to\_server** [pass-through | [integer]]

**link\_qos\_to\_client** [pass-through | [integer]]

**link\_qos\_to\_server** [pass-through | [integer]]

**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members** [integer]

**min\_up\_members** [integer]

**min\_up\_members\_action** [failover | reboot | restart-all]

**min\_up\_members\_checking** [enabled | disabled]

**monitor** [name]

**profiles** [none | profile\_name]

**queue\_depth\_limit** [integer]

**queue\_on\_connection\_limit** [enabled | disabled]

**queue\_time\_limit** [integer]

**reselect\_tries** [integer]

**service\_down\_action** [drop | none | reselect | reset]

**slow\_ramp\_time** [integer]

`salt.states.bigip.create_profile`(*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters |, , and : must be escaped using \ when used within strings.

```
salt.states.bigip.create_virtual(hostname, username, password, name, destination,
                                pool=None, address_status=None, auto_lasthop=None,
                                bwc_policy=None, cmp_enabled=None, connection_limit=None,
                                dhcp_relay=None, description=None, fallback_persistence=None,
                                flow_eviction_policy=None, gtm_score=None, ip_forward=None,
                                ip_protocol=None, internal=None, twelve_forward=None,
                                last_hop_pool=None, mask=None, mirror=None, nat64=None,
                                persist=None, profiles=None, policies=None, rate_class=None,
                                rate_limit=None, rate_limit_mode=None, rate_limit_dst=None,
                                rate_limit_src=None, rules=None, related_rules=None,
                                reject=None, source=None, source_address_translation=None,
                                source_port=None, virtual_state=None, traffic_classes=None,
                                translate_address=None, translate_port=None, vlans=None)
```

A function to connect to a bigip device and create a virtual server if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual to create

**destination** [ [virtual\_address\_name:port] | [ipv4:port] | [ipv6.port] ]

**pool** [ [pool\_name] | none ]

**address\_status** [yes | no]

    **vlan\_ids** [ list]  
    **enabled** [ true | false ]

**salt.states.bigip.delete\_monitor** (*hostname, username, password, monitor\_type, name*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_node** (*hostname, username, password, name*)

Delete an existing node.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node which will be deleted.

**salt.states.bigip.delete\_pool** (*hostname, username, password, name*)

Delete an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool which will be deleted

**salt.states.bigip.delete\_pool\_member** (*hostname, username, password, name, member*)

Delete an existing pool member.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to be modified

**member** The name of the member to delete from the pool

**salt.states.bigip.delete\_profile** (*hostname, username, password, profile\_type, name*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to create  
**name** The name of the profile to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_virtual**(*hostname, username, password, name*)

Delete an existing virtual.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual which will be deleted

**salt.states.bigip.list\_monitor**(*hostname, username, password, monitor\_type, name*)

A function to list an existing monitor.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to list  
**name** The name of the monitor to list

**salt.states.bigip.list\_node**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific node.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to list.

**salt.states.bigip.list\_pool**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific pool.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to list.

**salt.states.bigip.list\_profile**(*hostname, username, password, profile\_type, name*)

A function to list an existing profile.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to list  
**name** The name of the profile to list

**salt.states.bigip.list\_virtual**(*hostname, username, password, name*)

A function to list a specific virtual.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to list

**salt.states.bigip.manage\_monitor**(*hostname, username, password, monitor\_type, name,*  
*\*\*kwargs*)

Create a new monitor if a monitor of this type and name does not already exist. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create  
**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)
```

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to manage.  
**address** The address of the node  
**connection\_limit** [integer]  
**description** [string]  
**dynamic\_ratio**: [integer]  
**logging** [enabled | disabled]  
**monitor** [[name] | none | default]  
**rate\_limit** [integer]  
**ratio** [integer]  
**session** [user-enabled | user-disabled]  
**node\_state (state)** [user-down | user-up ]

```
salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to create  
**allow\_nat** [yes | no]  
**allow\_snat** [yes | no]  
**description** [string]  
**gateway\_failsafe\_device** [string]  
**ignore\_persisted\_weight** [enabled | disabled]  
**ip\_tos\_to\_client** [pass-through | [integer]]  
**ip\_tos\_to\_server** [pass-through | [integer]]  
**link\_qos\_to\_client** [pass-through | [integer]]  
**link\_qos\_to\_server** [pass-through | [integer]]

**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]  
**min\_active\_members** [integer]  
**min\_up\_members** [integer]  
**min\_up\_members\_action** [failover | reboot | restart-all]  
**min\_up\_members\_checking** [enabled | disabled]  
**monitor** [name]  
**profiles** [none | profile\_name]  
**queue\_depth\_limit** [integer]  
**queue\_on\_connection\_limit** [enabled | disabled]  
**queue\_time\_limit** [integer]  
**reselect\_tries** [integer]  
**service\_down\_action** [drop | none | reselect | reset]  
**slow\_ramp\_time** [integer]

**salt.states.bigip.manage\_pool\_members**(*hostname, username, password, name, members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**members** list of pool members to manage.

**salt.states.bigip.manage\_profile**(*hostname, username, password, profile\_type, name, \*\*kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

**salt.states.bigip.manage\_virtual**(*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, virtual\_state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to create  
**destination** [ [virtual\_address\_name:port] | [ipv4:port] | [ipv6.port] ]  
**pool** [ [pool\_name] | none ]  
**address\_status** [yes | no]  
**auto\_lasthop** [default | enabled | disabled ]  
**bwc\_policy** [none] | string]

`salt.states.bigip.modify_monitor` (*hostname*, *username*, *password*, *monitor\_type*, *name*, *\*\*kwargs*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create

**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None,
                             description=None, dynamic_ratio=None, logging=None, mon-
                             itor=None, rate_limit=None, ratio=None, session=None,
                             node_state=None)
```

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to modify  
**connection\_limit** [integer]  
**description** [string]  
**dynamic\_ratio** [integer]  
**logging** [enabled | disabled]  
**monitor** [[name] | none | default]  
**rate\_limit** [integer]  
**ratio** [integer]  
**session** [user-enabled | user-disabled]  
**node\_state (state)** [user-down | user-up ]

```
salt.states.bigip.modify_pool(hostname, username, password, name, al-
                              low_nat=None, allow_snat=None, description=None, gate-
                              way_failsafe_device=None, ignore_persisted_weight=None,
                              ip_tos_to_client=None, ip_tos_to_server=None,
                              link_qos_to_client=None, link_qos_to_server=None,
                              load_balancing_mode=None, min_active_members=None,
                              min_up_members=None, min_up_members_action=None,
                              min_up_members_checking=None, monitor=None, profiles=None,
                              queue_depth_limit=None, queue_on_connection_limit=None,
                              queue_time_limit=None, reselect_tries=None, ser-
                              vice_down_action=None, slow_ramp_time=None)
```

Modify an existing pool. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to create  
**allow\_nat** [yes | no]  
**allow\_snat** [yes | no]  
**description** [string]  
**gateway\_failsafe\_device** [string]  
**ignore\_persisted\_weight** [enabled | disabled]  
**ip\_tos\_to\_client** [pass-through | [integer]]  
**ip\_tos\_to\_server** [pass-through | [integer]]  
**link\_qos\_to\_client** [pass-through | [integer]]  
**link\_qos\_to\_server** [pass-through | [integer]]  
**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members** [integer]  
**min\_up\_members** [integer]  
**min\_up\_members\_action** [failover | reboot | restart-all]  
**min\_up\_members\_checking** [enabled | disabled]  
**monitor** [name]  
**profiles** [none | profile\_name]  
**queue\_depth\_limit** [integer]  
**queue\_on\_connection\_limit** [enabled | disabled]  
**queue\_time\_limit** [integer]  
**reselect\_tries** [integer]  
**service\_down\_action** [drop | none | reselect | reset]  
**slow\_ramp\_time** [integer]

**salt.states.bigip.modify\_pool\_member** (*hostname, username, password, name, member, connection\_limit=None, description=None, dynamic\_ratio=None, inherit\_profile=None, logging=None, monitor=None, priority\_group=None, profiles=None, rate\_limit=None, ratio=None, session=None, member\_state=None*)

A function to connect to a bigip device and modify a member of an existing pool.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to modify  
**member** The member modify  
**connection\_limit** [integer]  
**description** [string]  
**dynamic\_ratio** [integer]  
**inherit\_profile** [enabled | disabled]  
**logging** [enabled | disabled]  
**monitor** [name]  
**priority\_group** [integer]  
**profiles** [none | profile\_name]  
**rate\_limit** [integer]  
**ratio** [integer]  
**session** [user-enabled | user-disabled]  
**member\_state (state)** [ user-up | user-down ]

**salt.states.bigip.modify\_profile** (*hostname, username, password, profile\_type, name, \*\*kwargs*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to create  
**name** The name of the profile to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```

salt.states.bigip.modify_virtual(hostname, username, password, name, destination,
                                pool=None, address_status=None, auto_lasthop=None,
                                bwc_policy=None, cmp_enabled=None, connec-
                                tion_limit=None, dhcp_relay=None, description=None,
                                fallback_persistence=None, flow_eviction_policy=None,
                                gtm_score=None, ip_forward=None, ip_protocol=None, in-
                                ternal=None, twelve_forward=None, last_hop_pool=None,
                                mask=None, mirror=None, nat64=None, persist=None, pro-
                                files=None, policies=None, rate_class=None, rate_limit=None,
                                rate_limit_mode=None, rate_limit_dst=None,
                                rate_limit_src=None, rules=None, related_rules=None, re-
                                ject=None, source=None, source_address_translation=None,
                                source_port=None, virtual_state=None, traffic_classes=None,
                                translate_address=None, translate_port=None, vlans=None)

```

Modify an virtual server. modify an existing virtual. Only parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual to create

**destination** [ [virtual\_address\_name:port] | [ipv4:port] | [ipv6.port] ]

**pool** [ [pool\_name] | none]

**address\_status** [yes | no]

**auto\_lasthop** [default | enabled | disabled ]

**bwc\_policy** [none] | string]

**cmp\_enabled** [yes | no]

vlans [none | default | dictionary ]
    vlan_ids [ list]
    enabled [ true | false ]
```

#### 14.17.16 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.formatted`(*name*, *fs\_type*='ext4', *force*=False, *\*\*kwargs*)

Manage filesystems of partitions.

**name** The name of the block device

**fs\_type** The filesystem it should be formatted as

**force** Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned`(*name*, *\*\*kwargs*)

Manage options of block device

**name** The name of the block device

**opts:**

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

#### 14.17.17 salt.states.boto\_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBj08H
vpc.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgHs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBj08H
  key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgHs
  region: us-east-1
```

```
Ensure Apigateway API exists:
  boto_apigateway.present:
    - name: myfunction
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBj08H
    - key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgHs
```

`salt.states.boto_apigateway.absent`(*name*, *api\_name*, *stage\_name*, *nuke\_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the `stage_name` associated with the given `api_name` deployed by `boto_apigateway`'s present state is removed. If the currently associated deployment to the given `stage_name` has no other stages associated with it, the deployment will also be removed.

**name** Name of the swagger file in YAML format

**api\_name** Name of the rest api on AWS ApiGateway to ensure is absent.

**stage\_name** Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the `stage_name` has no other stages associated with it, the deployment will also be removed.

**nuke\_api** If True, removes the API itself only if there are no other stages associated with any other deployments once the given `stage_name` is removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_apigateway.present`(*name*, *api\_name*, *swagger\_file*, *stage\_name*, *api\_key\_required*, *lambda\_integration\_role*, *lambda\_region=None*, *stage\_variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *lambda\_funcname\_format='{stage}\_{api}\_{resource}\_{method}'*, *authorization\_type='NONE'*)

Ensure the specified `api_name` with the corresponding swaggerfile is deployed to the given `stage_name` in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{ `api_name`: api_name, `swagger_file`: basename_of_swagger_file `swagger_file_md5sum`:
  md5sum_of_swagger_file, `swagger_info_object`: info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided `lambda_funcname_format` parameters:

the default `lambda_funcname_format` is a string with the following substitutable keys: ``{stage}_{api}_{resource}_{method}``. The user can choose to reorder the known keys.

the stage key corresponds to the `stage_name` passed in. the api key corresponds to the `api_name` passed in. the resource corresponds to the resource path defined in the passed swagger file. the method corresponds to the method for a resource path defined in the passed swagger file.

for the default `lambda_funcname_format`, given the following input:

```
api_name = ` Test Service' stage_name = `alpha' basePath = `/api' path = `/a/{b}/c'
method = `POST'
```

**we will end up with the following Lambda Function Name that will be looked up:**

```
`test_service_alpha_a_b_c_post'
```

**The canonicalization of these input parameters is done in the following order:**

1. `lambda_funcname_format` is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path paramter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with ``_``
5. consecutive ``_`` are replaced with ``_``

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in `errorMessage` field to aid the response mapping from Lambda to the proper error return status codes.

**name** The name of the state definition

**api\_name** The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger\_file** Name of the location of the swagger rest api definition file in YAML format.

**stage\_name** Name of the stage we want to be associated with the given `api_name` and `swagger_file` definition

**api\_key\_required** True or False - whether the API Key is required to call API methods

**lambda\_integration\_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda\_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. `lambda_region` as passed in (is not None)
- 2) if `lambda_region` is None, use the region as if a `boto_lambda` function were executed without explicitly specifying lambda region. 3) if region determined in (2) is different than the region used by `boto_apigateway` functions, a final lookup will be attempted using the `boto_apigateway` region.

**stage\_variables** A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. `{`string`: `string`}`

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda\_funcname\_format** Please review the earlier example for the usage. The only substituable keys in the funcname format are `{stage}`, `{api}`, `{resource}`, `{method}`. Any other keys or positional substitution

parameters will be flagged as an invalid input.  
**authorization\_type** This field can be either `NONE`, or `AWS\_IAM`. This will be applied to all methods in the given swagger spec file. Default is set to `NONE`

### 14.17.18 salt.states.boto\_asg

#### Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkgsh
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkgsh
  region: us-east-1
```

```
Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- suspended_processes:
  - AddToLoadBalancer
  - AlarmNotification
- scaling_policies
  - adjustment_type: ChangeInCapacity
  - as_name: api-production-iad
  - cooldown: 1800
  - min_adjustment_step: None
  - name: ScaleDown
  - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
```

```

- key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs
      region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

```

```

- alarms:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_asg_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm
    # override CPU:attributes:threshold
    - alarms:

```

```
CPU:
  attributes:
    threshold: 50.0
```

`salt.states.boto_asg.absent` (*name, force=False, region=None, key=None, keyid=None, profile=None, remove\_lc=False*)

Ensure the named autoscale group is deleted.

**name** Name of the autoscale group.

**force** Force deletion of autoscale group.

**remove\_lc** Delete the launch config as well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.present` (*name, launch\_config\_name, availability\_zones, min\_size, max\_size, launch\_config=None, desired\_capacity=None, load\_balancers=None, default\_cooldown=None, health\_check\_type=None, health\_check\_period=None, placement\_group=None, vpc\_zone\_identifier=None, subnet\_names=None, tags=None, termination\_policies=None, termination\_policies\_from\_pillar='boto\_asg\_termination\_policies', suspended\_processes=None, scaling\_policies=None, scaling\_policies\_from\_pillar='boto\_asg\_scaling\_policies', scheduled\_actions=None, scheduled\_actions\_from\_pillar='boto\_asg\_scheduled\_actions', alarms=None, alarms\_from\_pillar='boto\_asg\_alarms', region=None, key=None, keyid=None, profile=None, notification\_arn=None, notification\_arn\_from\_pillar='boto\_asg\_notification\_arn', notification\_types=None, notification\_types\_from\_pillar='boto\_asg\_notification\_types'*)

Ensure the autoscale group exists.

**name** Name of the autoscale group.

**launch\_config\_name** Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

**launch\_config** A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```
my_asg:
  boto_asg.present:
    - launch_config:
      - ebs_optimized: false
      - instance_profile_name: my_iam_profile
      - kernel_id: ''
      - ramdisk_id: ''
      - key_name: my_ssh_key
      - image_name: aws2015091-hvm
      - instance_type: c3.xlarge
      - instance_monitoring: false
      - security_groups:
        - my_sec_group_01
        - my_sec_group_02
```

**availability\_zones** List of availability zones for the group.

**min\_size** Minimum size of the group.

**max\_size** Maximum size of the group.

**desired\_capacity** The desired capacity of the group.

**load\_balancers** List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default\_cooldown** Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health\_check\_type** The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health\_check\_period** Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement\_group** Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc\_zone\_identifier** A list of the subnet identifiers of the Virtual Private Cloud.

**subnet\_names** For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags** A list of tags. Example:

```
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

**termination\_policies** A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination\_policies\_from\_pillar:** name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**suspended\_processes** List of processes to be suspended. see [http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US\\_SuspendResume.html](http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html)

**scaling\_policies** List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

**scaling\_policies\_from\_pillar:** name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

**scheduled\_actions:** a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "0 19 * * 1-5"
```

**scheduled\_actions\_from\_pillar:** name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

**alarms:** a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include ":self:" this will be replaced with the asg name. For example, alarm\_actions reading ``['scaling\_policy:self:ScaleUp']`` will map to the arn for this asg's scaling policy named ``ScaleUp``. In addition, any alarms that have only scaling\_policy as actions will be ignored if min\_size is equal to max\_size for this ASG.

**alarms\_from\_pillar:** name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**notification\_arn** The AWS arn that notifications will be sent to

**notification\_arn\_from\_pillar** name of the pillar dict that contains notification\_arn settings. A notification\_arn defined for this specific state will override the one from pillar.

**notification\_types** A list of event names that will trigger a notification. The list of valid notification types is:

- autoscaling:EC2\_INSTANCE\_LAUNCH
- autoscaling:EC2\_INSTANCE\_LAUNCH\_ERROR
- autoscaling:EC2\_INSTANCE\_TERMINATE
- autoscaling:EC2\_INSTANCE\_TERMINATE\_ERROR
- autoscaling:TEST\_NOTIFICATION

**notification\_types\_from\_pillar** name of the pillar dict that contains notification\_types settings. notification\_types defined for this specific state will override those from the pillar.

### 14.17.19 salt.states.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

**depends** boto

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfkklgjsdfjajkghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADfalkfjasdf'
```

```
stack-absent:
  boto_cfn.absent:
    - name: mystack
```

**salt.states.boto\_cfn.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cfn.present(name, template_body=None, template_url=None,
                             parameters=None, notification_arns=None, disable_rollback=None,
                             timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None,
                             stack_policy_body=None, stack_policy_url=None, use_previous_template=None,
                             stack_policy_during_update_body=None, stack_policy_during_update_url=None,
                             region=None, key=None, keyid=None, profile=None)
```

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template\_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template\_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification\_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the [SNS\\_console](#) or your Command Line Interface (CLI).

disable\_rollback (bool) – Indicates whether or not to rollback on failure.

timeout\_in\_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE\_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY\_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on\_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO\_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack\_policy\_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack\_policy\_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use\_previous\_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack\_policy\_during\_update\_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

### 14.17.20 salt.states.boto\_cloudtrail module

#### Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

##### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
  region: us-east-1
```

```
Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
```

`salt.states.boto_cloudtrail.absent`(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the trail.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_cloudtrail.present(name, Name, S3BucketName, S3KeyPrefix=None,
                                     SnsTopicName=None, IncludeGlobalServiceEvents=True,
                                     IsMultiRegionTrail=None, EnableLogFileValidation=False,
                                     CloudWatchLogsLogGroupArn=None,
                                     CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True,
                                     Tags=None, region=None, key=None,
                                     keyid=None, profile=None)

```

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the trail.

**S3BucketName** Specifies the name of the Amazon S3 bucket designated for publishing log files.

**S3KeyPrefix** Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

**SnsTopicName** Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

**IncludeGlobalServiceEvents** Specifies whether the trail is publishing events from global services such as IAM to the log files.

**EnableLogFileValidation** Specifies whether log file integrity validation is enabled. The default is false.

**CloudWatchLogsLogGroupArn** Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

**CloudWatchLogsRoleArn** Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

**KmsKeyId** Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a an alias name prefixed by ``alias/``, a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled** Whether logging should be enabled for the trail

**Tags** A dictionary of tags that should be set on the trail

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.21 salt.states.boto\_cloudwatch\_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
        metric: ApproximateNumberOfMessagesVisible
        namespace: AWS/SQS
        statistic: Average
        comparison: ">="
        threshold: 20000.0
        period: 60
        evaluation_periods: 1
        description: test alarm via salt
        dimensions:
          QueueName:
            - the-sqs-queue-name
        alarm_actions:
          - arn:aws:sns:us-east-1:1111111:myalerting-action
```

`salt.states.boto_cloudwatch_alarm.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named cloudwatch alarm is deleted.

**name** Name of the alarm.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present` (*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

**name** Name of the alarm

**attributes** A dict of key/value cloudwatch alarm attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 14.17.22 salt.states.boto\_cloudwatch\_event module

### Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfklcdflkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklcdflkgjsdfjajkghs
  region: us-east-1
```

```
Ensure event rule exists:
  boto_cloudwatch_event.present:
    - Name: mytrail
    - ScheduleExpression: 'rate(120 minutes)'
    - State: 'DISABLED'
    - Targets:
      - Id: "target1"
        Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
        Input: '{"arbitrary": "json"}'
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklcdflkgjsdfjajkghs
```

**salt.states.boto\_cloudwatch\_event.absent**(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the event rule.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_cloudwatch\_event.present**(*name*, *Name*, *ScheduleExpression=None*, *EventPattern=None*, *Description=None*, *RoleArn=None*, *State=None*, *Targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the event rule.  
**ScheduleExpression** The scheduling expression. For example, ``cron(0 20 \* \* ? \*)``, ``rate(5 minutes)``  
**EventPattern** The event pattern.  
**Description** A description of the rule  
**State** Indicates whether the rule is ENABLED or DISABLED.  
**RoleArn** The Amazon Resource Name (ARN) of the IAM role associated with the rule.  
**Targets** A list of rresources to be invoked when the rule is triggered.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.23 salt.states.boto\_cognitoidentity module

#### Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure function exists:
  boto_cognitoidentity.pool_present:
    - PoolName: my_identity_pool
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

**salt.states.boto\_cognitoidentity.pool\_absent** (*name*, *IdentityPoolName*, *RemoveAll-  
Matched=False*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.

**name** The name of the state definition.

**IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

**RemoveAllMatched** If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, AuthenticatedRole, AllowUnauthenticatedIdentities=False, UnauthenticatedRole=None, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

```

Ensure Cognito Identity Pool exists.

**name** The name of the state definition

**IdentityPoolName** Name of the Cognito Identity Pool

**AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

**AllowUnauthenticatedIdentities** Whether to allow anonymous user identities

**UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities

**SupportedLoginProviders** A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

**DeveloperProviderName** A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs** A list or pillar name that contains a list of OpenID Connect provider ARNs.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.24 salt.states.boto\_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs

```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
  boto_datapipeline.present:
    - name: my-datapipeline
    - pipeline_objects:
        DefaultSchedule:
          name: Every 1 day
          fields:
            period: 1 Day
            type: Schedule
            startAt: FIRST_ACTIVATION_DATE_TIME
    - parameter_values:
        myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the `service_name` does not exist

**name** Name of the service to ensure a data pipeline does not exist for.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_datapipeline.present`(*name*, *pipeline\_objects=None*, *pipeline\_objects\_from\_pillars='boto\_datapipeline\_pipeline\_objects'*, *parameter\_objects=None*, *parameter\_objects\_from\_pillars='boto\_datapipeline\_parameter\_objects'*, *parameter\_values=None*, *parameter\_values\_from\_pillars='boto\_datapipeline\_parameter\_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

**name** Name of the service to ensure a data pipeline exists for.

**pipeline\_objects** Pipeline objects to use. Will override objects read from pillars.

**pipeline\_objects\_from\_pillars** The pillar key to use for lookup.

**parameter\_objects** Parameter objects to use. Will override objects read from pillars.

**parameter\_objects\_from\_pillars** The pillar key to use for lookup.

**parameter\_values** Parameter values to use. Will override values read from pillars.

**parameter\_values\_from\_pillars** The pillar key to use for lookup.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

### 14.17.25 salt.states.boto\_dynamodb

#### Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure DynamoDB table does not exist:
boto_dynamodb.absent:
- table_name: new_table
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- region: us-east-1
```

```
Ensure DynamoDB table exists:
boto_dynamodb.present:
- table_name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- region: us-east-1
- local_indexes:
  - index:
    - name: "primary_id_end_timestamp_index"
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: end_timestamp
    - range_key_data_type: N
- global_indexes:
  - index:
    - name: "name_end_timestamp_index"
    - hash_key: name
    - hash_key_data_type: S
```

- range\_key: end\_timestamp
- range\_key\_data\_type: N
- read\_capacity\_units: 3
- write\_capacity\_units: 4

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```
Ensure DynamoDB table exists:
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
    ConsumedWriteCapacityUnits:
      name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
      attributes:
        metric: ConsumedWriteCapacityUnits
        namespace: AWS/DynamoDB
        statistic: Sum
        comparison: '>='
        # threshold_percent is used to calculate the actual threshold
        # based on the provisioned capacity for the table.
        threshold_percent: 0.75
        period: 300
        evaluation_periods: 2
        unit: Count
        description: 'DynamoDB ConsumedWriteCapacityUnits'
        alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
        insufficient_data_actions: []
        ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
  - region: us-east-1
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto\_dynamodb\_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
```

```

unit: Count
description: 'DynamoDB ConsumedWriteCapacityUnits'
alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
insufficient_data_actions: []
ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

```

Ensure DynamoDB table exists:

```

boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
  ConsumedWriteCapacityUnits:
    attributes:
      threshold_percent: 0.90
      period: 900

```

`salt.states.boto_dynamodb.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the DynamoDB table does not exist.

**name** Name of the DynamoDB table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_dynamodb.present` (*name=None, table\_name=None, region=None, key=None, keyid=None, profile=None, read\_capacity\_units=None, write\_capacity\_units=None, alarms=None, alarms\_from\_pillar='boto\_dynamodb\_alarms', hash\_key=None, hash\_key\_data\_type=None, range\_key=None, range\_key\_data\_type=None, local\_indexes=None, global\_indexes=None, backup\_configs\_from\_pillars='boto\_dynamodb\_backup\_configs'*)

Ensure the DynamoDB table exists. Note: all properties of the table can only be set during table creation.

Adding or changing indexes or key schema cannot be done after table creation

**name** Name of the DynamoDB table

**table\_name** Name of the DynamoDB table (deprecated)

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**read\_capacity\_units** The read throughput for this table

**write\_capacity\_units** The write throughput for this table

**hash\_key** The name of the attribute that will be used as the hash key for this table

**hash\_key\_data\_type** The DynamoDB datatype of the hash key

**range\_key** The name of the attribute that will be used as the range key for this table

**range\_key\_data\_type** The DynamoDB datatype of the range key

**local\_indexes** The local indexes you would like to create

**global\_indexes** The local indexes you would like to create

**backup\_configs\_from\_pillars** Pillars to use to configure DataPipeline backups

### 14.17.26 salt.states.boto\_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

**salt.states.boto\_ec2.eni\_absent** (*name, release\_eip=False, region=None, key=None, keyid=None, profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**release\_eip** True/False - release any EIP associated with the ENI

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present` (*name*, *subnet\_id=None*, *subnet\_name=None*, *private\_ip\_address=None*, *description=None*, *groups=None*, *source\_dest\_check=True*, *allocate\_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**subnet\_id** The VPC subnet ID the ENI will exist within.

**subnet\_name** The VPC subnet name the ENI will exist within.

**private\_ip\_address** The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

**description** Description of the key.

**groups** A list of security groups to apply to the ENI.

**source\_dest\_check** Boolean specifying whether source/destination checking is enabled on the ENI.

**allocate\_eip** allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

**arecords** A list of arecord dicts with attributes needed for the DNS add\_record state. By default the boto\_route53.add\_record state will be used, which requires: name, zone, ttl, and identifier. See the boto\_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.instance_absent` (*name*, *instance\_name=None*, *instance\_id=None*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

**name** (string) - The name of the state definition.

**instance\_name** (string) - The name of the instance.

**instance\_id** (string) - The ID of the instance.

**release\_eip** (bool) - Release any associated EIPs during termination.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**filters** (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```

salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None,
                                     image_id=None, image_name=None,
                                     tags=None, key_name=None, security_groups=None,
                                     user_data=None, instance_type=None, placement=None,
                                     kernel_id=None, ramdisk_id=None, vpc_id=None,
                                     vpc_name=None, monitoring_enabled=None,
                                     subnet_id=None, subnet_name=None, private_ip_address=None,
                                     block_device_map=None, disable_api_termination=None,
                                     instance_initiated_shutdown_behavior=None,
                                     placement_group=None, client_token=None,
                                     security_group_ids=None, security_group_names=None,
                                     additional_info=None, tenancy=None, instance_profile_arn=None,
                                     instance_profile_name=None, ebs_optimized=None,
                                     network_interfaces=None, network_interface_name=None,
                                     network_interface_id=None, attributes=None, target_state=None,
                                     public_ip=None, allocation_id=None, allocate_eip=False,
                                     region=None, key=None, keyid=None, profile=None)

```

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the `instance_name` attribute (generally the FQDN of the instance).

**instance\_name** (string) - The name of the instance, generally its FQDN. Exclusive with `instance_id`.

**instance\_id** (string) - The ID of the instance (if known). Exclusive with `instance_name`.

**image\_id** (string) - The ID of the AMI image to run.

**image\_name** (string) - The name of the AMI image to run.

**tags** (dict) - Tags to apply to the instance.

**key\_name** (string) - The name of the key pair with which to launch instances.

**security\_groups** (list of strings) - The names of the EC2 classic security groups with which to associate instances

**user\_data** (string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance\_type** (string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

**placement** (string) - The Availability Zone to launch the instance into.

**kernel\_id** (string) - The ID of the kernel with which to launch the instances.

**ramdisk\_id** (string) - The ID of the RAM disk with which to launch the instances.

**vpc\_id** (string) - The ID of a VPC to attach the instance to.

**vpc\_name** (string) - The name of a VPC to attach the instance to.

**monitoring\_enabled** (bool) - Enable detailed CloudWatch monitoring on the instance.

**subnet\_id** (string) - The ID of the subnet within which to launch the instances for VPC.

**subnet\_name** (string) - The name of the subnet within which to launch the instances for VPC.

**private\_ip\_address** (string) - If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

**block\_device\_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) - A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

**disable\_api\_termination** (bool) - If True, the instances will be locked and will not be able to be terminated via the API.

**instance\_initiated\_shutdown\_behavior** (string) - Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- `'stop'`

- `terminate`

**placement\_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client\_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security\_group\_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.

**security\_group\_names** (list of strings) – The names of the VPC security groups with which to associate instances.

**additional\_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance\_profile\_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance\_profile\_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs\_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network\_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network\_interface\_name**

(string) - The name of Elastic Network Interface to attach

New in version 2016.11.0.

**network\_interface\_id**

(string) - The id of Elastic Network Interface to attach

New in version 2016.11.0.

**attributes** (dict) - Instance attributes and value to be applied to the instance. Available options are:

- instanceType - A valid instance type (m1.small)
- kernel - Kernel ID (None)
- ramdisk - Ramdisk ID (None)
- userData - Base64 encoded String (None)
- disableApiTermination - Boolean (true)
- instanceInitiatedShutdownBehavior - stop|terminate
- blockDeviceMapping - List of strings - ie: [‘/dev/sda=false’]
- sourceDestCheck - Boolean (true)
- groupSet - Set of Security Groups or IDs
- ebsOptimized - Boolean (false)
- sriovNetSupport - String - ie: ‘simple’

**target\_state** (string) - The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

**public\_ip:** (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation\_id instead.

**allocation\_id:** (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public\_ip instead.

**allocate\_eip:** (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you’ll want to release this address when terminating the instance, either manually or via the ‘release\_eip’ flag to ‘instance\_absent’.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
Deletes a key pair

`salt.states.boto_ec2.key_present` (*name*, *save\_private=None*, *upload\_public=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)  
Ensure key pair is present.

`salt.states.boto_ec2.snapshot_created` (*name*, *ami\_name*, *instance\_name*,  
*wait\_until\_available=True*,  
*wait\_timeout\_seconds=300*, *\*\*kwargs*)  
Create a snapshot from the given instance  
New in version 2016.3.0.

`salt.states.boto_ec2.volume_absent` (*name*, *volume\_name=None*, *volume\_id=None*, *in-*  
*stance\_name=None*, *instance\_id=None*, *device=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*)  
Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

**name** State definition name.

**volume\_name** Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

**volume\_id** Resource ID of the volume.

**instance\_name** Only remove volume if it is attached to instance with this Name tag. Exclusive with ``instance_id``. Requires ``device``.

**instance\_id** Only remove volume if it is attached to this instance. Exclusive with ``instance_name``. Requires ``device``.

**device** Match by device rather than ID. Requires one of ``instance_name`` or ``instance_id``.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.volumes_tagged` (*name*, *tag\_maps*, *authoritative=False*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)  
Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

**name** State definition name.

**tag\_maps** List of dicts of filters and tags, where ``filters`` is a dict suitable for passing to the ``filters`` argument of `boto_ec2.get_all_volumes()`, and ``tags`` is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

**authoritative** Should un-declared tags currently set on matched volumes be deleted? Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.27 salt.states.boto\_elasticache

#### Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

*# Passing in a profile*

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
```

```

- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgghs

```

`salt.states.boto_elasticache.absent`(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

**name** Name of the cache cluster.

**wait** Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.creategroup`(*name*, *primary\_cluster\_id*, *replication\_group\_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

**name** Name of replication group

**wait** Waits for the group to be available

**primary\_cluster\_id** Name of the master cache node

**replication\_group\_description** Description for the group

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.present`(*name*, *engine=None*, *cache\_node\_type=None*, *num\_cache\_nodes=None*, *preferred\_availability\_zone=None*, *port=None*, *cache\_parameter\_group\_name=None*, *cache\_security\_group\_names=None*, *replication\_group\_id=None*, *auto\_minor\_version\_upgrade=True*, *security\_group\_ids=None*, *cache\_subnet\_group\_name=None*, *engine\_version=None*, *notification\_topic\_arn=None*, *preferred\_maintenance\_window=None*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**engine** The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

**cache\_node\_type** The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: [https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create\\_cache\\_cluster](https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster)

**num\_cache\_nodes** The number of cache nodes that the cache cluster will have.

**preferred\_availability\_zone** The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

**port** The port number on which each of the cache nodes will accept connections.

**cache\_parameter\_group\_name** The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

- cache\_security\_group\_names** A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.
- replication\_group\_id** The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.
- auto\_minor\_version\_upgrade** Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.
- security\_group\_ids** One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.
- cache\_subnet\_group\_name** The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.
- engine\_version** The version number of the cache engine to be used for this cluster.
- notification\_topic\_arn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.
- preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00
- wait** Boolean. Wait for confirmation from boto that the cluster is in the available state.
- region** Region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.subnet_group_present` (*name*, *subnet\_ids=None*, *subnet\_names=None*, *description=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

- name** The name for the ElastiCache subnet group. This value is stored as a lowercase string.
- subnet\_ids** A list of VPC subnet IDs for the cache subnet group. Exclusive with `subnet_names`.
- subnet\_names** A list of VPC subnet names for the cache subnet group. Exclusive with `subnet_ids`.
- description** Subnet group description.
- tags** A list of tags.
- region** Region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 14.17.28 salt.states.boto\_elasticsearch\_domain module

### Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance

Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure domain exists:
  boto_elasticsearch_domain.present:
    - DomainName: mydomain
    - profile='user-credentials'
    - ElasticsearchClusterConfig:
        InstanceType: "t2.micro.elasticsearch"
        InstanceCount: 1
        DedicatedMasterEnabled: False
        ZoneAwarenessEnabled: False
    - EBSOptions:
        EBSEnabled: True
        VolumeType: "gp2"
        VolumeSize: 10
        Iops: 0
    - AccessPolicies:
        Version: "2012-10-17"
        Statement:
          - Effect: "Allow"
          - Principal:
              AWS: "*"
          - Action:
              - "es:*"
          - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
          - Condition:
              IPAddress:
                "aws:SourceIp":
                  - "127.0.0.1",
                  - "127.0.0.2",
    - SnapshotOptions:
        AutomatedSnapshotStartHour: 0
    - AdvancedOptions:
        rest.action.multi.allow_explicit_index: "true"
    - Tags:
        a: "b"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_elasticsearch_domain.absent` (*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

**name** The name of the state definition.

**DomainName** Name of the domain.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present` (*name, DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, Tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure domain exists.

**name** The name of the state definition

**DomainName** Name of the domain.

**ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) -- The instance type for an Elasticsearch cluster.

InstanceCount (integer) -- The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) -- The instance type for a dedicated master node.

DedicatedMasterCount (integer) -- Total number of dedicated master nodes, active and on standby, for the cluster.

**EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) -- Specifies whether EBS-based storage is enabled.

VolumeType (string) -- Specifies the volume type for EBS-based storage.

VolumeSize (integer) -- Integer to specify the size of an EBS volume.

Iops (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.29 salt.states.boto\_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdjfkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdjfkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelb ELB exists:
boto_elb.present:
  - name: myelb
  - region: us-east-1
  - availability_zones:
    - us-east-1a
    - us-east-1c
    - us-east-1d
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdjfkghWupUjasdfkldfklgjsdfjajkghs
  - listeners:
    - elb_port: 443
      instance_port: 80
      elb_protocol: HTTPS
      instance_protocol: HTTP
      certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
      policies:
        - my-ssl-policy
        - cookie-policy
    - elb_port: 8210
      instance_port: 8210
      elb_protocol: TCP
  - backends:
    - instance_port: 80
      policies:
        - enable-proxy-protocol
  - health_check:
    target: 'HTTP:80/'
  - attributes:
    cross_zone_load_balancing:
      enabled: true
    access_log:
      enabled: true
      s3_bucket_name: 'mybucket'
      s3_bucket_prefix: 'my-logs'
    emit_interval: 5
```

```

    connecting_settings:
      idle_timeout: 60
  - cnames:
    - name: mycname.example.com.
      zone: example.com.
      ttl: 60
    - name: myothercname.example.com.
      zone: example.com.
  - security_groups:
    - my-security-group
  - policies:
    - policy_name: my-ssl-policy
      policy_type: SSLNegotiationPolicyType
      policy:
        Protocol-TLSv1.2: true
        Protocol-SSLv3: false
        Server-Defined-Cipher-Order: true
        ECDHE-ECDSA-AES128-GCM-SHA256: true
    - policy_name: cookie-policy
      policy_type: LBCookieStickinessPolicyType
      policy: {} # no policy means this is a session cookie
    - policy_name: enable-proxy-protocol
      policy_type: ProxyProtocolPolicyType
      policy:
        ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile

# Passing in a profile
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key `boto\_elb\_attributes`, which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```

my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'

```

```
emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - attributes_from_pillar: my_elb_attributes
    # override cross_zone_load_balancing:enabled
    - attributes:
      cross_zone_load_balancing:
        enabled: false
    - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms:
      UnHealthyHostCount:
        name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
        attributes:
          metric: UnHealthyHostCount
          namespace: AWS/ELB
          statistic: Average
          comparison: '>='
          threshold: 1.0
          period: 600
          evaluation_periods: 6
          unit: null
          description: ELB UnHealthyHostCount
          alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
          insufficient_data_actions: []
          ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto\_elb\_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
```

```
description: ELB UnHealthyHostCount
alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
    # override UnHealthyHostCount:attributes:threshold
    - alarms:
      UnHealthyHostCount:
        attributes:
          threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
      MyTag: 'My Tag Value'
      OtherTag: 'My Other Value'
```

**salt.states.boto\_elb.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

**name** name of the ELB

**salt.states.boto\_elb.present** (*name, listeners, availability\_zones=None, subnets=None, subnet\_names=None, security\_groups=None, scheme='internet-facing', health\_check=None, attributes=None, attributes\_from\_pillar='boto\_elb\_attributes', cnames=None, alarms=None, alarms\_from\_pillar='boto\_elb\_alarms', policies=None, policies\_from\_pillar='boto\_elb\_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, tags=None, instance\_ids=None, instance\_names=None*)

Ensure the ELB exists.

**name** Name of the ELB.

**availability\_zones** A list of availability zones for this ELB.

**listeners** A list of listener lists; example:

```
[
  ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
  ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
↪mycert']
]
```

**subnets** A list of subnet IDs in your VPC to attach to your LoadBalancer.

**subnet\_names** A list of subnet names in your VPC to attach to your LoadBalancer.

**security\_groups** The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

**scheme** The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

**health\_check** A dict defining the health check for this ELB.

**attributes** A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the `salt.modules.boto_elb.set_attributes` function for recognized attributes.

**attributes\_from\_pillar** name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

**cnames** A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: `name`, `zone`, `ttl`, and `identifier`. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the `cnames` dict will be passed to the state as `kwargs`.

See the `salt.states.boto_route53` state for information about these attributes.

**alarms**: a dictionary of `name->boto_cloudwatch_alarm` sections to be associated with this ELB. All attributes should be specified except for `dimension` which will be automatically set to this ELB.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

**alarms\_from\_pillar**: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

**wait\_for\_sync** Wait for an `INSYNC` change status from `Route53`.

**tags** dict of tags

**instance\_ids** list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_names`.

**instance\_names** list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_ids`.

`salt.states.boto_elb.register_instances` (*name*, *instances*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

**name** The name of the Elastic Load Balancer to add EC2 instances to.

**instances** A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
```

```
- instance-id1
- instance-id2
```

### 14.17.30 salt.states.boto\_iam

#### Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
          "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"
          }]
        }
    - password: NewPassword$$1
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
      mypolicy: |
```

```

    {
      "Version": "2012-10-17",
      "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
    }
  - region: eu-west-1
  - keyid: 'AKIAJHTMIQ2ASDFLASDF'
  - key: 'safsdosal;fdkjsafkljsASSADFalkfj'

```

```

change-policy:
  boto_iam.account_policy:
    - change_password: True
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdosal;fdkjsafkljsASSADFalkfj'

```

```

create server certificate:
  boto_iam.server_cert_present:
    - name: mycert
    - public_key: salt://base/mycert.crt
    - private_key: salt://base/mycert.key
    - cert_chain: salt://base/mycert_chain.crt
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```

delete server certificate:
  boto_iam.server_cert_absent:
    - name: mycert

```

```

create keys for user:
  boto_iam.keys_present:
    - name: myusername
    - number: 2
    - save_dir: /root
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```

create policy:
  boto_iam.policy_present:
    - name: myname
    - policy_document: '{"MyPolicy": "Statement": [{"Action": ["sqs:*"], "Effect":
    ↪ "Allow", "Resource": ["arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```

add-saml-provider:
  boto_iam.saml_provider_present:
    - name: my_saml_provider
    - saml_metadata_document: salt://base/files/provider.xml
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdosal;fdkjsafkljsASSADFalkfj'

```

---

```

salt.states.boto_iam.account_policy(name=None, allow_users_to_change_password=None,
                                     hard_expiry=None, max_password_age=None,
                                     minimum_password_length=None, password_reuse_prevention=None,
                                     require_lowercase_characters=None, require_numbers=None,
                                     require_symbols=None, require_uppercase_characters=None,
                                     region=None, key=None, keyid=None, profile=None)

```

Change account policy.

New in version 2015.8.0.

**name (string)** The name of the account policy

**allow\_users\_to\_change\_password (bool)** Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

**hard\_expiry (bool)** Prevents IAM users from setting a new password after their password has expired.

**max\_password\_age (int)** The number of days that an IAM user password is valid.

**minimum\_password\_length (int)** The minimum number of characters allowed in an IAM user password.

**password\_reuse\_prevention (int)** Specifies the number of previous passwords that IAM users are prevented from reusing.

**require\_lowercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

**require\_numbers (bool)** Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require\_symbols (bool)** Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # \$ % ^ & \* ( ) \_ + - = [ ] { } | `

**require\_uppercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string)

```

salt.states.boto_iam.group_absent(name, region=None, key=None, keyid=None, profile=None)

```

New in version 2015.8.0.

Ensure the IAM group is absent.

**name (string)** The name of the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None, managed_policies=None,
                                     users=None, path='/', region=None, key=None, keyid=None, profile=None)

```

New in version 2015.8.0.

Ensure the IAM group is present

**name (string)** The name of the new group.

**path (string)** The path for the group, defaults to `/'

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

- managed\_policies (list)** A list of policy names or ARNs that should be attached to this group.
- users (list)** A list of users to be added to the group.
- region (string)** Region to connect to.
- key (string)** Secret key to be used.
- keyid (string)** Access key to be used.
- profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_absent` (*access\_keys, user\_name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user access\_key\_id is absent.

- access\_key\_id (list)** A list of access key ids
- user\_name (string)** The username of the user
- region (string)** Region to connect to.
- key (string)** Secret key to be used.
- keyid (string)** Access key to be used.
- profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_present` (*name, number, save\_dir, region=None, key=None, keyid=None, profile=None, save\_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.

- name (string)** The name of the new user.
- number (int)** Number of keys that user should have.
- save\_dir (string)** The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.
- region (string)** Region to connect to.
- key (string)** Secret key to be used.
- keyid (string)** Access key to be used.
- profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- save\_format (dict)** Save format is repeated for each key. Default format is ``{2}{0}{3}{1}``, where {0} and {1} are placeholders for new key\_id and key respectively, whereas {2} and {3} are ``key\_id-{number}`` and ``key-{number}`` strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name, region=None, key=None, keyid=None, profile=None*)  
New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

- name (string)** The name of the new policy.
- region (string)** Region to connect to.
- key (string)** Secret key to be used.
- keyid (string)** Access key to be used.
- profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_present` (*name, policy\_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

**name (string)** The name of the new policy.  
**policy\_document (dict)** The document of the new policy  
**path (string)** The path in which the policy will be created. Default is `/'.  
**description (string)** Description  
**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the SAML provider with the specified name is absent.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_present` (*name, saml\_metadata\_document, region=None, key=None, keyid=None, profile=None*)

Ensure the SAML provider with the specified name is present.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.server_cert_absent` (*name, region=None, key=None, keyid=None, profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.server_cert_present` (*name, public\_key, private\_key, cert\_chain=None, path=None, region=None, key=None, keyid=None, profile=None*)

Crete server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**public\_key (string)** The contents of the public key certificate in PEM-encoded format.

**private\_key (string)** The contents of the private key in PEM-encoded format.

**cert\_chain (string)** The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

**path (string)** The path for the server certificate.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect  
**keyid (string)** The keyid to be used in order to connect  
**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.user_absent`(*name*, *delete\_keys=True*, *delete\_mfa\_devices=True*,  
*delete\_profile=True*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

**name (string)** The name of the new user.  
**delete\_keys (bool)** Delete all keys from user.  
**delete\_mfa\_devices (bool)** Delete all mfa devices from user.

New in version 2016.3.0.

**delete\_profile (bool)** Delete profile from user.

New in version 2016.3.0.

**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.user_present`(*name*, *policies=None*, *policies\_from\_pillars=None*, *managed\_policies=None*, *password=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user is present

**name (string)** The name of the new user.  
**policies (dict)** A dict of IAM group policy documents.  
**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.  
**managed\_policies (list)** A list of managed policy names or ARNs that should be attached to this user.  
**password (string)** The password for the new user. Must comply with account policy.  
**path (string)** The path of the user. Default is `/'.

New in version 2015.8.2.

**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.31 salt.states.boto\_iam\_role

#### Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQLSPolicy:
        Statement:
          - Action:
              - sqs:*
            Effect: Allow
            Resource:
              - arn:aws:sqs:*:*:*
            Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
              - s3:GetObject
            Effect: Allow
            Resource:
              - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
      region: us-east-1
```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

`salt.states.boto_iam_role.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

**name** Name of the IAM role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam_role.present` (*name*, *policy\_document=None*, *path=None*, *policies=None*,  
*policies\_from\_pillars=None*, *managed\_policies=None*,  
*create\_instance\_profile=True*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*, *delete\_policies=True*)

Ensure the IAM role exists.

**name** Name of the IAM role.

**policy\_document** The policy that grants an entity permission to assume the role. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**path** The path to the role/instance profile. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policies** A dict of IAM role policies.

**policies\_from\_pillars** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies** A list of (AWS or Customer) managed policies to be attached to the role.

**create\_instance\_profile** A boolean of whether or not to create an instance profile and associate it with this role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies** Deletes existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

### 14.17.32 salt.states.boto\_iot module

#### Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure policy exists:
  boto_iot.policy_present:
    - policyName: mypolicy
    - policyDocument:
        Version: "2012-10-17"
        Statement:
          Action:
            - iot:Publish
          Resource:
            - "*"
          Effect: "Allow"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

```
Ensure topic rule exists:
  boto_iot.topic_rule_present:
    - ruleName: myrule
    - sql: "SELECT * FROM 'iot/test'"
    - description: 'test rule'
    - ruleDisabled: false
    - actions:
        - lambda:
            functionArn: "arn:aws:us-east-1:1234:function/functionname"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

**salt.states.boto\_iot.policy\_absent**(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

**name** The name of the state definition.

**policyName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.policy\_attached**(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.policy_detached(name, policyName, principal, region=None, key=None,
                                     keyid=None, profile=None)
```

Ensure policy is attached to the given principal.

**name** The name of the state definition.

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.policy_present(name, policyName, policyDocument, region=None,
                                    key=None, keyid=None, profile=None)
```

Ensure policy exists.

**name** The name of the state definition

**policyName** Name of the policy.

**policyDocument** The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.thing_type_absent(name, thingTypeName, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

**name** The name of the state definition.

**thingTypeName** Name of the thing type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.thing_type_present(name, thingTypeName, thingTypeDescription,
                                       searchableAttributesList, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure thing type exists.

New in version 2016.11.0.

**name** The name of the state definition

**thingTypeName** Name of the thing type

**thingTypeDescription** Description of the thing type

**searchableAttributesList** List of string attributes that are searchable for the thing type  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used  
**profile** A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

```
salt.states.boto_iot.topic_rule_absent(name, ruleName, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure topic rule with passed properties is absent.

**name** The name of the state definition.

**ruleName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.topic_rule_present(name, ruleName, sql, actions, description='',
                                       ruleDisabled=False, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure topic rule exists.

**name** The name of the state definition

**ruleName** Name of the rule.

**sql** The SQL statement used to query the topic.

**actions** The actions associated with the rule.

**description** The description of the rule.

**ruleDisable** Specifies whether the rule is disabled.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.33 salt.states.boto\_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfkdkfkjgjsdfjakghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKRB08H
        key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

```
salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
                                grants=None, manage_grants=False, key_rotation=False,
                                enabled=True, region=None, key=None, keyid=None, profile=None)
```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

**name** Name of the key.

**policy** Key usage policy.

**description** Description of the key.

**key\_usage** Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT\_DECRYPT, which is also the only supported option.

**grants** A list of grants to apply to the key. Not currently implemented.

**manage\_grants** Whether or not to manage grants. False by default, which will not manage any grants.

**key\_rotation** Whether or not key rotation is enabled for the key. False by default.

**enabled** Whether or not the key is enabled. True by default.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.34 salt.states.boto\_lambda module

##### Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

##### depends

- boto

- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure function exists:
  boto_lambda.function_present:
    - FunctionName: myfunction
    - Runtime: python2.7
    - Role: iam_role_name
    - Handler: entry_function
    - ZipFile: code.zip
    - S3Bucket: bucketname
    - S3Key: keyname
    - S3ObjectVersion: version
    - Description: "My Lambda Function"
    - Timeout: 3
    - MemorySize: 128
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_lambda.alias_absent` (*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**Name** Name of the alias.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present` (*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

**name** The name of the state definition.

**FunctionName** Name of the function for which you want to create an alias.

**Name** The name of the alias to be created.

**FunctionVersion** Function version for which you are creating the alias.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

**name** The name of the state definition.

**EventSourceArn** ARN of the event source.

**FunctionName** Name of the lambda function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_present`(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

**name** The name of the state definition.

**EventSourceArn** The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

**FunctionName** The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, ``Thumbnail``) or you can specify Amazon Resource Name (ARN) of the function (for example, ``arn:aws:lambda:us-west-2:account-id:function:ThumbNail``). AWS Lambda also allows you to specify only the account ID qualifier (for example, ``account-id:Thumbnail``). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

**StartingPosition** The position in the stream where AWS Lambda should start reading. (TRIM\_HORIZON | LATEST)

**Enabled** Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

**BatchSize** The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.function_absent`(*name*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure function with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler,
                                         ZipFile=None, S3Bucket=None, S3Key=None,
                                         S3ObjectVersion=None, Description='', Timeout=3,
                                         MemorySize=128, Permissions=None, RoleRe-
                                         tries=5, region=None, key=None, keyid=None,
                                         profile=None, VpcConfig=None)

```

Ensure function exists.

**name** The name of the state definition

**FunctionName** Name of the Function.

**Runtime** The Runtime environment for the function. One of `nodejs`, `java8`, or `python2.7`

**Role** The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

**Handler** The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.\*export\* value in your function. For Java, it can be package.classname::handler or package.class-name.

**ZipFile** A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

**S3Bucket** Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3Key** The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3ObjectVersion** The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**Timeout** The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

**MemorySize** The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

**VpcConfig** If your Lambda function accesses resources in a VPC, you provide this parameter identifying the list of security group IDs and subnet IDs. These must belong to the same VPC. You must provide at least one security group and one subnet ID.

New in version 2016.11.0.

**Permissions** A list of permission definitions to be added to the function's policy

**RoleRetries** IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.35 salt.states.boto\_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
      - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
      - '/dev/sda1':
          size: 20
          volume_type: 'io1'
          iops: 220
          delete_on_termination: true
    - cloud_init:
      boothooks:
        'disable-master.sh': |
          #!/bin/bash
          echo "manual" > /etc/init/salt-master.override
      scripts:
        'run_salt.sh': |
          #!/bin/bash

          add-apt-repository -y ppa:saltstack/salt
          apt-get update
          apt-get install -y salt-minion
```

```

    salt-call state.highstate
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdjfkghWupUjasdfldkflgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdjfkghWupUjasdfldkflgjsdfjajkghs
        region: us-east-1

```

**salt.states.boto\_lc.absent**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named launch configuration is deleted.

**name** Name of the launch configuration.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_lc.present**(*name, image\_id, key\_name=None, security\_groups=None, user\_data=None, cloud\_init=None, instance\_type='m1.small', kernel\_id=None, ramdisk\_id=None, block\_device\_mappings=None, instance\_monitoring=False, spot\_price=None, instance\_profile\_name=None, ebs\_optimized=False, associate\_public\_ip\_address=None, region=None, key=None, keyid=None, profile=None*)

Ensure the launch configuration exists.

**name** Name of the launch configuration.

**image\_id** AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

**key\_name** Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

**security\_groups** List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

**user\_data** The user data available to launched EC2 instances.

**cloud\_init** A dict of cloud\_init configuration. Currently supported values: scripts, cloud-config. Mutually exclusive with user\_data.

**instance\_type** The instance type. ex: m1.small.

**kernel\_id** The kernel id for the instance.

**ramdisk\_id** The RAM disk ID for the instance.

**block\_device\_mappings** A dict of block device mappings that contains a dict with volume\_type, delete\_on\_termination, iops, size, encrypted, snapshot\_id.

**volume\_type** Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

**delete\_on\_termination** Indicates whether to delete the volume on instance termination (true) or not

- (false).
- iops** For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
- size** Desired volume size (in GiB).
- encrypted** Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.
- instance\_monitoring** Whether instances in group are launched with detailed monitoring.
- spot\_price** The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.
- instance\_profile\_name** The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.
- ebs\_optimized** Specifies whether the instance is optimized for EBS I/O (true) or not (false).
- associate\_public\_ip\_address** Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.
- region** The region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.36 salt.states.boto\_rds

#### Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
  region: us-east-1
```

```
Ensure myrds RDS exists:
boto_rds.present:
- name: myrds
- allocated_storage: 5
- storage_type: standard
```

```

- db_instance_class: db.t2.micro
- engine: MySQL
- master_username: myuser
- master_user_password: mypass
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBj08H
- key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
- tags:
  -
    - key1
    - value1
  -
    - key2
    - value2

```

```

Ensure parameter group exists:
create-parameter-group:
  boto_rds.parameter_present:
    - name: myparametergroup
    - db_parameter_group_family: mysql5.6
    - description: "parameter group family"
    - parameters:
      - binlog_cache_size: 32768
      - binlog_checksum: CRC32
    - region: eu-west-1

```

**depends** boto3

**salt.states.boto\_rds.absent** (*name, skip\_final\_snapshot=None, final\_db\_snapshot\_identifier=None, tags=None, region=None, key=None, keyid=None, profile=None, wait\_for\_deletion=True, timeout=180*)

Ensure RDS instance is absent.

**name** Name of the RDS instance.

**skip\_final\_snapshot** Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

**final\_db\_snapshot\_identifier** If a final snapshot is requested, this is the identifier used for that snapshot.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_deletion (bool)** Wait for the RDS instance to be deleted completely before finishing the state.

**timeout (in seconds)** The amount of time that can pass before raising an Exception.

**salt.states.boto\_rds.parameter\_present** (*name, db\_parameter\_group\_family, description, parameters=None, apply\_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure DB parameter group exists and update parameters.

**name** The name for the parameter group.

**db\_parameter\_group\_family** The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

**description** Parameter group description.

**parameters** The DB parameters that need to be changed of type dictionary.

**apply\_method** The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)
```

Ensure RDS instance exists.

**name** Name of the RDS state definition.

**allocated\_storage** The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db\_instance\_class** The compute and memory capacity of the Amazon RDS DB instance.

**engine** The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master\_username** The name of master user for the client DB instance.

**master\_user\_password** The password for the master database user. Can be any printable ASCII character except ``/`, ``"`, or ``@`.

**db\_name** The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create\\_db\\_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage\_type** Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the Iops parameter.

**db\_security\_groups** A list of DB security groups to associate with this DB instance.

**vpc\_security\_group\_ids** A list of EC2 VPC security groups to associate with this DB instance.

**availability\_zone** The EC2 Availability Zone that the database instance will be created in.

**db\_subnet\_group\_name** A DB subnet group to associate with this DB instance.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur.

**db\_parameter\_group\_name** A DB parameter group to associate with this DB instance.

**db\_cluster\_identifier** If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

**tde\_credential\_arn** The ARN from the Key Store with which the instance is associated for TDE encryption.

**tde\_credential\_password** The password to use for TDE encryption if an encryption key is not used.

- storage\_encrypted** Specifies whether the DB instance is encrypted.
- kms\_keyid** If `storage_encrypted` is true, the KMS key identifier for the encrypted DB instance.
- backup\_retention\_period** The number of days for which automated backups are retained.
- preferred\_backup\_window** The daily time range during which automated backups are created if automated backups are enabled.
- port** The port number on which the database accepts connections.
- multi\_az** Specifies if the DB instance is a Multi-AZ deployment. You cannot set the `AvailabilityZone` parameter if the `MultiAZ` parameter is set to true.
- engine\_version** The version number of the database engine to use.
- auto\_minor\_version\_upgrade** Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.
- license\_model** License model information for this DB instance.
- iops** The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.
- option\_group\_name** Indicates that the DB instance should be associated with the specified option group.
- character\_set\_name** For supported engines, indicates that the DB instance should be associated with the specified `CharacterSet`.
- publicly\_accessible** Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.
- wait\_status** Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up
- tags** A list of tags.
- copy\_tags\_to\_snapshot** Specifies whether tags are copied from the DB instance to snapshots of the DB instance.
- region** Region to connect to.
- domain** The identifier of the Active Directory Domain.
- key** AWS secret key to be used.
- keyid** AWS access key to be used.
- monitoring\_interval** The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.
- monitoring\_role\_arn** The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.
- domain\_iam\_role\_name** Specify the name of the IAM role to be used when making API calls to the Directory Service.
- promotion\_tier** A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see [Fault Tolerance for an Aurora DB Cluster](#).
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
                                     availability_zone=None, port=None,
                                     auto_minor_version_upgrade=None, iops=None, op-
                                     tion_group_name=None, publicly_accessible=None,
                                     tags=None, region=None, key=None, keyid=None,
                                     profile=None, db_parameter_group_name=None)

```

Ensure RDS replica exists.

```

Ensure myrds replica RDS exists:
boto_rds.create_replica:
- name: myreplica
- source: mydb

```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name** The name for the DB subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**subnet\_names** A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**description** Subnet group description.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.37 salt.states.boto\_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit `route53` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

```
# Using a profile from pillars
```

```
myarecord:
```

```

boto_route53.present:
  - name: test.example.com.
  - value: 1.1.1.1
  - zone: example.com.
  - ttl: 60
  - record_type: A
  - region: us-east-1
  - profile: myprofile

# Passing in a profile
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs

```

`salt.states.boto_route53.absent` (*name, zone, record\_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False*)

Ensure the Route53 record is deleted.

**name** Name of the record.

**zone** The zone to delete the record from.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**identifier** An identifier to match for deletion.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using `split_dns`, specify if this is the private zone.

`salt.states.boto_route53.hosted_zone_absent` (*name, domain\_name=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**domain\_name** The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

`salt.states.boto_route53.hosted_zone_present` (*name, domain\_name=None, private\_zone=False, comment='', vpc\_id=None, vpc\_name=None, vpc\_region=None, region=None, key=None, keyid=None, profile=None*)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private\_zone** (AWS API limitation).

- comment** (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).

- `vpc_id` (same story - we really need to rewrite this module with boto3)
- `vpc_name` (really just a pointer to `vpc_id` anyway).
- `vpc_region` (again, supported in boto3 but not boto2).

**name** The name of the state definition. This will be used as the `'caller_ref'` param if/when creating the hosted zone.

**domain\_name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of `name` if not provided.

**comment** Any comments you want to include about the hosted zone.

**private\_zone** Set True if creating a private hosted zone.

**vpc\_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_name`. Ignored if passed for a non-private zone.

**vpc\_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_id`. Ignored if passed for a non-private zone.

**vpc\_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from `vpc_id` or `vpc_name`, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

```
salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None,
                                region=None, key=None, keyid=None, profile=None,
                                wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

**name** Name of the record.

**value**

**Value of the record. As a special case, you can pass in:** `private:<Name tag>` to have the function autodetermine the private IP `public:<Name tag>` to have the function autodetermine the public IP

**zone** The zone to create the record in.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using `split_dns`, specify if this is the private zone.

### 14.17.38 salt.states.boto\_s3\_bucket module

#### Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure bucket exists:
  boto_s3_bucket.present:
    - Bucket: mybucket
    - LocationConstraint: EU
    - ACL:
      - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
    - CORSRules:
      - AllowedHeaders: []
        AllowedMethods: ["GET"]
        AllowedOrigins: ["*"]
        ExposeHeaders: []
        MaxAgeSeconds: 123
    - LifecycleConfiguration:
      - Expiration:
          Days: 123
          ID: "idstring"
          Prefix: "prefixstring"
          Status: "enabled",
          ID: "lc1"
          Transitions:
            - Days: 123
              StorageClass: "GLACIER"
          NoncurrentVersionTransitions:
            - NoncurrentDays: 123
              StorageClass: "GLACIER"
          NoncurrentVersionExpiration:
            NoncurrentDays: 123
    - Logging:
      TargetBucket: log_bucket
      TargetPrefix: prefix
      TargetGrants:
        - Grantee:
            DisplayName: "string"
            EmailAddress: "string"
            ID: "string"
            Type: "AmazonCustomerByEmail"
            URI: "string"
            Permission: "READ"
    - NotificationConfiguration:
      LambdaFunctionConfiguration:
        - Id: "string"
```

```

    LambdaFunctionArn: "string"
    Events:
      - "s3:ObjectCreated:*"

          Protocol: "http"
          ReplaceKeyPrefixWith: "string"
          ReplaceKeyWith: "string"
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

`salt.states.boto_s3_bucket.absent`(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

**name** The name of the state definition.

**Bucket** Name of the bucket.  
**Force** Empty the bucket first if necessary - Boolean.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_s3_bucket.present(name, Bucket, LocationConstraint=None, ACL=None,
                                   CORSRules=None, LifecycleConfiguration=None, Logging=None,
                                   NotificationConfiguration=None, Policy=None, Replication=None,
                                   RequestPayment=None, Tagging=None, Versioning=None, Website=None,
                                   region=None, key=None, keyid=None, profile=None)

```

Ensure bucket exists.

**name** The name of the state definition

**Bucket** Name of the bucket.

**LocationConstraint** `EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

**ACL** The permissions on a bucket using access control lists (ACL).

**CORSRules** The cors configuration for a bucket.

**LifecycleConfiguration** Lifecycle configuration for your bucket

**Logging** The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

**NotificationConfiguration** notifications of specified events for a bucket

**Policy** Policy on the bucket

**Replication** Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

**RequestPayment** The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

**Tagging** A dictionary of tags that should be set on the bucket

**Versioning** The versioning state of the bucket

**Website** The website configuration of the bucket

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.39 salt.states.boto\_secgroup

#### Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - rules:
      - ip_protocol: tcp
        from_port: 80
        to_port: 80
        cidr_ip:
          - 10.0.0.0/0
          - 192.168.0.0/0
      - ip_protocol: icmp
        from_port: -1
        to_port: -1
        source_group_name: mysecgroup
    - rules_egress:
      - ip_protocol: all
        from_port: -1
        to_port: -1
        cidr_ip:
          - 10.0.0.0/0
          - 192.168.0.0/0
    - tags:
      SomeTag: 'My Tag Value'
      SomeOtherTag: 'Other Tag Value'
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile: myprofile
```

*# Passing in a profile*

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
      region: us-east-1
```

---

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

`salt.states.boto_secgroup.absent`(*name*, *vpc\_id=None*, *vpc\_name=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Ensure a security group with the specified name does not exist.

**name** Name of the security group.

**vpc\_id** The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

`salt.states.boto_secgroup.present`(*name*, *description*, *vpc\_id=None*, *vpc\_name=None*,  
*rules=None*, *rules\_egress=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*, *tags=None*)

Ensure the security group exists with the specified rules.

**name** Name of the security group.

**description** A description of this security group.

**vpc\_id** The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

**rules** A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

**rules\_egress** A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key`, and `keyid`.

**tags** List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

#### 14.17.40 salt.states.boto\_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_sns.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

**name** Name of the SNS topic.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**unsubscribe** If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present` (*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

**name** Name of the SNS topic.

**subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
  {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
  {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.41 salt.states.boto\_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
    - attributes:
      ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile

# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_sqs.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

**name** Name of the SQS queue.

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_sqs.present`(*name*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SQS queue exists.  
**name** Name of the SQS queue.  
**attributes** A dict of key/value SQS attributes.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.42 salt.states.boto\_vpc

#### Manage VPCs

New in version 2015.8.0.

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
        region: us-east-1
```

```
Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
```

```

- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
    - subnet_names:
      - subnet1
      - subnet2
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:

```

```
- conn_id: pcx-1873c371
- region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```
delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- conn_name: salt_vpc_peering
```

Delete also accepts a VPC peering connection id.

```
delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
- conn_id: pcx-1873c371
```

**salt.states.boto\_vpc.absent**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

**name** Name of the VPC.

**tags** A list of tags. All tags must match.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.accept\_vpc\_peering\_connection**(*name=None*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

**name** Name of this state

**conn\_id** The connection ID to accept. Exclusive with **conn\_name**. String type.

**conn\_name** The name of the VPC peering connection to accept. Exclusive with **conn\_id**. String type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
- conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
- conn_id: pbx-1873d472
- region: us-west-2
```

**salt.states.boto\_vpc.delete\_vpc\_peering\_connection**(*name*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

**name** Name of the state

**conn\_id** ID of the peering connection to delete. Exclusive with **conn\_name**.

**conn\_name** The name of the peering connection to delete. Exclusive with `conn_id`.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
 New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both `conn_name` and `conn_id` will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

`salt.states.boto_vpc.dhcp_options_absent` (*name=None, dhcp\_options\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure a set of DHCP options with the given settings exist.

**name** (string) Name of the DHCP options set.

**dhcp\_options\_id** (string) Id of the DHCP options set.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.dhcp_options_present` (*name, dhcp\_options\_id=None, vpc\_name=None, vpc\_id=None, domain\_name=None, domain\_name\_servers=None, ntp\_servers=None, netbios\_name\_servers=None, netbios\_node\_type=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or `dhcp_options_id` param.

**name** (string) Name of the DHCP options.

**vpc\_name** (string) Name of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**vpc\_id** (string) Id of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**domain\_name** (string) Domain name to be associated with this option set.

**domain\_name\_servers** (list of strings) The IP address(es) of up to four domain name servers.

**ntp\_servers** (list of strings) The IP address(es) of up to four desired NTP servers.

**netbios\_name\_servers** (list of strings) The IP address(es) of up to four NetBIOS name servers.

**netbios\_node\_type** (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

**tags** (dict of key:value pairs) A set of tags to be added.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent`(*name*, *detach=False*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Ensure the named internet gateway is absent.

**name** Name of the internet gateway.

**detach** First detach the internet gateway from a VPC, if attached.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present`(*name*, *vpc\_name=None*, *vpc\_id=None*,  
*tags=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure an internet gateway exists.

**name** Name of the internet gateway.

**vpc\_name** Name of the VPC to which the internet gateway should be attached.

**vpc\_id** Id of the VPC to which the internet\_gateway should be attached. Only one of vpc\_name or vpc\_id may be provided.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent`(*name=None*, *subnet\_name=None*, *subnet\_id=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*,  
*wait\_for\_delete\_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

**name** Name of the state.

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either subnet\_name or subnet\_id must be provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete\_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.nat_gateway_present`(*name*, *subnet\_name=None*, *subnet\_id=None*, *re-*  
*gion=None*, *key=None*, *keyid=None*, *profile=None*,  
*allocation\_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet
```

**name** Name of the state

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**allocation\_id** If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None,
                             dns_hostnames=None, tags=None, region=None, key=None,
                             keyid=None, profile=None)
```

Ensure VPC exists.

**name** Name of the VPC.

**cidr\_block** The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**instance\_tenancy** Instances launched in this VPC will be in single-tenant or dedicated hardware.

**dns\_support** Indicates whether the DNS resolution is supported for the VPC.

**dns\_hostnames** Indicates whether the instances launched in the VPC get DNS hostnames.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, region=None,
                                                    key=None,
                                                    keyid=None, profile=None)
```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with `requester_vpc_name`. String type.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with `requester_vpc_id`. String type.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`. String type.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account. Exclusive with `peer_vpc_id`. String type.

**conn\_name** The (optional) name to use for this VPC peering connection. String type.

**peer\_owner\_id** ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID.

Required if peering to a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

**salt.states.boto\_vpc.route\_table\_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named route table is absent.

**name** Name of the route table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.route\_table\_present**(*name*, *vpc\_name=None*, *vpc\_id=None*, *routes=None*, *subnet\_ids=None*, *subnet\_names=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
- name: my_route_table
- vpc_id: vpc-123456
- routes:
  - destination_cidr_block: 0.0.0.0/0
    internet_gateway_name: InternetGateway
  - destination_cidr_block: 10.10.11.0/24
    instance_id: i-123456
  - destination_cidr_block: 10.10.12.0/24
    interface_id: eni-123456
  - destination_cidr_block: 10.10.13.0/24
    instance_name: mygatewayserver
- subnet_names:
  - subnet1
  - subnet2
```

**name** Name of the route table.

**vpc\_name** Name of the VPC with which the route table should be associated.

**vpc\_id** Id of the VPC with which the route table should be associated. Either *vpc\_name* or *vpc\_id* must be provided.

**routes** A list of routes. Each route has a cidr and a target.

**subnet\_ids** A list of subnet ids to associate  
**subnet\_names** A list of subnet names to associate  
**tags** A list of tags.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_absent`(*name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

**name** Name of the subnet.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_present`(*name, cidr\_block, vpc\_name=None, vpc\_id=None, availability\_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route\_table\_id=None, route\_table\_name=None*)

Ensure a subnet exists.

**name** Name of the subnet.

**cidr\_block** The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**vpc\_name** Name of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**vpc\_id** Id of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**availability\_zone** AZ in which the subnet should be placed.

**tags** A list of tags.

**route\_table\_id** A route table ID to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**route\_table\_name** A route table name to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.vpc_peering_connection_present`(*name, requester\_vpc\_id=None, requester\_vpc\_name=None, peer\_vpc\_id=None, peer\_vpc\_name=None, conn\_name=None, peer\_owner\_id=None, region=None, key=None, keyid=None, profile=None*)

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with requester\_vpc\_name.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with requester\_vpc\_id.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with `peer_vpc_id`.

**conn\_name** The name to use for this VPC peering connection.

**peer\_owner\_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321
```

### 14.17.43 salt.states.bower

#### Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply `npm` and `git` in most cases), and `npm.installed` state for the package which provides bower.

Example:

```
npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

**salt.states.bower.bootstrap**(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute `'bower install'` on the specified directory.

**user** The user to run Bower with

**salt.states.bower.installed**(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```

underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project

```

**name** The package to install

**dir** The target directory in which to install the package

**pkgs** A list of packages to install with a single Bower invocation; specifying this argument will ignore the **name** argument

**user** The user to run Bower with

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.removed`(*name*, *dir*, *user=None*)

Verify that the given package is not installed.

**dir** The target directory in which to install the package

**user** The user to run Bower with

## 14.17.44 salt.states.cabal

### Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (cabal-install in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

```
cabal-install: pkg.installed
```

```
ShellCheck:
```

```
  cabal.installed:
```

- require: - pkg: cabal-install

`salt.states.cabal.installed`(*name*, *pkgs=None*, *user=None*, *install\_global=False*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
ShellCheck-0.3.5:
  cabal:
    - installed:
```

**name** The package to install

**user** The user to run cabal install with

**install\_global** Install package globally instead of locally

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed`(*name*, *user=None*, *env=None*)

Verify that given package is not installed.

### 14.17.45 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum`(*name*, *\*\*kwargs*)

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

### 14.17.46 salt.states.chef

#### Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

`salt.states.chef.client`(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**server** The chef server URL

**client\_key** Set the client key file location

**config** The configuration file to use

**config-file-jail** Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**localmode** Point chef-client at local repository if True

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**pid** Set the PID file location, defaults to /tmp/chef-client.pid

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**runlist** Permanently replace current run list with specified items

**user** User to set privilege to

**validation\_key** Set the validation key file location, used for registering new clients

`salt.states.chef.solo`(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**config** The configuration file to use

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**recipe-url** Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**user** User to set privilege to

#### 14.17.47 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

`salt.states.chocolatey.install`(*\*args*, *\*\*kwargs*)

Deprecated, please use `installed`. This function will be removed in Salt Nitrogen.

`salt.states.chocolatey.installed`(*name*, *version=None*, *source=None*, *force=False*, *pre\_versions=False*, *install\_args=None*, *override\_args=False*, *force\_x86=False*, *package\_args=None*)

Installs a package if not already installed

**name** The name of the package to be installed.

**version** Install a specific version of the package. Defaults to latest version.

**source** Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed.

**force** Reinstall the current version of an existing package. Default is false.

**pre\_versions** Include pre-release packages. Default is False.

**install\_args** A list of install arguments you want to pass to the installation process i.e product key or feature list

**override\_args** Set to true if you want to override the original install arguments ( for the native installer)in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

**force\_x86** Force x86 (32bit) installation on 64 bit systems. Defaults to false.

**package\_args** A list of arguments you want to pass to the package

```
Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
```

`salt.states.chocolatey.uninstall`(*\*args*, *\*\*kwargs*)

Deprecated, please use `uninstalled`. This function will be removed in Salt Nitrogen.

`salt.states.chocolatey.uninstalled`(*name*, *version=None*, *uninstall\_args=None*, *override\_args=False*)

Uninstalls a package

**name** The name of the package to be uninstalled

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

- uninstall\_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list
- override\_args** Set to true if you want to override the original uninstall arguments ( for the native uninstaller)in the package and use your own. When this is set to False uninstall\_args will be appended to the end of the default arguments

#### 14.17.48 salt.states.chronos\_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

**salt.states.chronos\_job.absent**(*name*)

Ensure that the chronos job with the given name is not present.

**Parameters** **name** -- The app name

**Returns** A standard Salt changes dictionary

**salt.states.chronos\_job.config**(*name, config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

**Parameters**

- **name** -- The job name
- **config** -- The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

#### 14.17.49 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

**salt.states.cisconso.value\_present**(*name, datastore, path, config*)

Ensure a specific value exists at a given path

**Parameters**

- **name** (str) -- The name for this rule
- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / seperated
- **config** (dict) -- The new value at the given path

Examples:

```
enable pap auth:
  cisconso.config_present:
    - name: enable_pap_auth
```

```

- datastore: running
- path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
- config:
  authentication:
    method: pap
    "list-name": foobar

```

### 14.17.50 salt.states.cloud

#### Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```

my-ec2-instance:
  cloud.profile:
    my-ec2-config

```

**salt.states.cloud.absent** (*name*, *onlyif=None*, *unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

**name** The name of the instance to destroy

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**salt.states.cloud.present** (*name*, *cloud\_provider*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

**name** The name of the instance to create

**cloud\_provider** The name of the cloud provider to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**opts** Any extra opts that need to be used

**salt.states.cloud.profile** (*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

**name** The name of the instance to create

**profile** The name of the cloud profile to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**kwargs** Any profile override or addition

**opts** Any extra opts that need to be used

`salt.states.cloud.volume_absent` (*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

`salt.states.cloud.volume_attached` (*name*, *server\_name*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached` (*name*, *server\_name=None*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present` (*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

### 14.17.51 salt.states.cmd

#### Execution of arbitrary commands

The `cmd` state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
date > /tmp/salt-run:
  cmd.run
```

Only run if another execution failed, in this case truncate `syslog` if there is no disk space:

```
> /var/log/messages:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files:

```
echo 'foo' | tee /tmp/bar > /tmp/baz:
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

---

**Note:** The `creates` option was added to version 2014.7.0

---

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the `stateful` argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a `changed` state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the `changed` state in the `cmd` state.

### Using the ``Stateful'' Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be `true` then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of `key=value` pairs delimited by spaces (no spaces on either side of `=`).
2. **If it's JSON then it must be a JSON object (e.g., `{}`).** If it's `key=value` pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the `key=value` string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a `stateful` command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The `stateful` argument can optionally include a `test_name` parameter.**

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

### Should I use `cmd.run` or `cmd.wait`?

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

`cmd.wait` will be deprecated in future due to the confusion it causes. The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
```

```
pkg.installed:
- require:
- file: /usr/local/bin/postinstall.sh
```

### How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.call`(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, output\_loglevel='debug', use\_vt=False, \*\*kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments (`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
  'comment': result if isinstance(result, string_types) else ''
}
```

`salt.states.cmd.mod_run_check`(*cmd\_kwargs, onlyif, unless, creates*)

Execute the `onlyif` and `unless` logic. Return a result dict if: \* `onlyif` failed (`onlyif != 0`) \* `unless` succeeded (`unless == 0`) else return `True`

`salt.states.cmd.mod_watch`(*name, \*\*kwargs*)

Execute a `cmd` function based on a watch call

`salt.states.cmd.run`(*name, onlyif=None, unless=None, creates=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, output\_loglevel='debug', quiet=False, timeout=None, ignore\_timeout=False, use\_vt=False, \*\*kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.

**umask** The umask (in octal) to use when running the command.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: `DEBUG`) regardless, unless `quiet` is used for this value.

**quiet** The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the 2014.1.0 release, and is being replaced with `output_loglevel: quiet`.

**timeout** If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

**ignore\_timeout** Ignore the timeout of commands, which is useful for running `nohup` processes.

New in version 2015.8.0.

**creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**bg** If `True`, run command in background and do not await or deliver it's results.

New in version 2016.3.6.

---

**Note:** `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```

getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True

```

`salt.states.cmd.script` (*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *timeout=None*, *use\_vt=False*, *output\_loglevel='debug'*, *defaults=None*, *context=None*, *\*\*kwargs*)

Download a script and execute it with specified arguments.

**source** The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wemply are supported

**name** Either ``cmd arg1 arg2 arg3...'` (cmd is not used) or a source ``salt://...'`.

**onlyif** Run the named command only if the command passed to the `onlyif` option returns true

**unless** Run the named command only if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The name of the user to run the command as

**shell** The shell to use for execution. The default is set in `grains['shell']`

**env** A list of environment variables to be set prior to execution. Example:

```

salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH'`:

```

salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"

```

One can still use the existing `$PATH` by using a bit of Jinja:

```

{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

```

**saltenv** [*base*] The Salt environment to use

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

**args** String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3''

**creates** Only run if the file or files specified by *creates* do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**context** New in version 2016.3.0.

Overrides default context variables passed to the template.

**defaults** New in version 2016.3.0.

Default context passed to the template.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless *quiet* is used for this value.

```
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None,
                    shell=None, env=(), stateful=False, umask=None, output_loglevel='debug',
                    use_vt=False, **kwargs)
```

Run the given command only if the watch statement calls it.

---

**Note:** Use *cmd.run* with onchange instead.

---

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the *onlyif* option returns true

**unless** A command to run as a check, only run the named command if the command passed to the *unless* option returns false

**cwd** The current working directory to execute the command in, defaults to /root

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to /bin/sh

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH'`:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**creates** Only run if the file or files specified by **creates** do not exist.

New in version 2014.7.0.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless **quiet** is used for this value.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**salt.states.cmd.wait\_script**(*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *use\_vt=False*, *output\_loglevel='debug'*, *\*\*kwargs*)

Download a script from a remote source and execute it only if a watch statement calls it.

**source** The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**template** If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the **onlyif** option returns true

**unless** A command to run as a check, only run the named command if the command passed to the **unless** option returns false

**cwd** The current working directory to execute the command in, defaults to /root

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**use\_vt**

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

### 14.17.52 salt.states.composer

#### Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```
get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
    - cwd: /root/
    - watch:
      - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true
```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True)

```

Verify that the correct versions of composer dependencies are present.

**dir** Directory location of the composer.json file.

**composer** Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php** Location of the php executable to use with composer. (i.e. /usr/bin/php)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** --prefer-source option of composer.

**prefer\_dist** --prefer-dist option of composer.

**no\_scripts** --no-scripts option of composer.

**no\_plugins** --no-plugins option of composer.

**optimize** --optimize-autoloader option of composer. Recommended for production.

**no\_dev** --no-dev option for composer. Recommended for production.

**quiet** --quiet option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable

**always\_check** If True, `_always_run composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.

```

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root')

```

Composer update the directory to ensure we have the latest versions of all project dependencies.

**dir** Directory location of the composer.json file.

**composer** Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php** Location of the php executable to use with composer. (i.e. /usr/bin/php)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** --prefer-source option of composer.

**prefer\_dist** --prefer-dist option of composer.

**no\_scripts** --no-scripts option of composer.

**no\_plugins** --no-plugins option of composer.

**optimize** --optimize-autoloader option of composer. Recommended for production.

**no\_dev** --no-dev option for composer. Recommended for production.

**quiet** --quiet option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable

### 14.17.53 salt.states.cron

#### Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month

- `dayweek` (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

**Warning:** Any timing arguments not specified take a value of `*`. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x` `minutes` very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
```

```
- user: root
- minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `@reboot` or `@hourly`.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

**salt.states.cron.absent**(*name*, *user*='root', *identifier*=False, *special*=None, *\*\*kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

**name** The command that should be absent in the user crontab.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

**special** The special keyword used in the job (eg. `@reboot`, `@hourly`...)

**salt.states.cron.env\_absent**(*name*, *user*='root')

Verifies that the specified environment variable is absent from the crontab for the specified user

**name** The name of the environment variable to remove from the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**salt.states.cron.env\_present**(*name*, *value*=None, *user*='root')

Verifies that the specified environment variable is present in the crontab for the specified user.

**name** The name of the environment variable to set in the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**value** The value to set for the given environment variable

`salt.states.cron.file`(*name*, *source\_hash*='', *source\_hash\_name*=None, *user*='root', *template*=None, *context*=None, *replace*=True, *defaults*=None, *backup*='', \*\**kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

**name** The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

**source\_hash** This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**user** The user to whom the crontab should be assigned. This defaults to root.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

**context** Overrides default context variables passed to the template.

**replace** If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for the user's crontab.

`salt.states.cron.present`(*name*, *user*='root', *minute*='\*', *hour*='\*', *daymonth*='\*', *month*='\*', *day-week*='\*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

**name** The command that should be executed by the cron job.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**minute** The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is \*

**hour** The information to be set in the hour section. Default is \*

**daymonth** The information to be set in the day of month section. Default is \*

**month** The information to be set in the month section. Default is \*

**dayweek** The information to be set in the day of week section. Default is \*

**comment** User comment to be added on line previous the cron job

**commented** The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

**special** A special keyword to specify periodicity (eg. @reboot, @hourly...)

New in version 2016.3.0.

#### 14.17.54 salt.states.csf module

`salt.states.csf.nics_skip`(*name, nics, ipv6*)

Alias for `csf.nics_skipped`

`salt.states.csf.nics_skipped`(*name, nics, ipv6=False*)

**name** Meaningless arg, but required for state.

**nics** A list of nics to skip.

**ipv6** Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.option_present`(*name, value, reload=False*)

Ensure the state of a particular option/setting in csf.

**name** The option name in csf.conf

**value** The value it should be set to.

**reload** Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.ports_open`(*name, ports, proto='tcp', direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP\_IN in the csf.conf file.

**ports** A list of ports that should be open.

**proto** The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

**direction** Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.rule_absent`(*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, reload=False*)

Ensure iptable is not present.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.temppdeny()` are used.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.rule_present` (*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, comment='', reload=False*)

Ensure iptable rule exists.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either `allow` or `deny`.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either `tcp`, or `udp`. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either `in`, or `out`. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either `s`, or `d`.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either `s`, or `d`. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.temppdeny()` are used.

**comment** An optional comment to appear after the rule as a `#comment`.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.testing_off` (*name, reload=False*)

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

`salt.states.csf.testing_on` (*name, reload=False*)

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

### 14.17.55 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

`class salt.states.cyg.DictDiffer` (*current\_dict, past\_dict*)

Calculate the difference between two dictionaries.

1.items added

2.items removed

3.keys same in both but changed values

4.keys same in both and unchanged values

**added()**

Return a set of additions to `past_dict`.

**changed()**

Return a set of the keys with changed values.

**removed()**

Return a set of things removed from `past_dict`.

**same()**

True if the two dicts are the same.

**unchanged()**

Return a set of the keys with unchanged values.

`salt.states.cyg.installed` (*name, cyg\_arch='x86\_64', mirrors=None*)

Make sure that a package is installed.

**name** The name of the package to install

**cyg\_arch** [x86\_64] The cygwin architecture to install the package into. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.removed**(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**cyg\_arch** [x86\_64] The cygwin architecture to remove the package from. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.updated**(*name*=None, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure all packages are up to date.

**name** [None] No affect, salt fails poorly without the arg available

**cyg\_arch** [x86\_64] The cygwin architecture to update. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

## 14.17.56 salt.states.ddns

### Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

**depends**

- [dnspython](#)

---

**Note:** The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

---

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
```

```
- nameserver: 123.234.345.456
- keyfile: /srv/salt/dnspsy_tsig_key.txt
```

`salt.states.ddns.absent` (*name, zone, data=None, rdtype=None, \*\*kwargs*)

Ensures that the named DNS record is absent.

**name** The host portion of the DNS record, e.g., `webserver`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check

**data** Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

**rdtype** DNS resource type. If omitted, all types will be purged.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

`salt.states.ddns.present` (*name, zone, ttl, data, rdtype='A', \*\*kwargs*)

Ensures that the named DNS record is present with the given ttl.

**name** The host portion of the DNS record, e.g., `webserver`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check/update

**ttl** TTL for the record

**data** Data for the DNS record. E.g., the IP address for an A record.

**rdtype** DNS resource type. Default `A`.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

## 14.17.57 salt.states.debconfmod

### Management of debconf selections

#### depends

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

### Available Functions

The `debconfmod` state has two functions, the `set` and `set_file` functions

**set** Set debconf selections from the state itself

**set\_file** Set debconf selections from a file

```
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
      'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
      'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
```

```

debconf.set:
- name: ferm
- data:
  'ferm/enable': {'type': 'boolean', 'value': True}

```

**Note:** Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

`salt.states.debconfmod.set`(*name*, *data*, *\*\*kwargs*)

Set debconf selections

```

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

```

**name:** The package name to set answers for.

**data:** A set of questions/answers for debconf. Note that everything under this must be indented twice.

**question:** The question that is being pre-answered

**type:** The type of question that is being asked (string, boolean, select, etc.)

**value:** The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, *\*\*kwargs*)

Set debconf selections from a file or a template

```

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
      some_value: "false"

```

**source:** The location of the file containing the package selections

**template** If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

### 14.17.58 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
```

```

server-3:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.20
  netmask: 255.255.0.0
  gateway: 172.17.17.1
server-4:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.2
  netmask: 255.255.0.0
  gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
    dellchassis.blade_idrac:
      - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}

```

```

{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}

```

**Note:** This state module relies on the `dracr.py` execution module, which runs `racadm` commands on the chassis, blades, etc. The `racadm` command runs very slowly and, depending on your state, the proxy minion return might timeout before the `racadm` commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```

salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
                                     idrac_ip=None, idrac_netmask=None,
                                     idrac_gateway=None, idrac_dnsname=None,
                                     idrac_dhcp=None)

```

Set parameters for iDRAC in a blade.

**Parameters** **idrac\_password** -- Password to use to connect to the iDRACs directly (`idrac_ipmi` and `idrac_dnsname` must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password) :param `idrac_ipmi`: Enable/Disable IPMI over LAN :param `idrac_ip`: Set IP address for iDRAC :param `idrac_netmask`: Set netmask for iDRAC :param `idrac_gateway`: Set gateway for iDRAC :param `idrac_dhcp`: Turn on DHCP for iDRAC (True turns on, False does nothing

because setting a static IP will disable DHCP).

**Returns** A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of `ip`, `netmask`, and `gateway` must be present

```

salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None,
                                 location=None, mode=None, idrac_launch=None,
                                 slot_names=None, blade_power_states=None)

```

Manage a Dell Chassis.

**chassis\_name** The name of the chassis.

**datacenter** The datacenter in which the chassis is located

**location** The location of the chassis.

**password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

**mode** The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor

- 2: Manage and Monitor

**idrac\_launch** The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot\_names** The names of the slots, provided as a list identified by their slot numbers.

**blade\_power\_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

**salt.states.dellchassis.firmware\_update** (*hosts=None, directory=''*)

State to update the firmware on host using the `racadm` command

**firmwarefile** filename (string) starting with `salt://`

**host** string representing the hostname supplied to the `racadm` command

**directory** Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

**salt.states.dellchassis.switch** (*name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None*)

Manage switches in a Dell Chassis.

**name** The switch designation (e.g. switch-1, switch-2)

**ip** The Static IP Address of the switch

**netmask** The netmask for the static IP

**gateway** The gateway for the static IP

**dhcp** True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

**password** The access (root) password for the switch

**snmp** The SNMP community string for the switch

Example:

```
my-dell-chassis:  
  dellchassis.switch:  
    - switch: switch-1  
    - ip: 192.168.1.1  
    - netmask: 255.255.255.0  
    - gateway: 192.168.1.254  
    - dhcp: True  
    - password: secret  
    - snmp: public
```

### 14.17.59 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:  
  disk.status:  
    - name: /dev/xda1  
    - maximum: 79%  
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:  
  disk.status:  
    - name: /dev/xda1  
    - maximum: 97%  
  
clear_cache:  
  cmd.run:  
    - name: rm -r /var/cache/app  
    - onfail:  
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:  
  disk.status:  
    - name: /dev/xda1  
    - minimum: 1024 KB  
    - maximum: 1048576 KB  
    - absolute: True
```

**salt.states.disk.status** (*name*, *maximum=None*, *minimum=None*, *absolute=False*)

Return the current disk usage stats for the named mount point

**name** Disk mount with which to check used space

**maximum** The maximum disk utilization

**minimum** The minimum disk utilization

**absolute** By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

### 14.17.60 salt.states.dockerio

#### Manage Docker containers

Deprecated since version 2015.8.0: Future feature development will be done only in *dockerng*. See the documentation for this module for information on the deprecation path.

Docker is a lightweight, portable, self-sufficient software container wrapper. The base supported wrapper type is LXC, cgroups, and the Linux Kernel.

---

**Note:** This state module requires `docker-py` version `>= 0.6.0` which supports Docker Remote API version 1.12.

---

#### Available Functions

- built

```
corp/mysuperdocker_img:
  docker.built:
    - path: /path/to/dir/container
```

- pulled

```
ubuntu:
  docker.pulled:
    - tag: latest
```

- pushed

```
corp/mysuperdocker_img:
  docker.pushed
```

- installed

```
mysuperdocker-container:
  docker.installed:
    - name: mysuperdocker
    - hostname: superdocker
    - image: corp/mysuperdocker_img
```

- loaded

```
mysuperdocker-file:
  docker.loaded:
    - name: mysuperdocker
    - source: salt://_files/tmp/docker_image.tar
```

- running

```
my_service:
  docker.running:
    - container: mysuperdocker
    - image: corp/mysuperdocker_img
    - ports:
      - "5000/tcp":
```

```
HostIp: ""
HostPort: "5000"
```

---

**Note:** The `ports` argument above is a dictionary. The double indentation is required for PyYAML to load the data structure properly as a python dictionary. More information can be found [here](#)

---

- absent

```
mys_old_uperdocker:
  docker.absent
```

- run

```
/finish-install.sh:
  docker.run:
    - cid: mysuperdocker
    - unless: grep -q something /var/log/foo
    - docker_unless: grep -q done /install_log
```

## Use Cases

Ensures the container is running with the latest image available

```
my-service-image:
  docker.pulled:
    - name: registry/my-service:latest
    - force: true

my-service-container:
  docker.installed:
    - image: registry/my-service:latest
    - watch:
      - docker: my-service-image

my-service:
  docker.running:
    - container: my-service-container
    - watch:
      - docker: my-service-container
```

---

**Note:** The docker modules are named `dockerio` because the name ``docker`` would conflict with the underlying `docker-py` library.

---

`salt.states.dockerio.absent`(*name*)

Ensure that the container is absent; if not, it will be killed and destroyed. (*docker inspect*)

**name:** Either the container name or id

`salt.states.dockerio.built`(*name*, *tag='latest'*, *path=None*, *quiet=False*, *nocache=False*, *rm=True*, *force=False*, *timeout=None*, *\*args*, *\*\*kwargs*)

Build a docker image from a path or URL to a dockerfile. (*docker build*)

**name** Name of the image

**tag** tag of the image (defaults to ``latest``)

**path** URL (e.g. `url/branch/docker_dir/dockerfile`) or filesystem path to the dockerfile

`salt.states.dockerio.installed`(*name*, *image*, *tag*='latest', *command*=None, *hostname*=None, *user*=None, *detach*=True, *stdin\_open*=False, *tty*=False, *mem\_limit*=None, *ports*=None, *environment*=None, *dns*=None, *volumes*=None, *volumes\_from*=None, *cpu\_shares*=None, *cpuset*=None, \*args, \*\*kwargs)

Ensure that a container with the given name exists; if not, build a new container from the specified image. (*docker run*)

**name** Name for the container

**image** Image from which to build this container

**tag** tag of the image (defaults to 'latest')

**environment**

Environment variables for the container, either

- a mapping of key, values
- a list of mappings of key, values

**ports**

List of ports definitions, either:

- a port to map
- a mapping of mapping portInHost : PortInContainer

**volumes** List of volumes (see notes for the running function)

For other parameters, see absolutely first the `salt.modules.dockerio` execution module and the [docker-py python bindings for docker documentation](#) for `docker.create_container`.

---

**Note:** This command does not verify that the named container is running the specified image.

---

`salt.states.dockerio.loaded`(*name*, *tag*='latest', *source*=None, *source\_hash*='', *force*=False)

Load an image into the local docker registry (*docker load*)

**name** Name of the docker image

**tag** tag of the image (defaults to 'latest')

**source** The source .tar file to download to the minion, created by docker save this source file can be hosted on either the salt master server, or on an HTTP or FTP server.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

---

**Note:** See first the documentation for Salt `file.managed`

---

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

**force** Load even if the image exists

`salt.states.dockerio.present`(*name*, *image*=None, *tag*='latest', *is\_latest*=False)

If a container with the given name is not present, this state will fail. Supports optionally checking for specific image/tag (*docker inspect*)

**name:** container id

**image:** image the container should be running (defaults to any)

**tag:** tag of the image (defaults to 'latest')

**is\_latest:** also check if the container runs the latest version of the image ( latest defined as the latest pulled onto the local machine)

`salt.states.dockerio.pulled`(*name*, *tag*='latest', *force*=False, *insecure\_registry*=False, \**args*, \*\**kwargs*)  
Pull an image from a docker registry. (*docker pull*)

---

**Note:** See first the documentation for *docker login*, *docker pull*, *docker push*, and `docker.import_image` (`docker import`). NOTE that we added in SaltStack a way to authenticate yourself with the Docker Hub Registry by supplying your credentials (username, email & password) using pillars. For more information, see `salt.modules.dockerio` execution module.

---

**name** Name of the image  
**tag** Tag of the image  
**force** Pull even if the image is already pulled  
**insecure\_registry** Set to True to allow connections to non-HTTPS registries. Default False.

`salt.states.dockerio.pushed`(*name*, *tag*='latest', *insecure\_registry*=False)  
Push an image from a docker registry. (*docker push*)

---

**Note:** See first the documentation for *docker login*, *docker pull*, *docker push*, and `docker.import_image` (`docker import`). NOTE that we added in SaltStack a way to authenticate yourself with the Docker Hub Registry by supplying your credentials (username, email & password) using pillars. For more information, see `salt.modules.dockerio` execution module.

---

**name** Name of the image  
**tag** Tag of the image [Optional]  
**insecure\_registry** Set to True to allow connections to non-HTTPS registries. Default False.

`salt.states.dockerio.run`(*name*, *cid*=None, *hostname*=None, *onlyif*=None, *unless*=None, *docked\_onlyif*=None, *docked\_unless*=None, \**args*, \*\**kwargs*)  
Run a command in a specific container

You can match by either name or hostname

**name** command to run in the container  
**cid** Container id or name  
**state\_id** state\_id  
**onlyif** Only execute cmd if statement on the host returns 0  
**unless** Do not execute cmd if statement on the host returns 0  
**docked\_onlyif** Only execute cmd if statement in the container returns 0  
**docked\_unless** Do not execute cmd if statement in the container returns 0

`salt.states.dockerio.running`(*name*, *image*, *tag*='latest', *container*=None, *command*=None, *hostname*=None, *user*=None, *detach*=True, *stdin\_open*=False, *tty*=False, *mem\_limit*=None, *ports*=None, *environment*=None, *dns*=None, *volumes*=None, *volumes\_from*=None, *start*=True, *cap\_add*=None, *cap\_drop*=None, *privileged*=None, *lxc\_conf*=None, *network\_mode*=None, *check\_is\_running*=True, *publish\_all\_ports*=False, *links*=None, *restart\_policy*=None, *cpu\_shares*=None, *cpuset*=None, *kill\_signal*=None, \**args*, \*\**kwargs*)

Ensure that a container is running. If the container does not exist, it will be created from the specified image. (*docker run*)

**name / container** Name for the container  
**image** Image from which to build this container  
**tag** tag of the image (defaults to 'latest')  
**environment**  
    Environment variables for the container, either

- a mapping of key, values
- a list of mappings of key, values

**ports**

List of ports definitions, either:

- a port to map
- a mapping of mapping portInHost : PortInContainer

```
- ports:
  - "5000/tcp":
      HostIp: ""
      HostPort: "5000"
```

**publish\_all\_ports** Publish all ports from the port list (default is false, only meaningful if port does not contain portinhost:portincontainer mapping)

**volumes** List of volumes to mount or create in the container (like `-v` of `docker run` command), mapping host directory to container directory.

To specify a volume in the container in terse list format:

```
- volumes:
  - "/var/log/service" # container-only volume
  - "/srv/timezone:/etc/timezone" # bound volume
  - "/usr/local/etc/passwd:/etc/passwd:ro" # read-only bound volume
```

You can also use the short dictionary form (note that the notion of source:target from docker is preserved):

```
- volumes:
  - /var/log/service: /var/log/service # mandatory read-write implied
```

Or, alternatively, to specify read-only mounting, use the extended form:

```
- volumes:
  - /home/user1:
      bind: /mnt/vol2
      ro: True
  - /var/www:
      bind: /mnt/vol1
      ro: False
```

Or (for backwards compatibility) another dict style:

```
- volumes:
  /home/user1:
    bind: /mnt/vol2
    ro: True
  /var/www:
    bind: /mnt/vol1
    ro: False
```

**volumes\_from** List of containers to share volumes with

**dns** List of DNS servers.

```
- dns:
  - 127.0.0.1
```

**network\_mode**

- `'bridge'`: creates a new network stack for the container on the docker bridge

- ``none``: no networking for this container
- ``container:[name|id]``: reuses another container network stack)
- ``host``: use the host network stack inside the container

```
- network_mode: host
```

**restart\_policy** Restart policy to apply when a container exits (no, on-failure[:max-retry], always)

```
- restart_policy:
  MaximumRetryCount: 5
  Name: on-failure
```

**cap\_add** List of capabilities to add in a container.

**cap\_drop** List of capabilities to drop in a container.

**check\_is\_running** Enable checking if a container should run or not. Useful for data-only containers that must be linked to another one. e.g. `nginx <- static-files`

**cpu\_shares** CPU shares (relative weight)

```
- cpu_shares: 2
```

**cpuset** CPUs in which to allow execution (``0-3`` or ``0,1``)

```
- cpuset: '0-3'
```

**kill\_signal** If defined, its value will be sent as a kill signal to the running container. i.e. It will use `client.kill(signal=kill_signal)` instead of `client.restart()`, when the state is triggered by a watcher requisite.

possible use case: Soft reload of nginx

```
nginx:
  docker.running:
    - image: some-fictional-registry.com/nginx
    - tag: latest
    - kill_signal: SIGHUP
    - watch:
      - file: /etc/nginx/nginx.conf
```

This state will ask nginx to reload (instead of restart) each time the `/etc/nginx/nginx.conf` is modified.

New in version 2015.8.0.

For other parameters, see `salt.modules.dockerio` execution module and the `docker-py` python bindings for docker documentation <<https://github.com/docker/docker-py#api>>`\_ for `docker.create_container`.

---

**Note:** This command does not verify that the named container is running the specified image.

---

`salt.states.dockerio.script(*args, **kw)`

Placeholder function for a `cmd.script` alike.

---

**Note:** Not yet implemented. Its implementation might be very similar from [salt.states.dockerio.run](#)

---

### 14.17.61 salt.states.dockerng

Management of Docker containers

New in version 2015.8.0.

This is the state module to accompany the *dockerng* execution module.

### Why Make a Second Docker State Module?

We have received a lot of feedback on our Docker support. In the process of implementing recommended improvements, it became obvious that major changes needed to be made to the functions and return data. In the end, a complete rewrite was done.

The changes being too significant, it was decided that making a separate execution module and state module (called *dockerng*) would be the best option. This will give users a couple release cycles to modify their scripts, SLS files, etc. to use the new functionality, rather than forcing users to change everything immediately.

In the **Nitrogen** release of Salt (due in 2017), this execution module will take the place of the default Docker execution module, and backwards-compatible naming will be maintained for a couple releases after that to allow users time to replace references to *dockerng* with *docker*.

---

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

---

`salt.states.dockerng.absent` (*name*, *force=False*)

Ensure that a container is absent

**name** Name of the container

**force** [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  dockerng.absent

multiple_containers:
  dockerng.absent:
    - names:
      - foo
      - bar
      - baz
```

`salt.states.dockerng.image_absent` (*name=None*, *images=None*, *force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

**images** Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  dockerng.image_absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  dockerng.image_absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force** [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

**Note:** This option can also be overridden by Pillar data. If the Minion has a pillar variable named `dockerng.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{dockerng.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `dockerng.force.image_name` will affect only the named image.

```
salt.states.dockerng.image_present(name, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None,
**kwargs)
```

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, or loaded from a saved image. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed). Repo identifier is mandatory, we don't assume the default repository is docker hub.

If neither of the `build` or `load` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:mytag:
  dockerng.image_present
```

**build** Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:mytag:
  dockerng.image_present:
    - build: /home/myuser/docker/myimage

myuser/myimage:mytag:
  dockerng.image_present:
    - build: /home/myuser/docker/myimage
    - dockerfile: Dockerfile.alternative

.. versionadded:: develop
```

The image will be built using *dockerng.build* and the specified image name and tag will be applied to it.

**load** Loads a tar archive created with *dockerng.load* (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:mytag:
  dockerng.image_present:
    - load: salt://path/to/image.tar
```

**force** [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.  
**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

**dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version develop.

`salt.states.dockerng.network_absent` (*name*, *driver=None*)

Ensure that a network is absent.

**name** Name of the network

Usage Examples:

```
network_foo:
  dockerng.network_absent
```

`salt.states.dockerng.network_present` (*name*, *driver=None*, *containers=None*)

Ensure that a network is present.

**name** Name of the network

**driver** Type of driver for that network.

**containers:** List of container names that should be part of this network

Usage Examples:

```
network_foo:
  dockerng.network_present
```

```
network_bar:
  dockerng.network_present
  - name: bar
  - containers:
    - cont1
    - cont2
```

`salt.states.dockerng.running` (*name*, *image=None*, *force=False*, *stop\_timeout=10*, *validate\_ip\_addrs=True*, *watch\_action='force'*, *client\_timeout=60*, *start=True*, *\*\*kwargs*)

Ensure that a container with a specific configuration is present and running

**name** Name of the container

**image** Image to use for the container. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

---

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `dockerng.image_present` should be used to manage the image.

---

**force** [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

**stop\_timeout** [10] If the container needs to be replaced, the container will be stopped using `dockerng.stop`. The value of this parameter will be passed to `dockerng.stop` as the `timeout` value, telling Docker how long to wait for a graceful shutdown before killing the container.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

**watch\_action** [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals

can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  dockerng.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

---

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

#### CONTAINER CONFIGURATION PARAMETERS

**command** or **cmd** Command to run in the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - command: bash
```

OR

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cmd: bash
```

Changed in version 2015.8.1: `cmd` is now also accepted

**hostname** Hostname of the container. If not provided, and if a name has been provided, the `hostname` will default to the name that was passed.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: web1
```

**Warning:** `hostname` cannot be set if `network_mode` is set to `host`. The below example will result in an error:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

**domainname** Domain name of the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: domain.tld
```

**interactive** [False] Leave stdin open

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - interactive: True
```

**tty** [False] Attach TTYS

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - tty: True
```

**detach** [True] If True, run the container's command in the background (daemon mode)

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - detach: False
```

**user** User under which to run docker

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - user: foo
```

**memory** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - memory: 512M
```

**memory\_swap** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - memory_swap: 1G
```

**mac\_address** MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

**network\_disabled** [False] If True, networking will be disabled within the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - network_disabled: True
```

**working\_dir** Working directory inside the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

**entrypoint** Entrypoint for the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

The entrypoint can also be specified as a list of arguments:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

**environment** Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

---

**Note:** Values must be strings. Otherwise it will be considered as an error.

---

**ports** A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

**volumes** [None] List of directories to expose as volumes. Can either be a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      volumes:
        - /mnt/vol1
        - /mnt/vol2
```

**cpu\_shares** CPU shares (relative weight)

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      cpu_shares: 0.5
```

**cpuset** CPUs on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      cpuset: "0,1"
```

**binds** Files/directories to bind mount. Each bind mount should be passed in the format <host\_path>:<container\_path>:<read\_only>, where <read\_only> is one of rw (for read-write access) or ro (for read-only access).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

Binds can be passed as a YAML list instead of a comma-separated list:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      binds:
        - /srv/www:/var/www:ro
        - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

Optionally, the read-only information can be left off the end and the bind mount will be assumed to be read-write. The example below is equivalent to the one above:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
      binds:
        - /srv/www:/var/www:ro
        - /home/myuser/conf/foo.conf:/etc/foo.conf
```

**port\_bindings** Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - port_bindings: "5000:5000,2123:2123/udp,8080"
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - port_bindings:
      - 5000:5000
      - 2123:2123/udp
      - "8080"
```

---

**Note:** When configuring bindings for UDP ports, the protocol must be passed in the `containerPort` value, as seen in the examples above.

---

**lxc\_conf** Additional LXC configuration parameters to set before starting the container.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
```

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has not been the default for some time.

---

**security\_opt:** Security configuration for MLS systems such as SELinux and AppArmor.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - security_opts:
      - 'apparmor:unconfined'
```

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

**publish\_all\_ports** [False] Allocates a random host port for each port exposed using the `ports` parameter

```
foo:
  dockerng.running:
```

```
- image: bar/baz:latest
- ports: 8080
- publish_all_ports: True
```

**links** Link this container to another. Links should be specified in the format <container\_name\_or\_id>:<link\_alias>. Multiple links can be passed, either as a comma separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

**dns** List of DNS nameservers. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**dns\_search** List of DNS search domains. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

**volumes\_from** Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

**network\_mode** [bridge] One of the following:

- **bridge** - Creates a new network stack for the container on the docker bridge
- **null** - No networking (equivalent of the Docker CLI argument `--net=none`)
- **container:<name\_or\_id>** - Reuses another container's network stack
- **host** - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `dockerng.network_present`.

**Warning:** Using host mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - network_mode: null
```

**restart\_policy** Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always` or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` restart policy.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  dockerng.running:
    - image: bar/baz:latest
    - restart_policy: always
```

**cap\_add** List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**cap\_drop** List of capabilities to drop within the container. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**privileged** Give extended privileges to container.

**extra\_hosts** Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

---

**Note:** This option requires Docker 1.3.0 or newer.

---

**pid\_mode** Set to `host` to use the host container's PID namespace within the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - pid_mode: host
```

---

**Note:** This option requires Docker 1.5.0 or newer.

---

**ulimits** List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional.

New in version 2016.3.6,2016.11.4,Nitrogen.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

Ulimits can be passed as a YAML list instead of a comma-separated list:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

**labels** Add Metadata to the container. Can be a list of strings/dictionaries or a dictionary of strings (keys and values).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      - LABEL1
      - LABEL2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      KEY1: VALUE1
      KEY2: VALUE2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      - KEY1: VALUE1
      - KEY2: VALUE2
```

**start** [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the `django migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

**stop\_signal** Specify the signal docker will send to the container when stopping. Useful when running `systemd` as PID 1 inside the container.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

---

**Note:** This option requires Docker 1.9.0 or newer and `docker-py` 1.7.0 or newer.

---

New in version 2016.11.0.

`salt.states.dockerng.stopped` (*name=None, containers=None, stop\_timeout=10, unpause=False, error\_on\_absent=True*)

Ensure that a container (or containers) is stopped

**name** Name or ID of the container

**containers** Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  dockerng.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  dockerng.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

**stop\_timeout** [10] Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed.

**unpause** [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

**error\_on\_absent** [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

`salt.states.dockerng.volume_absent` (*name, driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

**name** Name of the volume

Usage Examples:

```
volume_foo:
  dockerng.volume_absent
```

`salt.states.dockerng.volume_present` (*name, driver=None, driver\_opts=None, force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This function no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

**name** Name of the volume

**driver** Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

**driver\_opts** Options for the volume driver

**force** [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  dockerng.volume_present
```

```
volume_bar:
  dockerng.volume_present
  - name: bar
  - driver: local
  - driver_opts:
    foo: bar
```

```
volume_bar:
  dockerng.volume_present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value
```

### 14.17.62 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1
```

**salt.states.drac.absent**(*name*)

Ensure a user does not exist on the Dell DRAC

**name:** The users username

**salt.states.drac.network**(*ip, netmask, gateway*)

Ensure the DRAC network settings are consistent

**salt.states.drac.present**(*name, password, permission*)

Ensure the user exists on the Dell DRAC

**name:** The users username  
**password** The password used to authenticate  
**permission** The permissions that should be assigned to a user

### 14.17.63 salt.states.elasticsearch\_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

`salt.states.elasticsearch_index.absent(name)`

Ensure that the named index is absent

`salt.states.elasticsearch_index.present(name, definition)`

Ensure that the named index is present

### 14.17.64 salt.states.elasticsearch\_index\_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

`salt.states.elasticsearch_index_template.absent(name)`

Ensure that the named index template is absent

`salt.states.elasticsearch_index_template.present(name, definition=None)`

Ensure that the named index template is present

### 14.17.65 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.setenv(name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False)`

Set the salt process environment variables.

**name** The environment key to set. Must be a string.

**value** Either a string or dict. When string, it will be the value set for the environment key of `name` above. When a dict, each key/value pair represents an environment variable to set.

**false\_unsets** If a key's value is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False

**clear\_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear\_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

**update\_minion** If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM`` for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
  environ.setenv:
    - name: foo
```

```
- value: bar
- update_minion: True

a_dict_env:
  environ.setenv:
    - name: does_not_matter
    - value:
      foo: bar
      baz: quux
```

### 14.17.66 salt.states.eselect

#### Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```
profile:
  eselect.set:
    target: hardened/linux/amd64
```

**salt.states.eselect.set**(*name*, *target*, *module\_parameter=None*, *action\_parameter=None*)

Verify that the given module is set to the given target

**name** The name of the module

**target** The target to be set for this module

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the defined action

### 14.17.67 salt.states.etcd\_mod

#### Manage etcd Keys

New in version 2015.8.0.

##### depends

- python-etcd

This state module supports setting and removing keys from etcd.

#### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

**Note:** The `etcd` configuration can also be set in the Salt Master config file, but in order to use any `etcd` configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

## Available Functions

- `set`

This will set a value to a key in `etcd`. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- `wait_set`

Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

This will delete a key from `etcd`. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- `wait_rm`

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.mod_watch(name, **kwargs)`

Execute a etcd function based on a watch call requisite.

`salt.states.etcd_mod.rm(name, recurse=False, profile=None)`

Deletes a key from etcd. This function is also aliased as `rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.set(name, value, profile=None)`

Set a key in etcd and can be called as `set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_set(name, value, profile=None)`

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

### 14.17.68 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

**codeauthor** Krzysztof Pawlowski <[msciciel@msciciel.eu](mailto:msciciel@msciciel.eu)>

**maturity** new

**depends** python-ethtool

**platform** linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48
```

```
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024
```

```
eth0:
```

```

ethtool.offload:
  - name: eth0
  - tcp_segmentation_offload: on

```

`salt.states.ethtool.coalesce`(*name*, *\*\*kwargs*)

Manage coalescing settings of network device

**name** Interface name to apply coalescing settings

```

eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
    - rx_frames_high: 0
    - tx_usecs_high: 0
    - tx_frames_high: 0
    - sample_interval: 0

```

`salt.states.ethtool.offload`(*name*, *\*\*kwargs*)

Manage protocol offload and other features of network device

**name** Interface name to apply coalescing settings

```

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on

```

`salt.states.ethtool.ring`(*name*, *\*\*kwargs*)

Manage rx/tx ring parameters of network device

Use `max` word to set with factory maximum

**name** Interface name to apply ring parameters

```

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max

```

### 14.17.69 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

#### Dependencies

- pyVmomi Python Module
- ESXCLI

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

#### ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
                                     dump_port=6500)
```

Ensures a host's core dump configuration.

**name** Name of the state.

**enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

**dump\_ip** The IP address of host that will accept the dump.

**host\_vnic** Host VNic port through which to communicate. Defaults to `vmk0`.

**dump\_port** TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

```
salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None,
                                service_restart=False, update_datetime=False)
```

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name** Name of the state.

**service\_running** Ensures the running state of the `ntp` daemon for the host. Boolean value where `True` indicates that `ntpd` should be running and `False` indicates that it should be stopped.

**ntp\_servers** A list of servers that should be added to the ESXi host's NTP configuration.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the `yaml` parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the `ntp` daemon will be restarted, regardless of its previous running state. Default is `False`.

**update\_datetime** If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```

configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True

```

`salt.states.esxi.password_present` (*name*, *password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

**name** Name of the state.

**password** The new password to change on the host.

Example:

```

configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'

```

`salt.states.esxi.ssh_configured` (*name*, *service\_running*, *ssh\_key=None*, *ssh\_key\_file=None*, *service\_policy=None*, *service\_restart=False*, *certificate\_verify=False*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**name** Name of the state.

**service\_running** Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

**ssh\_key** Public SSH key to added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

**ssh\_key\_file** File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

**certificate\_verify** If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```

configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True

```

```

- ssh_key_file: /etc/salt/ssh_keys/my_key.pub
- service_policy: 'on'
- service_restart: True
- certificate_verify: True

```

`salt.states.esxi.syslog_configured`(*name, syslog\_configs, firewall=True, reset\_service=True, reset\_syslog\_config=False, reset\_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

**name** Name of the state.

**syslog\_configs** Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**firewall** Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service** After a successful parameter set, reset the service. Defaults to `True`.

**reset\_syslog\_config** Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

**reset\_configs** A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```

configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
      loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
      default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout

```

`salt.states.esxi.vmotion_configured`(*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

**name** Name of the state.

**enabled** Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

**device** The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```

configure-vmotion:
  esxi.vmotion_configured:

```

```
- enabled: True
- device: sample-device
```

`salt.states.esxi.vsan_configured`(*name*, *enabled*, *add\_disks\_to\_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

**name** Name of the state.

**enabled** Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

**add\_disks\_to\_vsan** If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```

### 14.17.70 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send`(*name*, *data=None*, *preload=None*, *with\_env=False*, *with\_grains=False*, *with\_pillar=False*, *\*\*kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.wait`(*name*, *sfun=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd
```

```
# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
        - pkg: apache
```

### 14.17.71 salt.states.file

#### Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - template: jinja
    - defaults:
        custom_var: "default value"
        other_var: 123
{% if grains['os'] == 'Ubuntu' %}
    - context:
        custom_var: "override"
{% endif %}
```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context]) # Arguments as globals
    return '\n\n'.join(lines)
```

---

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information.*

---

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - backup: minion
```

---

**Note:** Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the [backup\\_mode documentation](#).

---

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf?saltenv=dev
    - user: foo
    - group: users
    - mode: '0644'
```

**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

There is more documentation about this feature in the [Names declaration](#) section of the

[Highstate docs](#).

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
```

```

- minor: 8
- user: named
- group: named
- mode: 660

```

Here is an example of a block device:

```

/var/named/chroot/dev/loop0:
file.mknod:
- ntype: b
- major: 7
- minor: 0
- user: named
- group: named
- mode: 660

```

Here is an example of a fifo pipe:

```

/var/named/chroot/var/log/logfifo:
file.mknod:
- ntype: p
- user: named
- group: named
- mode: 660

```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```

/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True

```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```

/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
- recurse:
- user
- group
- mode

```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```

/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- file_mode: 744
- dir_mode: 755

```

```
- makedirs: True
- recurse:
  - user
  - group
  - mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 14
        first_of_week: 6
        first_of_month: 6
        first_of_year: all
```

#### `salt.states.file.absent`(*name*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

**name** The path which should be deleted

#### `salt.states.file.accumulated`(*name, filename, text, \*\*kwargs*)

Prepare accumulator which can be used in template in `file.managed` state. Accumulator dictionary becomes

available in template. It can also be used in file.blockreplace.

**name** Accumulator name

**filename** Filename which would receive this accumulator (see file.managed state documentation about name)

**text** String or list for adding in accumulator

**require\_in / watch\_in** One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja
```

One might write a template for animal\_file.txt like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↪animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

---

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

```
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, tem-
                        plate='jinja', sources=None, source_hashes=None, defaults=None, con-
                        text=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object\_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of `source_hashes` corresponding to the `sources` list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.append:
- text:
  - Trust no one unless you have eaten much salt with him.
  - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```

/etc/motd:
  file:
    - append
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tpl
      - salt://motd/hr-messages.tpl
      - salt://motd/general-messages.tpl

```

New in version 0.9.5.

`salt.states.file.blockreplace`(*name*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *content*='', *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *show\_changes*=True)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits. Note: this function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

**name** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output. Note: you can use `file.accumulated` and target this state. All accumulated data dictionaries content will be added as new lines in the content

**content** The content to be used between the two lines identified by `marker_start` and `marker_end`

**source** The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or None (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```

file_override_example:
  file.blockreplace:
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists

```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the downloaded file. Defaults to `jinjja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinjja`
- `mako`
- `py`
- `wempy`

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**append\_if\_not\_found** If markers are not found and set to `True` then the markers and content will be appended to the file. Default is `False`

**prepend\_if\_not\_found** If markers are not found and set to `True` then the markers and content will be prepended to the file. Default is `False`

**backup** The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

**dry\_run** Don't make any edits to the file

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

```
hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
        text 3
        text 4
    - require_in:
        - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in /etc/hosts:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

**salt.states.file.comment**(*name, regex, char='#', backup='.bak'*)

Comment out specified lines in a file.

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you *need* the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

**char** [#] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/fstab:
  file.comment:
    - regex: ^bind 127.0.0.1
```

New in version 0.9.5.

**salt.states.file.copy**(*name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, \*\*kwargs*)

If the source file exists on the system, copy it to the named file. The named file will not be overwritten if it already exists unless the `force` option is set to `True`.

**name** The location of the file to copy to

**source** The location of the file to copy to the location specified with `name`

**force** If the target location is present then the file will not be moved, specify `force: True` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

**preserve** New in version 2015.5.0.

Set `preserve: True` to preserve user/group ownership and mode after copying. Default is `False`.

If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

---

```
salt.states.file.decode(name, encoded_data=None, contents_pillar=None, encoding_type='base64',
                        checksum='md5')
```

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name** Path of the file to be written.

**encoded\_data** The encoded file. Either this option or `contents_pillar` must be specified.

**contents\_pillar** A Pillar path to the encoded file. Uses the same path syntax as `pillar.get`. The `hashutil.base64_encodefile` function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

**encoding\_type** [base64] The type of encoding.

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
```

```
- encoded_data: |
  {{ salt.pillar.get('path:to:data') | indent(8) }}
```

`salt.states.file.directory`(*name*, *user=None*, *group=None*, *recurse=None*, *max\_depth=None*, *dir\_mode=None*, *file\_mode=None*, *makedirs=False*, *clean=False*, *require=None*, *exclude\_pat=None*, *follow\_symlinks=False*, *force=False*, *backupname=None*, *allow\_symlink=True*, *children\_only=False*, *\*\*kwargs*)

Ensure that a named directory is present and has the right perms

**name** The location to create or manage a directory

**user** The user to own the directory; this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

**recurse** Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If mode is defined, will recurse on both *file\_mode* and *dir\_mode* if they are defined. If *ignore\_files* or *ignore\_dirs* is included, files or directories will be left unchanged respectively. Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs
```

New in version 2015.5.0.

**max\_depth** Limit the recursion depth. The default is no limit=None. *max\_depth* and *clean* are mutually exclusive.

New in version 2016.11.0.

**dir\_mode** / **mode** The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**file\_mode** The permissions mode to set any files created if *mode* is run in *recurse*. This defaults to *dir\_mode*. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**makedirs** If the directory is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. `'clean'` and `'max_depth'` are mutually exclusive.

**require** Require other resources such as packages or files

**exclude\_pat** When `'clean'` is set to `True`, exclude this pattern from removal list and preserve in the destination.

**follow\_symlinks** [False] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

**force** If the name of the directory exists and is not a directory and `force` is set to `False`, the state will fail. If `force` is set to `True`, the file in the way of the directory will be deleted to make room for the directory, unless `backupname` is set, then it will be renamed.

New in version 2014.7.0.

**backupname** If the name of the directory exists and is not a directory, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first.

New in version 2014.7.0.

**allow\_symlink** [True] If `allow_symlink` is `True` and the specified path is a symlink, it will be allowed to remain if it points to a directory. If `allow_symlink` is `False` then the state will fail, unless `force` is also set to `True`, in which case it will be removed or renamed, depending on the value of the `backupname` argument.

New in version 2014.7.0.

**children\_only** [False] If `children_only` is `True` the base of a path is excluded when performing a recursive operation. In case of `/path/to/base`, `base` will be ignored while all of `/path/to/base/*` are still operated on.

`salt.states.file.exists`(*name*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

**name** Absolute path which must exist

`salt.states.file.line`(*name, content, match=None, mode=None, location=None, before=None, after=None, show\_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file\_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

**name** Filesystem path to the file to be edited.

**content** Content of the line.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` becomes the `content` value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location** Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a `location` is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
  - **end** Place the content at the end of the file.
- before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

- backup** Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds``.
- quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- indent** Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

#### Parameters

- **create** -- Create an empty file if doesn't exists.  
New in version 2016.11.0.
- **user** -- The user to own the file, this defaults to the user salt is running as on the minion.  
New in version 2016.11.0.
- **group** -- The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.  
New in version 2016.11.0.
- **file\_mode** -- The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.  
New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt.states.file.managed(name, source=None, source_hash='', source_hash_name=None,
                        user=None, group=None, mode=None, template=None, makedirs=False,
                        dir_mode=None, context=None, replace=True, defaults=None, backup='',
                        show_changes=True, create=True, contents=None, tmp_ext='',
                        contents_pillar=None, contents_grains=None, contents_newline=True,
                        contents_delimiter=':', allow_empty=True, follow_symlinks=True,
                        check_cmd=None, skip_verify=False, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name** The location of the file to manage

**source** The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see

swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source\_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

### source\_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

**Using a Source Hash File** The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source\_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
    ↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
    ↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

### Inserting the Source Hash in the SLS Data

The `source_hash` can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
      ↪src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

**Note:** Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
      ↪src-0.7.3.tar.gz
    - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      ↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      ↪tomdroid-src-0.7.3.tar.gz/+md5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument

is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.3.5.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

---

**Note:** `keep` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**makedirs** [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace** [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** [True] If set to `False`, then the file will only be managed if the file already exists on the system.

**contents** Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings,

then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
      This is line 1
      This is line 2
```

**contents\_pillar** New in version 0.17.0.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      MIIeowIBAAKCAQEAOQiwO3JhBquPAalQF9qP1LLZNXVjYMIswrMe2HcWUVBgh+vY
      U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGL1vgA0bJAnMT623dMXjVKwnEagZPRJIXDy
      B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvlGGrfgz70m0pqxu+UyFbAGLin+
      GpxzZAMaFpZw4sSbIIRuissXZj/sHpQb8p9M5Ie04Z3rjkCp1cxI
      -----END RSA PRIVATE KEY-----
```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the `file_tree external pillar` can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

**contents\_grains** New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in `grains.get`. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

**contents\_newline** [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will omit this final newline.

**contents\_delimiter** New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

**allow\_empty** [True] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow\_symlinks** [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check\_cmd** New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - source: salt://sudoers/files/sudoers.jinja
    - template: jinja
    - check_cmd: /usr/sbin/visudo -c -f
```

**NOTE:** This `check_cmd` functions differently than the requisite `check_cmd`.

**tmp\_ext** Suffix for temp file created by `check_cmd`. Useful for checkers dependant on config file extension (e.g. the `init-checkconf` upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
      - 'start on started mountall'
```

```

- 'stop on shutdown'
- 'respawn'
- 'exec salt-minion'
- check_cmd: init-checkconf -f

```

**skip\_verify** [False] If True, hash verification of remote file sources (<http://>, <https://>, <ftp://>) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**salt.states.file.missing**(*name*)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

**name** Absolute path which must NOT exist

**salt.states.file.mknod**(*name, ntype, major=0, minor=0, user=None, group=None, mode='0600'*)

Create a special file similar to the ``nix mknod` command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of ``nix mknod`. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

**name** name of the file

**ntype** node type ``p'` (fifo pipe), ``c'` (character device), or ``b'` (block device)

**major** major number of the device does not apply to a fifo pipe

**minor** minor number of the device does not apply to a fifo pipe

**user** owning user of the device/pipe

**group** owning group of the device/pipe

**mode** permissions on the device/pipe

Usage:

```

/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660

```

New in version 0.17.0.

`salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)`

Execute the `check_cmd` logic.

Return a result dict if `check_cmd` succeeds (`check_cmd == 0`) otherwise return `True`

`salt.states.file.patch(name, source=None, options='', dry_run_first=True, **kwargs)`

Apply a patch to a file or directory.

---

**Note:** A suitable `patch` executable must be available on the minion when using this state function.

---

**name** The file or directory to which the patch will be applied.

**source** The source patch to download to the minion, this source file must be hosted on the salt master server. If the file is located in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. A source is required.

**hash** The hash of the patched file. If the hash of the target file matches this value then the patch is assumed to have been applied. For versions 2016.11.4 and newer, the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>:<hash_value>` (e.g. `md5:e138491e9d5b97023cea823fe17bac22`).

**options** Extra options to pass to patch.

**dry\_run\_first** [True] Run patch with `--dry-run` first to check if it will apply cleanly.

**saltenv** Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Usage:

```
# Equivalent to `patch --forward /opt/file.txt file.patch`
/opt/file.txt:
file.patch:
- source: salt://file.patch
- hash: e138491e9d5b97023cea823fe17bac22
```

---

**Note:** For minions running version 2016.11.3 or older, the hash in the example above would need to be specified with the hash type (i.e. `md5:e138491e9d5b97023cea823fe17bac22`).

---

`salt.states.file.prepend(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None)`

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

Multi-line example:

```
/etc/motd:
file.prepend:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```

/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."

```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```

/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.

```

Gather text from multiple template files:

```

/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl

```

New in version 2014.7.0.

`salt.states.file.recurse`(*name*, *source*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir\_mode=None*, *file\_mode=None*, *sym\_mode=None*, *template=None*, *context=None*, *defaults=None*, *include\_empty=False*, *backup=''*, *include\_pat=None*, *exclude\_pat=None*, *maxdepth=None*, *keep\_symlinks=False*, *force\_symlinks=False*, *\*\*kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name** The directory to set the recursion in

**source** The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode** The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**file\_mode** The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**sym\_mode** The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

---

**Note:** The `template` option is required when recursively applying templates.

---

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**include\_empty** Set this to True if empty directories should also be created (default is False)

**backup** Overrides the default backup mode for all replaced files. See [backup\\_mode documentation](#) for more details.

**include\_pat** When copying, include only this pattern from the source. Default is glob match; if prefixed with ``E@'`, then regexp match. Example:

```
- include_pat: hello*           :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello         :: regexp matches 'otherhello',
                               'hello01' ...
```

**exclude\_pat** Exclude this pattern from the source when copying. If both `include_pat` and `exclude_pat` are supplied, then it will apply conditions cumulatively. i.e. first select based on `include_pat`, and then within that result apply `exclude_pat`.

Also, when ``clean=True'`, exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*         :: glob matches APPDATA.01,
                               APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                                       or TEMPDATA for exclusion
```

**maxdepth** When copying, only copy paths which are of depth `maxdepth` from the source path. Example:

```
- maxdepth: 0                 :: Only include files located in the source
                               directory
- maxdepth: 1                 :: Only include files located in the source
                               or immediate subdirectories
```

**keep\_symlinks** Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

**force\_symlinks** Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

`salt.states.file.rename` (*name*, *source*, *force=False*, *makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

**name** The location of the file to rename to

**source** The location of the file to move to the location specified with name

**force** If the target location is present then the file will not be moved, specify ``force: True`` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

`salt.states.file.replace` (*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append\_if\_not\_found=False*, *prepend\_if\_not\_found=False*, *not\_found\_content=None*, *backup='.bak'*, *show\_changes=True*, *ignore\_if\_missing=False*)

Maintain an edit in a file.

New in version 0.17.0.

**name** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern** A regular expression, to be matched using Python's `search()`.

**repl** The replacement text

**count** Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** A list of flags defined in the [re module documentation](#). Each list item should be a string that will correlate to the human-friendly flag name. E.g., [ 'IGNORECASE' , 'MULTILINE' ]. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to [ 'MULTILINE' ]).

---

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to [ 'MULTILINE' ]. When overriding the default value for `flags`, if 'MULTILINE' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE' to the list of flags.

---

**bufsize** How much of the file to buffer into memory at once. The default value 1 processes one line at a time.

The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found** [False] If set to True, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

**prepend\_if\_not\_found** [False] If set to True and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

**not\_found\_content** Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

**backup** The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

**show\_changes** [True] Output a unified diff of the old file and the new file. If False return a boolean if any changes were made. Returns a boolean or a string.

**ignore\_if\_missing** [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
        CentOS \((2.6.32[^\n]+\n\s+root[^\n]+\n\)+
```

**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might loose line feeds.

`salt.states.file.retention_schedule` (*name*, *retain*, *strptime\_format=None*, *timezone=None*)  
Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

#### Parameters

- **name** -- The filesystem path to the directory containing backups to be managed.
- **retain** -- Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - most\_recent** `N` Keep the most recent `N` files.
  - first\_of\_hour** `N` For the last `N` hours from now, keep the first file after the hour.
  - first\_of\_day** `N` For the last `N` days from now, keep the first file after midnight. See also `timezone`.
  - first\_of\_week** `N` For the last `N` weeks from now, keep the first file after Sunday midnight.
  - first\_of\_month** `N` For the last `N` months from now, keep the first file after the start of the month.
  - first\_of\_year** `N` For the last `N` years from now, keep the first file after the start of the year.
- **strptime\_format** -- A python strptime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

`salt.states.file.serialize` (*name*, *dataset=None*, *dataset\_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=''*, *makedirs=False*, *show\_diff=None*, *show\_changes=True*, *create=True*, *merge\_if\_exists=False*, *\*\*kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name** The location of the file to create

**dataset** The dataset that will be serialized

**dataset\_pillar** Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

**formatter** Write the data as this format. Supported output formats:

- JSON
- YAML
- Python (via `pprint.pformat`)

**user** The user to own the directory, this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**backup** Overrides the default backup mode for this specific file.

**makedirs** Create parent directories for destination file.

New in version 2014.1.3.

**show\_diff** DEPRECATED: Please use `show_changes`.

If set to `False`, the diff will not be shown in the return data if changes are made.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** Default is `True`, if `create` is set to `False` then the file will only be managed if the file already exists on the system.

**merge\_if\_exists** Default is `False`, if `merge_if_exists` is `True` then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
- dataset:
  name: naive
  description: A package using naive versioning
  author: A confused individual <iam@confused.com>
  dependencies:
    express: >= 1.2.0
    optimist: >= 0.1.0
  engine: node 0.4.1
- formatter: json
```

will manage the file `/etc/dummy/package.json`:

```
{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
```

```

"engine": "node 0.4.1",
"name": "naive"
}

```

`salt.states.file.symlink`(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *\*\*kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

**name** The location of the symlink to create

**target** The location that the symlink points to

**force** If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

**backupname** If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

`salt.states.file.touch`(*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the `nix ``touch` command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:

```

/var/log/httpd/logrotate.empty:
  file.touch

```

New in version 0.9.5.

`salt.states.file.uncomment`(*name*, *regex*, *char='#*, *backup='.bak'*)

Uncomment specified commented lines in a file

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[ t]*`)

**char** [#] The character to remove in order to uncomment a line

**backup** [.bak] The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 14.17.72 salt.states.firewall module

State to check firewall configurations .. versionadded:: 2016.3.0

`salt.states.firewall.check`(*name*, *port=None*, *\*\*kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

**name** host name or ip address to test connection to

**port** The port to test the connection on

**\*\*kwargs**

Additional parameters, parameters allowed are: `proto` (tcp or udp) `family` (ipv4 or ipv6) `timeout`

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

### 14.17.73 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

**class salt.states.firewalld.ForwardingMapping**(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

**todict**()

Returns a pretty dictionary meant for command line output.

**salt.states.firewalld.present**(*name, block\_icmp=None, default=None, masquerade=False, ports=None, port\_fwd=None, services=None, prune\_services=True, interfaces=None, sources=None, rich\_rules=None*)

Ensure a zone has specific attributes.

**salt.states.firewalld.service**(*name, ports=None, protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

### 14.17.74 salt.states.gem

#### Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
  gem.installed:
    - user: rvm
    - ruby: jruby@jgemset
```

**salt.states.gem.installed**(*name*, *ruby=None*, *gem\_bin=None*, *user=None*, *version=None*, *rdoc=False*, *ri=False*, *pre\_releases=False*, *proxy=None*, *source=None*)

Make sure that a gem is installed.

**name** The name of the gem to install

**ruby: None** Only for RVM or rbenv installations: the ruby version and gemset to target.

**gem\_bin: None** Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

**user: None** The user under which to run the gem command

New in version 0.17.0.

**version** [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

**rdoc** [False] Generate RDoc documentation for the gem(s).

**ri** [False] Generate RI documentation for the gem(s).

**pre\_releases** [False] Install pre-release version of gem(s) if available.

**proxy** [None] Use the specified HTTP proxy server for all outgoing traffic. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])

**source** [None] Use the specified HTTP gem source server to download gem. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])

**salt.states.gem.removed**(*name*, *ruby=None*, *user=None*, *gem\_bin=None*)

Make sure that a gem is not installed.

**name** The name of the gem to uninstall

**gem\_bin** [None] Full path to gem binary to use.

**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.

**user: None** The user under which to run the gem command

New in version 0.17.0.

**salt.states.gem.sources\_add**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.

**name** The URL of the gem source to be added

**ruby: None** For RVM or rbenv installations: the ruby version and gemset to target.

**user: None** The user under which to run the gem command

New in version 0.17.0.

**salt.states.gem.sources\_remove**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.

**name** The URL of the gem source to be removed

**ruby: None** For RVM or rbenv installations: the ruby version and gemset to target.

**user: None** The user under which to run the gem command

New in version 0.17.0.

### 14.17.75 salt.states.git

States to manage git repositories and git configuration

---

**Important:** Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

---

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.config_set`(*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name** Name of the git config value to set

**value** Set a single value for the config item

**multivar** Set multiple values for the config item

---

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

---

New in version 2015.8.0.

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

Changed in version 2015.8.0: Option renamed from `is_global` to `global`. For earlier versions, use `is_global`.

**Local Config Example:**

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

**Global Config Example (User ``foo``):**

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

`salt.states.git.config_unset`(*name*, *value\_regex=None*, *repo=None*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

**name** The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

**value\_regex** Regex indicating the values to unset for the matching key(s)

---

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

**all** [False] If `True`, unset all matches

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

**Examples:**

```
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
```

```
- name: foo.bar
- global: True
```

```
salt.states.git.detached(name, ref, target=None, remote='origin', user=None, password=None,
                        force_clone=False, force_checkout=False, fetch_remote=True,
                        hard_reset=False, submodules=False, identity=None, https_user=None,
                        https_pass=None, onlyif=False, unless=False, **kwargs)
```

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `ref`.

**name** Address of the remote repository.

**ref** The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**target** Name of the target directory where repository is about to be cloned.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_checkout** [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**fetch\_remote** [True] If `False` a fetch will not be performed and only local refs will be reachable.

**hard\_reset** [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

---

**Note:** Changes resulting from a hard reset will not trigger requisites.

---

**submodules** [False] Update submodules

**identity** A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

```
salt.states.git.latest(name, rev='HEAD', target=None, branch=None, user=None, password=None,
                      update_head=True, force_checkout=False, force_clone=False,
                      force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False,
                      remote='origin', fetch_tags=True, depth=None, identity=None,
                      https_user=None, https_pass=None, onlyif=False, unless=False, **kwargs)
```

Make sure the repository is cloned to the given directory and is up-to-date.

**name** Address of the remote repository, as passed to `git clone`

---

**Note:** From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh://` URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlasian Stash/BitBucket Server](#). In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

**rev** [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

**target** Name of the target directory where repository is about to be cloned

**branch** Name of the local branch into which to checkout the specified `rev`. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

**user** Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

---

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

---

New in version 0.17.0.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update\_head** [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force** [False] Deprecated since version 2015.8.0: Use `force_clone` instead. For earlier Salt versions, `force` must be used.

**force\_checkout** [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_fetch** [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force\_reset** [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

**submodules** [False] Update submodules on clone or branch change

**bare** [False] Set to `True` if the repository is to be a bare clone of the remote repository.

**mirror** Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**remote\_name** Deprecated since version 2015.8.0: Use `remote` instead. For earlier Salt versions, `remote_name` must be used.

**fetch\_tags** [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**depth** Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch. This is not compatible with tags or revision IDs.

**identity** Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For

example:

```
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**Note:** Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
```

```

- target: /usr/share/nginx/staging
- identity: /root/.ssh/website_id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

```

`salt.states.git.mod_run_check`(*cmd\_kwargs*, *onlyif*, *unless*)

Execute the *onlyif* and *unless* logic. Return a result dict if:

- *onlyif* failed (*onlyif* != 0)
- *unless* succeeded (*unless* == 0)

Otherwise, returns `True`

`salt.states.git.present`(*name*, *force=False*, *bare=True*, *template=None*, *separate\_git\_dir=None*, *shared=None*, *user=None*, *password=None*)

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, *name* points to a [worktree](#), and *force* is set to `True`, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [`False`] If `True`, and if *name* points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [`True`] If `True`, and a repository must be initialized, then the repository will be a bare repository.

**Note:** This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

**template** If a new repository is initialized, this argument will specify an alternate ``template directory`_`

New in version 2015.8.0.

**separate\_git\_dir** If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See [git-init\(1\)](#) for more details.

New in version 2015.5.0.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

### 14.17.76 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
  github.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

**salt.states.github.absent** (*name, profile='github', \*\*kwargs*)

Ensure a github user is absent

```
ensure user test is absent in github:
  github.absent:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

The following parameters are required:

**name** Github handle of the user in organization

**salt.states.github.present** (*name, profile='github', \*\*kwargs*)

Ensure a user is present

```
ensure user test is present in github:
  github.present:
    - name: 'gitexample'
```

The following parameters are required:

**name** This is the github handle of the user in the organization

**salt.states.github.repo\_absent** (*name, profile='github', \*\*kwargs*)

Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
  github.repo_absent:
    - name: 'test'
```

The following parameters are required:

**name** This is the name of the repository in the organization.

New in version 2016.11.0.

```
salt.states.github.repo_present(name, description=None, homepage=None, private=False,
                               has_issues=True, has_wiki=True, has_downloads=True,
                               auto_init=False, gitignore_template=None, li-
                               cense_template=None, profile='github', **kwargs)
```

Ensure a repository is present

**name** This is the name of the repository.

**description** The description of the repository.

**homepage** The URL with more information about the repository.

**private** The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues** Whether to enable issues for this repository.

**has\_wiki** Whether to enable the wiki for this repository.

**has\_downloads** Whether to enable downloads for this repository.

**auto\_init** Whether to create an initial commit with an empty README.

**gitignore\_template** The desired language or platform for a .gitignore, e.g ``Haskell``.

**license\_template** The desired LICENSE template to apply, e.g ``mit`` or ``mozilla``.

Example:

```
Ensure repo my-repo is present in github:
github.repo_present:
  - name: 'my-repo'
  - description: 'My very important repository'
```

New in version 2016.11.0.

```
salt.states.github.team_absent(name, profile='github', **kwargs)
```

Ensure a team is absent.

Example:

```
ensure team test is present in github:
github.team_absent:
  - name: 'test'
```

The following parameters are required:

**name** This is the name of the team in the organization.

New in version 2016.11.0.

```
salt.states.github.team_present(name, description=None, repo_names=None, privacy='secret',
                                permission='pull', members=None, enforce_mfa=False,
                                no_mfa_grace_seconds=0, profile='github', **kwargs)
```

Ensure a team is present

**name** This is the name of the team in the organization.

**description** The description of the team.

**repo\_names** The names of repositories to add the team to.

**privacy** The level of privacy for the team, can be `secret` or `closed`. Defaults to secret.

**permission** The default permission for new repositories added to the team, can be `pull`, `push` or `admin`. Defaults to pull.

**members** The members belonging to the team, specified as a dict of member name to optional configuration. Options include `enforce\_mfa\_from` and `mfa\_exempt`.

**enforce\_mfa** Whether to enforce MFA requirements on members of the team. If True then all members without *mfa\_exempt: True* configured will be removed from the team. Note that *no\_mfa\_grace\_seconds* may be set to allow members a grace period.

**no\_mfa\_grace\_seconds** The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce\_mfa\_from* on the member

configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
  github.team_present:
    - name: 'test'
    - members:
      user1: {}
      user2: {}

Ensure team test_mfa is present in github:
  github.team_present:
    - name: 'test_mfa'
    - members:
      user1:
        enforce_mfa_from: 2016/06/15
    - enforce_mfa: True
```

New in version 2016.11.0.

### 14.17.77 salt.states.glance

#### Managing Images in OpenStack Glance

**salt.states.glance.image\_present** (*name*, *visibility='public'*, *protected=None*, *checksum=None*, *location=None*, *wait\_for=None*, *timeout=30*)

Checks if given image is present with properties set as specified.

An image should go through the stages `queued`, `saving` before becoming `active`. The attribute `checksum` can only be checked once the image is active. If you don't specify `wait\_for` but `checksum` the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached `saving`. The default timeout for both is 30 seconds.

**Supported properties:**

- visibility (`public` or `private`)
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)

### 14.17.78 salt.states.glusterfs

Manage GlusterFS pool.

**salt.states.glusterfs.add\_volume\_bricks** (*name*, *bricks*)

Add brick(s) to an existing volume

**name** Volume name

**bricks** List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2
```

Replicated Volume:

```
glusterfs.add_volume_bricks:
```

```
- name: volume2
- bricks:
  - host1:/srv/gluster/drive2
  - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.created(*args, **kwargs)`

Deprecated version of more descriptively named `volume_present`

`salt.states.glusterfs.peered(name)`

Check if node is peered.

**name** The remote host with which to peer.

```
peer-cluster:
  glusterfs.peered:
    - name: two

peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four
```

`salt.states.glusterfs.started(name)`

Check if volume has been started

**name** name of the volume

```
mycluster:
  glusterfs.started: []
```

`salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False)`

Ensure that the volume exists

**name** name of the volume

**bricks** list of brick paths

**start** ensure that the volume is also started

```
myvolume:
  glusterfs.created:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.created:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True
```

### 14.17.79 salt.states.gnomedesktop

#### Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6
localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true
localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h
```

```
salt.states.gnomedesktop.desktop_interface(name, user=None, auto-
  matic_mnemonics=None,
  buttons_have_icons=None,
  can_change_accels=None,
  clock_format=None, clock_show_date=None,
  clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None,
  cursor_blink_timeout=None, cursor_size=None, cursor_theme=None,
  document_font_name=None,
  enable_animations=None,
  font_name=None, gtk_color_palette=None,
  gtk_color_scheme=None,
  gtk_im_module=None,
  gtk_im_preedit_style=None,
  gtk_im_status_style=None,
  gtk_key_theme=None, gtk_theme=None,
  gtk_timeout_initial=None,
  gtk_timeout_repeat=None,
  icon_theme=None, menubar_accel=None,
  menubar_detachable=None,
  menus_have_icons=None,
  menus_have_tearoff=None,
  monospace_font_name=None,
  show_input_method_menu=None,
  show_unicode_menu=None,
  text_scaling_factor=None, toolbar_detachable=None, toolbar_style=None,
  toolbar_icons_size=None, toolkit_accessibility=None, **kwargs)

desktop_interface: sets values in the org.gnome.desktop.interface schema
```

```

salt.states.gnomedesktop.desktop_lockdown(name, user=None, disable_application_handlers=None,
                                              disable_command_line=None, disable_lock_screen=None,
                                              disable_log_out=None, disable_print_setup=None,
                                              disable_printing=None, disable_save_to_disk=None,
                                              disable_user_switching=None, user_administration_disabled=None, **kwargs)
desktop_lockdown: sets values in the org.gnome.desktop.lockdown schema

```

```

salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None,
                                          action_middle_click_titlebar=None, action_right_click_titlebar=None,
                                          application_based=None, audible_bell=None, auto_raise=None,
                                          auto_raise_delay=None, button_layout=None, disable_workarounds=None,
                                          focus_mode=None, focus_new_windows=None, mouse_button_modifier=None,
                                          num_workspaces=None, raise_on_click=None,
                                          resize_with_right_button=None, theme=None, titlebar_font=None,
                                          titlebar_uses_system_font=None, visual_bell=None,
                                          visual_bell_type=None, workspace_names=None, **kwargs)
wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

```

### 14.17.80 salt.states.gpg module

#### Management of the GPG keychains

New in version 2016.3.0.

```

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)

```

Ensure GPG public key is absent in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Add GPG keys to the user's keychain

**gnupghome** Override GNUPG Home directory

```

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None,
                          trust=None, **kwargs)

```

Ensure GPG public key is present in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Add GPG keys to the user's keychain

**keyserver** The keyserver to retrieve the keys from.

**gnupghome** Override GNUPG Home directory

**trust** Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not\_trusted, marginally, fully, ultimately

### 14.17.81 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```
mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```

```
# Basic usage (uses default pillar profile key 'grafana')
```

```
Ensure myservice dashboard is managed:
```

```
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows_from_pillar:
    - systemhealth
    - requests
```

```
# Passing hosts in
```

```
Ensure myservice dashboard is managed:
```

```
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows:
    - collapse: false
      editable: true
      height: 150px
      title: System Health
      panels:
        - aliasColors: {}
          id: 200000
          annotate:
            enable: false
          bars: false
          datasource: null
          editable: true
          error: false

    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```

*# Using a profile from pillars*

Ensure myservice dashboard is managed:

```
grafana.dashboard_present:
- name: myservice
- dashboard:
  annotations:
    enable: true
    list: []
  editable: true
  hideAllLegends: false
  hideControls: false
  nav:
    - collapse: false
      enable: true
      notice: false
      now: true
      refresh_intervals:
        - 10s
        - 30s
        - 1m
        - 5m
        - 15m
        - 30m
        - 1h
```

```

    - 2h
    - 1d
    status: Stable
    time_options:
      - 5m
      - 15m
      - 1h
      - 2h
      - 3h
      - 4h
      - 6h
      - 12h
      - 1d
      - 2d
      - 4d
      - 7d
      - 16d
      - 30d
    type: timepicker
    originalTitle: dockerregistry
    refresh: 1m
    rows: []
    sharedCrosshair: false
    style: dark
    tags: []
    templating:
      enable: true
      list: []
    time:

      to: now
    timezone: browser
  - rows_from_pillars:
    - systemhealth
    - requests
  - profile: mygrafanaprofile

```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**salt.states.grafana.dashboard\_absent** (*name*, *hosts=None*, *profile='grafana'*)

Ensure the named grafana dashboard is deleted.

**name** Name of the grafana dashboard.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

**salt.states.grafana.dashboard\_present** (*name*, *dashboard=None*, *dashboard\_from\_pillar=None*,  
*rows=None*, *rows\_from\_pillar=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**dashboard** A dict that defines a dashboard that should be managed.

**dashboard\_from\_pillar** A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

**rows** A list of grafana rows.

**rows\_from\_pillar** A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

### 14.17.82 salt.states.grafana\_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
    panels:
      - targets:
        - target: alias(constantLine(50), 'max')
        title: Imaginary
        type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**salt.states.grafana\_dashboard.absent**(*name*, *profile*='grafana')

Ensure the named grafana dashboard is absent.

**name** Name of the grafana dashboard.

**profile** A pillar key or dict that contains grafana information

**salt.states.grafana\_dashboard.present**(*name*, *base\_dashboards\_from\_pillar*=None, *base\_panels\_from\_pillar*=None, *base\_rows\_from\_pillar*=None, *dashboard*=None, *profile*='grafana')

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**base\_dashboards\_from\_pillar** A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar** A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar** A pillar key that contains a list of rows to inherit from

**dashboard** A dict that defines a dashboard that should be managed.

**profile** A pillar key or dict that contains grafana information

### 14.17.83 salt.states.grafana\_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

`salt.states.grafana_datasource.absent` (*name*, *profile*='grafana')

Ensure that a data source is present.

**name** Name of the data source to remove.

`salt.states.grafana_datasource.present` (*name*, *type*, *url*, *access*='proxy', *user*='', *password*='', *database*='', *basic\_auth*=False, *basic\_auth\_user*='', *basic\_auth\_password*='', *is\_default*=False, *json\_data*=None, *profile*='grafana')

Ensure that a data source is present.

**name** Name of the data source.

**type** Which type of data source it is ('graphite', 'influxdb' etc.).

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source

**password** Optional - password to authenticate with the data source

**basic\_auth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basic\_auth\_user** Optional - HTTP basic auth username.

**basic\_auth\_password** Optional - HTTP basic auth password.

**is\_default** Default: False

## 14.17.84 salt.states.grains

### Manage grains on the minion

This state allows for grains to be set. Grains set or altered this way are stored in the 'grains' file on the minions, by default at: /etc/salt/grains

Note: This does NOT override any grains set in the minion file.

`salt.states.grains.absent` (*name*, *destructive*=False, *delimiter*=':', *force*=False)

New in version 2014.7.0.

Delete a grain from the grains config file

**name** The grain name

**destructive** If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent: []
```

**salt.states.grains.append**(*name, value, convert=False, delimiter=''*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

**name** The grain name

**value** The value to append

**convert** If *convert* is True, convert non-list contents into a list. If *convert* is False and the grain contains non-list contents, an error is given. Defaults to False.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

**salt.states.grains.list\_absent**(*name, value, delimiter=''*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

**name** The grain name.

**value** The value to delete from the grain list.

**delimiter** A delimiter different from the default : can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

**salt.states.grains.list\_present**(*name, value, delimiter=''*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in *name* is not present on the system, this new grain will be created with the corresponding provided value.

**name** The grain name.

**value** The value is present in the list type grain.

**delimiter** A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be `list type`

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.present` (*name*, *value*, *delimiter=':'*, *force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.

**name** The grain name

**value** The value to set on the grain

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type.  
Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ,
```

### 14.17.85 salt.states.group

#### Management of user groups

The group module is used to create and manage unix group settings, groups can be either present or absent:

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2
```

**salt.states.group.absent**(*name*)

Ensure that the named group is absent

**name** The name of the group to remove

**salt.states.group.present**(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*)

Ensure that a group is present

**name** The name of the group to manage

**gid** The group id to assign to the named group; if left empty, then the next available group id will be assigned

**system** Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'.

**addusers** List of additional users to be added as a group members.

**delusers** Ensure these user are removed from the group membership.

**members** Replace existing group members with a list of new members.

**Note:** Options 'members' and 'addusers/delusers' are mutually exclusive and can not be used together.

### 14.17.86 salt.states.hg

#### Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known\_hosts, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
  hg.latest:
    - rev: tip
    - target: /tmp/example_repo
```

**salt.states.hg.latest**(*name*, *rev=None*, *target=None*, *clean=False*, *user=None*, *identity=None*, *force=False*, *opts=False*)

Make sure the repository is cloned to the given directory and is up to date

**name** Address of the remote repository as passed to ``hg clone``  
**rev** The remote branch, tag, or revision hash to clone/pull  
**target** Target destination directory path on minion to clone into  
**clean** Force a clean update with -C (Default: False)  
**user** Name of the user performing repository management operations

New in version 0.17.0.

**identity** Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

**force** Force hg to clone into pre-existing directories (deletes contents)

**opts** Include additional arguments and options to the hg command line

### 14.17.87 salt.states.hipchat

#### Send a message to Hipchat

This state is useful for sending messages to Hipchat during state runs.

The property `api_url` is optional. By default will use the public HipChat API at <https://api.hipchat.com>

New in version 2015.5.0.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
```

The api key can be specified in the master or minion configuration like below:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

`salt.states.hipchat.send_message` (*name*, *room\_id*, *from\_name*, *message*, *api\_url=None*, *api\_key=None*, *api\_version=None*, *message\_color='yellow'*, *notify=False*)

Send a message to a Hipchat room.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
    - color: green
    - notify: True
```

The following parameters are required:

**name** The unique name for this event.

**room\_id** The room to send the message to. Can either be the ID or the name.

**from\_name** The name of that is to be shown in the ``from" field. If not specified, defaults to.

**message** The message that is to be sent to the Hipchat room.

The following parameters are optional:

**api\_url** The API URL to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: <https://api.hipchat.com>

**api\_key** The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.

**api\_version** The api version for Hipchat to use, if not specified in the configuration options of master or minion.

**color** The color the Hipchat message should be displayed in. One of the following, default: yellow ``yellow", ``red", ``green", ``purple", ``gray", or ``random".

**notify** Should a notification in the room be raised.

### 14.17.88 salt.states.host

#### Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

---

**Note:** Changing the names in `host.present` does not cause an update to remove the old entry.

---

```
server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
  host.only:
    - hostnames: []
```

**salt.states.host.absent**(*name, ip*)

Ensure that the named host is absent

**name** The host to remove

**ip** The ip addr(s) of the host to remove

**salt.states.host.only**(*name, hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

**name** The IP address to associate with the given hostnames.

**hostnames** Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

**salt.states.host.present**(*name, ip*)

Ensures that the named host is present with the given ip

**name** The host to assign an ip to

**ip** The ip addr(s) to apply to the host

### 14.17.89 salt.states.htpasswd

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

**salt.states.htpasswd.user\_exists**(*name, password=None, htpasswd\_file=None, options='`, force=False, runas=None*)

Make sure the user is inside the specified htpasswd file

**name** User name

**password** User password

**htpasswd\_file** Path to the htpasswd file

**options** See [salt.modules.htpasswd.useradd](#)

**force** Touch the file even if user already created

**runas** The system user to run htpasswd command with

### 14.17.90 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query`(*name*, *match*=None, *match\_type*='string', *status*=None, *wait\_for*=None, *\*\*kwargs*)

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

**name** The name of the query.

**match** Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of *match* in the return text.

**match\_type** Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcr` to use regular expression matching if a more complex pattern matching is required.

---

**Note:** Despite the name of *match\_type* for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

**status** The status code for a URL for which to be checked. Can be used instead of or in addition to the *match* setting.

If both *match* and *status* options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: '200'
```

`salt.states.http.wait_for_successful_query`(*name*, *wait\_for*=300, *\*\*kwargs*)

Like `query` but, repeat and wait until *match*/*match\_type* or *status* is fulfilled. State returns result from last query state in case of success or if no successful query was made within *wait\_for* timeout.

### 14.17.91 salt.states.ifttt

#### Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event`(*name*, *event*, *value1*=None, *value2*=None, *value3*=None)

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
```

```
- value2: 'A second value that we want to send.'
- value3: 'A third value that wen want to send.'
```

The following parameters are required:

**name** The unique name for this event.

**event** The name of the event to trigger in IFTTT.

The following parameters are optional:

**value1** One of the values that we can send to IFTTT.

**value2** One of the values that we can send to IFTTT.

**value3** One of the values that we can send to IFTTT.

## 14.17.92 salt.states.incron

### Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
      - IN_ACCESS
    - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

`salt.states.incron.absent` (*name*, *path*, *mask*, *cmd*, *user*='root')

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

`salt.states.incron.present`(*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the `incrontab` man page: `man 5 incrontab`.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

### 14.17.93 `salt.states.influxdb08_database` module

#### Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.absent`(*name, user=None, password=None, host=None, port=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**user** The user to connect as (must be able to remove the database)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

`salt.states.influxdb08_database.present`(*name, user=None, password=None, host=None, port=None*)

Ensure that the named database is present

**name** The name of the database to create

**user** The user to connect as (must be able to remove the database)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

### 14.17.94 `salt.states.influxdb08_user` module

#### Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.absent`(*name, database=None, user=None, password=None, host=None, port=None*)

Ensure that the named cluster admin or database user is absent.

**name** The name of the user to remove

**database** The database to remove the user from

**user** The user to connect as (must be able to remove the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

`salt.states.influxdb08_user.present` (*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Ensure that the cluster admin or database user is present.

**name** The name of the user to manage  
**passwd** The password of the user  
**database** The database to create the user in  
**user** The user to connect as (must be able to create the user)  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to

### 14.17.95 salt.states.influxdb\_database

#### Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent` (*name*, *\*\*client\_args*)

Ensure that given database is absent.

**name** Name of the database to remove.

`salt.states.influxdb_database.present` (*name*, *\*\*client\_args*)

Ensure that given database is present.

**name** Name of the database to create.

### 14.17.96 salt.states.influxdb\_user

#### Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent` (*name*, *\*\*client\_args*)

Ensure that given user is absent.

**name** The name of the user to manage

`salt.states.influxdb_user.present` (*name*, *password*, *admin=False*, *\*\*client\_args*)

Ensure that given user is present.

**name** Name of the user to manage

**password** Password of the user

**admin** [False] Whether the user should have cluster administration privileges or not.

### 14.17.97 salt.states.infoblox module

states for infoblox stuff

ensures a record is either present or absent in an Infoblox DNS system

New in version 2016.3.0.

`salt.states.infoblox.absent` (*name*, *record\_type*, *dns\_view*, *infoblox\_server=None*, *infoblox\_user=None*, *infoblox\_password=None*, *infoblox\_api\_version='v1.4.2'*, *sslVerify=True*)

Ensure a record does not exist

**name** Name of the record

**record\_type** record type (host, a, cname, etc)

**dns\_view** DNS View  
**infoblox\_server** infoblox server to connect to (will try pillar if not specified)  
**infoblox\_user** username to use to connect to infoblox (will try pillar if not specified)  
**infoblox\_password** password to use to connect to infoblox (will try pillar if not specified)  
**verify\_ssl** verify SSL certificates  
 Example:

```
some-state:
  infoblox.absent:
    - name: some.dns.record
    - record_type: host
    - dns_view: MyView
    - sslVerify: False
```

**salt.states.infoblox.present**(*name, value, record\_type, dns\_view, infoblox\_server=None, infoblox\_user=None, infoblox\_password=None, infoblox\_api\_version='v1.4.2', sslVerify=True*)

Ensure a record exists  
**name** Name of the record  
**value** Value of the record  
**record\_type** record type (host, a, cname, etc)  
**dns\_view** DNS View  
**infoblox\_server** infoblox server to connect to (will try pillar if not specified)  
**infoblox\_user** username to use to connect to infoblox (will try pillar if not specified)  
**infoblox\_password** password to use to connect to infoblox (will try pillar if not specified)  
**verify\_ssl** verify SSL certificates  
 Example:

```
some-state:
  infoblox.present:
    - name: some.dns.record
    - value: 10.1.1.3
    - record_type: host
    - sslVerify: False
```

## 14.17.98 salt.states.ini\_manage

### Manage ini files

**maintainer** <akilesh1597@gmail.com>  
**maturity** new  
**depends** re  
**platform** all

**salt.states.ini\_manage.options\_absent**(*name, sections=None, separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.options_absent:
    - separator: '='
    - sections:
      test:
        - testkey
```

```

- secondoption
test1:
- testkey1

```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present(name, sections=None, separator='=')`

```

/home/saltminion/api-paste.ini:
ini.options_present:
- separator: '='
- sections:
  test:
    testkey: 'testval'
    secondoption: 'secondvalue'
  test1:
    testkey1: 'testval121'

```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent(name, sections=None, separator='=')`

```

/home/saltminion/api-paste.ini:
ini.sections_absent:
- separator: '='
- sections:
  - test
  - test1

```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present(name, sections=None, separator='=')`

```

/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
  - section_one
  - section_two

```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

## 14.17.99 salt.states.ipmi

### Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
  ipmi.boot_device:
    - name: network
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
    - api_kg: None

ensure myipmi system is powered on:
  ipmi.power:
    - name: boot
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
```

**salt.states.ipmi.boot\_device** (*name='default', \*\*kwargs*)

Request power state change

**name = default**

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting `safe mode`
- optical -- boot from CD/DVD/BD drive
- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

**salt.states.ipmi.power** (*name='power\_on', wait=300, \*\*kwargs*)

Request power state change

**name**

**Ensure power state one of:**

- power\_on -- system turn on
- power\_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then `on`, else `reset`

**wait** wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

**kwargs**

- api\_host=localhost
- api\_user=admin

- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_absent`(*name*, *channel=14*, *\*\*kwargs*)

Remove user Delete all user (uid) records having the matching name.

**name** string name of user to delete

**channel** channel to remove user access from defaults to 14 for auto.

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_present`(*name*, *uid*, *password*, *channel=14*, *callback=False*, *link\_auth=True*, *ipmi\_msg=True*, *privilege\_level='administrator'*, *\*\*kwargs*)

Ensure IPMI user and user privileges.

**name** name of user (limit 16 bytes)

**uid** user id number (1 to 7)

**password** user password (limit 16 bytes)

**channel** ipmi channel defaults to 14 for auto

**callback** User Restricted to Callback

**False** = User Privilege Limit is determined by the User Privilege Limit parameter `privilege_level`, for both callback and non-callback connections.

**True** = User Privilege Limit is determined by the `privilege_level` parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in` to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

**link\_auth** User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

**ipmi\_msg** User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging` refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) `ipmi_msg`

**privilege\_level**

- callback
- user
- operator
- administrator
- proprietary
- no\_access

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

## 14.17.100 salt.states.ipset

### Management of ipsets

This is an ipset-specific module designed to manage IPsets for use in IPTables Firewalls.

```
setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:
  ipset.set_absent:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname_entries:
  ipset.present:
    - set_name: setname
    - entry: 192.168.0.3
    - comment: Hello
    - require:
      - ipset: baz

setname_entries:
  ipset.present:
    - set_name: setname
    - entry:
      - 192.168.0.3
      - 192.168.1.3
    - comment: Hello
    - require:
      - ipset: baz

setname_entries:
  ipset.absent:
    - set_name: setname
    - entry:
      - 192.168.0.3
      - 192.168.1.3
    - comment: Hello
    - require:
      - ipset: baz

setname:
  ipset.flush:
```

`salt.states.ipset.absent`(*name*, *entry=None*, *entries=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**family** Network family, ipv4 or ipv6.

`salt.states.ipset.flush`(*name*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Flush current ipset set

**family** Networking family, either ipv4 or ipv6

`salt.states.ipset.present`(*name*, *entry=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Append a entry to a set

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**entry** A single entry to add to a set or a list of entries to add to a set

**family** Network family, ipv4 or ipv6.

`salt.states.ipset.set_absent`(*name*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Verify the set is absent.

**family** Networking family, either ipv4 or ipv6

`salt.states.ipset.set_present`(*name*, *set\_type*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Verify the set exists.

**name** A user-defined set name.

**set\_type** The type for the set.

**family** Networking family, either ipv4 or ipv6

### 14.17.101 salt.states.iptables

#### Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - dport: 80
  
```

- proto: tcp
- sport: 1025:65535
- save: True

httpd:

- iptables.append:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match:
    - state
    - comment
  - comment: "Allow HTTP"
  - connstate: NEW
  - source: '127.0.0.1'
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

.. Invert Rule

httpd:

- iptables.append:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match:
    - state
    - comment
  - comment: "Allow HTTP"
  - connstate: NEW
  - source: '! 127.0.0.1'
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.append:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match:
    - state
    - comment
  - comment: "Allow HTTP"
  - connstate: NEW
  - source: 'not 127.0.0.1'
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.append:
  - table: filter
  - family: ipv6
  - chain: INPUT

- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

- iptables.append:
  - table: filter
  - family: ipv4
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dports:
    - 80
    - 443
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.insert:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.insert:
  - position: 1
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80

```
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
  iptables.delete:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
    - chain: INPUT
    - policy: ACCEPT
```

---

**Note:** Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

---

`salt.states.iptables.append` (*name*, *table='filter'*, *family='ipv4'*, *\*\*kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain.

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain which should be modified

**family** Network family, `ipv4` or `ipv6`.

All other arguments are passed in with the same name as the long option that would normally be used for `iptables`, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent` (*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is absent.

**table** The table to remove the chain from  
**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.chain_present(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Flush current iptables state

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**position** The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.mod_aggregate(low, chunks, running)`

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.set_policy(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**policy** The requested table policy

### 14.17.102 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the `jboss-cli.sh` script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a `jboss_config` dictionary with the following properties must be passed:

```
jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the `cli_user` and `cli_password` parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that `jboss_config` is contained in the pillar.

**salt.states.jboss7.bindings\_exist**(*name, jboss\_config, bindings, profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

**jboss\_config**: Dict with connection properties (see state description)

**bindings**: Dict with bindings to set.

**profile**: The profile name (domain mode only)

Example:

```
jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
        'java:global/sampleapp/environment': 'DEV'
        'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
        ↪properties'
    - jboss_config: {{ pillar['jboss'] }}
```

**salt.states.jboss7.datasource\_exists**(*name, jboss\_config, datasource\_properties, recreate=False, profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

**name** Datasource property name

**jboss\_config** Dict with connection properties (see state description)

**datasource\_properties** Dict with datasource properties

**recreate** [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

**profile** [None] The profile name for this datasource (domain mode only)

Example:

```

sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
        driver-name: mysql
        connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
        jndi-name: 'java:jboss/datasources/sampleDS'
        user-name: sampleuser
        password: secret
        min-pool-size: 3
        use-java-context: True
    - jboss_config: {{ pillar['jboss'] }}
    - profile: full-ha

```

`salt.states.jboss7.deployed` (*name*, *jboss\_config*, *salt\_source=None*)

Ensures that the given application is deployed on server.

**jboss\_config**: Dict with connection properties (see state description)

**salt\_source**:

**How to find the artifact to be deployed.**

**target\_file**: Where to look in the minion's file system for the artifact to be deployed (e.g. `/tmp/application-web-0.39.war`). When source is specified, also specifies where to save the retrieved file.

**source**: (optional) File on salt master (e.g. `salt://application-web-0.39.war`). If absent, no files will be retrieved and the artifact in `target_file` will be used for the deployment.

**undeploy**: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion's local file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

It is assumed that `/tmp/webapp.war` was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}

```

Here, `application-web-0.39.war` file is downloaded from Salt file system to `/tmp/application-web-0.39.war` file on minion. Existing deployments are checked if any of them matches `application-web-.*` regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of `salt_source` is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.reloaded` (*name*, *jboss\_config*, *timeout=60*, *interval=5*)

Reloads configuration of jboss server.

**jboss\_config**: Dict with connection properties (see state description)

**timeout**: Time to wait until jboss is back in running state. Default timeout is 60s.

**interval**: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to `jboss-cli` which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

### 14.17.103 salt.states.jenkins module

#### Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.absent` (*name*, *\*\*kwargs*)

Ensure the job is present in the Jenkins configured jobs

**name** The name of the Jenkins job to remove.

`salt.states.jenkins.present` (*name*, *config=None*, *\*\*kwargs*)

Ensure the job is present in the Jenkins configured jobs

**name** The unique name for the Jenkins job

**config** The Salt URL for the file to use for configuring the job.

### 14.17.104 salt.states.junos module

#### State modules to interact with Junos devices.

These modules call the corresponding execution modules. Refer to *junos* for further information.

`salt.states.junos.cli` (*name*)

Executes the CLI commands and reuturns the text output.

```
show version:
  junos.cli
```

**name**: the command to be executed on junos CLI.

`salt.states.junos.commit` (*name*)

Commits the changes loaded into the candidate configuration.

```
commit the changes:
  junos.commit
```

name: can be anything

`salt.states.junos.diff(name)`

Gets the difference between the candidate and the current configuration.

```
get the diff:
junos.diff
```

name: can be anything

`salt.states.junos.file_copy(name, dest=None)`

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
junos:
- file_copy
- dest: info_copy.txt
```

name: source path of the file.

dest: destination path where the file will be placed.

`salt.states.junos.install_config(name, **kwargs)`

Loads and commits the configuration provided.

```
/home/user/config.set:
junos:
- install_config
- timeout: 100
```

name: path to the configuration file.

keyworded arguments taken by load function of PyEZ

`salt.states.junos.install_os(name, **kwargs)`

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
/home/user/junos_image.tgz:
junos:
- install_os
- timeout: 100
- reboot: True
```

name: path to the image file.

kwargs: keyworded arguments to be given such as timeout, reboot etc

`salt.states.junos.rollback(name)`

Rollbacks the committed changes.

```
rollback the changes:
junos.rollback
```

name: can be anything

`salt.states.junos.rpc(name, dest=None, format='xml', args=None, **kwargs)`

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with `dest` as an argument

```
get-interface-information:
  junos:
    - rpc
    - dest: /home/user/rpc.log
    - interface_name: lo0
```

name: the rpc to be executed.

args: other arguments as taken by rpc call of PyEZ

kwargs: keyworded arguments taken by rpc call of PyEZ

`salt.states.junos.set_hostname(name, commit_changes=True)`  
Changes the hostname of the device.

```
device name:
  junos:
    - set_hostname
    - commit_changes: False
```

name: the name to be given to the device

commit\_changes: whether to commit the changes

`salt.states.junos.shutdown(name, time=0)`  
Shuts down the device.

```
shut the device:
  junos:
    - shutdown
    - time: 10
```

name: can be anything

time: time after which the system should shutdown(in seconds, default=0)

`salt.states.junos.zeroize(name)`  
Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

### 14.17.105 salt.states.k8s

Manage Kubernetes

New in version 2016.3.0.

```
kube_label_1:
  k8s.label_present:
    - name: mylabel
    - value: myvalue
    - node: myothernodename
    - apiserver: http://mykubepiserer:8080

kube_label_2:
  k8s.label_absent:
    - name: mylabel
```

```
- node: myothernodename
- apiserver: http://mykubeapiserver:8080
```

```
kube_label_3:
  k8s.label_folder_present:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserver:8080
```

**salt.states.k8s.label\_absent**(*name, node=None, apiserver=None*)

Ensure the label doesn't exist on the kube node.

**name** Name of the label.

**node** Override node ID.

**apiserver** K8S apiserver URL.

**salt.states.k8s.label\_folder\_absent**(*name, node=None, apiserver=None*)

Ensure the label folder doesn't exist on the kube node.

**name** Name of the label folder.

**node** Override node ID.

**apiserver** K8S apiserver URL.

**salt.states.k8s.label\_present**(*name, value, node=None, apiserver=None*)

Ensure the label exists on the kube node.

**name** Name of the label.

**value** Value of the label.

**node** Override node ID.

**apiserver** K8S apiserver URL.

### 14.17.106 salt.states.kapacitor module

Kapacitor state module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

**salt.states.kapacitor.task\_absent**(*name*)

Ensure that a task is absent from Kapacitor.

**name** Name of the task.

**salt.states.kapacitor.task\_present**(*name, tick\_script, task\_type='stream', database=None, retention\_policy='default', enable=True*)

Ensure that a task is present and up-to-date in Kapacitor.

**name** Name of the task.

**tick\_script** Path to the TICK script for the task. Can be a salt:// source.

**task\_type** Task type. Defaults to `'stream'`

**database** Which database to fetch data from. Defaults to `None`, which will use the default database in InfluxDB.

**retention\_policy** Which retention policy to fetch data from. Defaults to `'default'`.

**enable** Whether to enable the task or not. Defaults to `True`.

### 14.17.107 salt.states.keyboard

#### Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

`salt.states.keyboard.system(name)`

Set the keyboard layout for the system

**name** The keyboard layout to use

`salt.states.keyboard.xorg(name)`

Set the keyboard layout for XOrg

**layout** The keyboard layout to use

### 14.17.108 salt.states.keystone

#### Management of Keystone users

##### depends

- keystoneclient Python module

**configuration** See `salt.modules.keystone` for setup instructions.

```
Keystone tenants:
keystone.tenant_present:
  - names:
    - admin
    - demo
    - service

Keystone roles:
keystone.role_present:
  - names:
    - admin
    - Member

admin:
keystone.user_present:
  - password: R00T_4CC3SS
  - email: admin@domain.com
  - roles:
    admin: # tenants
      - admin # roles
    service:
      - admin
      - Member
  - require:
    - keystone: Keystone tenants
```

```

    - keystone: Keystone roles
nova:
  keystone.user_present:
    - password: '$up3rn0v4'
    - email: nova@domain.com
    - tenant: service
    - roles:
      service:
        - admin
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles
demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
      demo:
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles
nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

```

**salt.states.keystone.endpoint\_absent** (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

**name** The name of the service whose endpoints should not exist

**salt.states.keystone.endpoint\_present** (*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region='RegionOne'*, *profile=None*, *url=None*, *interface=None*, *\*\*connection\_args*)

Ensure the specified endpoints exists for service

**name** The Service name

**publicurl** The public url of service endpoint (for V2 API)

**internalurl** The internal url of service endpoint (for V2 API)

**adminurl** The admin url of the service endpoint (for V2 API)

**region** The region of the endpoint

**url** The endpoint URL (for V3 API)

**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

**salt.states.keystone.project\_absent** (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project that should not exist

```

delete_nova:
  keystone.project_absent:
    - name: nova

```

`salt.states.keystone.project_present`(*name*, *description=None*, *enabled=True*, *profile=None*,  
*\*\*connection\_args*)

Ensures that the keystone project exists Alias for `tenant_present` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project to manage

**description** The description to use for this project

**enabled** Availability state for this project

```
nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'
```

`salt.states.keystone.role_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone role is absent.

**name** The name of the role that should not exist

`salt.states.keystone.role_present`(*name*, *profile=None*, *\*\*connection\_args*)

Ensures that the keystone role exists

**name** The name of the role that should be present

`salt.states.keystone.service_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the service doesn't exist in Keystone catalog

**name** The name of the service that should not exist

`salt.states.keystone.service_present`(*name*, *service\_type*, *description=None*, *profile=None*,  
*\*\*connection\_args*)

Ensure service present in Keystone catalog

**name** The name of the service

**service\_type** The type of Openstack Service

**description (optional)** Description of the service

`salt.states.keystone.tenant_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone tenant is absent.

**name** The name of the tenant that should not exist

`salt.states.keystone.tenant_present`(*name*, *description=None*, *enabled=True*, *profile=None*,  
*\*\*connection\_args*)

Ensures that the keystone tenant exists

**name** The name of the tenant to manage

**description** The description to use for this tenant

**enabled** Availability state for this tenant

`salt.states.keystone.user_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone user is absent.

**name** The name of the user that should not exist

`salt.states.keystone.user_present`(*name*, *password*, *email*, *tenant=None*, *enabled=True*,  
*roles=None*, *profile=None*, *password\_reset=True*,  
*project=None*, *\*\*connection\_args*)

Ensure that the keystone user is present with the specified properties.

**name** The name of the user to manage

**password** The password to use for this user.

---

**Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if

this is not the desired behavior.

**password\_reset** Whether or not to reset password after initial set. Defaults to True.

**email** The email address for this user

**tenant** The tenant (name) for this user

**project** The project (name) for this user (overrides tenant in api v3)

**enabled** Availability state for this user

**roles** The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
  admin: # tenant
    - admin # role
  service:
    - admin
    - Member
```

### 14.17.109 salt.states.kmod

#### Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

**salt.states.kmod.absent** (*name, persist=False, comment=True, mods=None*)

Verify that the named kernel module is not loaded

**name** The name of the kernel module to verify is not loaded

**persist** Remove module from `/etc/modules`

**comment** Comment out module in `/etc/modules` rather than remove it

**mods** A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

**salt.states.kmod.present** (*name, persist=False, mods=None*)

Ensure that the specified kernel module is loaded

**name** The name of the kernel module to verify is loaded

**persist** Also add module to `/etc/modules`

**mods** A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

### 14.17.110 `salt.states.layman`

#### Management of Gentoo Overlays using `layman`

A state module to manage Gentoo package overlays via `layman`

```
sunrise:
  layman.present
```

`salt.states.layman.absent`(*name*)

Verify that the overlay is absent

**name** The name of the overlay to delete

`salt.states.layman.present`(*name*)

Verify that the overlay is present

**name** The name of the overlay to add

### 14.17.111 `salt.states.ldap`

#### Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed`(*name*, *entries*, *connect\_spec=None*)

Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
  ldap.managed:
    - connect_spec:
        bind:
          method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
          - delete_others: True

      # make sure the entry exists with only the specified
      # attribute values
      - cn=admin,dc=example,dc=com:
          - delete_others: True
          - replace:
              cn:
                - admin
              description:
```

```

    - LDAP administrator
  objectClass:
    - simpleSecurityObject
    - organizationalRole
  userPassword:
    - {{pillar.ldap_admin_password}}

# make sure the entry exists, its olcRootDN attribute
# has only the specified value, the olcRootDN attribute
# doesn't exist, and all other attributes are ignored
- 'olcDatabase={1}hdb,cn=config':
  - replace:
    olcRootDN:
      - cn=admin,dc=example,dc=com
      # the admin entry has its own password attribute
    olcRootPW: []

# note the use of 'default'. also note how you don't
# have to use list syntax if there is only one attribute
# value
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    userPassword: changeme
    shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    sshPublicKey: []
  - replace:
    cn: foo
    uid: foo
    uidNumber: 1000
    gidNumber: 1000
    gecos: Foo Bar
    givenName: Foo
    sn: Bar
    homeDirectory: /home/foo
    loginShell: /bin/bash
    objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount

```

### Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is pro-

cessed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```
[{dn1: [{directive1: directive1_state,
        directive2: directive2_state},
        {directive3: directive3_state}],
  dn2: [{directive4: directive4_state,
        directive5: directive5_state}]},
 {dn3: [{directive6: directive6_state}]}]
```

These are the directives:

- **'delete\_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.

- **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.

- **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be `NONE`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect\_spec** -- See the description of the `connect_spec` parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the `'url'` entry is not specified, the `'url'` entry is set to the value of the `name` parameter.

#### Returns

A dict with the following keys:

- **'name'** This is the same object passed to the `name` parameter.

- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
- **'new'** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
        'new': {'attr1': ['val1', 'val2']}}}
```

Example 'changes' dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
        'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
  - `True` if no changes were necessary or if all changes were applied successfully.
  - `False` if at least one change was unable to be applied.
  - `None` if changes would be applied but it is in test mode.

### 14.17.112 salt.states.libcloud\_dns module

Manage DNS records and zones using libcloud

codeauthor :email: Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
```

```
driver: route53
key: blah
secret: blah
```

Example:

```
webserver:
  libcloud_dns.zone_present:
    name: mywebsite.com
    profile: profile1
  libcloud_dns.record_present:
    name: www
    zone: mywebsite.com
    type: A
    data: 12.34.32.3
    profile: profile1
```

**depends** apache-libcloud

**salt.states.libcloud\_dns.record\_absent**(*name, zone, type, data, profile*)

Ensures a record is absent.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (``) for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.record\_present**(*name, zone, type, data, profile*)

Ensures a record is present.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (``) for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.state\_result**(*result, message*)

**salt.states.libcloud\_dns.zone\_absent**(*domain, profile*)

Ensures a record is absent.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.zone\_present**(*domain, type, profile*)

Ensures a record is present.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **type** (str) -- Zone type (master / slave), defaults to master
- **profile** (str) -- The profile key

**14.17.113 salt.states.linux\_acl**

Linux File Access Control Lists

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

`salt.states.linux_acl.absent` (*name*, *acl\_type*, *acl\_name*='', *perms*='', *recurse=False*)  
Ensure a Linux ACL does not exist

`salt.states.linux_acl.present` (*name*, *acl\_type*, *acl\_name*='', *perms*='', *recurse=False*)  
Ensure a Linux ACL is present

**14.17.114 salt.states.locale****Management of languages/locales**

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

`salt.states.locale.present` (*name*)  
Generate a locale if it is not present

New in version 2014.7.0.

**name** The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.system(name)`

Set the locale for the system

**name** The name of the locale to use

### 14.17.115 salt.states.lvm

#### Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

`salt.states.lvm.lv_absent(name, vgname=None)`

Remove a given existing logical volume from a named existing volume group

**name** The logical volume to remove

**vgname** The volume group name

`salt.states.lvm.lv_present(name, vgname=None, size=None, extents=None, snapshot=None, pv='',  
thinvolume=False, thinpool=False, **kwargs)`

Create a new logical volume

**name** The name of the logical volume

**vgname** The volume group name for this logical volume

**size** The initial size of the logical volume

**extents** The number of logical extents to allocate

**snapshot** The name of the snapshot

**pv** The physical volume to use

**kwargs** Any supported options to `lvcreate`. See [linux\\_lvm](#) for more details.

New in version to `_complete`.

**thinvolume** Logical volume is thinly provisioned

**thinpool** Logical volume is a thin pool

`salt.states.lvm.pv_absent(name)`

Ensure that a Physical Device is not being used by lvm

**name** The device name to initialize.

`salt.states.lvm.pv_present(name, **kwargs)`

Set a physical device to be used as an LVM physical volume

**name** The device name to initialize.

**kwargs** Any supported options to `pvcreeate`. See [linux\\_lvm](#) for more details.

`salt.states.lvm.vg_absent(name)`

Remove an LVM volume group

**name** The volume group to remove

`salt.states.lvm.vg_present`(*name*, *devices=None*, *\*\*kwargs*)

Create an LVM volume group

**name** The volume group name to create

**devices** A list of devices that will be added to the volume group

**kwargs** Any supported options to `vgcreate`. See [linux\\_lvm](#) for more details.

#### 14.17.116 salt.states.lvs\_server

##### Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.absent`(*name*, *protocol=None*, *server\_address=None*, *service\_address=None*)

Ensure the LVS Real Server in specified service is absent.

**name** The name of the LVS server.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**server\_address** The LVS real server address.

`salt.states.lvs_server.present`(*name*, *protocol=None*, *server\_address=None*, *service\_address=None*, *packet\_forward\_method='dr'*, *weight=1*)

Ensure that the named service is present.

**name** The LVS server name

**protocol** The service protocol

**service\_address** The LVS service address

**server\_address** The real server address.

**packet\_forward\_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight** The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

#### 14.17.117 salt.states.lvs\_service

##### Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent`(*name*, *protocol=None*, *service\_address=None*)

Ensure the LVS service is absent.

**name** The name of the LVS service

**protocol** The service protocol

**service\_address** The LVS service address

`salt.states.lvs_service.present`(*name*, *protocol=None*, *service\_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

**name** The LVS service name

**protocol** The service protocol

**service\_address** The LVS service address

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

## 14.17.118 salt.states.lxc

### Manage Linux Containers

**salt.states.lxc.absent** (*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

**name** Name of the container to destroy

**stop** stop before destroying default: false

New in version 2015.5.2.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

**salt.states.lxc.edited\_conf** (*name*, *lxc\_conf=None*, *lxc\_conf\_unset=None*)

**Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface). It is slated to be replaced, and as of version 2015.5.0 it is deprecated.

Edit LXC configuration options

Deprecated since version 2015.5.0.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
      - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
      - lxc.utsname
```

**salt.states.lxc.frozen** (*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

---

**Note:** This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use `lxc.present`.

---

**name** The name of the container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**start** [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

`salt.states.lxc.present`(*name*, *running=None*, *clone\_from=None*, *snapshot=False*, *profile=None*, *network\_profile=None*, *template=None*, *options=None*, *image=None*, *config=None*, *fstype=None*, *size=None*, *backing=None*, *vgname=None*, *lvname=None*, *path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

**name** The name of the container to be created

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**running** [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

**clone\_from** Create named container as a clone of the specified container

**snapshot** [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

**profile** Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

**network\_profile** Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

**Container Creation Arguments**

**template** The template to use. E.g., 'ubuntu' or 'fedora'. Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

**options**

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
```

```
dist: centos
release: 6
arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to `filesystem` within `/var/lib/lxc`.

**fstype** Filesystem type to use on LVM logical volume

**size** Size of the volume to create. Only applicable if `backing` is set to `lvm`.

**vgname** [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.running`(*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

---

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

---

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**restart** [`False`] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass`(*name*, *\*\*kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.stopped`(*name*, *kill=False*, *path=None*)

Ensure that a container is stopped

---

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to

---

ensure that the container does not exist.

**name** The name of the container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

### 14.17.119 salt.states.mac\_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osascript:
  assistive.installed:
    - enabled: True
```

**salt.states.mac\_assistive.installed**(*name, enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

**name** The bundle ID or path to command

**enable** Should assistive access be enabled on this application?

### 14.17.120 salt.states.mac\_defaults module

Writing/reading defaults from a macOS minion

**salt.states.mac\_defaults.absent**(*name, domain, user=None*)

Make sure the defaults value is absent

**name** The key of the given domain to remove

**domain** The name of the domain to remove from

**user** The user to write the defaults to

**salt.states.mac\_defaults.write**(*name, domain, value, vtype='string', user=None*)

Write a default to the system

**name** The key of the given domain to write to

**domain** The name of the domain to write to

**value** The value to write to the given key

**vtype** The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

**user** The user to write the defaults to

### 14.17.121 salt.states.mac\_keychain module

#### Installing of certificates to the keychain

Install certificates to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

`salt.states.mac_keychain.default_keychain`(*name*, *domain*='user', *user*=None)

Set the default keychain to use

**name** The chain in which to use as the default

**domain** The domain to use valid values are user|system|common|dynamic, the default is user

**user** The user to run as

`salt.states.mac_keychain.installed`(*name*, *password*, *keychain*='/Library/Keychains/System.keychain', *\*\*kwargs*)

Install a p12 certificate file into the macOS keychain

**name** The certificate to install

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

**allow\_any** Allow any application to access the imported certificate without warning

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.uninstalled`(*name*, *password*, *keychain*='/Library/Keychains/System.keychain', *keychain\_password*=None)

Uninstall a p12 certificate file from the macOS keychain

**name** The certificate to uninstall, this can be a path for a .p12 or the friendly name

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**cert\_name** The friendly name of the certificate, this can be used instead of giving a certificate

**keychain** The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

### 14.17.122 salt.states.mac\_package module

#### Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
```

```

- dmg: True
- app: True
- target: /Applications/Xcode.app
- version_check: xcodebuild -version=Xcode 7.1

```

\*7B91b

```

salt.states.mac_package.installed(name, target='LocalSystem', dmg=False, store=False,
                                   app=False, mpkg=False, user=None, onlyif=None, un-
                                   less=None, force=False, allow_untrusted=False, ver-
                                   sion_check=None)

```

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

**name** The pkg or dmg file to install

**target** The location in which to install the package. This can be a path or LocalSystem

**dmg** Is the given file a dmg file?

**store** Should the pkg be installed as if it was from the Mac OS Store?

**app** Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

**mpkg** Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

**user** Name of the user performing the unless or onlyif checks

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**force** Force the package to be installed even if its already been found installed

**allow\_untrusted** Allow the installation of untrusted packages

**version\_check** The command and version that we want to check against, the version number can use regex.

### 14.17.123 salt.states.mac\_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```

/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111

```

```

salt.states.mac_xattr.delete(name, attributes)

```

Make sure the given attributes are deleted from the file/directory

**name** The path to the file/directory

**attributes** The attributes that should be removed from the file/directory, this is accepted as an array.

```

salt.states.mac_xattr.exists(name, attributes)

```

Make sure the given attributes exist on the file/directory

**name** The path to the file/directory

**attributes** The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

### 14.17.124 salt.states.makeconf

#### Management of Gentoo make.conf

A state module to manage Gentoo's make.conf file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

**salt.states.makeconf.absent**(*name*)

Verify that the variable is not in the make.conf.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**salt.states.makeconf.present**(*name*, *value=None*, *contains=None*, *excludes=None*)

Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**value** Enforce that the value of the variable is set to the provided value

**contains** Enforce that the value of the variable contains the provided value

**excludes** Enforce that the value of the variable does not contain the provided value.

### 14.17.125 salt.states.marathon\_app module

Configure Marathon apps via a salt proxy.

```
my_app:
  marathon_app.config:
    - config:
      cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      cpus: 0.1
      mem: 10
      instances: 3
```

New in version 2015.8.2.

**salt.states.marathon\_app.absent**(*name*)

Ensure that the marathon app with the given id is not present.

**Parameters** **name** -- The app name/id

**Returns** A standard Salt changes dictionary

**salt.states.marathon\_app.config**(*name*, *config*)

Ensure that the marathon app with the given id is present and is configured to match the given config values.

**Parameters**

- **name** -- The app name/id

- **config** -- The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

**salt.states.marathon\_app.running**(*name*, *restart=False*, *force=True*)

Ensure that the marathon app with the given id is present and restart if set.

**Parameters**

- **name** -- The app name/id

- **restart** -- Restart the app
  - **force** -- Override the current deployment
- Returns** A standard Salt changes dictionary

### 14.17.126 salt.states.mdadm

#### Managing software RAID with mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

**salt.states.mdadm.absent**(*name*)

Verify that the raid is absent

**name** The name of raid device to be destroyed

```
/dev/md0:
  raid:
    - absent
```

**salt.states.mdadm.present**(*name, level, devices, \*\*kwargs*)

Verify that the raid is present

Changed in version 2014.7.0.

**name** The name of raid device to be created

**level** The RAID level to use when creating the raid.

**devices** A list of devices used to build the array.

**kwargs** Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

### 14.17.127 salt.states.memcached

#### States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

**name** The key

**value** [None] If specified, only ensure that the key is absent if it matches the specified value.

**host** The memcached server IP address

**port** The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

`salt.states.memcached.managed`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min\_compress\_len=0*)

Manage a memcached key.

**name** The key to manage

**value** The value to set for that key

**host** The memcached server IP address

**port** The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```

### 14.17.128 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated`(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_disabled`(*name*, *workers=None*, *profile='default'*)

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_recover`(*name*, *workers=None*, *profile='default'*)

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_stopped`(*name*, *workers=None*, *profile='default'*)  
Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

### 14.17.129 salt.states.modjk\_worker

#### Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.\*** functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module *documentation*

`salt.states.modjk_worker.activate`(*name*, *lbn*, *target*, *profile='default'*, *expr\_form='glob'*)  
Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain
```

`salt.states.modjk_worker.disable`(*name*, *lbn*, *target*, *profile='default'*, *expr\_form='glob'*)  
Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain
```

`salt.states.modjk_worker.stop` (*name, lbn, target, profile='default', expr\_form='glob'*)

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain
```

### 14.17.130 salt.states.module

#### Execution of Salt modules from within states

These states allow individual execution module calls to be made via states. To call a single module function use a `module.run` state:

```
mine.send:
  module.run:
    - name: network.interfaces
```

Note that this example is probably unnecessary to use in practice, since the `mine_functions` and `mine_interval` config parameters can be used to schedule updates for the mine (see [here](#) for more info).

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```
mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces
```

All arguments that the `module` state does not consume are passed through to the execution module function being executed:

```
fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'
```

Due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state

- saltenv

For example:

```
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
        - test-vlad
    - kwargs: {
        ssh_username: 'ubuntu',
        image: 'ami-8d6d9daa',
        securitygroup: 'default',
        size: 'c3.large',
        location: 'ap-northeast-1',
        delvol_on_destroy: 'True'
      }
```

`salt.states.module.mod_watch(name, **kwargs)`

This function is an alias of `run`.

Run a single module function

**name** The module function to execute

**returner** Specify the returner to send the return of the module execution to

**kwargs** Pass any arguments needed to execute the function

`salt.states.module.run(name, **kwargs)`

Run a single module function

**name** The module function to execute

**returner** Specify the returner to send the return of the module execution to

**kwargs** Pass any arguments needed to execute the function

`salt.states.module.wait(name, **kwargs)`

Run a single module function only if the watch statement calls it

**name** The module function to execute

**\*\*kwargs** Pass any arguments needed to execute the function

---

**Note:** Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
  2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
-

### 14.17.131 salt.states.mongodb\_database

Management of MongoDB databases

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`

`salt.states.mongodb_database.absent` (*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**user** The user to connect as (must be able to create the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

**authdb** The database in which to authenticate

### 14.17.132 salt.states.mongodb\_user

Management of MongoDB users

---

**Note:** This module requires PyMongo to be installed.

---

`salt.states.mongodb_user.absent` (*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Ensure that the named user is absent

**name** The name of the user to remove

**user** MongoDB user with sufficient privilege to create the user

**password** Password for the admin user specified by the `user` parameter

**host** The hostname/IP address of the MongoDB server

**port** The port on which MongoDB is listening

**database** The database from which to remove the user specified by the `name` parameter

**authdb** The database in which to authenticate

`salt.states.mongodb_user.present` (*name*, *passwd*, *database='admin'*, *user=None*, *password=None*, *host='localhost'*, *port=27017*, *authdb=None*)

Ensure that the user is present with the specified properties

**name** The name of the user to manage

**passwd** The password of the user to manage

**user** MongoDB user with sufficient privilege to create the user

**password** Password for the admin user specified with the `user` parameter

**host** The hostname/IP address of the MongoDB server

**port** The port on which MongoDB is listening

**database** The database in which to create the user

---

**Note:** If the database doesn't exist, it will be created.

---

**authdb** The database in which to authenticate

Example:

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
```

```
# Connect as admin:sekrit
- user: admin
- password: sekret
```

### 14.17.133 salt.states.monit

#### Monit state

Manage monit states

#### monit\_enable\_service\_monitoring:

##### monit.monitor:

- name: service

#### monit\_disable\_service\_monitoring:

##### monit.unmonitor:

- name: service

---

**Note:** Use of these states require that the *monit* execution module is available.

---

#### salt.states.monit.**monitor**(name)

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

#### salt.states.monit.**unmonitor**(name)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

### 14.17.134 salt.states.mount

#### Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
```

- persist: True
- mkmnt: True

`salt.states.mount.mod_watch`(*name*, *user=None*, *\*\*kwargs*)

The mounted watcher, called to invoke the watch command.

**name** The name of the mount point

`salt.states.mount.mounted`(*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass\_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match\_on='auto'*, *device\_name\_regex=None*, *extra\_mount\_invisible\_options=None*, *extra\_mount\_invisible\_keys=None*, *extra\_mount\_ignore\_fs\_keys=None*, *extra\_mount\_translate\_options=None*, *hidden\_opts=None*)

Verify that a device is mounted

**name** The path to the location where the device is to be mounted

**device** The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

**fstype** The filesystem type, this will be `xf`s, `ext2/3/4` in the case of classic filesystems, and `fuse` in the case of fuse mounts

**mkmnt** If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

**opts** A list object of options or a comma delimited list

**dump** The dump value to be passed into the fstab, Default is 0

**pass\_num** The pass value to be passed into the fstab, Default is 0

**config** Set an alternative location for the fstab, Default is `/etc/fstab`

**persist** Set if the mount should be saved in the fstab, Default is `True`

**mount** Set if the mount should be mounted immediately, Default is `True`

**user** The user to own the mount; this defaults to the user salt is running as on the minion

**match\_on** A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on `fstype`. In general, `auto` matches on `name` for recognized special devices and `device` otherwise.

**device\_name\_regex** A list of device exact names or regular expressions which should not force a remount. For example, `glusterfs` may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

**extra\_mount\_invisible\_options** A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If an option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

**extra\_mount\_invisible\_keys** A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

**extra\_mount\_ignore\_fs\_keys** A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
  'ramfs': ['size']
}
```

**extra\_mount\_translate\_options** A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

**hidden\_opts** A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

**salt.states.mount.swap** (*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
  mount.swap
```

---

**Note:** swap does not currently support LABEL

---

**salt.states.mount.unmounted** (*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*)

New in version 0.17.0.

Verify that a device is not mounted

**name** The path to the location where the device is to be unmounted from

**device** The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

**config** Set an alternative location for the fstab, Default is `/etc/fstab`

**persist** Set if the mount should be purged from the fstab, Default is `False`

**user** The user to own the mount; this defaults to the user salt is running as on the minion

### 14.17.135 salt.states.mysql\_database

#### Management of MySQL databases (schemas)

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.absent` (*name*, *\*\*connection\_args*)

Ensure that the named database is absent

**name** The name of the database to remove

`salt.states.mysql_database.present` (*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)

Ensure that the named database is present with the specified properties

**name** The name of the database to manage

### 14.17.136 salt.states.mysql\_grants

#### Management of MySQL grants (user permissions)

##### depends

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a `'priv_level'` in the same specification as defined in the MySQL documentation:

- \*
- \*\*
- db\_name.\*
- db\_name.tbl\_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exempledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exempledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
```

```
mysql_grants.present:
- grant: select
- database: somedb.sometable
- user: joe
```

`salt.states.mysql_grants.absent` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *\*\*connection\_args*)

Ensure that the grant is absent

**name** The name (key) of the grant to add

**grant** The grant priv\_type (i.e. select,insert,update OR all privileges)

**database** The database priv\_level (i.e. db.tbl OR db.\*)

**user** The user to apply the grant to

**host** The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *revoke\_first=False*, *ssl\_option=False*, *\*\*connection\_args*)

Ensure that the grant is present with the specified properties

**name** The name (key) of the grant to add

**grant** The grant priv\_type (i.e. select,insert,update OR all privileges)

**database** The database priv\_level (i.e. db.tbl OR db.\*)

**user** The user to apply the grant to

**host** The network/host that the grant should apply to

**grant\_option** Adds the WITH GRANT OPTION to the defined grant. Default is `False`

**escape** Defines if the database value gets escaped or not. Default is `True`

**revoke\_first** By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the ``revoke_first`` options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

**ssl\_option** Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

### 14.17.137 salt.states.mysql\_query

#### Execution of MySQL queries

New in version 2014.7.0.

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
  - database: my_database
  - query:    "SELECT * FROM table;"
  - output:   "/tmp/query_id.txt"
```

`salt.states.mysql_query.run`(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *\*\*connection\_args*)

Execute an arbitrary query on the specified database

**name** Used only as an ID

**database** The name of the database to execute the query on

**query** The query to execute

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need `output=grain`)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

### 14.17.138 salt.states.mysql\_user

#### Management of MySQL users

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

```
frank:
  mysql_user.present:
  - host: localhost
  - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
  - host: localhost
  - password: "bob@cat"
  - connection_user: someuser
  - connection_pass: somepass
  - connection_charset: utf8
  - saltenv:
    - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

`salt.states.mysql_user.absent` (*name*, *host*='localhost', *\*\*connection\_args*)

Ensure that the named user is absent

**name** The name of the user to remove

`salt.states.mysql_user.present` (*name*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *\*\*connection\_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

**name** The name of the user to manage

**host** Host for which this user/password combo applies

**password** The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

**password\_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the `mysql` command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless** If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

**unix\_socket** If `True` and `allow_passwordless` is `True`, the `unix_socket` auth plugin will be used.

### 14.17.139 salt.states.netntp

#### Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- Requires `netaddr` to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: `pip install dnspython` to resolve the nameserver entities

(in case the user does not configure the peers/servers using their IP addresses) - *NAPALM proxy minion - NTP operational and configuration management module*

`salt.states.netntp.managed`(*name*, *peers=None*, *servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36
```

Output example:

```
{
  'edge01.nrt04': {
    'netntp_|-netntp_example_|-netntp_example_|-managed': {
      'comment': 'NTP servers already configured as needed.',
      'name': 'netntp_example',
      'start_time': '12:45:24.056659',
      'duration': 2938.857,
      'changes': {
        'peers': {
          'removed': [
            '192.168.0.2',
            '192.168.0.3'
          ],
          'added': [
            '192.168.0.1',
            '172.17.17.1'
          ]
        }
      },
      'result': None
    }
  }
}
```

### 14.17.140 salt.states.netsnmp module

#### Network SNMP

Manage the SNMP configuration on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- *napalm snmp management module (salt.modules.napalm\_snmp)*

`salt.states.netsnmp.managed`(*name, config=None, defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
  netsnmp.managed:
    - config:
      location: Honolulu, HI, US
    - defaults:
      contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
-----
      ID: snmp_example
  Function: snmp.managed
     Result: None
  Comment: Testing mode: configuration was not changed!
  Started: 13:29:06.872363
  Duration: 920.466 ms
  Changes:
  -----
         added:
         -----
             chassis_id:
                 None
             contact:
                 noc@cloudflare.com
             location:
                 Honolulu, HI, US

Summary for edge01.hnl01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time: 920.466 ms
```

### 14.17.141 salt.states.netusers module

#### Network Users

Manage the users configuration on network devices via the NAPALM proxy.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm

platform unix

## Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

`salt.states.netusers.managed` (*name*, *users=None*, *defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
  netusers.managed:
    - users:
      admin:
        level: 15
        password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
        sshkeys: []
      restricted:
        level: 1
        password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
      martin:
        level: 15
        password: ''
        sshkeys:

### 14.17.142 salt.states.network

#### Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

**Note:** Prior to version 2014.1.0, only RedHat-based systems (RHEL, CentOS, Scientific Linux, etc.) are supported. Support for Debian/Ubuntu is new in 2014.1.0 and should be considered experimental.

Other platforms are not yet supported.

```

system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: none
    - ipaddr: 10.1.0.1
    - netmask: 255.255.255.0
    - dns:
      - 8.8.8.8
      - 8.8.4.4

eth0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

```

```
bond0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

eth1.0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000

bond0.1-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000

.. note::
    add support of ranged interfaces (vlan, bond and eth) for redhat system,
    Important:type must be eth.

routes:
  network.routes:
    - name: eth0
    - routes:
      - name: secure_network
        ipaddr: 10.2.0.0

```

```
bond0.3:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.3
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.10:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.4
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.12:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.5
    - use:
      - network: bond0
    - require:
      - network: bond0

br0:
  network.managed:
    - enabled: True
    - type: bridge
    - proto: dhcp
    - bridge: br0
    - delay: 0
    - ports: eth4
    - bypassfirewall: True
    - use:
      - network: eth4
    - require:
      - network: eth4

system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True
    - apply_hostname: True

lo:
  network.managed:
    - name: lo
    - type: eth
    - onboot: yes
    - userctl: no
    - ipv6_autoconf: no
```

```

- enable_ipv6: true
- ipaddrs:
  - 127.0.0.1/8
  - 10.1.0.4/32
  - 10.1.0.12/32
- ipv6addrs:
  - fc00::1/128
  - fc00::100/128

.. note::
    Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

.. note::
    Use `retain_settings` to retain current network settings that are not
    otherwise specified in the state. Particularly useful if only setting
    the hostname. Default behavior is to delete unspecified network
    settings.

.. versionadded:: 2016.11.0

```

---

**Note:** When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

---

**salt.states.network.managed**(*name*, *type*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**type** Type of interface and configuration.

**enabled** Designates the state of this interface.

**kwargs** The IP parameters for this interface.

**salt.states.network.routes**(*name*, *\*\*kwargs*)

Manage network interface static routes.

**name** Interface name to apply the route to.

**kwargs** Named routes

**salt.states.network.system**(*name*, *\*\*kwargs*)

Ensure that global network settings are configured properly.

**name** Custom name to represent this configuration change.

**kwargs** The global parameters for the system.

### 14.17.143 salt.states.nftables

#### Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
```

```

- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

httpd:

```

nftables.delete:
- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

httpd:

```

nftables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

**salt.states.nftables.append**(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 0.17.0.

Append a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

**salt.states.nftables.chain\_absent**(*name*, *table*='filter', *family*='ipv4')

New in version 2014.7.0.

Verify the chain is absent.

**family** Networking family, either ipv4 or ipv6

**salt.states.nftables.chain\_present**(*name*, *table*='filter', *table\_type*=None, *hook*=None, *priority*=None, *family*='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

**salt.states.nftables.delete**(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.flush`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Flush current nftables state

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.insert`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

#### 14.17.144 salt.states.npm

##### Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

`salt.states.npm.bootstrap`(*name*, *user*=None, *silent*=True)

Bootstraps a node.js application.

Will execute ``npm install --json`` on the specified directory.

**user** The user to run NPM with

New in version 0.17.0.

`salt.states.npm.cache_cleaned`(*name*=None, *user*=None)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

**name** The name of the package to remove from the cache, or None for all packages

**user** The user to run NPM with

`salt.states.npm.installed`(*name*, *pkgs*=None, *dir*=None, *user*=None, *force\_reinstall*=False, *registry*=None, *env*=None)

Verify that the given package is installed and is at the correct version (if specified).

```

coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []

```

**name** The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

**pkgs** A list of packages to install with a single npm invocation; specifying this argument will ignore the **name** argument

New in version 2014.7.0.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

**registry** The NPM registry from which to install the package

New in version 2014.7.0.

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force\_reinstall** Install the package even if it is already installed

`salt.states.npm.removed` (*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

### 14.17.145 salt.states.ntp

#### Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```

win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org

```

`salt.states.ntp.managed` (*name*, *servers=None*)

Manage NTP servers

**servers** A list of NTP servers

### 14.17.146 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for *salt.proxy.nxos*.

#### `salt.states.nxos.config_absent(name)`

Ensure a specific configuration line does not exist in the running config

**name** config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin
```

---

**Note:** For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

---

#### `salt.states.nxos.config_present(name)`

Ensure a specific configuration line exists in the running config

**name** config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw
```

#### `salt.states.nxos.replace(name, repl, full_match=False)`

Replace all instances of a string or full line in the running config

**name** String to replace

**repl** The replacement text

**full\_match** Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, `*` is added around *name* for matching in the *show run* config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

---

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is

---

removed, but not readded, because it was not matched.

`salt.states.nxos.user_absent(name)`

Ensure a user is not present

**name** username to remove if it exists

Examples:

```
delete:
  nxos.user_absent:
    - name: daniel
```

`salt.states.nxos.user_present(name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256')`

Ensure a user is present with the specified groups

**name** Name of user

**password** Encrypted or Plain Text password for user

**roles** List of roles the user should be assigned. Any roles not in this list will be removed

**encrypted** Whether the password is encrypted already or not. Defaults to False

**crypt\_salt** Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

**algorithm** Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin
```

### 14.17.147 salt.states.openstack\_config

Manage OpenStack configuration file settings.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

`salt.states.openstack_config.absent` (*name, filename, section, parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.present` (*name, filename, section, value, parameter=None*)

Ensure a value is set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

**value** The value to set

### 14.17.148 `salt.states.openvswitch_bridge` module

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.absent` (*name*)

Ensures that the named bridge does not exist, eventually deletes it.

**Parameters** **name** -- The name of the bridge.

`salt.states.openvswitch_bridge.present` (*name*)

Ensures that the named bridge exists, eventually creates it.

**Parameters** **name** -- The name of the bridge.

### 14.17.149 `salt.states.openvswitch_port` module

Management of Open vSwitch ports.

`salt.states.openvswitch_port.absent` (*name, bridge=None*)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

`salt.states.openvswitch_port.present` (*name, bridge, type=None, id=None, remote=None, dst\_port=None*)

Ensures that the named port exists on bridge, eventually creates it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst\_port** -- Port to use when creating tunnelport in the switch.

### 14.17.150 salt.states.pagerduty

#### Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

`salt.states.pagerduty.create_event` (*name, details, service\_key, profile*)

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

**name** This is a short description of the event.

**details** This can be a more detailed description of the event.

**service\_key** This key can be found by using `pagerduty.list_services`.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

### 14.17.151 salt.states.pagerduty\_escalation\_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
  pagerduty_escalation_policy.present:
    - name: bruce test escalation policy
    - escalation_rules:
      - targets:
        - type: schedule
          id: 'bruce test schedule level1'
        - type: user
          id: 'Bruce Sherrrod'
      escalation_delay_in_minutes: 15
    - targets:
      - type: schedule
        id: 'bruce test schedule level2'
      escalation_delay_in_minutes: 15
    - targets:
      - type: user
        id: 'Bruce TestUser1'
      - type: user
```

```

    id: 'Bruce TestUser2'
  - type: user
    id: 'Bruce TestUser3'
  - type: user
    id: 'bruce+test4@lyft.com'
  escalation_delay_in_minutes: 15

```

`salt.states.pagerduty_escalation_policy.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that `pagerduty_escalation_policy.present` accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in [https://developer.pagerduty.com/documentation/rest/escalation\\_policies/create](https://developer.pagerduty.com/documentation/rest/escalation_policies/create). In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```

pagerduty_escalation_policy.present:

```

- name: bruce test escalation policy
- escalation\_rules:
  - targets:
    - \* type: schedule id: `bruce test schedule level1`
    - \* type: user id: `Bruce Sherrod`

In this example, `Bruce Sherrod` will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

### 14.17.152 salt.states.pagerduty\_schedule

Manage PagerDuty schedules.

#### Example

```

ensure test schedule:

```

```

  pagerduty_schedule.present:

```

- name: `bruce test schedule level1`
  - schedule: name: `bruce test schedule level1` time\_zone: `Pacific Time (US & Canada)` schedule\_layers:
    - name: `Schedule Layer 1` start: `2015-01-01T00:00:00` users:
      - \* user: `id: `Bruce TestUser1`
- member\_order: 1

```

* user: `id`: `Bruce TestUser2`
  member_order: 2
* user: `id`: `bruce+test3@lyft.com`
  member_order: 3
* user: `id`: `bruce+test4@lyft.com`
  member_order: 4
rotation_virtual_start: `2015-01-01T00:00:00`  priority: 1  rota-
tion_turn_length_seconds: 604800

```

`salt.states.pagerduty_schedule.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

`salt.states.pagerduty_schedule.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called ``schedule``.

User id's can be pagerduty id, or name, or email address.

### 14.17.153 salt.states.pagerduty\_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```

```

ensure test service

pagerduty\_service.present:

- name: `my service`
- escalation\_policy\_id: `my escalation policy`
- type: nagios

[etc]

`salt.states.pagerduty_service.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the ``type`` argument.

Examples:

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com ensure generic email service exists:
pagerduty_service.present:
    • name: my email service
    • service: description: ``email service controlled by salt" escalation_policy_id: ``my
      escalation policy" type: ``generic_email" service_key: ``test-email"
# create a pagerduty service using cloudwatch integration ensure my cloudwatch service exists:
pagerduty_service.present:
    • name: my cloudwatch service
    • service: escalation_policy_id: ``my escalation policy" type: aws_cloudwatch de-
      scription: ``my cloudwatch service controlled by salt"
TODO: aws_cloudwatch type should be integrated with boto_sns
```

### 14.17.154 salt.states.pagerduty\_user

Manage PagerDuty users.

#### Example

```
ensure bruce test user 1:
```

```
pagerduty.user_present:
```

- name: `Bruce TestUser1`
- email: bruce+test1@lyft.com
- requester\_id: P1GV5NT

```
salt.states.pagerduty_user.absent(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

```
salt.states.pagerduty_user.present(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

### 14.17.155 salt.states.pcs module

#### Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system(PCS)

New in version 2016.110.

```
depends pcs
```

Walkthrough of a complete pcs cluster setup:

**Requirements:** PCS is installed, pcs service is started and the password for the hacluster user is set and known.

**Remark on the cibname variable used in the examples:** The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at ones to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.
→example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

## 4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

## 5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

## 6. Configure Fencing (!is not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

## 7. Add resources to your cluster:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↳org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

## 8. Optional: Add constraints (locations, colocations, orders):

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
```

```

- 'vip_galera'
- 'with'
- 'haproxy-clone'
- cibname: cib_for_haproxy

```

New in version 2016.3.0.

**salt.states.pcs.auth**(*name, nodes, pcsuser='hacluster', pcspasswd='hacluster', extra\_args=None*)

Ensure all nodes are authorized to the cluster

**name** Irrelevant, not used (recommended: pcs\_auth\_\_auth)

**nodes** a list of nodes which should be authorized to the cluster

**pcsuser** user for communication with pcs (default: hacluster)

**pcspasswd** password for pcsuser (default: hacluster)

**extra\_args** list of extra option for the `pcs cluster auth` command

Example:

```

pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []

```

**salt.states.pcs.cib\_present**(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: {{formulaname}}\_\_cib\_present\_{{cibname}})

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB (default:

**extra\_args** additional options for creating the CIB-file

Example:

```

mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None

```

**salt.states.pcs.cib\_pushed**(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with pcs.cib\_present

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: {{formulaname}}\_\_cib\_pushed\_{{cibname}})

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB

**extra\_args** additional options for creating the CIB-file

Example:

```

mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None

```

`salt.states.pcs.cluster_node_present` (*name, node, extra\_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

**name** Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

**node** node that should be added

**extra\_args** list of extra option for the `pcs cluster node add` command

Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

`salt.states.pcs.cluster_setup` (*name, nodes, pcsclustername='pcscluster', extra\_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_setup__setup`)

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster

**extra\_args** list of extra option for the `pcs cluster setup` command

Example:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
```

`salt.states.pcs.constraint_present` (*name, constraint\_id, constraint\_type, constraint\_options=None, cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `{{formulaname}}__constraint_present_{{constraint_id}}`)

**constraint\_id** name for the constraint (try first to create manually to find out the autogenerated name)

**constraint\_type** constraint type (location, colocation, order)

**constraint\_options** options for creating the constraint

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy
```

`salt.states.pcs.prop_has_value`(*name, prop, value, extra\_args=None, cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_properties__prop_has_value_{{prop}}`)

**prop** name of the property

**value** value of the property prop

**extra\_args** additional options for the pcs property command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_defaults_to`(*name, default, value, extra\_args=None, cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_defaults_to_{{default}}`)

**default** name of the default resource property

**value** value of the default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_op_defaults_to`(*name, op\_default, value, extra\_args=None, cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_op_defaults_to_{{op_default}}`)

**op\_default** name of the operation default resource property

**value** value of the operation default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_present`(*name, resource\_id, resource\_type, resource\_options=None, cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `{{formulaname}}__resource_present_{{resource_id}}`)

**resource\_id** name for the resource

**resource\_type** resource type (f.e. `ocf:heartbeat:IPaddr2` or `VirtualIP`)

**resource\_options** additional options for creating the resource

**cibname** use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
      ↪org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present` (*name*, *stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options*=None, *cibname*=None)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_stonith__created_{{stonith_id}}`)

**stonith\_id** name for the stonith resource

**stonith\_device\_type** name of the stonith agent `fence_eps`, `fence_xvm` f.e.

**stonith\_device\_options** additional options for creating the stonith resource

**cibname** use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

### 14.17.156 salt.states.pecl

#### Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that `php-pear` must be installed for these states to be available, so `pecl` states should include a requisite to a `pkg.installed` state for the package which provides `pecl` (`php-pear` in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.installed`(*name*, *version=None*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Make sure that a pecl extension is installed.

**name** The pecl extension name to install

**version** The pecl extension version to install. This option may be ignored to install the latest stable version.

**defaults** Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

**preferred\_state** The pecl extension state to install

`salt.states.pecl.removed`(*name*)

Make sure that a pecl extension is not installed.

**name** The pecl extension name to uninstall

### 14.17.157 salt.states.pip\_state

#### Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.installed`(*name*, *pkgs=None*, *pip\_bin=None*, *requirements=None*, *bin\_env=None*, *use\_wheel=False*, *no\_use\_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *repo=None*, *editable=None*, *find\_links=None*, *index\_url=None*, *extra\_index\_url=None*, *no\_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download\_cache=None*, *source=None*, *upgrade=False*, *force\_reinstall=False*, *ignore\_installed=False*, *exists\_action=None*, *no\_deps=False*, *no\_install=False*, *no\_download=False*, *install\_options=None*, *global\_options=None*, *user=None*, *no\_chown=False*, *cwd=None*, *pre\_releases=False*, *cert=None*, *allow\_all\_external=False*, *allow\_external=None*, *allow\_unverified=None*, *process\_dependency\_links=False*, *env\_vars=None*, *use\_vt=False*, *trusted\_host=None*, *no\_cache\_dir=False*, *cache\_dir=None*)

Make sure the package is installed

**name** The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If **requirements** is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

**requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user** The user under which to run pip

**use\_wheel** [False] Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel** [False] Force to not use wheel archives (requires pip>=1.4)

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find\_links** URL to look for packages at

**index\_url** Base URL of Python Package Index

**extra\_index\_url** Extra URLs of package indexes to use in addition to **index\_url**

**no\_index** Ignore package index

**mirrors** Specific mirror URL(s) to query (automatically adds --use-mirrors)

**build** Unpack packages into **build** dir

**target** Install packages into **target** dir

**download** Download packages into **download** instead of installing them

**download\_cache** Cache downloaded packages in **download\_cache** dir

**source** Check out **editable** packages into **source** dir

**upgrade** Upgrade all packages to the newest available version

**force\_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.

**ignore\_installed** Ignore the installed packages (reinstalling instead)

**exists\_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no\_deps** Ignore package dependencies

**no\_install** Download and unpack all packages, but don't actually install them

**no\_chown** When user is given, do not attempt to copy and chown a requirements file

**no\_cache\_dir**: Disable the cache.

**cwd** Current working directory to run pip from

**pre\_releases** Include pre-releases in the available versions

**cert** Provide a path to an alternate CA bundle

**allow\_all\_external** Allow the installation of all externally hosted files

**allow\_external** Allow the installation of externally hosted files (comma separated list)

**allow\_unverified** Allow the installation of insecure and unverifiable files (comma separated list)

**process\_dependency\_links** Enable the processing of dependency links

**bin\_env** [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at /foo/.virtualenvs/bar.

**env\_vars** Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```

django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True

```

**use\_vt** Use VT terminal emulation (see output while installing)

**trusted\_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip

```

Or

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip

```

---

### Attention

The following arguments are deprecated, do not use.

---

**pip\_bin** [None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

**install\_options**

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```

django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip

```

**global\_options** Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

---

### Attention

As of Salt 0.17.0 the pip state **needs** an importable pip module. This usually means having the system's pip package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because pip already does a pretty good job parsing its own requirements. It makes no sense for Salt to do pip requirements parsing and validation before passing them to the pip library. It's functionality duplication and it's more error prone.

---

#### Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

---

Example:

```
pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i
```

`salt.states.pip_state.removed`(*name, requirements=None, bin\_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use\_vt=False*)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**user** The user under which to run pip

**bin\_env** [None] the pip executable or virtualenv to use

**use\_vt** Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate`(*name, bin\_env=None, user=None, cwd=None, use\_vt=False*)

New in version 2015.5.0.

Verify that the system is completely up to date.

**name** The name has no functional value and is only used as a tracking reference

**user** The user under which to run pip

**bin\_env** the pip executable or virtualenv to use

**use\_vt** Use VT terminal emulation (see output while installing)

## 14.17.158 salt.states.pkg

### Installation of packages using OS package managers such as yum or apt-get

---

**Note:** On minions running `systemd` >= 205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

---

Salt can manage software packages via the `pkg` state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the pkgs state module

```
dotdeb.repo:
  pkgrepo.managed:
    - humanname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotdeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.group_installed` (*name*, *skip=None*, *include=None*, *\*\*kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in *pacman*

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and *pacman* package managers.

**skip** Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

**include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

---

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

---

```
salt.states.pkg.installed(name, version=None, refresh=None, fromrepo=None, skip_verify=False,
                           skip_suggestions=False, pkgs=None, sources=None, allow_updates=False,
                           pkg_verify=False, normalize=True, ignore_epoch=False, reinstall=False,
                           update_holds=False, **kwargs)
```

Ensure that the package is installed, and that it is the correct version (if specified).

**param str name** The name of the package to be installed. This parameter is ignored if either `pkgs` or `sources` is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option detailed below.

**param str version** Install a specific version of a package. This option is ignored if `sources` is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
  2:7.4.160-1.el7
```

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

---

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs httpd
myminion:
  -----
  base:
    |_
    -----
    httpd:
      2.2.15-29.el6.centos
  updates:
    |_
    -----
    httpd:
      2.2.15-30.el6.centos
```

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

**param bool refresh** This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

**param str cache\_valid\_time** New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
```

- cache\_valid\_time: 300
- allow\_updates: True
- hold: False

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

**param str fromrepo** Specify a repository from which to install

---

**Note:** Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise
↳main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
↳ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
       7:0.10.11-1~precise1 0
          500 http://ppa.launchpad.net/jon-severinsson/
↳ffmpeg/ubuntu/ precise/main amd64 Packages
       4:0.8.10-0ubuntu0.12.04.1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise-updates/main amd64 Packages
          500 http://security.ubuntu.com/ubuntu/ precise-
↳security/main amd64 Packages
       4:0.8.1-0ubuntu1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version `4:0.8.10-0ubuntu0.12.04.1` either

`precise-updates` or `precise-security` could be used for the `from-repo` value.

**param bool skip\_verify** Skip the GPG verification check for the package to be installed

**param bool skip\_suggestions** Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

**param bool allow\_updates** Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6-ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

**param bool pkg\_verify** New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use `pkg.verify` to determine if any of the files installed by the package have been altered. If files have been altered, the `reinstall` option of `pkg.install` is used to force a reinstall. Types to ignore can be passed to `pkg.verify`. Additionally, `verify_options` can be used to modify further the behavior of `pkg.verify`. See examples below. Currently, this option is supported for the following pkg providers: *yumpkg*.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

**param list ignore\_types** List of types to ignore when verifying the package

New in version 2014.7.0.

**param list verify\_options** List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

**param bool normalize** Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

**param bool ignore\_epoch** When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`), and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

#### MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

**param list pkgs** A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True
```

**NOTE:** For *apt*, *ebuild*, *pacman*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, *ebuild*, *pacman* and *zypper* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

**NOTE:** When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

**param list sources** A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

#### PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

**param bool hold** Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

**param bool update\_holds** If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

This option is currently supported only for YUM/DNF.

New in version 2016.11.0.

**param list names** A list of packages to install from a software repository. Each package will be installed individually by the package manager.

**Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

**param bool install\_recommends** Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

**param bool only\_upgrade** Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

---

**Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

---

Parameters **report\_reboot\_exit\_codes** (*bool*) --

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

```
win_system.set_reboot_required_witnessed
```

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

**return** A dictionary containing the state of the software installation

**rtype** dict

---

**Note:** The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

---

`salt.states.pkg.latest` (*name*, *refresh=None*, *fromrepo=None*, *skip\_verify=False*, *pkgs=None*, *watch\_flags=True*, *\*\*kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

**name** The name of the package to maintain at the latest available version. This parameter is ignored if `pkgs` is used.

**fromrepo** Specify a repository from which to install

**skip\_verify** Skip the GPG verification check for the package to be installed

**refresh** This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will

be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

**param str cache\_valid\_time** New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

**pkgs** A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

**install\_recommends** Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

**only\_upgrade** Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

---

**Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

---

**report\_reboot\_exit\_codes** If the installer exits with a recognized exit code indicating that a reboot is required, the module function

*win\_system.set\_reboot\_required\_witnessed*

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This paramater has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

`salt.states.pkg.mod_aggregate` (*low, chunks, running*)

The `mod_aggregate` function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

`salt.states.pkg.mod_init` (*low*)

Set a flag to tell the install functions to refresh the package database. This ensures that the package database is refreshed only once during a state run significantly improving the speed of package management during a state run.

It sets a flag for a number of reasons, primarily due to timeline logic. When originally setting up the `mod_init` for `pkg` a number of corner cases arose with different package managers and how they refresh package data.

It also runs the `ex_mod_init` from the package manager module that is currently loaded. The `ex_mod_init` is expected to work as a normal `mod_init` function.

See also:

[`salt.modules.ebuild.ex\_mod\_init\(\)`](#)

`salt.states.pkg.mod_watch` (*name, \*\*kwargs*)

Install/reinstall a package based on a watch requisite

`salt.states.pkg.purged` (*name, version=None, pkgs=None, normalize=True, ignore\_epoch=False, \*\*kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

**name** The name of the package to be purged.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

**pkgs** A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.removed`(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore\_epoch=False*,  
*\*\*kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

**name** The name of the package to be removed.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

**pkgs** A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, *\*\*kwargs*)

New in version 2014.7.0.

Verify that the system is completely up to date.

**name** The name has no functional value and is only used as a tracking reference

**refresh** refresh the package database before checking for new upgrades

**Parameters** **cache\_valid\_time** (*str*) -- This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case `cache_valid_time` is set, `refresh` will not take place for amount in seconds since last `apt-get update` executed on the system.

---

**Note:** This parameter available only on Debian based distributions, and have no effect on the rest.

---

**kwargs** Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

### 14.17.159 salt.states.pkgbuild

The `pkgbuild` state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
```

```

- salt-master-2015.5.2-2.el7.centos.noarch.rpm
- salt-minion-2015.5.2-2.el7.centos.noarch.rpm
- salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
- salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
- dest_dir: /tmp/pkg
- spec: salt://pkg/salt/spec/salt.spec
- template: jinja
- deps:
  - salt://pkg/salt/sources/required_dependency.rpm
- tgt: epel-7-x86_64
- sources:
  - salt://pkg/salt/sources/logrotate.salt
  - salt://pkg/salt/sources/README.fedora
  - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
  - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
  - salt://pkg/salt/sources/salt-api
  - salt://pkg/salt/sources/salt-api.service
  - salt://pkg/salt/sources/salt-master
  - salt://pkg/salt/sources/salt-master.service
  - salt://pkg/salt/sources/salt-minion
  - salt://pkg/salt/sources/salt-minion.service
  - salt://pkg/salt/sources/saltpkg.sls
  - salt://pkg/salt/sources/salt-syndic
  - salt://pkg/salt/sources/salt-syndic.service
  - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo

```

`salt.states.pkgbuild.built`(*name*, *runas*, *dest\_dir*, *spec*, *sources*, *tgt*, *template=None*, *deps=None*, *env=None*, *results=None*, *force=False*, *saltenv='base'*, *log\_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

**name** The name to track the build, the name value is otherwise unused

**runas** The user to run the build process as

**dest\_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**tgt** The target platform to run the build on

**template** Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

**deps** Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

**env** A dictionary of environment variables to be set prior to execution. Example:

```

- env:
  DEB_BUILD_OPTIONS: 'nocheck'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results** The names of the expected rpms that will be built

**force** [False] If True, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**log\_dir** [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

**salt.states.pkgbuild.repo** (*name*, *keyid=None*, *env=None*, *use\_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='builder'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name** The directory to find packages that will be in the repository

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R50mgHqvdyEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  bYP7t5iwJmQzRMYfInYRt77wkJBPCpJc9FPNebL9vLzCn4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SszRIwCFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
  OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

---

**Note:** This parameter is not used for making yum repositories.

---

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`

**runas** [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

## 14.17.160 salt.states.pkgng

### Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

## 14.17.161 salt.states.pkgrepo

### Management of APT/YUM package repos

Package repositories for APT-based and YUM-based distros can be managed with these states. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
      ↪ repo=os
    - comments:
```

```

- 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
- gpgcheck: 1
- gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6

```

```

base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True

```

```

base:
  pkgrepo.managed:
    - humanname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub

```

```

base:
  pkgrepo.managed:
    - humanname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub

```

```

base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True

```

**Note:** On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a [bug](#) in their `python-software-properties` package, a missing dependency on `pycurl`, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-software-properties`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.absent` (*name*, *\*\*kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

**name** The name of the package repo, as it would be referred to when running the regular package manager commands.

#### UBUNTU-SPECIFIC OPTIONS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the **ppa** specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

**keyid** If passed, then the GPG key corresponding to the passed KeyID will also be removed.

**keyid\_ppa** [False] If set to True, the GPG key's ID will be looked up from `ppa.launchpad.net` and removed, and the `keyid` argument will be ignored.

---

**Note:** This option will be disregarded unless the `ppa` argument is present.

---

`salt.states.pkgrepo.managed` (*name*, *ppa=None*, *\*\*kwargs*)

This state manages software package repositories. Currently, *yum*, *apt*, and *zypper* repositories are supported.

#### YUM/DNF/ZYPPER-BASED SYSTEMS

---

**Note:** One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

---

**name** This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. [foo]) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

**enabled** [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

**disabled** [False] Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a yum/dnf/zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

**humanname** This is used as the `name` value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

**baseurl** The URL to a yum repository

**mirrorlist** A URL which points to a file containing a collection of baseurls

**comments** Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

Additional configuration values seen in yum repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

### APT-BASED SYSTEMS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

**name** On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

**Note:** The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

**disabled** [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.  
**enabled** [True] Included to reduce confusion due to yum/dnf/zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

**comps** On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

**file** The filename for the `.list` that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

**dist** This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

**keyid** The KeyID of the GPG key to install. This option also requires the `keyserver` option to be set.

**keyserver** This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

**key\_url** URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

---

**Note:** Use either `keyid/keyserver` or `key_url`, but not both.

---

**consolidate** If set to true, this will consolidate all sources definitions to the `sources.list` file, cleanup the now unused files, consolidate components (e.g. `main`) for the same URI, type, and architecture to a single line, and finally remove comments from the `sources.list` file. The `consolidate` will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

**clean\_file** If set to true, empty file before config repo, dangerous if use multiple sources in one file.

New in version 2015.8.0.

**refresh\_db** If set to false this will skip refreshing the apt package database on debian based systems.

**require\_in** Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a `require in` the `pkg` will not work for this.

### 14.17.162 salt.states.portage\_config

#### Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
  portage_config.flags:
    - use:
      - openssl
```

`salt.states.portage_config.flags` (*name*, *use=None*, *accept\_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)

Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

**name** The name of the package or its DEPEND atom

**use** A list of USE flags

**accept\_keywords** A list of keywords to accept. `~ARCH` means current host arch, and will be translated into a line without keywords

**env** A list of environment files

**license** A list of accepted licenses

**properties** A list of additional properties

**unmask** A boolean to unmask the package

**mask** A boolean to mask the package

`salt.states.portage_config.mod_init` (*low*)

Enforce a nice structure on the configuration files.

### 14.17.163 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

---

**Note:** It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.installed` (*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

**options** Make sure that the desired non-default options are set

**Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

## 14.17.164 salt.states.postgres\_cluster module

### Management of PostgreSQL clusters

The `postgres_cluster` state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
    - name: 'main'
    - version: '9.3'
```

`salt.states.postgres_cluster.absent` (*version*, *name*)

Ensure that the named cluster is absent

**version** Version of the postgresql server of the cluster to remove

**name** The name of the cluster to remove

New in version 2015.XX.

`salt.states.postgres_cluster.present` (*version*, *name*, *port=None*, *encoding=None*, *locale=None*, *datadir=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

**version** Version of the postgresql cluster

**name** The name of the cluster

**port** Cluster port

**encoding** The character encoding scheme to be used in this database

**locale** Locale with which to create cluster

**datadir** Where the cluster is stored

New in version 2015.XX.

### 14.17.165 salt.states.postgres\_database

#### Management of PostgreSQL databases

The postgres\_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

**absent** (*name*, *user=None*, *maintenance\_db=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*,  
*db\_user=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**present** (*name*, *tablespace=None*, *encoding=None*,  
*lc\_collate=None*, *lc\_ctype=None*, *owner=None*,  
*owner\_recurse=False*, *template=None*, *user=None*,  
*maintenance\_db=None*, *db\_password=None*,  
*db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

**name** The name of the database to manage

**tablespace** Default tablespace for the database

**encoding** The character encoding scheme to be used in this database

**lc\_collate** The LC\_COLLATE setting to be used in this database

**lc\_ctype** The LC\_CTYPE setting to be used in this database

**owner** The username of the database owner

**owner\_recurse** Recurse owner change to all relations in the database

**template** The template database from which to build this database

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

New in version 0.17.0.

### 14.17.166 salt.states.postgres\_extension

#### Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

`salt.states.postgres_extension.absent` (*name*, *if\_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *maintenance\_db=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named extension is absent.

**name** Extension name of the extension to remove

**if\_exists** Add if exist slug

**restrict** Add restrict slug

**cascade** Drop on cascade

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_extension.present` (*name*, *if\_not\_exists=None*, *schema=None*, *ext\_version=None*, *from\_version=None*, *user=None*, *maintenance\_db=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named extension is present.

---

**Note:** Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

---

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

**name** The name of the extension to be installed

**if\_not\_exists** Add an IF NOT EXISTS parameter to the DDL statement

**schema** Schema to install the extension into

**ext\_version** Version to install

**from\_version** Old extension version if already installed

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.167 salt.states.postgres\_group

#### Management of PostgreSQL groups (roles)

The `postgres_group` module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

`salt.states.postgres_group.absent` (*name*, *user=None*, *maintenance\_db=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that the named group is absent

**name** The groupname of the group to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_group.present` (*name*, *createdb=*None, *createroles=*None, *createuser=*None, *encrypted=*None, *superuser=*None, *inherit=*None, *login=*None, *replication=*None, *password=*None, *refresh\_password=*None, *groups=*None, *user=*None, *maintenance\_db=*None, *db\_password=*None, *db\_host=*None, *db\_port=*None, *db\_user=*None)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the group to manage

**createdb** Is the group allowed to create databases?

**createroles** Is the group allowed to create other roles/users

**createuser** Alias to create roles, and history problem, in pgsqll normally createuser == superuser

**encrypted** Should the password be encrypted in the system catalog?

**login** Should the group have login perm

**inherit** Should the group inherit permissions

**superuser** Should the new group be a ``superuser``

**replication** Should the new group be allowed to initiate streaming replication

**password** The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh\_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups** A string of comma separated groups the group should be in

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.168 salt.states.postgres\_initdb

#### Initialization of PostgreSQL data directory

The postgres\_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```

pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres

```

`salt.states.postgres_initdb.present` (*name*, *user=None*, *password=None*, *auth='password'*, *encoding='UTF8'*, *locale=None*, *runas=None*)

Initialize the PostgreSQL data directory

**name** The name of the directory to initialize

**user** The database superuser name

**password** The password to set for the postgres user

**auth** The default authentication method for local connections

**encoding** The default encoding for new databases

**locale** The default locale for new databases

**runas** The system user the operation should be performed on behalf of

### 14.17.169 salt.states.postgres\_language

#### Management of PostgreSQL languages

The `postgres_language` module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```

plpgsql:
  postgres_language.present:
    - maintenance_db: testdb

```

```

plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb

```

`salt.states.postgres_language.absent` (*name*, *maintenance\_db*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that a named language is absent in the specified database.

**name** The name of the language to remove

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_language.present` (*name*, *maintenance\_db*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that a named language is present in the specified database.

**name** The name of the language to install

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

### 14.17.170 salt.states.postgres\_privileges

#### Management of PostgreSQL Privileges

The postgres\_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
```

```
- DELETE
- prepend: public
- maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.absent`(*name*, *object\_name*, *object\_type*, *privileges=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Revoke the requested privilege(s) on the specified object(s)

**name** Name of the role whose privileges should be revoked

**object\_name** Name of the object on which the revoke is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when revoking group membership

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_privileges.present`(*name*, *object\_name*, *object\_type*, *privileges=None*, *grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Grant the requested privilege(s) on the specified object to a role

**name** Name of the role to which privileges should be granted

**object\_name** Name of the object on which the grant is to be performed. `ALL` may be used for objects of type `table` or `sequence`.

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

**privileges** List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when granting group membership

**grant\_option** If grant\_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.171 salt.states.postgres\_schema

#### Management of PostgreSQL schemas

The postgres\_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

**absent**(*dbname*, *name*, *db\_user=None*, *db\_password=None*,  
*db\_host=None*, *db\_port=None*)

Ensure that the named schema is absent.

**dbname** The database's name will work on

**name** The name of the schema to remove

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_schema.present`(*dbname*, *name*, *owner=None*, *db\_user=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named schema is present in the database.

**dbname** The database's name will work on

**name** The name of the schema to manage

**owner** The database user that will be the owner of the schema

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.172 salt.states.postgres\_tablespace

#### Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data

```

New in version 2015.8.0.

`salt.states.postgres_tablespace.absent`(*name*, *user=None*, *maintenance\_db=None*,  
*db\_user=None*, *db\_password=None*, *db\_host=None*,  
*db\_port=None*)

Ensure that the named tablespace is absent.

**name** The name of the tablespace to remove

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_tablespace.present`(*name*, *directory*, *options=None*, *owner=None*,  
*user=None*, *maintenance\_db=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*,  
*db\_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options see `man ``create_tablespace``(7)`.

**name** The name of the tablespace to create/manage.

**directory** The directory where the tablespace will be located, must already exist

**options** A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0

```

**owner** The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.173 salt.states.postgres\_user

#### Management of PostgreSQL users (roles)

The postgres\_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

**absent** (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is absent

**name** The username of the user to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**present** (*name, createdb=None, createroles=None, createuser=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default\_password=None, refresh\_password=None, groups=None, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the system user to manage.

**createdb** Is the user allowed to create databases?

**createroles** Is the user allowed to create other users?

**createuser** Alias to create roles

**encrypted** Should the password be encrypted in the system catalog?

**login** Should the group have login perm

**inherit** Should the group inherit permissions

**superuser** Should the new user be a ``superuser``

**replication** Should the new user be allowed to initiate streaming replication

**password** The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**default\_password** The password used only when creating the user, unless password is set.

New in version 2016.3.0.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups** A string of comma separated groups the user should be in

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** Postres database username, if different from config or default.

**db\_password** Postgres user's password, if any password, for a specified `db_user`.

**db\_host** Postgres database host, if different from config or default.

**db\_port** Postgres database port, if different from config or default.

### 14.17.174 salt.states.powerpath

#### Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

**salt.states.powerpath.license\_absent** (*name*)

Ensures that the specified PowerPath license key is absent on the host.

**name** The license key to ensure is absent

**salt.states.powerpath.license\_present** (*name*)

Ensures that the specified PowerPath license key is present on the host.

**name** The license key to ensure is present

### 14.17.175 salt.states.probes

#### Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *napalm probes management module*

`salt.states.probes.managed` (*name, probes, defaults=None*)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

**Parameters** **probes** -- Defines the probes as expected to be configured on the device.

In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (`defaults`) can be used, providing common characteristics. `:param defaults`: Specifies common parameters for the probes.

SLS Example:

```
rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
        probe1_test3:
          target: 8.8.8.8
          probe_type: http-ping
      probe_name2:
        probe2_test1:
          test_interval: 100
    - defaults:
      target: 10.10.10.10
      probe_count: 15
      test_interval: 3
      probe_type: icmp-ping
```

In the probes configuration, the only mandatory attribute is `target` (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- **source**: Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface `loopback0`.
- **target**: Destination IP Address.
- **probe\_count**: Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- **probe\_interval**: Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- **probe\_type**: Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```
probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
```

```

    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping
  probe_name2:
    probe2_test1:
      target: 10.10.10.10
      probe_count: 15
      test_interval: 3
      probe_type: icmp-ping

```

### 14.17.176 salt.states.process

#### Process Management

Ensure a process matching a given pattern is absent.

```

httpd-absent:
  process.absent:
    - name: apache2

```

**salt.states.process.absent** (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

**name** The pattern to match.

**user** The user process belongs

**signal** Signal to send to the process(es).

### 14.17.177 salt.states.proxy module

#### Allows you to manage proxy settings on minions

Setup proxy settings on minions

```

192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
      - localhost
      - 127.0.0.1

```

**salt.states.proxy.managed** (*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass\_domains=None*, *network\_service='Ethernet'*)

Manages proxy settings for this minion

**name** The proxy server to use

**port** The port used by the proxy server

**services** A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**bypass\_domains** An array of the domains that should bypass the proxy

**network\_service** The network service to apply the changes to, this only necessary on macOS

## 14.17.178 salt.states.pushover

### Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```

pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.pushover.post_message` (*name*, *user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api\_version=1*, *token=None*)

Send a message to a PushOver channel.

```

pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:

**name** The unique name for this event.

**user** The user or group of users to send the message to. Must be ID of user, not name or email address.

**message** The message that is to be sent to the PushOver channel.

The following parameters are optional:

**title** The title to use for the message.

**device** The device for the user to send the message to.

**priority** The priority for the message.

**expire** The message should expire after specified amount of seconds.

**retry** The message should be resent this many times.

**token** The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

### 14.17.179 salt.states.pyenv

#### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv\_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps
python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

`salt.states.pyenv.absent` (*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

**name** The version of python to uninstall

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.install_pyenv` (*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

**user: None** The user to run pyenv as.

`salt.states.pyenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

**name** The version of python to install

**default** [False] Whether to make this python the default.

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

### 14.17.180 `salt.states.pyrax_queues`

#### Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or pip. This module is greatly inspired by `boto_*` modules from SaltStack code source.

```
myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax
```

`salt.states.pyrax_queues.absent` (*name*, *provider*)

Ensure the named Rackspace queue is deleted.

**name** Name of the Rackspace queue.

**provider** Salt Cloud provider

`salt.states.pyrax_queues.present` (*name*, *provider*)

Ensure the RackSpace queue exists.

**name** Name of the Rackspace queue.

**provider** Salt Cloud Provider

### 14.17.181 `salt.states.quota`

#### Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.mode` (*name*, *mode*, *quotatype*)

Set the quota for the system

**name** The filesystem to set the quota mode on

**mode** Whether the quota system is on or off

**quotatype** Must be user or group

### 14.17.182 salt.states.rabbitmq\_cluster

#### Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

**salt.states.rabbitmq\_cluster.join**(*name, host, user='rabbit', ram\_node=None, runas='root'*)

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node `user@host`

**name** Irrelevant, not used (recommended: `user@host`)

**user** The user of node to join to (default: `rabbit`)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

**salt.states.rabbitmq\_cluster.joined**(*name, host, user='rabbit', ram\_node=None, runas='root'*)

Ensure the current node joined to a cluster with node `user@host`

**name** Irrelevant, not used (recommended: `user@host`)

**user** The user of node to join to (default: `rabbit`)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

### 14.17.183 salt.states.rabbitmq\_plugin

#### Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

**salt.states.rabbitmq\_plugin.disabled**(*name, runas=None*)

Ensure the RabbitMQ plugin is disabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

**salt.states.rabbitmq\_plugin.enabled**(*name, runas=None*)

Ensure the RabbitMQ plugin is enabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

### 14.17.184 salt.states.rabbitmq\_policy

#### Manage RabbitMQ Policies

**maintainer** Benn Eichhorn <benn@getlocalmeasure.com>

**maturity** new

**platform** all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

**salt.states.rabbitmq\_policy.absent**(*name*, *vhost*='/', *runas*=None)

Ensure the named policy is absent

Reference: <http://www.rabbitmq.com/ha.html>

**name** The name of the policy to remove

**runas** Name of the user to run the command as

**salt.states.rabbitmq\_policy.present**(*name*, *pattern*, *definition*, *priority*=0, *vhost*='/', *runas*=None)

Ensure the RabbitMQ policy exists.

Reference: <http://www.rabbitmq.com/ha.html>

**name** Policy name

**pattern** A regex of queues to apply the policy to

**definition** A json dict describing the policy

**priority** Priority (defaults to 0)

**vhost** Virtual host to apply to (defaults to '/')

**runas** Name of the user to run the command as

## 14.17.185 salt.states.rabbitmq\_user

### Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

**salt.states.rabbitmq\_user.absent**(*name*, *runas*=None)

Ensure the named user is absent

**name** The name of the user to remove

**runas** User to run the command

`salt.states.rabbitmq_user.present` (*name*, *password=None*, *force=False*, *tags=None*, *perms=()*, *runas=None*)

Ensure the RabbitMQ user exists.

**name** User name

**password** User's password, if one needs to be set

**force** If user exists, forcibly change the password

**tags** Optional list of tags for the user

**perms** A list of dicts with vhost keys and 3-tuple values

**runas** Name of the user to run the command

## 14.17.186 salt.states.rabbitmq\_vhost

### Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

`salt.states.rabbitmq_vhost.absent` (*name*)

Ensure the RabbitMQ Virtual Host is absent

**name** Name of the Virtual Host to remove

**runas** User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.present` (*name*)

Ensure the RabbitMQ VHost exists.

**name** VHost name

**user** Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

**owner** Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

**conf** Initial conf string to apply to the VHost and user. Defaults to \*

Deprecated since version 2015.8.0.

**write** Initial write permissions to apply to the VHost and user. Defaults to \*

Deprecated since version 2015.8.0.

**read** Initial read permissions to apply to the VHost and user. Defaults to \*

Deprecated since version 2015.8.0.

**runas** Name of the user to run the command

Deprecated since version 2015.8.0.

### 14.17.187 salt.states.rbenv

#### Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: <https://github.com/sstephenson/ruby-build/wiki>

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV\_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps
```

**salt.states.rbenv.absent** (*name*, *user=None*)

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

**name** The version of ruby to uninstall

**user: None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

**salt.states.rbenv.install\_rbenv** (*name*, *user=None*)

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `rbenv.root` configuration option to set the path for `rbenv` if you want a system wide install that is not in a user home dir.

**user:** `None` The user to run `rbenv` as.

`salt.states.rbenv.installed`(*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with `rbenv`. `rbenv` is installed if necessary.

**name** The version of ruby to install

**default** [`False`] Whether to make this ruby the default.

**user:** `None` The user to run `rbenv` as.

New in version 0.17.0.

New in version 0.16.0.

### 14.17.188 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.disabled`(*name*)

Disable the RDP service

`salt.states.rdp.enabled`(*name*)

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

### 14.17.189 salt.states.redismod

#### Management of Redis server

New in version 2014.7.0.

**depends**

- `redis` Python module

**configuration** See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The `redis` server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.absent`(*name*, *keys=None*, *\*\*connection\_args*)

Ensure key absent from `redis`

**name** Key to ensure absent from `redis`

**keys** list of keys to ensure absent, `name` will be ignored if this is used

`salt.states.redismod.slaveof`(*name*, *sentinel\_host=None*, *sentinel\_port=None*, *sentinel\_password=None*, *\*\*connection\_args*)

Set this `redis` instance as a slave.

**name** Master to make this a slave of  
**sentinel\_host** Ip of the sentinel to check for the master  
**sentinel\_port** Port of the sentinel to check for the master

`salt.states.redismod.string`(*name, value, expire=None, expireat=None, \*\*connection\_args*)

Ensure that the key exists in redis with the value specified

**name** Redis key to manage

**value** Data to persist in key

**expire** Sets time to live for key in seconds

**expireat** Sets expiration time for key via UNIX timestamp, overrides *expire*

### 14.17.190 salt.states.reg

#### Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

#### Hives

This is the top level of the registry. They all begin with HKEY. - HKEY\_CLASSES\_ROOT (HKCR)  
- HKEY\_CURRENT\_USER(HKCU) - HKEY\_LOCAL\_MACHINE (HKLM) - HKEY\_USER (HKU) -  
HKEY\_CURRENT\_CONFIG

#### Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

#### Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. It is usually `((Default)=(value not set))`. The actual value for the name and the date is Null. The registry editor will display `((Default))` and `((value not set))`.

The following example is taken from the windows startup portion of the registry: ```  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run] "RTHD-  
VCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"  
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update  
Core\\NvBackend.exe\""  
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files  
(x86)\\Intel\\Bluetooth\\btmshellex.dll",TrayApp" ``` In this example these are the  
values for each:

Hive: `HKEY_LOCAL_MACHINE`

Key and subkeys: `SOFTWAREMicrosoftWindowsCurrentVersionRun`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.absent`(*name, vname=None, use\_32bit\_registry=False*)

Ensure a registry value is removed. To remove a key use `key_absent`.

**Parameters** **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include:

- HKEY\_CURRENT\_USER or HKCU
- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_USERS or HKU

**Parameters** **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

**Parameters** **use\_32bit\_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
  - vname: version
```

In the above example the value named `version` will be removed from the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive. If `vname` was not passed, the (Default) value would be deleted.

`salt.states.reg.key_absent` (*name*, *use\_32bit\_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove a key and all value entries it contains. It will fail if the key contains subkeys.

**Parameters** **name** (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:

- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_CURRENT\_USER or HKCU
- HKEY\_USER or HKU

**Parameters** **use\_32bit\_registry** (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

The following example will delete the `SOFTWARE\Salt` key and all subkeys under the `HKEY_CURRENT_USER` hive.

Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.key_absent:
  - force: True
```

In the above example the path is interpreted as follows:

- HKEY\_CURRENT\_USER is the hive
- SOFTWARE\Salt is the key

`salt.states.reg.present` (*name*, *vname=None*, *vdata=None*, *vtype='REG\_SZ'*, *use\_32bit\_registry=False*)

Ensure a registry key or value is present.

**Parameters** **name** (*str*) -- A string value representing the full path of the key to

include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include: - HKEY\_CURRENT\_USER or HKCU - HKEY\_LOCAL\_MACHINE or HKLM - HKEY\_USERS or HKU

**Parameters `vname` (*str*)** -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

**Parameters `vdata` (*str*)** -- The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type for the (Default) value is always REG\_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

**Parameters `vtype` (*str*)** -- The value type for the data you wish to store in the registry. Valid values are:

- REG\_BINARY
- REG\_DWORD
- REG\_EXPAND\_SZ
- REG\_MULTI\_SZ
- REG\_SZ (Default)

**Parameters `use_32bit_registry` (*bool*)** -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

The following example will set the (Default) value for the SOFTWARE\Salt key in the HKEY\_CURRENT\_USER hive to 2016.3.1:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
reg.present:
- vdata: 2016.3.1
```

The following example will set the value for the `version` entry under the SOFTWARE\Salt key in the HKEY\_CURRENT\_USER hive to 2016.3.1. The value will be reflected in `Wow6432Node`:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
reg.present:
- vname: version
- vdata: 2016.3.1
```

In the above example the path is interpreted as follows: - HKEY\_CURRENT\_USER is the hive - SOFTWARE\Salt is the key - `vname` is the value name ('version') that will be created under the key - `vdata` is the data that will be assigned to 'version'

### 14.17.191 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
rsync.synchronized:
```

- source: /home
- force: True

`salt.states.rsync.synchronized`(*name*, *source*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *prepare=False*, *dryrun=False*)

Guarantees that the source directory is always copied to the target.

**name** Name of the target directory.

**source** Source directory.

**prepare** Create destination directory if it does not exist.

**delete** Delete extraneous files from the destination dirs (True or False)

**force** Force deletion of dirs even if not empty

**update** Skip files that are newer on the receiver (True or False)

**passwordfile** Read daemon-access password from the file (path)

**exclude** Exclude files, that matches pattern.

**excludefrom** Read exclude patterns from the file (path)

**dryrun** Perform a trial run with no changes made. Is the same as doing `test=True`

New in version 2016.3.1.

### 14.17.192 salt.states.rvm

#### Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```
rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
```

- openssl
- libreadline6
- libreadline6-dev
- curl
- git-core
- zlib1g
- zlib1g-dev
- libssl-dev
- libyaml-dev
- libsqlite3-0
- libsqlite3-dev
- sqlite3
- libxml2-dev
- libxslt1-dev
- autoconf
- libc6-dev
- libncurses5-dev
- automake
- libtool
- bison
- subversion
- ruby

jruby-deps:

pkg.installed:

- pkgs:
- curl
- g++
- openjdk-6-jre-headless

ruby-1.9.2:

rvm.installed:

- default: True
- user: rvm
- require:
- pkg: rvm-deps
- pkg: mri-deps
- user: rvm

jruby:

rvm.installed:

- user: rvm
- require:
- pkg: rvm-deps
- pkg: jruby-deps
- user: rvm

jgemset:

rvm.gemset\_present:

- ruby: jruby
- user: rvm
- require:
- rvm: jruby

mygemset:

rvm.gemset\_present:

- ruby: ruby-1.9.2
- user: rvm

```
- require:
  - rvm: ruby-1.9.2
```

`salt.states.rvm.gemset_present` (*name*, *ruby='default'*, *user=None*)

Verify that the gemset is present.

**name** The name of the gemset.

**ruby: default** The ruby version this gemset belongs to.

**user: None** The user to run rvm as.

New in version 0.17.0.

`salt.states.rvm.installed` (*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

**name** The version of ruby to install

**default** [False] Whether to make this ruby the default.

**user: None** The user to run rvm as.

New in version 0.17.0.

### 14.17.193 salt.states.salt\_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

This state will configure the salt proxy settings within `/etc/salt/proxy` (if `/etc/salt/proxy` doesn't exist) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.configure_proxy` (*name*, *proxyname='p8000'*, *start=True*)

Create the salt proxy file and start the proxy process if required

**Parameters**

- **name** -- The name of this state
- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started

Example:

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

## 14.17.194 salt.states.saltmod

### Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [The Orchestrate runner](#)

`salt.states.saltmod.function`(*name*, *tgt*, *ssh=False*, *tgt\_type=None*, *expr\_form=None*, *ret='`*,  
*expect\_minions=False*, *fail\_minions=None*, *fail\_function=None*,  
*arg=None*, *kwarg=None*, *timeout=None*, *batch=None*)

Execute a single module function on a remote minion via salt or salt-ssh

**name** The name of the function to run, aka `cmd.run` or `pkg.install`

**tgt** The target specification, aka ``*`` for all minions

**tgt\_type** | **expr\_form** The target type, defaults to `glob`

**arg** The list of arguments to pass into the function

**kwarg** The dict (not a list) of keyword arguments to pass into the function

**ret** Optionally set a single or a list of returners to use

**expect\_minions** An optional boolean for failing if some minions do not respond

**fail\_minions** An optional list of targeted minions where failure is an option

**fail\_function** An optional string that points to a salt module that returns `True` or `False` based on the returned data dict for individual minions

**ssh** Set to `True` to use the ssh client instead of the standard salt client

`salt.states.saltmod.runner`(*name*, *\*\*kwargs*)

Execute a runner module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the runner function

```
run-manage-up:
  salt.runner:
    - name: manage.up
```

`salt.states.saltmod.state`(*name*, *tgt*, *ssh=False*, *tgt\_type=None*, *expr\_form=None*, *ret='`*, *high-state=None*, *sls=None*, *top=None*, *saltenv=None*, *test=False*, *pillar=None*, *expect\_minions=False*, *fail\_minions=None*, *allow\_fail=0*, *concurrent=False*, *timeout=None*, *batch=None*, *queue=False*, *orchestration\_jid=None*)

Invoke a state run on a given target

**name** An arbitrary name used to track the state execution

**tgt** The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

**tgt\_type** | **expr\_form** The target type to resolve, defaults to `glob`

**ret** Optionally set a single or a list of returners to use

**highstate** Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions

**top** Should be the name of a top file. If set state.top is called with this top file instead of state.sls.

**sls** A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files

**test** Pass `test=true` through to the state function

**pillar** Pass the `pillar` kwarg through to the state function

**saltenv** The default salt environment to pull sls files from

**ssh** Set to `True` to use the ssh client instead of the standard salt client

**roster** In the event of using salt-ssh, a roster system can be set

**expect\_minions** An optional boolean for failing if some minions do not respond

**fail\_minions** An optional list of targeted minions where failure is an option

**allow\_fail** Pass in the number of minions to allow for failure before setting the result of the execution to False

**concurrent** Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

**queue** Pass `queue=true` through to the state function

**batch** Execute the command *in batches*. E.g.: 10%.

New in version 2016.3.0.

Examples:

Run a list of sls files via `state.sls` on target minions:

```
webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run a full `state.highstate` on target mininons.

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

`salt.states.saltmod.wait_for_event`(*name, id\_list, event\_id='id', timeout=300, node='master'*)  
Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

**name** An event tag to watch for; supports Reactor-style globbing.

**id\_list** A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

**event\_id** [*id*] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

**timeout** [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
```

```
- name: system.reboot
- tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions
```

`salt.states.saltmod.wheel`(*name*, *\*\*kwargs*)

Execute a wheel module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the wheel function

```
accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank
```

### 14.17.195 salt.states.schedule

#### Management of the Salt scheduler

```
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10
```

This will schedule the command: `test.ping` every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

```
job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
      start: 10
      end: 20
```

This will schedule the command: `test.ping` every 15 seconds splaying the time between 10 and 20 seconds

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
```

```

- httpd
- job_kwargs:
  test: True
- when:
  - Monday 5:00pm
  - Tuesday 3:00pm
  - Wednesday 5:00pm
  - Thursday 3:00pm
  - Friday 5:00pm

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that `python-dateutil` is installed on the minion.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - cron: '*/5 * * * *'

```

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: `state.sls httpd test=True` to run every 5 minutes. Requires that `python-croniter` is installed on the minion.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - when:
      - Monday 5:00pm
      - Tuesday 3:00pm
      - Wednesday 5:00pm
      - Thursday 3:00pm
      - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
      recipient: user@domain.com

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the `xmpp` returner to return the results of the scheduled job, with the alternative configuration options found in the `xmpp_state_run` section.

`salt.states.schedule.absent`(*name*, *\*\*kwargs*)

Ensure a job is absent from the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.disabled`(*name*, *\*\*kwargs*)

Ensure a job is disabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.enabled(name, **kwargs)`

Ensure a job is enabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.present(name, **kwargs)`

Ensure a job is present in the schedule

**name** The unique name that is given to the scheduled job.

**seconds** The scheduled job will be executed after the specified number of seconds have passed.

**minutes** The scheduled job will be executed after the specified number of minutes have passed.

**hours** The scheduled job will be executed after the specified number of hours have passed.

**days** The scheduled job will be executed after the specified number of days have passed.

**when** This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.

**cron** This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.

**run\_on\_start** Whether the job will run when Salt minion start. Value should be a boolean.

**function** The function that should be executed by the scheduled job.

**job\_args** The arguments that will be used by the scheduled job.

**job\_kwargs** The keyword arguments that will be used by the scheduled job.

**maxrunning** Ensure that there are no more than N copies of a particular job running.

**jid\_include** Include the job into the job cache.

**splay** The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.

**range** This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

**once** This will schedule a job to run once on the specified date.

**once\_fmt** The default date format is ISO 8601 but can be overridden by also specifying the once\_fmt option.

**enabled** Whether the job should be enabled or disabled. Value should be a boolean.

**return\_job** Whether to return information to the Salt master upon job completion.

**metadata** Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return\_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.

**returner** The returner to use to return the results of the scheduled job.

**return\_config** The alternative configuration to use for returner configuration options.

**return\_kwargs** Any individual returner configuration items to override. Should be passed as a dictionary.

**persist** Whether the job should persist between minion restarts, defaults to True.

## 14.17.196 salt.states.selinux

### Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
  selinux.mode

samba_create_home_dirs:
  selinux.boolean:
    - value: True
    - persist: True

nginx:
```

```
selinux.module:
  - enabled: False
```

**Note:** Use of these states require that the `selinux` execution module is available.

`salt.states.selinux.boolean` (*name*, *value*, *persist=False*)

Set up an SELinux boolean

**name** The name of the boolean to set

**value** The value to set on the boolean

**persist** Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.mode` (*name*)

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

**Note:** A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

**name** The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.module` (*name*, *module\_state='Enabled'*, *version='any'*)

Enable/Disable and optionally force a specific version for an SELinux module

**name** The name of the module to control

**module\_state** Should the module be enabled or disabled?

**version** Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

New in version 2016.3.0.

## 14.17.197 salt.states.serverdensity\_device

### Monitor Server with Server Density

New in version 2014.7.0.

`Server Density` Is a hosted monitoring service.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

**Note:** Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

```
salt.states.serverdensity_device.monitored(name, group=None, salt_name=True,
                                           salt_params=True, agent_version=1,
                                           **params)
```

Device is monitored with Server Density.

**name** Device name in Server Density.

**salt\_name** If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.

**group** Group name under which device will appear in Server Density dashboard. Default - `None`.

**agent\_version** The agent version you want to use. Valid values are 1 or 2. Default - 1.

**salt\_params** If `True` (default), needed config parameters will be sourced from grains and from `status.all_status`.

**params** Add parameters that you want to appear in the Server Density dashboard. Will overwrite the `salt_params` parameters. For more info, see the [API docs](#).

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

## 14.17.198 salt.states.service

### Starting or restarting of services and daemons

Services are defined as system daemons typically started with system init or rc scripts. The service state uses whichever service module that is loaded on the minion with the virtualname of `service`. Services can be defined as running or dead.

If you need to know if your init system is supported, see the list of supported `service` modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the [Overriding Virtual Module Providers](#) section of Salt's module documentation to work around possible errors.

---

**Note:** The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

---

```
httpd:
  service.running: []
```

The service can also be set to be started at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is by default restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

---

**Note:** More details regarding watch can be found in the [Requisites](#) documentation.

---

**salt.states.service.dead**(*name*, *enable=None*, *sig=None*, *\*\*kwargs*)

Ensure that the named service is dead by stopping the service if it is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with ps

**salt.states.service.disabled**(*name*, *\*\*kwargs*)

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the `enable: False` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

**salt.states.service.enabled**(*name*, *\*\*kwargs*)

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the `enable: True` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

**salt.states.service.mod\_watch**(*name*, *sfun=None*, *sig=None*, *reload=False*, *full\_restart=False*, *init\_delay=None*, *force=False*, *\*\*kwargs*)

The service watcher, called to invoke the watch command.

**name** The name of the init or rc script used to manage the service

**sfun** The original function which triggered the mod\_watch call (*service.running*, for example).

**sig** The string to search for when looking for the service process with ps

**reload** Use reload instead of the default restart (exclusive option with `full_restart`, defaults to reload if both are used)

**full\_restart** Use `service.full_restart` instead of restart (exclusive option with reload)

**force** Use `service.force_reload` instead of reload (needs reload to be set to True)

**init\_delay** Add a sleep command (in seconds) before the service is restarted/reloaded

`salt.states.service.running` (*name*, *enable=None*, *sig=None*, *init\_delay=None*, *\*\*kwargs*)

Ensure that the service is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with ps

**init\_delay** Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an `init_delay` to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

Note:

**watch** can be used with `service.running` to restart a service when another state changes ( example: a `file.managed` state that creates the service's config file ). More details regarding `watch` can be found in the [Requisites](#) documentation.

## 14.17.199 salt.states.slack

### Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.post_message` (*name*, *channel*, *from\_name*, *message*, *api\_key=None*, *icon=None*)

Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

**name** The unique name for this event.

**channel** The channel to send the message to. Can either be the ID or the name.

**from\_name** The name of that is to be shown in the `from` field.

**message** The message that is to be sent to the Slack channel.

The following parameters are optional:

**api\_key** The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

**icon** URL to an image to use as the icon for this message

### 14.17.200 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** vmadm, imgadm

**platform** smartos

New in version 2016.3.0.

```

vmtest.example.org:
  smartos.vm_present:
    - config:
      reprovision: true
    - vmconfig:
      image_uuid: c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
      brand: joyent
      alias: vmtest

  disk0
    size: 2048
    model: virtio
    compression: lz4
    boot: true
nics:
  "82:1b:8e:49:e9:15"
    nic_tag: trunk
    mtu: 1500
    ips:
      - dhcp
    vlan_id: 30

cleanup_images:
  smartos.image_vacuum
```

---

**Note:** Keep in mind that when removing properties from `vmconfig` they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via `add_*`, `set_*`, `update_*`, and `remove_*`. Properties must be manually reset to their default value. The same behavior as when using ``vmadm update'`.

---

**salt.states.smartos.config\_absent**(*name*)  
Ensure configuration property is absent in `/usbkey/config`  
**name** [string] name of property

**salt.states.smartos.config\_present**(*name*, *value*)  
Ensure configuration property is set to value in `/usbkey/config`  
**name** [string] name of property  
**value** [string] value of property

**salt.states.smartos.image\_absent**(*name*)  
Ensure image is absent on the `computenode`  
**name** [string] uuid of image

---

**Note:** `computenode.image_absent` will only remove the image if it is not used by a vm.

---

**salt.states.smartos.image\_present**(*name*)  
Ensure image is present on the `computenode`  
**name** [string] uuid of image

**salt.states.smartos.image\_vacuum**(*name*)  
Delete images not in use or installed via `image_present`

**salt.states.smartos.vm\_absent**(*name*, *archive=False*)  
Ensure vm is absent on the `computenode`  
**name** [string] hostname of vm  
**archive** [boolean] toggle archiving of vm on removal

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

**salt.states.smartos.vm\_present**(*name*, *vmconfig*, *config=None*)

Ensure vm is present on the computenode  
**name** [string] hostname of vm  
**vmconfig** [dict] options to set for the vm  
**config** [dict] fine grain control over vm\_present

**Note:**

The following configuration properties can be toggled in the config parameter.

- `kvm_reboot` (true) - reboots of kvm zones if needed for a config update
- `auto_import` (false) - automatic importing of missing images
- `reprovision` (false) - reprovision on image\_uuid changes

**Note:** State ID is used as hostname. Hostnames must be unique.

**Note:** If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

**Note:**

The following instances should have a unique ID.

- `nic` : mac
- `filesystem`: target
- `disk` : path or diskN for zvols

e.g. `disk0` will be the first disk added, `disk1` the 2nd,...

`salt.states.smartos.vm_running(name)`

Ensure vm is in the running state on the computenode

**name** [string] hostname of vm

**Note:** State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.vm_stopped(name)`

Ensure vm is in the stopped state on the computenode

**name** [string] hostname of vm

**Note:** State ID is used as hostname. Hostnames must be unique.

## 14.17.201 salt.states.smtp

### Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
```

```
- profile: my-smtp-account
- recipient: admins@example.com
```

`salt.states.smtp.send_msg`(*name, recipient, subject, sender, profile, use\_ssl='True'*)  
Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
```

**name** The message to send via SMTP

### 14.17.202 salt.states.snapper module

#### Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```
my_baseline_external_storage:
  snapper.baseline_snapshot:
    • tag: my_custom_baseline_tag
```

- config: external
- ignore: - /mnt/tmp\_files/

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache

hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

**Warning:** Do not specify more than one baseline rule as only the last one will affect the result.

**codeauthor** Duncan Mac-Vicar P. <dmacvicar@suse.de>

**codeauthor** Pablo Suárez Hernández <psuarezhernandez@suse.de>

**maturity** new

**platform** Linux

**salt.states.snapper.baseline\_snapshot** (*name*, *number=None*, *tag=None*, *include\_diff=True*, *config='root'*, *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

**number** Number of selected baseline snapshot.

**tag** Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

**include\_diff** Include a diff in the response (Default: True)

**config** Snapper config name (Default: root)

**ignore** List of files to ignore. (Default: None)

### 14.17.203 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
  splunk.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
```

**salt.states.splunk.absent** (*email, profile='splunk', \*\*kwargs*)

Ensure a splunk user is absent

```
ensure example test user 1:
  splunk.absent:
    - email: 'example@domain.com'
    - name: 'exampleuser'
```

The following parameters are required:

**email** This is the email of the user in splunk

**name** This is the splunk username used to identify the user.

**salt.states.splunk.present** (*email, profile='splunk', \*\*kwargs*)

Ensure a user is present

```
ensure example test user 1:
  splunk.user_present:
    - realname: 'Example TestUser1'
    - name: 'exampleuser'
    - email: 'example@domain.com'
    - roles: ['user']
```

The following parameters are required:

**email** This is the email of the user in splunk

### 14.17.204 salt.states.splunk\_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```
server-warning-message:
  splunk_search.present:
    - name: This is the splunk search name
    - search: index=main sourcetype=
```

**salt.states.splunk\_search.absent** (*name, profile='splunk'*)

Ensure a search is absent

```
API Error Search:
  splunk_search.absent
```

The following parameters are required:  
**name** This is the name of the search in splunk

`salt.states.splunk_search.present` (*name*, *profile='splunk'*, *\*\*kwargs*)  
 Ensure a search is present

```
API Error Search:
  splunk_search.present:
    search: index=main sourcetype=blah
    template: alert_5min
```

The following parameters are required:  
**name** This is the name of the search in splunk

### 14.17.205 salt.states.sqlite3

#### Management of SQLite3 databases

##### depends

- SQLite3 Python Module

**configuration** See `salt.modules.sqlite3` for setup instructions

New in version 2016.3.0.

The `sqlite3` module is used to create and manage `sqlite3` databases and execute queries

Here is an example of creating a table using `sql` statements:

```
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
    ↪ `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using `yaml/jinja` instead of `sql`:

```
users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
      - email TEXT COLLATE NOCASE UNIQUE NOT NULL
      - firstname TEXT NOT NULL
      - lastname TEXT NOT NULL
      - company TEXT NOT NULL
      - password BLOB NOT NULL
      - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```
badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite
```

Sometimes you would have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```
user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
    - data:
      email: john.doe@companyxyz.com
      lastname: doe
      firstname: john
      company: companyxyz.com
      password: abcdef012934125
      salt: abcdef012934125
    - require:
      - sqlite3: users
```

Here is an example of removing a row from a table:

```
user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users
```

`salt.states.sqlite3.row_absent`(*name*, *db*, *table*, *where\_sql*, *where\_args=None*)

Makes sure the specified row is absent in db. If multiple rows match *where\_sql*, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in *where\_sql*

`salt.states.sqlite3.row_present`(*name*, *db*, *table*, *data*, *where\_sql*, *where\_args=None*, *update=False*)

Checks to make sure the given row exists. If row exists and *update* is `True` then row will be updated with *data*. Otherwise it will leave existing row unmodified and check it against *data*. If the existing data doesn't match *data\_check* the state will fail. If the row doesn't exist then it will insert data into the table. If more than one row matches, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check the data

**data** The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in *where\_sql*

**update** `True` will replace the existing row with *data* When `False` and the row exists and *data* does not equal the row data then the state will fail

`salt.states.sqlite3.table_absent`(*name*, *db*)

Make sure the specified table does not exist

**name** The name of the table

**db** The name of the database file

`salt.states.sqlite3.table_present`(*name*, *db*, *schema*, *force=False*)

Make sure the specified table exists with the specified schema

- name** The name of the table
- db** The name of the database file
- schema** The dictionary containing the schema information
- force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

### 14.17.206 salt.states.ssh\_auth

#### Control of entries in SSH authorized\_key files

The information stored in a user's SSH authorized key file can be easily controlled via the `ssh_auth` state. Defaults can be set by the `enc`, `options`, and `comment` keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment
```

**salt.states.ssh\_auth.absent** (*name*, *user*, *enc*='ssh-rsa', *comment*='', *source*='', *options*=None, *config*='.ssh/authorized\_keys')

Verifies that the specified SSH key is absent

**name** The SSH key to manage

**user** The user who owns the SSH authorized keys file to modify

**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

**comment** The comment to be placed with the SSH public key

**options** The options passed to the key, pass a list object

**source** The source file for the key(s). Can contain any number of public keys, in standard ``authorized\_keys`` format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.

**salt.states.ssh\_auth.present**(*name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized\_keys', \*\*kwargs*)

Verifies that the specified SSH key is present for the specified user

**name** The SSH key to manage

**user** The user who owns the SSH authorized keys file to modify

**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

**comment** The comment to be placed with the SSH public key

**source** The source file for the key(s). Can contain any number of public keys, in standard ``authorized\_keys`` format. If this is set, comment and enc will be ignored.

---

**Note:** The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
  2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized\_keys file.
  3. Paste it into a new file.
- 

**options** The options passed to the key, pass a list object

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.

## 14.17.207 salt.states.ssh\_known\_hosts

### Control of SSH known\_hosts entries

Manage the information stored in the known\_hosts files.

```
github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48

example.com:
  ssh_known_hosts:
    - absent
    - user: root
```

**salt.states.ssh\_known\_hosts.absent**(*name, user=None, config=None*)

Verifies that the specified host is not known by the given user

**name** The host name

**user** The user who owns the ssh authorized keys file to modify

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to ``/etc/ssh/ssh\_known\_hosts``. If present, must be an absolute path when a user is not specified.

```

salt.states.ssh_known_hosts.present(name, user=None, fingerprint=None,
                                     key=None, port=None, enc=None, config=None,
                                     hash_known_hosts=True, timeout=5, finger-
                                     print_hash_type=None)

```

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

**name** The name of the remote host (e.g. `github.com`)

**user** The user who owns the ssh authorized keys file to modify

**fingerprint** The fingerprint of the key which must be present in the `known_hosts` file (optional if key specified)

**key** The public key which must be present in the `known_hosts` file (optional if fingerprint specified)

**port** optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

**enc** Defines what type of key is being used, can be `ed25519`, `ecdsa ssh-rsa` or `ssh-dss`

**config** The location of the authorized keys file relative to the user's home directory, defaults to `ssh/known_hosts`. If no user is specified, defaults to `etc/ssh/ssh_known_hosts`. If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `md5` if not specified.

New in version 2016.11.4.

---

**Note:** The default value of the `fingerprint_hash_type` will change to `sha256` in Salt Nitrogen.

---

## 14.17.208 salt.states.stateconf

### Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

```

salt.states.stateconf.context(name, **kwargs)

```

No-op state to support state config via the stateconf renderer.

```

salt.states.stateconf.set(name, **kwargs)

```

No-op state to support state config via the stateconf renderer.

## 14.17.209 salt.states.status

Minion status monitoring

Maps to the `status` execution module.

```

salt.states.status.loadavg(name, maximum=None, minimum=None)

```

Return the current load average for the specified minion. Available values for name are `1-min`, `5-min` and `15-min`. `minimum` and `maximum` values should be passed in as strings.

`salt.states.status.process`(*name*)

Return whether the specified signature is found in the process tree. This differs slightly from the `services` states, in that it may refer to a process that is not managed via the init system.

### 14.17.210 `salt.states.stormpath_account`

Support for Stormpath.

New in version 2015.8.0.

`salt.states.stormpath_account.absent`(*name*, *directory\_id=None*)

Ensure that an account associated with the given email address is absent. Will search all directories for the account, unless a `directory_id` is specified.

**name** The email address of the account to delete.

**directory\_id** Optional. The ID of the directory that the account is expected to belong to. If not specified, then a list of directories will be retrieved, and each will be scanned for the account. Specifying a `directory_id` will therefore cut down on the number of requests to Stormpath, and increase performance of this state.

`salt.states.stormpath_account.present`(*name*, *\*\*kwargs*)

Ensure that an account is present and properly configured

**name** The email address associated with the Stormpath account

**directory\_id** The ID of a directory which the account belongs to. Required.

**password** Required when creating a new account. If specified, it is advisable to reference the password in another database using an `sdb://` URL. Will NOT update the password if an account already exists.

**givenName** Required when creating a new account.

**surname** Required when creating a new account.

**username** Optional. Must be unique across the owning directory. If not specified, the username will default to the email field.

**middleName** Optional.

**status** `enabled` accounts are able to login to their assigned applications, `disabled` accounts may not login to applications, `unverified` accounts are disabled and have not verified their email address.

**customData**. Optional. Must be specified as a dict.

### 14.17.211 `salt.states.supervisord`

#### Interaction with the Supervisor daemon

```
wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

`salt.states.supervisord.dead`(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*, *\*\*kwargs*)

Ensure the named service is dead (not running).

**name** Service name as defined in the supervisor configuration file

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.running`(*name*, *restart=False*, *update=False*, *user=None*, *conf\_file=None*, *bin\_env=None*, *\*\*kwargs*)

Ensure the named service is running.

**name** Service name as defined in the supervisor configuration file

**restart** Whether to force a restart

**update** Whether to update the supervisor configuration.

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

## 14.17.212 salt.states.svn

### Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:

```
subversion:
  pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
  svn.latest:
    - target: /tmp/swallow
```

`salt.states.svn.dirty`(*name*, *target*, *user=None*, *username=None*, *password=None*, *ignore\_unversioned=False*)

Determine if the working directory has been changed.

`salt.states.svn.export`(*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *overwrite=False*, *externals=True*, *trust=False*)

Export a file or directory from an SVN repository

**name** Address and path to the file or directory to be exported.

**target** Name of the target directory where the checkout will put the working directory

**rev** [None] The name revision number to checkout. Enable ``force" if the directory already exists.

**user** [None] Name of the user performing repository management operations

**username** [None] The user to access the name repository with. The svn default is the current user

**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered

**overwrite** [False] Overwrite existing target

**externals** [True] Change to False to not checkout or update externals

**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert

`salt.states.svn.latest`(*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *externals=True*, *trust=False*)

Checkout or update the working directory to the latest revision from the remote repository.

**name** Address of the name repository as passed to ``svn checkout"

**target** Name of the target directory where the checkout will put the working directory

**rev** [None] The name revision number to checkout. Enable ``force" if the directory already exists.

**user** [None] Name of the user performing repository management operations

**username** [None] The user to access the name repository with. The svn default is the current user

**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered  
**externals** [True] Change to False to not checkout or update externals  
**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert

### 14.17.213 salt.states.sysctl

#### Configuration of the Linux kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:  
  sysctl.present:  
    - value: 20
```

**salt.states.sysctl.present** (*name*, *value*, *config=None*)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is `/etc/sysctl.conf`

**name** The name of the sysctl value to edit

**value** The sysctl value to apply

**config** The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

### 14.17.214 salt.states.syslog\_ng

#### State module for syslog\_ng

**maintainer** Tibor Benke <[btibi@sch.bme.hu](mailto:btibi@sch.bme.hu)>

**maturity** new

**depends** cmd, ps, syslog\_ng

**platform** all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

#### Details

The service module is not available on all system, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see syslog-ng state usage.

#### Syslog-ng configuration file format

The syntax of a configuration snippet in `syslog-ng.conf`:

```
object_type object_id {<options>;
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: <http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5>

```
salt.states.syslog_ng.config(name, config, write=True)
```

Builds syslog-ng configuration.

**name** : the id of the Salt document config : the parsed YAML code  
**write** : if True, it writes the config into the configuration file, otherwise just returns it

```
salt.states.syslog_ng.reloaded(name)
```

Reloads syslog-ng.

```
salt.states.syslog_ng.started(name=None, user=None, group=None, chroot=None, caps=None,
                               no_caps=False, pidfile=None, enable_core=False, fd_limit=None,
                               verbose=False, debug=False, trace=False, yydebug=False, per-
                               sist_file=None, control=None, worker_threads=None, *args,
                               **kwargs)
```

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

```
salt.states.syslog_ng.stopped(name=None)
```

Kills syslog-ng.

#### 14.17.215 salt.states.sysrc

```
salt.states.sysrc.absent(name, **kwargs)
```

Ensure a sysrc variable is absent.

**name** The variable name to set

**file** (optional) The rc file to add the variable to.

**jail** (option) the name or JID of the jail to set the value in.

```
salt.states.sysrc.managed(name, value, **kwargs)
```

Ensure a sysrc variable is set to a specific value.

**name** The variable name to set

**value** Value to set the variable to

**file** (optional) The rc file to add the variable to.

**jail** (option) the name or JID of the jail to set the value in.

Example:

```
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

#### 14.17.216 salt.states.telemetry\_alert

New in version 2016.3.0..

##### Manage Telemetry alert configurations

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
  telemetry_alert.present:
    - deployment_id: "rs-XXXXXX"
    - metric_name: "testMetric"
    - alert_config:
      max: 1
      filter: SERVER_ROLE_MONGOD_PRIMARY
      escalate_to: "example@pagerduty.com"
    - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

**salt.states.telemetry\_alert.absent**(*name, deployment\_id, metric\_name, api\_key=None, profile='telemetry'*)

Ensure the telemetry alert config is deleted

**name** An optional description of the alarms (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**api\_key** Telemetry api key for the user

**profile** A dict with telemetry config data. If present, will be used instead of **api\_key**.

**salt.states.telemetry\_alert.present**(*name, deployment\_id, metric\_name, alert\_config, api\_key=None, profile='telemetry'*)

Ensure the telemetry alert exists.

**name** An optional description of the alarm (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**alert\_config:** Is a list of dictionaries where each dict contains the following fields:

**filter** By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.

**min** the smallest ``ok`` value the metric may take on; if missing or null, no minimum is enforced.

**max** the largest ``ok`` value the metric may take on; if missing or null, no maximum is enforced.

**notify\_all** Used to indicate if you want to alert both onCallEngineer and apiNotifications

**api\_key** Telemetry api key for the user

**profile** A dict of telemetry config information. If present, will be used instead of **api\_key**.

### 14.17.217 salt.states.test

#### Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```
always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo
```

```

always-fails:
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

```

`salt.states.test.check_pillar`(*name*, *present=None*, *boolean=None*, *integer=None*, *string=None*, *listing=None*, *dictionary=None*, *verbose=False*)

Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

```

`salt.states.test.configurable_test_state`(*name*, *changes=True*, *result=True*, *comment=''*)

A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.

**name:** A unique string.

**changes:** Do we return anything in the changes field? Accepts True, False, and `Random` Default is True

**result:** Do we return successfully or not? Accepts True, False, and `Random` Default is True If test is True and changes is True, this will be None. If test is True and changes is False, this will be True.

**comment:** String to fill the comment field with. Default is ``

`salt.states.test.fail_with_changes`(*name*)

Returns failure and changes is not empty.

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.fail_without_changes`(*name*)

Returns failure.

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.mod_watch(name, sfun=None, **kwargs)`

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```
this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes
```

`salt.states.test.nop(name, **kwargs)`

A no-op state that does nothing. Useful in conjunction with the `use` requisite, or in templates which could otherwise be empty due to jinja rendering

New in version 2015.8.1.

`salt.states.test.show_notification(name, text=None, **kwargs)`

Simple notification using text argument.

New in version 2015.8.0.

**name** A unique string.

**text** Text to return in the comment.

`salt.states.test.succeed_with_changes(name)`

Returns successful and changes is not empty

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.succeed_without_changes(name)`

Returns successful.

New in version 2014.7.0.

**name** A unique string.

### 14.17.218 salt.states.testinframod module

### 14.17.219 salt.states.timezone

#### Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

**salt.states.timezone.system**(*name, utc=True*)

Set the timezone for the system.

**name** The name of the timezone to use (e.g.: America/Denver)

**utc** Whether or not to set the hardware clock to UTC (default is True)

### 14.17.220 salt.states.tls

#### Enforce state for SSL/TLS

**salt.states.tls.valid\_certificate**(*name, weeks=0, days=0, hours=0, minutes=0, seconds=0*)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

### 14.17.221 salt.states.tomcat

#### Manage Apache Tomcat web applications

---

**Note:** This state requires the Tomcat Manager webapp to be installed and running.

---

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```

#### Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 14.1: conf/tomcat-users.xml

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

## Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

- Last tested on:

Tomcat Version: Apache Tomcat/7.0.54

JVM Vendor: Oracle Corporation

JVM Version: 1.8.0\_101-b13

OS Architecture: amd64

OS Name: Linux

OS Version: 3.10.0-327.22.2.el7.x86\_64

`salt.states.tomcat.mod_watch` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

The tomcat watcher function. When called it will reload the webapp in question

`salt.states.tomcat.undeployed` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Enforce that the WAR will be undeployed from the server

**name** The context path to undeploy.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

`salt.states.tomcat.wait` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the tomcat.war\_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```

tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager

```

`salt.states.tomcat.war_deployed`(*name*, *war*, *force=False*, *url='http://localhost:8080/manager'*, *timeout=180*, *temp\_war\_location=None*, *version=True*)

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

---

**Note:** For more info about Tomcats file paths and context naming, please see <http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming>

---

**name** The context path to deploy (incl. forward slash) the WAR to.

**war** Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

**force** [False] Force deployment even if the version strings are the same. Disabled by default.

**url** [<http://localhost:8080/manager>] The URL of the Tomcat Web Application Manager.

**timeout** [180] Timeout for HTTP requests to the Tomcat Manager.

**temp\_war\_location** [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

**version** [``] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```

jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-jenkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service

```

---

**Note:** Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set `version` to `False`.

---

### 14.17.222 salt.states.trafficserver

#### Control Apache Traffic Server

New in version 2015.8.0.

**salt.states.trafficserver.bounce\_cluster**(*name*)

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

**salt.states.trafficserver.bounce\_local**(*name*, *drain=False*)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

**salt.states.trafficserver.clear\_cluster**(*name*)

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
  trafficserver.clear_cluster
```

**salt.states.trafficserver.clear\_node**(*name*)

Clears accumulated statistics on the local node.

```
clear_ats_node:
  trafficserver.clear_node
```

**salt.states.trafficserver.config**(*name*, *value*)

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
  trafficserver.config:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

**salt.states.trafficserver.offline**(*name*, *path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have

used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic\_server process.

```
offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache
```

#### `salt.states.trafficserver.refresh(name)`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
refresh_ats:
  trafficserver.refresh
```

#### `salt.states.trafficserver.restart_cluster(name)`

Restart the traffic\_manager process and the traffic\_server process on all the nodes in a cluster.

```
restart_ats_cluster:
  trafficserver.restart_cluster
```

#### `salt.states.trafficserver.restart_local(name, drain=False)`

Restart the traffic\_manager and traffic\_server processes on the local node.

This option modifies the behavior of traffic\_line -b and traffic\_line -L such that traffic\_server is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
restart_ats_local:
  trafficserver.restart_local

restart_ats_local_drain:
  trafficserver.restart_local
  - drain: True
```

#### `salt.states.trafficserver.set_var(name, value)`

Set Traffic Server configuration variable values.

Deprecated since version Oxygen: Use `trafficserver.config` instead.

```
proxy.config.proxy_name:
  trafficserver.set_var:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
  trafficserver.set_var:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

#### `salt.states.trafficserver.shutdown(name)`

Shut down Traffic Server on the local node.

```
shutdown_ats:
  trafficserver.shutdown
```

`salt.states.trafficserver.startup(name)`

Start Traffic Server on the local node.

```
startup_ats:
  trafficserver.startup
```

`salt.states.trafficserver.zero_cluster(name)`

Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

`salt.states.trafficserver.zero_node(name)`

Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

### 14.17.223 salt.states.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <[alicsyed@gmail.com](mailto:alicsyed@gmail.com)>

**maturity** new

**depends** cmd.run

**platform** Linux

`salt.states.tuned.off(name=None)`

Turns `tuned` off. Example tuned.sls file for turning tuned off:

```
tuned: tuned.off: []
```

To see a valid list of states call execution module: `tuned.list`

`salt.states.tuned.profile(name)`

This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest

```
tuned:
```

```
  tuned:
```

- profile
- name: virtual-guest

**name** tuned profile name to set the system to

To see a valid list of states call execution module: `tuned.list`

### 14.17.224 salt.states.uptime

#### Monitor Web Server with Uptime

[Uptime](#) is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

**salt.states.uptime.monitored**(*name*, *\*\*params*)

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

### 14.17.225 salt.states.user

#### Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

**salt.states.user.absent**(*name*, *purge=False*, *force=False*)

Ensure that the named user is absent

**name** The name of the user to remove

**purge** Set purge to True to delete all of the user's files as well as the user, Default is False.

**force** If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is False.

**salt.states.user.present**(*name*, *uid=None*, *gid=None*, *gid\_from\_name=False*, *groups=None*, *optional\_groups=None*, *remove\_groups=True*, *home=None*, *createhome=True*, *password=None*, *hash\_password=False*, *enforce\_password=True*, *empty\_password=False*, *shell=None*, *unique=True*, *system=False*, *full\_name=None*, *roomnumber=None*, *workphone=None*, *homephone=None*, *loginclass=None*, *date=None*, *mindays=None*, *maxdays=None*, *inactdays=None*, *warndays=None*, *expire=None*, *win\_homedrive=None*, *win\_profile=None*, *win\_logonscript=None*, *win\_description=None*)

Ensure that the named user is present with the specified properties

**name** The name of the user to manage

**uid** The user id to assign, if left empty then the next available user id will be assigned

**gid** The default group id. Also accepts group name.

**gid\_from\_name** If True, the default group id will be set to the id of the group with the same name as the user, Default is `False`.

**groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

**optional\_groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both ``groups`` and ``optional\_groups``, then it will be assumed to be required and not optional.

**remove\_groups** Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

**home** The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if `createhome` is set to `True`.

**createhome** [`True`] If set to `False`, the home directory will not be created if it doesn't already exist.

**Warning:** Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for `home` must already exist.

**password** A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

Changed in version 0.16.0: BSD support added.

**hash\_password** Set to `True` to hash the clear text password. Default is `False`.

**enforce\_password** Set to `False` to keep the password from being changed if it has already been set and the password hash differs from what is specified in the ``password`` field. This option will be ignored if ``password`` is not specified, Default is `True`.

**empty\_password** Set to `True` to enable password-less login for user, Default is `False`.

**shell** The login shell, defaults to the system default shell

**unique** Require a unique UID, Default is `True`.

**system** Choose UID in the range of `FIRST_SYSTEM_UID` and `LAST_SYSTEM_UID`, Default is `False`.

**loginclass** The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

**fullname** The user's full name

**roomnumber** The user's room number (not supported in MacOS)

**workphone** The user's work phone number (not supported in MacOS)

**homephone** The user's home phone number (not supported in MacOS) If GECOS field contains more than 3 commas, this field will have the rest of `em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

**date** Date of last change of password, represented in days since epoch (January 1, 1970).

**mindays** The minimum number of days between password changes.

**maxdays** The maximum number of days between password changes.

**inactdays** The number of days after a password expires before an account is locked.

**warndays** Number of days prior to maxdays to warn users.

**expire** Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

**win\_homedrive (Windows Only)** The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie:  
- win\_homedrive: `U`:

Changed in version 2015.8.0.

**win\_profile (Windows Only)** The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

**win\_logonscript (Windows Only)** The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

**win\_description (Windows Only)** A brief description of the purpose of the users account.

Changed in version 2015.8.0.

### 14.17.226 salt.states.vbox\_guest

VirtualBox Guest Additions installer state

**salt.states.vbox\_guest.additions\_installed**(*name, reboot=False, upgrade\_os=False*)

Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

**name** The name has no functional value and is only used as a tracking reference.

**reboot** [False] Restart OS to complete installation.

**upgrade\_os** [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

**salt.states.vbox\_guest.additions\_removed**(*name, force=False*)

Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).

**name** The name has no functional value and is only used as a tracking reference.

**force** Force VirtualBox Guest Additions removing.

**salt.states.vbox\_guest.grant\_access\_to\_shared\_folders\_to**(*name, users=None*)

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*.

**name** Name of the user to grant access to auto-mounted shared folders to.

**users** List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

### 14.17.227 salt.states.victorops

#### Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```
webservice-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
```

```
- entity_id: 'webserver/diskspace'
- state_message: 'Webserver disk space is low.'
```

`salt.states.victorops.create_event` (*name*, *message\_type*, *routing\_key*='everyone', *\*\*kwargs*)  
Create an event on the VictorOps service

```
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver disk space is low.'

database-server-warning-message:
  victorops.create_event:
    - message_type: 'WARNING'
    - entity_id: 'db_server/load'
    - state_message: 'Database Server load is high.'
    - entity_is_host: True
    - entity_display_name: 'dbdserver.example.com'
```

The following parameters are required:

**name** This is a short description of the event.

**message\_type** One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

**routing\_key** The key for where messages should be routed. By default, sent to `everyone` route.

**entity\_id** The name of alerting entity. If not provided, a random name will be assigned.

**timestamp** Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

**timestamp\_fmt** The date format for the timestamp parameter. Defaults to `'%Y-%m-%dT%H:%M:%S'`.

**state\_start\_time** The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

**state\_start\_time\_fmt** The date format for the timestamp parameter. Defaults to `'%Y-%m-%dT%H:%M:%S'`.

**state\_message** Any additional status information from the alert item.

**entity\_is\_host** Used within VictorOps to select the appropriate display format for the incident.

**entity\_display\_name** Used within VictorOps to display a human-readable name for the entity.

**ack\_message** A user entered comment for the acknowledgment.

**ack\_author** The user that acknowledged the incident.

### 14.17.228 salt.states.virt module

#### Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```
libvirt_keys:
  virt.keys
```

`salt.states.virt.keys` (*name*, *basepath*='/etc/pki')

Manage libvirt keys.

**name** The name variable used to track the execution

**basepath** Defaults to `/etc/pki`, this is the root location used for libvirt keys on the hypervisor

`salt.states.virt.powered_off(name)`

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.rebooted(name)`

Reboots VMs

New in version 2016.3.0.

**Parameters** `name` --

**Returns**

`salt.states.virt.reverted(name, snapshot=None, cleanup=False)`

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
  virt.reverted:
    - cleanup: True

domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False
```

`salt.states.virt.running(name, **kwargs)`

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

```
domain_name:
  virt.running
```

```
domain_name:
  virt.running:
    - cpu: 2
    - mem: 2048
    - eth0_mac: 00:00:6a:53:00:e3
```

`salt.states.virt.saved(name, suffix=None)`

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic
```

`salt.states.virt.snapshot`(*name*, *suffix=None*)

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic
```

`salt.states.virt.stopped`(*name*)

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.unpowered`(*name*)

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

### 14.17.229 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

`salt.states.virtualenv_mod.managed`(*name*, *venv\_bin=None*, *requirements=None*, *system\_site\_packages=False*, *distribute=False*, *use\_wheel=False*, *clear=False*, *python=None*, *extra\_search\_dir=None*, *never\_download=None*, *prompt=None*, *user=None*, *no\_chown=False*, *cwd=None*, *index\_url=None*, *extra\_index\_url=None*, *pre\_releases=False*, *no\_deps=False*, *pip\_download=None*, *pip\_download\_cache=None*, *pip\_exists\_action=None*, *pip\_ignore\_installed=False*, *proxy=None*, *use\_vt=False*, *env\_vars=None*, *no\_use\_wheel=False*, *pip\_upgrade=False*, *pip\_pkgs=None*, *pip\_no\_cache\_dir=False*, *pip\_cache\_dir=None*)

Create a virtualenv and optionally manage it with pip

**name** Path to the virtualenv.

**requirements**: **None** Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

**use\_wheel**: **False** Prefer wheel archives (requires pip >= 1.4).

**python** [None] Python executable used to build the virtualenv

**user**: **None** The user under which to run virtualenv and pip.

**no\_chown:** **False** When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)

**cwd:** **None** Path to the working directory where *pip install* is executed.

**no\_deps:** **False** Pass *--no-deps* to *pip install*.

**pip\_exists\_action:** **None** Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

**proxy:** **None** Proxy address which is passed to *pip install*.

**env\_vars:** **None** Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling.

**no\_use\_wheel:** **False** Force to not use wheel archives (requires `pip>=1.4`)

**pip\_upgrade:** **False** Pass *--upgrade* to *pip install*.

**pip\_pkgs:** **None** As an alternative to *requirements*, pass a list of pip packages that should be installed. Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `-distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
```

### 14.17.230 salt.states.win\_certutil module

#### Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher
```

`salt.states.win_certutil.add_store` (*name*, *store*, *saltenv*='base')

Store a certificate to the given store

**name** The certificate to store, this can use local paths or `salt://` paths

**store** The store to add the certificate to

**saltenv** The salt environment to use, this is ignored if a local path is specified

`salt.states.win_certutil.del_store` (*name*, *store*, *saltenv*='base')

Remove a certificate in the given store

**name** The certificate to remove, this can use local paths or `salt://` paths

**store** The store to remove the certificate from

**saltenv** The salt environment to use, this is ignored if a local path is specified

### 14.17.231 salt.states.win\_dacl

Windows Object Access Control Lists

Ensure an ACL is present

**parameters:** *name* - the path of the object *objectType* - Registry/File/Directory *user* - user account or SID for the ace *permission* - permission for the ace (see module `win_acl` for available permissions for each *objectType*) *acetype* - Allow/Deny propagation - how the ACL should apply to child objects (see module `win_acl` for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

#### Ensure an ACL does not exist

**parameters:** name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win\_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win\_acl for available propagation types)

#### removeAcl:

##### win\_dacl.absent:

- name: HKEY\_LOCAL\_MACHINESOFTWAREmykey
- objectType: Registry
- user: FakeUser
- permission: FullControl
- acetype: ALLOW
- propagation: KEY&SUBKEYS

#### Ensure an object is inheriting permissions

**parameters:** name - the path of the object objectType - Registry/File/Directory clear\_existing\_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

#### eInherit:

##### win\_dacl.enableinheritance:

- name: HKEY\_LOCAL\_MACHINESOFTWAREmykey
- objectType: Registry
- clear\_existing\_acl: True

#### Ensure an object is not inheriting permissions

**parameters:** name - the path of the object objectType - Registry/File/Directory copy\_inherited\_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

#### dInherit:

##### win\_dacl.disableinheritance:

- name: HKEY\_LOCAL\_MACHINESOFTWAREmykey

- objectType: Registry
- copy\_inherited\_acl: False

`salt.states.win_dacl.absent`(*name, objectType, user, permission, acetype, propagation*)  
Ensure a Linux ACL does not exist

`salt.states.win_dacl.disinherit`(*name, objectType, copy\_inherited\_acl=True*)  
Ensure an object is not inheriting ACLs from its parent

`salt.states.win_dacl.inherit`(*name, objectType, clear\_existing\_acl=False*)  
Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.present`(*name, objectType, user, permission, acetype, propagation*)  
Ensure an ACE is present

### 14.17.232 salt.states.win\_dism module

#### Installing of Windows features using DISM

Install windows features/capabilities with DISM

```
Language.Basic~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed
```

`salt.states.win_dism.capability_installed`(*name, source=None, limit\_access=False, image=None, restart=False*)

Install a DISM capability

##### Parameters

- **name** (*str*) -- The capability to install
- **source** (*str*) -- The optional source of the capability
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for online images
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

#### Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~en~
```

`salt.states.win_dism.capability_removed`(*name, image=None, restart=False*)

Uninstall a DISM capability

##### Parameters

- **name** (*str*) -- The capability to uninstall

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~~~~
```

```
salt.states.win_dism.feature_installed(name, package=None, source=None,
                                       limit_access=False, enable_parent=False, image=None, restart=False)
```

Install a DISM feature

#### Parameters

- **name** (*str*) -- The feature in which to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) -- The optional source of the feature
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **enable\_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None, restart=False)
```

Disables a feature.

#### Parameters

- **name** (*str*) -- The feature to disable
- **remove\_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

`salt.states.win_dism.package_installed`(*name*, *ignore\_check=False*, *prevent\_pending=False*, *image=None*, *restart=False*)

Install a package.

#### Parameters

- **name** (*str*) -- The package to install. Can be a `.cab` file, a `.msu` file, or a folder
- **ignore\_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.package_removed`(*name*, *image=None*, *restart=False*)

Uninstall a package

#### Parameters

- **name** (*str*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

### 14.17.233 salt.states.win\_dns\_client

Module for configuring DNS Client on Windows systems

**salt.states.win\_dns\_client.dns\_dhcp** (*name, interface='Local Area Connection'*)

Configure the DNS server list from DHCP Server

**salt.states.win\_dns\_client.dns\_exists** (*name, servers=None, interface='Local Area Connection', replace=False*)

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list, default is False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

**salt.states.win\_dns\_client.primary\_suffix** (*name, suffix=None, updates=False*)

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

**suffix** [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

**updates** [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
  win_dns_client.primary_suffix:
    - suffix: sub.domain.tld
    - updates: True
```

### 14.17.234 salt.states.win\_firewall

State for configuring Windows Firewall

**salt.states.win\_firewall.add\_rule** (*name, localport, protocol='tcp', action='allow', dir='in'*)

Add a new firewall rule (Windows only)

**salt.states.win\_firewall.disabled** (*name='allprofiles'*)

Disable all the firewall profiles (Windows only)

**salt.states.win\_firewall.enabled** (*name='allprofiles'*)

Enable all the firewall profiles (Windows only)

### 14.17.235 salt.states.win\_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

**salt.states.win\_iis.container\_setting**(*name, container, settings=None*)

Set the value of the setting for an IIS container.

#### Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values.

Example of usage for the AppPools container:

```
site0-appool-setting:
  win_iis.container_setting:
    - name: site0
    - container: AppPools
    - settings:
        managedPipelineMode: Integrated
        processModel.maxProcesses: 1
        processModel.userName: TestUser
        processModel.password: TestPassword
```

Example of usage for the Sites container:

```
site0-site-setting:
  win_iis.container_setting:
    - name: site0
    - container: Sites
    - settings:
        logFile.logFormat: W3C
        logFile.period: Daily
        limits.maxUrlSegments: 32
```

**salt.states.win\_iis.create\_app**(*name, site, sourcepath, apppool=None*)

Create an IIS application.

#### Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Example of usage with only the required arguments:

```
site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```

site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
    - apppool: site0

```

`salt.states.win_iis.create_apppool`(*name*)

Create an IIS application pool.

**Parameters** *name* (*str*) -- The name of the IIS application pool.

Usage:

```

site0-apppool:
  win_iis.create_apppool:
    - name: site0

```

`salt.states.win_iis.create_binding`(*name*, *site*, *hostheader*='', *ipaddress*='\*', *port*=80, *protocol*='http', *sslflags*=0)

Create an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```

site0-https-binding:
  win_iis.create_binding:
    - site: site0

```

Example of usage specifying all available arguments:

```

site0-https-binding:
  win_iis.create_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https
    - sslflags: 0

```

`salt.states.win_iis.create_cert_binding`(*name*, *site*, *hostheader*='', *ipaddress*='\*', *port*=443, *sslflags*=0)

Assign a certificate to an IIS binding.

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.

- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
    - sslflags: 1
```

New in version 2016.11.0.

`salt.states.win_iis.create_vdir` (*name*, *site*, *sourcepath*, *app*='/')

Create an IIS virtual directory.

#### Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
    - app: v1
```

`salt.states.win_iis.deployed` (*name*, *sourcepath*, *apppool*='', *hostheader*='', *ipaddress*='\*', *port*=80, *protocol*='http')

Ensure the website has been deployed.

#### Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.

- **appool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0
    - appool: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https
```

`salt.states.win_iis.remove_app`(*name*, *site*)

Remove an IIS application.

#### Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Usage:

```
site0-v1-app-remove:
  win_iis.remove_app:
    - name: v1
    - site: site0
```

`salt.states.win_iis.remove_apppool`(*name*)

Remove an IIS application pool.

**Parameters** **name** (*str*) -- The name of the IIS application pool.

Usage:

```
defaultappool-remove:
  win_iis.remove_apppool:
    - name: DefaultAppPool
```

`salt.states.win_iis.remove_binding`(*name*, *site*, *hostheader=''*, *ipaddress='\*'*, *port=80*)

Remove an IIS binding.

#### Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.

- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
```

`salt.states.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='*', port=443)`

Remove a certificate from an IIS binding.

#### Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
```

New in version 2016.11.0.

`salt.states.win_iis.remove_site(name)`

Delete a website from IIS.

**Parameters** **name** (*str*) -- The IIS site name.

Usage:

```
defaultwebsite-remove:
  win_iis.remove_site:
    - name: Default Web Site
```

`salt.states.win_iis.remove_vdir(name, site, app='')`

Remove an IIS virtual directory.

#### Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
    - app: v1
```

### 14.17.236 salt.states.win\_lgpo module

#### Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

```
Ensure Account Lockout Duration:
  lgpo.set:
    - name: Account lockout duration
    - setting: 90
    - policy_class: Machine
```

```
Account lockout duration:
  gpo.set:
    - setting: 120
    - policy_class: Machine
```

Multiple policy configuration

```
Company Local Group Policy:
  lgpo.set:
    - computer_policy:
        Deny logon locally: Guest
        Account lockout duration: 120
        Account lockout threshold: 10
        Reset account lockout counter after: 1440
        Enforce password history: 24
        Maximum password age: 60
        Minimum password age: 1
        Minimum password length: 14
```

```

Password must meet complexity requirements: Enabled
Store passwords using reversible encryption: Disabled
Configure Automatic Updates:
    Configure automatic updating: 4 - Auto download and schedule the intsa11
    Scheduled install day: 7 - Every Saturday
    Scheduled install time: 17:00
Specify intranet Microsoft update service location:
    Set the intranet update service for detecting updates: http://mywsus
    Set the intranet statistics server: http://mywsus
- user_policy:
    Do not process the legacy run list: Enabled

```

```

server_policy:
  lgpo.set:
    - computer_policy:
        Maximum password age: 60
        Minimum password age: 1
        Minimum password length: 14
        Account lockout duration: 1440
        Account lockout threshold: 10
        Reset account lockout counter after: 1440
        Manage auditing and security log:
          - "BUILTIN\Administrators"
        Replace a process level token:
          - "NT AUTHORITY\NETWORK SERVICE"
          - "NT AUTHORITY\LOCAL SERVICE"
        "Accounts: Guest account status": Disabled
        "Accounts: Rename guest account": Not_4_U
        "Audit: Audit the use of Backup and Restore privilege": Enabled
        "Interactive logon: Do not display last user name": Enabled
        "Network\DNS Client\Dynamic update": Disabled
        "System\Logon\Do not display the Getting Started welcome screen at logon": ☒
    → Enabled
        "Windows Components\Remote Desktop Services\Remote Desktop Session ☒
    → Host\Connections\Select RDP transport protocols":
        "Select Transport Type": "Use both UDP and TCP"
        "Windows Components\Windows Update\Allow Automatic Updates immediate ☒
    → installation": Enabled
        "Windows Components\Windows Update\Allow non-administrators to receive update ☒
    → notifications": Disabled
        "Windows Components\Windows Update\Always automatically restart at the ☒
    → scheduled time":
        "The restart timer will give users this much time to save their work ☒
    → (minutes)": 15
        "Windows Components\Windows Update\Automatic Updates detection frequency":
        "Check for updates at the following interval (hours)": 1
        "Windows Components\Windows Update\Configure Automatic Updates":
        "Configure automatic updating": 4 - Auto download and schedule the install
        "Install during automatic maintenance": False
        "Scheduled install day": 7 - Every Saturday
        "Scheduled install time": "17:00"
        "Windows Components\Windows Update\Delay Restart for scheduled installations":
        "Wait the following period before proceeding with a scheduled restart ☒
    → (minutes)": 1
        "Windows Components\Windows Update\No auto-restart with logged on users for ☒
    → scheduled automatic updates installations": Disabled
        "Windows Components\Windows Update\Re-prompt for restart with scheduled ☒
    → installations":

```

```

        "Wait the following period before prompting again with a scheduled restart
→(minutes)": 30
        "Windows Components\Windows Update\Reschedule Automatic Updates scheduled
→installations": Disabled
        "Windows Components\Windows Update\Specify intranet Microsoft update service
→location":
        "Set the intranet update service for detecting updates": http://mywsus
        "Set the intranet statistics server": http://mywsus
        - cumulative_rights_assignments: True

```

```

salt.states.win_lgpo.set(name, setting=None, policy_class=None, computer_policy=None,
                        user_policy=None, cumulative_rights_assignments=True,
                        adml_language='en-US')

```

Ensure the specified policy is set

**name** the name of a single policy to configure

**setting** the configuration setting for the single named policy if this argument is used the computer\_policy/user\_policy arguments will be ignored

**policy\_class** the policy class of the single named policy to configure this can ``machine``, ``user``, or ``both``

**computer\_policy** a dict of policyname: value pairs of a set of computer policies to configure if this argument is used, the name/setting/policy\_class arguments will be ignored

**user\_policy** a dict of policyname: value pairs of a set of user policies to configure if this argument is used, the name/setting/policy\_class arguments will be ignored

**cumulative\_rights\_assignments** determine if any user right assignment policies specified will be cumulative or explicit

**adml\_language** the adml language to use for AMDX policy data/display conversions

### 14.17.237 salt.states.win\_license module

#### Installation and activation of windows licenses

Install and activate windows licenses

```

XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
  license.activate

```

```

salt.states.win_license.activate(name)

```

Install and activate the given product key

**name** The 5x5 product key given to you by Microsoft

### 14.17.238 salt.states.win\_network

#### Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the network state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```

Local Area Connection #2:
  network.managed:
    - dns_proto: dhcp
    - ip_proto: dhcp

```

---

**Note:** Both the `dns_proto` and `ip_proto` arguments are required.

---

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
network.managed:
  - dns_proto: static
  - dns_servers:
    - 8.8.8.8
    - 8.8.4.4
  - ip_proto: static
  - ip_addrs:
    - 10.2.3.4/24
```

---

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

---

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
network.managed:
  - dns_proto: static
  - dns_servers:
    - 8.8.8.8
    - 8.8.4.4
  - ip_proto: static
  - ip_addrs:
    - 10.2.3.4/24
  - gateway: 10.2.3.1
```

`salt.states.win_network.managed`(*name*, *dns\_proto=None*, *dns\_servers=None*, *ip\_proto=None*, *ip\_addrs=None*, *gateway=None*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**dns\_proto** [None] Set to `static` and use the `dns_servers` parameter to provide a list of DNS name-servers. set to `dhcp` to use DHCP to get the DNS servers.

**dns\_servers** [None] A list of static DNS servers.

**ip\_proto** [None] Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.

**ip\_addrs** [None] A list of static IP addresses.

**gateway** [None] A list of static IP addresses.

**enabled** [True] Set to `False` to ensure that this interface is disabled.

### 14.17.239 salt.states.win\_path

Manage the Windows System PATH

`salt.states.win_path.absent`(*name*)

Remove the directory from the SYSTEM path

index: where the directory should be placed in the PATH (default: 0)

Example:

```
'C:\sysinternals':
  win_path.absent
```

`salt.states.win_path.exists` (*name*, *index=None*)

Add the directory to the system PATH at index location

*index*: where the directory should be placed in the PATH (default: None) [Note: Providing no index will append directory to PATH and will not enforce its location within the PATH.]

Example:

```
'C:\python27':
  win_path.exists

'C:\sysinternals':
  win_path.exists:
    - index: 0
```

### 14.17.240 salt.states.win\_pki module

Microsoft certificate management via the Pki PowerShell module.

**platform** Windows

New in version 2016.11.0.

`salt.states.win_pki.import_cert` (*name*, *cert\_format='cer'*, *context='LocalMachine'*, *store='My'*, *exportable=True*, *password=''*, *saltenv='base'*)

Import the certificate file into the given certificate store.

#### Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert\_format** (*str*) -- The certificate format. Specify `cer` for X.509, or `pfx` for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) -- The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
    - context: LocalMachine
    - store: My
```

```
- exportable: True
- password: TestPassword
- saltenv: base
```

`salt.states.win_pki.remove_cert(name, thumbprint, context='LocalMachine', store='My')`

Remove the certificate from the given certificate store.

#### Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
    - context: LocalMachine
    - store: My
```

### 14.17.241 salt.states.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc
```

`salt.states.win_powercfg.set_timeout(name, value, power='ac')`

Set the sleep timeouts of specific items such as disk, monitor.

CLI Example:

```
monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

disk:
  powercfg.set_timeout:
    - value: 12
    - power: ac
```

**name** The setting to change, can be one of the following: monitor, disk, standby, hibernate

**timeout** The amount of time in minutes before the item will timeout i.e the monitor

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

### 14.17.242 salt.states.win\_servermanager

Manage Windows features via the ServerManager powershell module

`salt.states.win_servermanager.installed`(*name*, *recurse=False*, *force=False*, *restart=False*, *source=None*, *exclude=None*)

Install the windows feature

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`)
- **recurse** (*Optional[bool]*) -- install all sub-features as well
- **force** (*Optional[bool]*) -- if the feature is installed but one of its sub-features are not installed set this to True to force the installation of the sub-features
- **source** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature.

**restart:** Restarts the computer when installation is complete, if restarting is required by the role feature installed.

---

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

---

#### Example

Run `salt MinionName win_servermanager.list_available` to get a list of available roles and features. Use the name in the right column. Do not use the role or feature names mentioned in the PKGMGR documentation. In this example for IIS-WebServerRole the name to be used is Web-Server.

```
ISWebserverRole:
  win_servermanager.installed:
    - force: True
    - recurse: True
    - name: Web-Server
```

`salt.states.win_servermanager.removed`(*name*, *remove\_payload=False*, *restart=False*)

Remove the windows feature

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`)
- **remove\_payload** (*Optional[bool]*) -- True will case the feature to be removed from the side-by-side store
- **restart** (*Optional[bool]*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

---

**Note:** Some features require a reboot after uninstallation. If so the feature will not be completely uninstalled until the server is restarted.

---

### Example

Run `salt MinionName win_servermanager.list_installed` to get a list of all features installed. Use the top name listed for each feature, not the indented one. Do not use the role or feature names mentioned in the PKGMGR documentation.

```
ISWebserverRole:
  win_servermanager.removed:
    - name: Web-Server
```

### 14.17.243 salt.states.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.active_log_format` (*name*, *log\_format*, *server*='SmtpSvc/1')

Manage the active log format for the SMTP server.

#### Parameters

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-log-format:
  win_smtp_server.active_log_format:
    - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.connection_ip_list` (*name*, *addresses*=None, *grant\_by\_default*=False, *server*='SmtpSvc/1')

Manage IP list for SMTP connections.

#### Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
  win_smtp_server.connection_ip_list:
    - addresses:
        127.0.0.1: 255.255.255.255
        172.16.1.98: 255.255.255.255
        172.16.1.99: 255.255.255.255
    - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses:
        172.16.1.100: 255.255.255.255
        172.16.1.101: 255.255.255.255
    - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses: {}
    - grant_by_default: True
```

`salt.states.win_smtp_server.relay_ip_list` (*name*, *addresses=None*, *server='SmtpSvc/1'*)

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting `127.0.0.1` as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive `Only the list below` GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive `All except the list below` GUI parameter.

#### Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
        - 24.0.0.128
        - 32.0.0.128
        - 60.0.0.128
        - 1.0.0.0
        - 76.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 1.0.0.0
        - 1.0.0.0
        - 2.0.0.0
        - 2.0.0.0
        - 4.0.0.0
        - 0.0.0.0
        - 76.0.0.128
```

```

- 0.0.0.0
- 0.0.0.0
- 0.0.0.0
- 0.0.0.0
- 255.255.255.255
- 127.0.0.1

```

Example of usage for disabling relaying:

```

smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: None

```

Example of usage for allowing relaying from any source:

```

smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: []

```

`salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtSvc/1')`  
 Ensure the value is set for the specified setting.

---

**Note:** The setting names are case-sensitive.

---

#### Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```

smtp-settings:
  win_smtp_server.server_setting:
    - settings:
      LogType: 1
      LogFilePeriod: 1
      MaxMessageSize: 16777216
      MaxRecipients: 10000
      MaxSessionSize: 16777216

```

### 14.17.244 salt.states.win\_snmp module

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.agent_settings(name, contact, location, services=None)`  
 Manage the SNMP sysContact, sysLocation, and sysServices settings.

#### Parameters

- **contact** (*str*) -- The SNMP contact.
- **location** (*str*) -- The SNMP location.
- **services** (*str*) -- A list of selected services.

Example of usage:

```
snmp-agent-settings:
  win_snmp.agent_settings:
    - contact: Test Contact
    - location: Test Location
    - services:
      - Physical
      - Internet
```

`salt.states.win_snmp.auth_traps_enabled`(*name*, *status=True*)

Manage the sending of authentication traps.

**Parameters** **status** (*bool*) -- The enabled status.

Example of usage:

```
snmp-auth-traps:
  win_snmp.auth_traps_enabled:
    - status: True
```

`salt.states.win_snmp.community_names`(*name*, *communities=None*)

Manage the SNMP accepted community names and their permissions.

**Parameters** **communities** (*str*) -- A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
  win_snmp.community_names:
    - communities:
      TestCommunity: Read Only
      OtherCommunity: Read Write
```

## 14.17.245 salt.states.win\_system

### Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
  system.computer_name: []

This is Erik's computer, don't touch!:
  system.computer_desc: []
```

`salt.states.win_system.computer_desc`(*name*)

Manage the computer's description field

**name** The desired computer description

`salt.states.win_system.computer_name`(*name*)

Manage the computer's name

**name** The desired computer name

`salt.states.win_system.hostname`(*name*)

New in version 2016.3.0.

Manage the hostname of the computer

**name** The hostname to set

`salt.states.win_system.join_domain`(*name*, *username=None*, *password=None*, *account\_ou=None*, *account\_exists=False*, *restart=False*)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

**name:** The name of the Domain.

**username:** Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply `user`.

**password:** Password of the account to add the computer to the Domain.

**account\_ou:** The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`.

**account\_exists:** Needs to be set to True to allow re-using an existing computer account.

**restart:** Needs to be set to True to restart the computer after a successful join.

### 14.17.246 salt.states.win\_update

#### Management of the windows update agent

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete.

Optionally set `category` to a category of your choice to only install certain updates. Default is to set to install all available updates.

The following example will install all Security and Critical Updates, and download but not install standard updates.

```
updates:
  win_update.installed:
    - categories:
      - 'Critical Updates'
      - 'Security Updates'
    - skips:
      - downloaded
  win_update.downloaded:
    - categories:
      - 'Updates'
    - skips:
      - downloaded
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, included by default
'present' - Present on computer, skipped by default
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - Skip updates that have been hidden, skipped by default
'software' - Software updates, included by default
'driver' - driver updates, included by default
```

The following example installs all driver updates that don't require a reboot: .. code-block:: yaml

```
gryffindor:
```

```
  win_update.installed:
```

- skips: - driver: True - software: False - reboot: False

To just update your windows machine, add this your sls:

```
updates:
  win_update.installed
```

`salt.states.win_update.downloaded`(*name, categories=None, skips=None, retries=10*)

Cache updates for later install.

**name:** if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

**categories:** the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

**skips:** a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

**retries** Number of retries to make before giving up. This is total, not per step.

`salt.states.win_update.installed`(*name, categories=None, skips=None, retries=10*)

Install specified windows updates.

**name:** if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

**categories:** the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

**skips:** a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

**retries** Number of retries to make before giving up. This is total, not per step.

### 14.17.247 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.genrepo` (*name*, *force=False*, *allow\_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If *force* is True no checks will be made and the repository will be generated if *allow\_empty* is True then the state will not return an error if there are 0 packages,

---

**Note:** This state only loads on minions that have the `roles: salt-master` grain set.

---

Example:

```
winrepo:
  winrepo.genrepo
```

### 14.17.248 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

**depends** M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CA's, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

`/etc/salt/master.d/peer.conf`

```
peer:
  .*:
    - x509.sign_remote_certificate
```

`/srv/salt/top.sls`

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

`/srv/salt/ca.sls`

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory: []

/etc/pki/issued_certs:
  file.directory: []

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - managed_private_key:
      name: /etc/pki/ca.key
      bits: 4096
      backup: True
    - require:
      - file: /etc/pki

mine.send:
  module.run:
    - func: x509.get_pem_entries
    - kwargs:
      glob_path: /etc/pki/ca.crt
    - onchanges:
      - x509: /etc/pki/ca.crt
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/signing\_policies.conf

```
x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
```

```

- basicConstraints: "critical CA:false"
- keyUsage: "critical keyEncipherment"
- subjectKeyIdentifier: hash
- authorityKeyIdentifier: keyid,issuer:always
- days_valid: 90
- copypath: /etc/pki/issued_certs/

```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered yml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

```
/srv/salt/cert.sls
```

```

/usr/local/share/ca-certificates:
  file.directory: []

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
    ↪']|replace('\n', '') }}

```

This state creates a private key then requests a certificate signed by ca according to the www policy.

```
/srv/salt/www.sls
```

```

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
    - managed_private_key:
      name: /etc/pki/www.key
      bits: 4096
      backup: True

```

```

salt.states.x509.certificate_managed(name,
                                   days_remaining=90,
                                   managed_private_key=None,
                                   append_certs=None,
                                   **kwargs)

```

Manage a Certificate

**name:** Path to the certificate

**days\_remaining:** The minimum number of days remaining when the certificate should be recreated. Default is 90. A value of 0 disables automatic renewal.

**managed\_private\_key:** Manages the private key corresponding to the certificate. All of the arguments supported by `:state: x509.private_key_managed <salt.states.x509.private_key_managed>` are supported. If `name` is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.

**append\_certs:** A list of certificates to be appended to the managed file.

**kwargs:** Any arguments supported by `x509.create_certificate` or `:state: file.managed <salt.states.file.managed>` are supported.

Examples:

```

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key

```

```

- CN: ca.example.com
- C: US
- ST: Utah
- L: Salt Lake City
- basicConstraints: "critical CA:true"
- keyUsage: "critical cRLSign, keyCertSign"
- subjectKeyIdentifier: hash
- authorityKeyIdentifier: keyid,issuer:always
- days_valid: 3650
- days_remaining: 0
- backup: True

```

```

/etc/ssl/www.crt:
  x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True

```

`salt.states.x509.crl_managed`(*name*, *signing\_private\_key*, *signing\_private\_key\_passphrase*=None, *signing\_cert*=None, *revoked*=None, *days\_valid*=100, *digest*='', *days\_remaining*=30, *include\_expired*=False, *\*\*kwargs*)

Manage a Certificate Revocation List

**name:** Path to the certificate

**signing\_private\_key:** The private key that will be used to sign this crl. This is usually your CA's private key.

**signing\_private\_key\_passphrase:** Passphrase to decrypt the private key.

**signing\_cert:** The certificate of the authority that will be used to sign this crl. This is usually your CA's certificate.

**revoked:** A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

**days\_valid:** The number of days the certificate should be valid for. Default is 100.

**digest:** The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

**days\_remaining:** The crl should be automatically recreated if there are less than `days_remaining` days until the crl expires. Set to 0 to disable automatic renewal. Default is 30.

**include\_expired:** Include expired certificates in the CRL. Default is `False`.

**kwargs:** Any arguments supported by `:state:file.managed <salt.states.file.managed>` are supported.

Example:

```

/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromised_web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation

```

`salt.states.x509.csr_managed(name, **kwargs)`

Manage a Certificate Signing Request

**name:** Path to the CSR

**properties:** The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

**kwargs:** Any arguments supported by `:state:file.managed <salt.states.file.managed>` are supported.

Example:

```
/etc/pki/mycert.csr:
  x509.csr_managed:
    - private_key: /etc/pki/mycert.key
    - CN: www.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - keyUsage: 'critical dataEncipherment'
```

`salt.states.x509.pem_managed(name, text, backup=False, **kwargs)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name:** The path to the file to manage

**text:** The PEM formatted text to write.

**kwargs:** Any arguments supported by `:state:file.managed <salt.states.file.managed>` are supported.

`salt.states.x509.private_key_managed(name, bits=2048, passphrase=None, cipher='aes_128_cbc', new=False, overwrite=False, verbose=True, **kwargs)`

Manage a private key's existence.

**name:** Path to the private key

**bits:** Key length in bits. Default 2048.

**passphrase:** Passphrase for encrypting the private key.

**cipher:** Cipher for encrypting the private key.

**new:** Always create a new key. Defaults to False. Combining new with `prereq`, or when used as part of a `managed_private_key` can allow key rotation whenever a new certificate is generated.

**overwrite:** Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose:** Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs:** Any kwargs supported by `file.managed` are supported.

Example:

The jinja templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True
    {% if salt['file.file_exists']('/etc/pki/ca.key') -%}
    - prereq:
      - x509: /etc/pki/www.crt
    {%- endif %}
```

### 14.17.249 salt.states.xmpp

#### Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

**salt.states.xmpp.send\_msg** (*name, recipient, profile*)  
Send a message to an XMPP user

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

**salt.states.xmpp.send\_msg\_multi** (*name, profile, recipients=None, rooms=None*)  
Send a message to an list of recipients or rooms

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
      - admins@xmpp.example.com/salt
    - rooms:
      - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

### 14.17.250 salt.states.zabbix\_host module

Management of Zabbix hosts.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.states.zabbix\_host.absent** (*name*)  
Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

**Param** name: technical name of the host

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
TestHostWithInterfaces:
  zabbix_host.absent
```

`salt.states.zabbix_host.present` (*host, groups, interfaces, \*\*kwargs*)

Ensures that the host exists, eventually creates new host. NOTE: please use argument `visible_name` instead of `name` to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

#### Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- Optional - string with visible name of the host, use `visible_name` instead of `name` parameter to not mess with value supplied from Salt sls file.

```
create_test_host:
  zabbix_host.present:
    - host: TestHostWithInterfaces
    - groups:
      - 5
      - 6
      - 7
    - interfaces:
      - test1.example.com:
        - ip: '192.168.1.8'
        - type: 'Agent'
        - port: 92
      - testing2_create:
        - ip: '192.168.1.9'
        - dns: 'test2.example.com'
        - type: 'agent'
        - main: false
      - testovaci1_ipmi:
        - ip: '192.168.100.111'
        - type: 'ipmi'
```

### 14.17.251 salt.states.zabbix\_hostgroup module

Management of Zabbix host groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_hostgroup.absent(name)`

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_testing_host_group:  
  zabbix_hostgroup.absent:  
    - name: 'My hostgroup name'
```

`salt.states.zabbix_hostgroup.present(name)`

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
create_testing_host_group:  
  zabbix_hostgroup.present:  
    - name: 'My hostgroup name'
```

## 14.17.252 salt.states.zabbix\_user module

Management of Zabbix users.

`codeauthor` Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_user.absent(name)`

Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

#### Parameters

- **name** -- user alias
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
George:
zabbix_user.absent
```

`salt.states.zabbix_user.present` (*alias, passwd, usrgrps, medias, password\_reset=False, \*\*kwargs*)

Ensures that the user exists, eventually creates new user. NOTE: use argument `firstname` instead of `name` to not mess values with `name` from salt sls.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **medias** -- user's medias to create
- **password\_reset** -- whether or not to reset password at update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use `'firstname'` instead of `'name'` parameter to not mess with value supplied from Salt sls file.

```
make_user:
  zabbix_user.present:
    - alias: George
    - passwd: donottellanyonE@456x
    - password_reset: True
    - usrgrps:
      - 13
      - 7
    - medias:
      - me@example.com:
          - mediatype: mail
          - period: '1-7,00:00-24:00'
          - severity: NIWAHD
      - make_jabber:
          - active: true
          - mediatype: jabber
          - period: '1-5,08:00-19:00'
          - sendto: jabbera@example.com
      - text_me_morning_disabled:
          - active: false
          - mediatype: sms
          - period: '1-5,09:30-10:00'
          - severity: D
          - sendto: '+42032132588568'
```

### 14.17.253 salt.states.zabbix\_usergroup module

Management of Zabbix user groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_usergroup.absent`(*name*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_thai_monks_usrgrp:
  zabbix_usergroup.absent:
    - name: 'Thai monks'
```

`salt.states.zabbix_usergroup.present`(*name*, **\*\*kwargs**)

Creates new user. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user\\_group](https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group)

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_thai_monks_usergroup:
  zabbix_usergroup.present:
    - name: 'Thai monks'
    - gui_access: 1
    - debug_mode: 0
    - users_status: 0
```

### 14.17.254 salt.states.zcbuildout

#### Management of zc.buildout

This module is inspired from minitage's buildout maker (<https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py>)

New in version 2016.3.0.

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

## Available Functions

- built

```

installed1
  buildout.installed:
    - name: /path/to/buildout

installed2
  buildout.installed:
    - name: /path/to/buildout
    - parts:
      - a
      - b
    - python: /path/to/pythonpath/bin/python
    - unless: /bin/test_something_installed
    - onlyif: /bin/test_else_installed

```

```

salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None,
                                user=None, env=(), buildout_ver=None, test_release=False,
                                distribute=None, new_st=None, offline=False, newest=False,
                                python='/usr/bin/python', debug=False, verbose=False, un-
                                less=None, onlyif=None, use_vt=False, loglevel='debug',
                                **kwargs)

```

Install buildout in a specific directory

It is a thin wrapper to `modules.buildout.buildout`

**name** directory to execute in

**quiet**

do not output console & logs

**config** buildout config to use (default: buildout.cfg)

**parts** specific buildout parts to run

**user** user used to run buildout as

New in version 2014.1.4.

**env** environment variables to set when running

**buildout\_ver** force a specific buildout version (1 | 2)

**test\_release** buildout accept test release

**new\_st** Forcing use of setuptools >= 0.7

**distribute** use distribute over setuptools if possible

**offline** does buildout run offline

**python** python to use

**debug** run buildout with -D debug flag

**onlyif** Only execute cmd if statement on the host return 0

**unless** Do not execute cmd if statement on the host return 0

**newest** run buildout in newest mode

**verbose** run buildout in verbose mode (-vvvvv)

**use\_vt** Use the new salt VT to stream output [experimental]

`loglevel` loglevel for buildout commands

### 14.17.255 `salt.states.zenoss`

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the `'zenoss'` Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x is supported.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

`salt.states.zenoss.monitored`(*name*, *device\_class*=None, *collector*='localhost', *prod\_state*=None)

Ensure a device is monitored. The `'name'` given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

### 14.17.256 `salt.states.zk_concurrency`

#### Control concurrency of steps within state execution using zookeeper

This module allows you to ```wrap``` a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than `max_concurrency` steps are executing with a single path.

```
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficserver

trafficserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
```

```

- source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficserver
    - require:
      - service: trafficserver

```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```

salt.states.zk_concurrency.lock(name, zk_hosts, identifier=None, max_concurrency=1, time-
                                out=None, ephemeral_lease=False)
    Block state execution until you are able to get the lock (or hit the timeout)

```

```

salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False)
    Ensure that there are min_nodes in the party at name, optionally blocking if not available.

```

```

salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1,
                                   ephemeral_lease=False)
    Remove lease from semaphore.

```

#### 14.17.257 salt.states.zfs

Management zfs datasets

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** zfs

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```

test/shares/yuki:
  zfs.filesystem_present:
    - create_parent: true
    - properties:
      quota: 16G

test/iscsi/haruhi:
  zfs.volume_present:
    - create_parent: true
    - volume_size: 16M
    - sparse: true
    - properties:
      readonly: on

test/shares/yuki@frozen:
  zfs.snapshot_present

moka_origin:
  zfs.hold_present:
    - snapshot: test/shares/yuki@frozen

test/shares/moka:
  zfs.filesystem_present:

```

```
- cloned_from: test/shares/yuki@frozen
```

```
test/shares/moka@tsukune:  
zfs.snapshot_absent
```

**salt.states.zfs.bookmark\_absent**(*name*, *force=False*, *recursive=False*)

ensure bookmark is absent on the system

**name** [string] name of snapshot

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.bookmark\_present**(*name*, *snapshot*)

ensure bookmark exists

**name** [string] name of bookmark

**snapshot** [string] name of snapshot

**salt.states.zfs.filesystem\_absent**(*name*, *force=False*, *recursive=False*)

ensure filesystem is absent on the system

**name** [string] name of filesystem

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

..warning:

If a volume with **name** exists, this state will succeed without destroying the volume specified by **name**. This module is dataset type sensitive.

**salt.states.zfs.filesystem\_present**(*name*, *create\_parent=False*, *properties=None*,  
*cloned\_from=None*)

ensure filesystem exists and has properties set

**name** [string] name of filesystem

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (-o)

---

**Note:** **cloned\_from** is only use if the filesystem does not exist yet, when **cloned\_from** is set after the filesystem exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

---

**salt.states.zfs.hold\_absent**(*name*, *snapshot*, *recursive=False*)

ensure hold is absent on the system

**name** [string] name of holdt

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.hold\_present**(*name*, *snapshot*, *recursive=False*)

ensure hold is present on the system

**name** [string] name of holdt

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.promoted**(*name*)

ensure a dataset is not a clone  
**name** [string] name of fileset or volume  
 ..warning:

only one dataset can be the origin,  
**if** you promote a clone the original will now point to the promoted dataset

**salt.states.zfs.scheduled\_snapshot**(*name, prefix, recursive=True, schedule=None*)

maintain a set of snapshots based on a schedule

**name** [string] name of filesystem or volume

**prefix** [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-YYYYMMDD\_HHMM'

**recursive** [boolean] create snapshots for all children also

**schedule** [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

..warning:

snapshots will only be created and pruned every time the state runs.  
 a schedule must be setup to automatically run the state. this means that if  
 you run the state daily the hourly snapshot will only be made once per day!

**salt.states.zfs.snapshot\_absent**(*name, force=False, recursive=False*)

ensure snapshot is absent on the system

**name** [string] name of snapshot

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.snapshot\_present**(*name, recursive=False, properties=None*)

ensure snapshot exists and has properties set

**name** [string] name of snapshot

**recursive** [boolean] recursively create snapshots of all descendent datasets

**properties** [dict] additional zfs properties (-o)

**salt.states.zfs.volume\_absent**(*name, force=False, recursive=False*)

ensure volume is absent on the system

**name** [string] name of volume

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

..warning:

If a filesystem with **name** exists, this state will succeed without destroying the filesystem specified by **name**. This module is dataset type sensitive.

**salt.states.zfs.volume\_present**(*name, volume\_size, sparse=False, create\_parent=False, properties=None, cloned\_from=None*)

ensure volume exists and has properties set

**name** [string] name of volume

**volume\_size** [string] size of volume

**sparse** [boolean] create sparse volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (-o)

---

**Note:** **cloned\_from** is only use if the volume does not exist yet, when **cloned\_from** is set after the volume exists it will be ignored.

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The `sparse` parameter is ignored when using `cloned_from`.

---

### 14.17.258 `salt.states.zpool`

Management `zpool`

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** `zpool`

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```
oldpool:
  zpool.absent:
    - export: true

newpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: salty storage pool
    - layout:
        mirror-0:
          /dev/disk0
          /dev/disk1
        mirror-1:
          /dev/disk2
          /dev/disk3

simplepool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: another salty storage pool
    - layout:
      - /dev/disk0
      - /dev/disk1
```

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, ... this is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

`salt.states.zpool.absent` (*name*, *export=False*, *force=False*)

ensure storage pool is absent on the system

**name** [string] name of storage pool

**export** [boolean] export instead of destroy the zpool if present

**force** [boolean] force destroy or export

`salt.states.zpool.present` (*name*, *properties=None*, *filesystem\_properties=None*, *layout=None*, *config=None*)

ensure storage pool is present on the system

**name** [string] name of storage pool

**properties** [dict] optional set of properties to set for the storage pool

**filesystem\_properties** [dict] optional set of filesystem properties to set for the storage pool (creation only)

**layout: dict** disk layout to use if the pool does not exist (creation only)

**config** [dict] fine grain control over this state

---

**Note:**

The following configuration properties can be toggled in the config parameter.

- `import` (true) - try to import the pool before creating it if absent
  - `import_dirs` (None) - specify additional locations to scan for devices on import
  - `device_dir` (None, SunOS=/dev/rdisk) - specify device directory to use if not absolute path
  - `force` (false) - try to force the import or creation
- 

**Note:** Because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
  /tmp/vdisk3
  /tmp/vdisk2
mirror-1:
  /tmp/vdisk0
  /tmp/vdisk1
```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** Pay attention to the order of your dict!

```
mirror-0:
  /tmp/vdisk0
  /tmp/vdisk1
/tmp/vdisk2:
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! Why you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

## 14.18 thorium modules

|               |  |
|---------------|--|
| <i>calc</i>   | Used to manage the thorium register.   |
| <i>check</i>  | The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite. |
| <i>file</i>   | Writes matches to disk to verify activity, helpful when testing  |
| <i>key</i>    | The key Thorium State is used to apply changes to the accepted/rejected/pending keys   |
| <i>local</i>  | Run remote execution commands via the local client   |
| <i>reg</i>    | Used to manage the thorium register.   |
| <i>runner</i> | React by calling async runners   |
| <i>status</i> | This thorium state is used to track the status beacon events and keep track of   |
| <i>timer</i>  | Allow for flow based timers.   |
| <i>wheel</i>  | React by calling async runners   |

### 14.18.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

**depends** statistics PyPi module

`salt.thorium.calc.add` (*name, num, minimum=0, maximum=0, ref=None*)

Adds together the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.add:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.calc` (*name, num, oper, minimum=0, maximum=0, ref=None*)

Perform a calculation on the num most recent values. Requires a list. Valid values for `oper` are:

- `add`: Add last num values together
- `mul`: Multiple last num values together
- `mean`: Calculate mean of last num values
- `median`: Calculate median of last num values
- `median_low`: Calculate low median of last num values
- `median_high`: Calculate high median of last num values
- `median_grouped`: Calculate grouped median of last num values
- `mode`: Calculate mode of last num values

USAGE:

```
foo:
  calc.calc:
```

```
- name: myregentry
- num: 5
- oper: mean
```

`salt.thorium.calc.mean`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the mean of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.mean:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the mean of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.median:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_grouped`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the grouped mean of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_grouped:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_high`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the high mean of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_high:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_low`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the low mean of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_low:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.mode`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the mode of the *num* most recent values. Requires a list.

USAGE:

```
foo:
  calc.mode:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.mul`(*name, num, minimum=0, maximum=0, ref=None*)

Multiplies together the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.mul:
    - name: myregentry
    - num: 5
```

### 14.18.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.contains`(*name, value*)

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.eq`(*name, value*)

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.event`(*name*)

Checks for a specific event match and returns result True if the match happens

USAGE:

```

salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar

```

**salt.thorium.check.gt**(*name, value*)

Only succeed if the value in the given register location is greater than the given value

USAGE:

```

foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

```

**salt.thorium.check.gte**(*name, value*)

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```

foo:
  check.gte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

```

**salt.thorium.check.lt**(*name, value*)

Only succeed if the value in the given register location is less than the given value

USAGE:

```

foo:
  check.lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

```

`salt.thorium.check.lte`(*name*, *value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.ne`(*name*, *value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

### 14.18.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

Then the file will be saved to:

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
  file.save
```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.save`(*name*, *filter=False*)

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

USAGE:

```
foo:
  file.save

/tmp/foo:
  file.save
```

#### 14.18.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.timeout` (*name*, *delete=0*, *reject=0*)

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
  status.reg

clean_keys:
  key.timeout:
    - require:
      - status: statreg
    - delete: 300
```

#### 14.18.5 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.cmd` (*name*, *tgt*, *func*, *arg=()*, *tgt\_type='glob'*, *ret=''*, *kwarg=None*, *\*\*kwargs*)

Execute a remote execution command

USAGE:

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg:
      - 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30
```

### 14.18.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.clear(name)`

Clear the namespace from the register

USAGE:

```
clearns:
  reg.clear:
    - name: myregister
```

`salt.thorium.reg.delete(name)`

Delete the namespace from the register

USAGE:

```
deletens:
  reg.delete:
    - name: myregister
```

`salt.thorium.reg.list(name, add, match, stamp=False, prune=0)`

Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last

`prune` values will be kept in the list.

USAGE:

```
foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```

`salt.thorium.reg.mean(name, add, match)`

Accept a numeric value from the matched events and store a running average of the values in the given register.

If the specified value is not numeric it will be skipped

USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

`salt.thorium.reg.set(name, add, match)`

Add a value to the named set

USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

### 14.18.7 salt.thorium.runner module

React by calling async runners

`salt.thorium.runner.cmd(name, fun=None, arg=(), **kwargs)`

Execute a runner async:

USAGE:

```
run_cloud:
  runner.cmd:
    - fun: cloud.create
    - arg:
      - my-ec2-config
      - myinstance

run_cloud:
  runner.cmd:
    - fun: cloud.create
    - kwargs:
      provider: my-ec2-config
      instances: myinstance
```

### 14.18.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.reg(name)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

### 14.18.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.hold(name, seconds)`

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
  timer.hold:
    - seconds: 30
```

### 14.18.10 salt.thorium.wheel module

React by calling async runners

`salt.thorium.wheel.cmd(name, fun=None, arg=(), **kwargs)`

Execute a runner async:

USAGE:

```
run_cloud:
  wheel.cmd:
    - fun: key.delete
    - match: minion_id
```

## 14.19 master tops modules

|                        |  |
|------------------------|--|
| <i>cobbler</i>         | Cobbler Tops   |
| <i>ext_nodes</i>       | External Nodes Classifier  |
| <i>mongo</i>           | Read tops data from a mongodb collection   |
| <i>reclass_adapter</i> | Read tops data from a reclass database   |
| <i>varstack</i>        | Use <i>Varstack</i> < <a href="https://github.com/conversis/varstack">https://github.com/conversis/varstack</a> > to provide tops data |

### 14.19.1 salt.tops.cobbler

#### Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

#### Module Documentation

`salt.tops.cobbler.top(**kwargs)`  
Look up top data in Cobbler for a minion.

### 14.19.2 salt.tops.ext\_nodes

#### External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to `cobbler-ext-nodes` above, but currently the data must be formatted in the same way that the standard `cobbler-ext-nodes` does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
  '*':
    - basepackages
    - database

base:
  '*':
    - basepackages
    - database
```

```
salt.tops.ext_nodes.top(**kwargs)
    Run the command configured
```

### 14.19.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

#### Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ""
    re_pattern: \.example\.com
```

```
states_field: states
environment_field: environment
```

## Module Documentation

`salt.tops.mongo.top(**kwargs)`

Connect to a mongo database and read per-node tops data.

### Parameters

- **collection** (\*) -- The mongodb collection to read data from. Defaults to 'tops'.
- **id\_field** (\*) -- The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern** (\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re\_replace** (\*) -- Use as the replacement value in node ids matched with *re\_pattern*. Defaults to ```. Feel free to use backreferences here.
- **states\_field** (\*) -- The name of the field providing a list of states.
- **environment\_field** (\*) -- The name of the field providing the environment. Defaults to `environment`.

### 14.19.4 salt.tops.reclass\_adapter

Read tops data from a reclass database

This *master\_tops* plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass
```

```

master_tops:
  reclass: *reclass

```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHON-PATH environment variable, or by setting the configuration option, like in the example above.

```

salt.tops.reclass_adapter.top(**kwargs)
    Query reclass for the top data (states of the minions).

```

### 14.19.5 salt.tops.varstack

Use *Varstack* <<https://github.com/conversis/varstack>> to provide tops data

This *master\_tops* plugin provides access to the **varstack** hierarchical yaml files, so you can use **varstack** as a full *external node classifier* and store state information (top data) in it.

#### Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```

master_tops:
  varstack: /path/to/the/config/file/varstack.yaml

```

Varstack will then use /path/to/the/config/file/varstack.yaml (usually /etc/varstack.yaml) to determine which configuration data to return as adapter information. From there you can take a look at the *README* <<https://github.com/conversis/varstack/blob/master/README.md>> of varstack to learn how this file is evaluated. The ENC part will just return the `states' dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```

---
states:
  - sudo
  - openssh
  - apache
  - salt.minion

```

these will be returned as {'base': ['sudo', `openssh', `apache', `salt.minion']} and managed by salt as if given from a top.sls file.

```

salt.tops.varstack.top(**kwargs)
    Query varstack for the top data (states of the minions).

```

### 14.20 wheel modules

|                        |  |
|------------------------|--|
| <i>config</i>          | Manage the master configuration file                                       |
| <i>error</i>           | Error generator to enable integration testing of salt wheel error handling |
| <i>file_roots</i>      | Read in files from the file_root and save files to the file root           |
| Continued on next page |  |

Table 14.20 -- continued from previous page

|                     |   |
|---------------------|---|
| <i>key</i>          | Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.        |
| <i>minions</i>      | Wheel system wrapper for connected minions  |
| <i>pillar_roots</i> | The <i>pillar_roots</i> wheel module is used to manage files under the pillar roots directories on the master server. |

### 14.20.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.apply(key, value)`  
Set a single key

---

**Note:** This will strip comments from your config file

---

`salt.wheel.config.update_config(file_name, yaml_contents)`  
Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
  'username': 'salt',
  'password': 'salt',
  'fun': 'config.update_config',
  'file_name': 'gui',
  'yaml_contents': {'id': 1},
  'client': 'wheel',
  'eauth': 'pam',
}
```

`salt.wheel.config.values()`  
Return the raw values of the config file

### 14.20.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.error(name=None, message='')`  
If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

### 14.20.3 salt.wheel.file\_roots

Read in files from the file\_root and save files to the file root

```
salt.wheel.file_roots.find(path, saltenv='base')
```

Return a dict of the files located with the given path and environment

```
salt.wheel.file_roots.list_env(saltenv='base')
```

Return all of the file paths found in an environment

```
salt.wheel.file_roots.list_roots()
```

Return all of the files names in all available environments

```
salt.wheel.file_roots.read(path, saltenv='base')
```

Read the contents of a text file, if the file is binary then

```
salt.wheel.file_roots.write(data, path, saltenv='base', index=0)
```

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

### 14.20.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the WheelClient must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless `external_auth` is configured and the user is authorized to execute wheel functions.

The function documentation starts with the wheel reference from the code sample above and use the WheelClient functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a salt command at the CLI using the saltutil execution module.

```
salt.wheel.key.accept(match, include_rejected=False, include_denied=False)
```

Accept keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to accept.

**include\_rejected** To include rejected keys in the match along with pending keys, set this to True. Defaults to False.

**include\_denied** To include denied keys in the match along with pending keys, set this to True. Defaults to False.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

```
salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)
```

Accept keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to accept.

**include\_rejected** To include rejected keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('accept_dict',
{
    'minions_pre': [
        'jerry',
        'stuart',
        'bob',
    ],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

`salt.wheel.key.delete`(*match*)

Delete keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.delete_dict`(*match*)

Delete keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.finger`(*match*, *hash\_type=None*)

Return the matching key fingerprints. Returns a dictionary.

**match** The key for with to retrieve the fingerprint.

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.finger_master`(*hash\_type=None*)

Return the fingerprint of the master's public key

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.gen`(*id\_=None*, *keysize=2048*)

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the pub and priv keys with their generated values.

**id\_** Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTPN9e8HwcZjXQnm8OrcUl10WHw09SDWLOlnW+
iQIDAQAB
```

```
-----END PUBLIC KEY-----`, `priv': `-----BEGIN RSA PRIVATE KEY-----
```

```
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv ... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
-----END RSA PRIVATE KEY-----`}
```

`salt.wheel.key.gen_accept(id_, keysize=2048, force=False)`

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

**id\_** The name of the minion for which to generate a key pair.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

**force** If a public key has already been accepted for the given minion on the master, then the `gen_accept` function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTPN9e8HwcZjXQnm8OrcUl10WHw09SDWLOlnW+
iQIDAQAB
```

```
-----END PUBLIC KEY-----`, `priv': `-----BEGIN RSA PRIVATE KEY-----
```

```
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
-----END RSA PRIVATE KEY-----`}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.gen_keys(keydir=None, keyname=None, keysize=None, user=None)`

Generate minion RSA public keypair

`salt.wheel.key.gen_signature(priv, pub, signature_path, auto_create=False, keysize=None)`

Generate master public-key-signature

`salt.wheel.key.print(match)`

Return information about the key. Returns a dictionary.

**match** The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0B ... TWugEQpPt
```

```
iQIDAQAB -----END PUBLIC KEY-----`}}
```

`salt.wheel.key.list`(*match*)

List all the keys under a named status. Returns a dictionary.

**match** The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.list_all`()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
 'minions_denied': [], 'minions_pre': [],
 'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.name_match`(*match*)

List all the keys based on a glob match

`salt.wheel.key.reject`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.reject_dict`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
 'match': {
   'minions': [
     'jerry',
     'stuart',
     'bob',
   ],
 })
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

### 14.20.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.connected()`  
List all connected minions on a salt-master

### 14.20.6 salt.wheel.pillar\_roots

The *pillar\_roots* wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.find(path, saltenv='base')`  
Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.list_env(saltenv='base')`  
Return all of the file paths found in an environment

`salt.wheel.pillar_roots.list_roots()`  
Return all of the files names in all available environments

`salt.wheel.pillar_roots.read(path, saltenv='base')`  
Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)`  
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

---

## 15.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

### See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's *outputter system* to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the *state.event* runner to utilize Salt's event bus from shell scripts.

Salt's *netapi module* provides access to Salt externally via a REST interface. Review the *netapi module* documentation for more information.

### 15.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the *master* or *minion* config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like *LocalClient*.

```
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None,
                        cache_minion_id=False, ignore_config_errors=True, minion_id=None)
```

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the *Caller* class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

### 15.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the *mine*, *publish*, and *peer* execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the *Caller* class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False,
                      loaded_base_name=None, notify=False, static_modules=None, proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

#### Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in `__context__`
- **utils** (*dict*) -- Utility functions which should be made available to Salt modules in `__utils__`. See *utils\_dir* in `salt.config` for additional information about configuration.
- **whitelist** (*list*) -- A list of modules which should be whitelisted.
- **initial\_load** (*bool*) -- Deprecated flag! Unused.
- **loaded\_base\_name** (*str*) -- A string marker for the loaded base name.
- **notify** (*bool*) -- Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

```
salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.states`(*opts, functions, utils, serializers, whitelist=None, proxy=None*)

Returns the state modules

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **functions** (*dict*) -- A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.grains`(*opts, force\_refresh=False, proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have `__salt__` or `__proxy__` available. At proxy-minion startup, this function is called with the proxymodule `LazyLoader` object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.grain_funcs`(*opts, proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

### 15.1.3 Salt's Client Interfaces

#### LocalClient

```
class salt.client.LocalClient(c_path='/etc/salt/master', mopts=None, skip_perm_errors=False,
                             io_loop=None, keep_loop=False, auto_reconnect=False)
```

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless `external_auth` is configured and authentication credentials are included in the execution).

**Note:** The `LocalClient` uses a Tornado `IOLoop`, this can create issues when using the `LocalClient` inside an existing `IOLoop`. If creating the `LocalClient` in partnership with another `IOLoop` either create the `IOLoop` before creating the `LocalClient`, or when creating the `IOLoop` use `ioloop.current()` which will return the `ioloop` created by `LocalClient`.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

**cmd**(*tgt*, *fun*, *arg*=(), *timeout*=None, *expr\_form*='glob', *ret*='', *jid*='', *kwarg*=None, *\*\*kwargs*)  
Synchronously execute a command on targeted minions

The `cmd` method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
    'grains.items',
    'sys.doc',
    'cmd.run',
],
[
    [],
    [],
    ['uptime'],
])
```

#### Parameters

- **tgt** (*string or list*) -- Which minions to target for the execution. Default is shell glob. Modified by the `expr_form` option.
- **fun** (*string or list of strings*) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

**Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take arguments must still have a corresponding empty list at the expected index.

- **arg** (*list or list-of-lists*) -- A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except when executing a compound command.
- **timeout** -- Seconds to wait after the last minion returns but before all minions return.
- **expr\_form** -- The type of `tgt`. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `grain_pcre` - Grain comparison with a regex
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string
- **ret** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** -- A dictionary with keyword arguments for the function.
- **kwargs** -- Optional keyword arguments. Authentication credentials may be passed when using [external\\_auth](#).

For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev')`  
 Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

**Returns** A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

**cmd\_async** (*tgt, fun, arg=(), expr\_form='glob', ret='', jid='', kwarg=None, \*\*kwargs*)  
 Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

**cmd\_batch** (*tgt, fun, arg=(), expr\_form='glob', ret='', kwarg=None, batch='10%', \*\*kwargs*)  
 Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

**Parameters batch** -- The batch identifier of systems to execute on

**Returns** A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

**cmd\_iter**(*tgt, fun, arg=(), timeout=None, expr\_form='glob', ret='', kwarg=None, \*\*kwargs*)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd\_iter\_no\_block**(*tgt, fun, arg=(), timeout=None, expr\_form='glob', ret='', kwarg=None, show\_jid=False, verbose=False, \*\*kwargs*)

Yields the individual minion returns as they come in, or `None` when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns, or `None` when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd\_subset**(*tgt, fun, arg=(), expr\_form='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, \*\*kwargs*)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

**Parameters** `sub` -- The number of systems to execute on

```
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

**get\_cli\_returns**(*jid, minions, timeout=None, tgt='\*', tgt\_type='glob', verbose=False, show\_jid=False, \*\*kwargs*)

Starts a watcher looking at the return data for a specified JID

**Returns** all of the information for the JID

**get\_event\_iter\_returns**(*jid, minions, timeout=None*)

Gather the return data from the event system, break hard when timeout is reached.

**run\_job**(*tgt, fun, arg=(), expr\_form='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, \*\*kwargs*)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

**Returns** A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

## Salt Caller

class `salt.client.Caller` (`c_path='/etc/salt/minion'`, `mopts=None`)

Caller is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

**cmd** (`fun`, `*args`, `**kwargs`)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
           data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## RunnerClient

class `salt.runner.RunnerClient` (`opts`)

The interface used by the **salt-run** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's `external_auth` can be used to authenticate calls. The `eauth` user must be authorized to execute runner modules: (`@runner`). Only the `master_call()` below supports `eauth`.

**async** (*fun, low, user='UNKNOWN', pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun, arg=None, pub\_data=None, kwarg=None, print\_event=True, full\_return=False*)

Execute a function

**cmd\_async** (*low*)

Execute a runner function asynchronously; `eauth` is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

**cmd\_sync** (*low, timeout=None*)

Execute a runner function synchronously; `eauth` is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

## WheelClient

class `salt.wheel.WheelClient` (*opts=None*)

An interface to Salt's wheel modules

*Wheel modules* interact with various parts of the Salt Master.

Importing and using `WheelClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless `external_auth` is configured and the user is authorized to execute wheel functions: (`@wheel`).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

**async** (*fun, low, user='UNKNOWN', pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun, arg=None, pub\_data=None, kwarg=None, print\_event=True, full\_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**cmd\_async** (*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

**cmd\_sync** (*low, timeout=None*)

Execute a wheel function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@wheel).

```
>>> wheel.cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**CloudClient**

class salt.cloud.**CloudClient** (*path=None, opts=None, config\_dir=None, pillars=None*)

The client class to wrap cloud interactions

**action** (*fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'})
)
```

**create** (*provider, names, \*\*kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(names=['myinstance'], provider='my-ec2-config',
    kwargs={'image': 'ami-1624987f', 'size': 't1.micro',
        'ssh_username': 'ec2-user', 'securitygroup': 'default',
        'delvol_on_destroy': True})
```

**destroy** (*names*)

Destroy the named VMs

**extra\_action** (*names, provider, action, \*\*kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
                    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000}
                    )
client.extra_action(names=['salt-net'], action='network_create',
                    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'}
                    )
```

**full\_query** (*query\_type='list\_nodes\_full'*)

Query all instance information

**list\_images** (*provider=None*)

List all available images in configured cloud systems

**list\_locations** (*provider=None*)

List all available locations in configured cloud systems

**list\_sizes** (*provider=None*)

List all available sizes in configured cloud systems

**low** (*fun, low*)

Pass the cloud function and low data structure to run

**map\_run** (*path, \*\*kwargs*)

Pass in a location for a map to execute

**min\_query** (*query\_type='list\_nodes\_min'*)

Query select instance information

**profile** (*profile, names, vm\_overrides=None, \*\*kwargs*)

Pass in a profile to create, names is a list of vm names to allocate

vm\_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'u'backups_active': 'False',
              u'created_at': '2014-09-04T18:10:15Z',
              u'droplet': {'u'event_id': 31000502,
                           u'id': 2530006,
                           u'image_id': 5140006,
                           u'name': u'minion01',
                           u'size_id': 66},
              u'id': '2530006',
              u'image_id': '5140006',
              u'ip_address': '107.XXX.XXX.XXX',
              u'locked': 'True',
              u'name': 'minion01',
              u'private_ip_address': None,
              u'region_id': '4',
              u'size_id': '66',
              u'status': 'new'}}
```

**query** (*query\_type='list\_nodes'*)  
Query basic instance information

**select\_query** (*query\_type='list\_nodes\_select'*)  
Query select instance information

## SSHClient

```
class salt.client.ssh.client.SSHClient(c_path='/etc/salt/master', mopts=None,
                                     disable_custom_roster=False)
```

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd** (*tgt, fun, arg=(), timeout=None, expr\_form='glob', kwarg=None, \*\*kwargs*)  
Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd\_iter** (*tgt, fun, arg=(), timeout=None, expr\_form='glob', ret=',', kwarg=None, \*\*kwargs*)  
Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

## 15.2 netapi modules

### 15.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **salt-api** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

---

#### salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

---

See also:

*The full list of netapi modules*

### 15.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

class `salt.netapi.NetapiClient`(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

**local**(*\*args*, *\*\*kwargs*)

Run *execution modules* synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

**Returns** Returns the result from the execution module

**local\_async**(*\*args*, *\*\*kwargs*)

Run *execution modules* asynchronously

Wraps `salt.client.LocalClient.run_job()`.

**Returns** job ID

**local\_subset**(*\*args*, *\*\*kwargs*)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner**(*fun*, *timeout=None*, *\*\*kwargs*)

Run *runner modules* <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the runner module

**runner\_async**(*fun*, *\*\*kwargs*)

Run *runner modules* <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** event data and a job ID for the executed function.

**ssh**(*\*args*, *\*\*kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

**Returns** Returns the result from the salt-ssh command

**wheel**(*fun*, *\*\*kwargs*)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**wheel\_async** (*fun*, *\*\*kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

## HTTP Modules

This tutorial demonstrates using the various HTTP modules available in Salt. These modules wrap the Python `tornado`, `urllib2`, and `requests` libraries, extending them in a manner that is more consistent with Salt workflows.

### The `salt.utils.http` Library

This library forms the core of the HTTP modules. Since it is designed to be used from the minion as an execution module, in addition to the master as a runner, it was abstracted into this multi-use library. This library can also be imported by 3rd-party programs wishing to take advantage of its extended functionality.

Core functionality of the execution, state, and runner modules is derived from this library, so common usages between them are described here. Documentation specific to each module is described below.

This library can be imported with:

```
import salt.utils.http
```

### Configuring Libraries

This library can make use of either `tornado`, which is required by Salt, `urllib2`, which ships with Python, or `requests`, which can be installed separately. By default, `tornado` will be used. In order to switch to `urllib2`, set the following variable:

```
backend: urllib2
```

In order to switch to `requests`, set the following variable:

```
backend: requests
```

This can be set in the master or minion configuration file, or passed as an option directly to any `http.query()` functions.

### `salt.utils.http.query()`

This function forms a basic query, but with some add-ons not present in the `tornado`, `urllib2`, and `requests` libraries. Not all functionality currently available in these libraries has been added, but can be in future iterations.

### HTTPS Request Methods

A basic query can be performed by calling this function with no more than a single URL:

```
salt.utils.http.query('http://example.com')
```

By default the query will be performed with a GET method. The method can be overridden with the `method` argument:

```
salt.utils.http.query('http://example.com/delete/url', 'DELETE')
```

When using the POST method (and others, such as PUT), extra data is usually sent as well. This data can be sent directly, in whatever format is required by the remote server (XML, JSON, plain text, etc).

```
salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    data=json.loads(mydict)
)
```

### Data Formatting and Templating

Bear in mind that the data must be sent pre-formatted; this function will not format it for you. However, a templated file stored on the local system may be passed through, along with variables to populate it with. To pass through only the file (untemplated):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.xml'
)
```

To pass through a file that contains jinja + yaml templating (the default):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

To pass through a file that contains mako templating:

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.mako',
    data_render=True,
    data_renderer='mako',
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

Because this function uses Salt's own rendering system, any Salt renderer can be used. Because Salt's renderer requires `__opts__` to be set, an `opts` dictionary should be passed in. If it is not, then the default `__opts__` values for the node type (master or minion) will be used. Because this library is intended primarily for use by minions, the default node type is `minion`. However, this can be changed to `master` if necessary.

```

salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    opts=__opts__
)

salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    node='master'
)

```

## Headers

Headers may also be passed through, either as a `header_list`, a `header_dict`, or as a `header_file`. As with the `data_file`, the `header_file` may also be templated. Take note that because HTTP headers are normally syntactically-correct YAML, they will automatically be imported as an a Python dict.

```

salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    header_file='/srv/salt/headers.jinja',
    header_render=True,
    header_renderer='jinja',
    template_data={'key1': 'value1', 'key2': 'value2'}
)

```

Because much of the data that would be templated between headers and data may be the same, the `template_data` is the same for both. Correcting possible variable name collisions is up to the user.

## Authentication

The `query()` function supports basic HTTP authentication. A username and password may be passed in as `username` and `password`, respectively.

```

salt.utils.http.query(
    'http://example.com',
    username='larry',
    password='`5700g3543v4r`',
)

```

## Cookies and Sessions

Cookies are also supported, using Python's built-in `cookieclib`. However, they are turned off by default. To turn cookies on, set `cookies` to `True`.

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True  
)
```

By default cookies are stored in Salt's cache directory, normally `/var/cache/salt`, as a file called `cookies.txt`. However, this location may be changed with the `cookie_jar` argument:

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True,  
    cookie_jar='/path/to/cookie_jar.txt'  
)
```

By default, the format of the cookie jar is LWP (aka, lib-www-perl). This default was chosen because it is a human-readable text file. If desired, the format of the cookie jar can be set to Mozilla:

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True,  
    cookie_jar='/path/to/cookie_jar.txt',  
    cookie_format='mozilla'  
)
```

Because Salt commands are normally one-off commands that are piped together, this library cannot normally behave as a normal browser, with session cookies that persist across multiple HTTP requests. However, the session can be persisted in a separate cookie jar. The default filename for this file, inside Salt's cache directory, is `cookies.session.p`. This can also be changed.

```
salt.utils.http.query(  
    'http://example.com',  
    persist_session=True,  
    session_cookie_jar='/path/to/jar.p'  
)
```

The format of this file is msgpack, which is consistent with much of the rest of Salt's internal structure. Historically, the extension for this file is `.p`. There are no current plans to make this configurable.

## Proxy

If the `tornado` backend is used (`tornado` is the default), proxy information configured in `proxy_host`, `proxy_port`, `proxy_username`, and `proxy_password` from the `__opts__` dictionary will be used. Normally these are set in the minion configuration file.

```
proxy_host: proxy.my-domain  
proxy_port: 31337  
proxy_username: charon  
proxy_password: obolus
```

```
salt.utils.http.query(  
    'http://example.com',  
    opts=__opts__,  
    backend='tornado'  
)
```

## Return Data

**Note:** Return data encoding

If `decode` is set to `True`, `query()` will attempt to decode the return data. `decode_type` defaults to `auto`. Set it to a specific encoding, `xml`, for example, to override autodetection.

Because Salt's `http` library was designed to be used with REST interfaces, `query()` will attempt to decode the data received from the remote server when `decode` is set to `True`. First it will check the `Content-type` header to try and find references to XML. If it does not find any, it will look for references to JSON. If it does not find any, it will fall back to plain text, which will not be decoded.

JSON data is translated into a dict using Python's built-in `json` library. XML is translated using `salt.utils.xml_util`, which will use Python's built-in XML libraries to attempt to convert the XML into a dict. In order to force either JSON or XML decoding, the `decode_type` may be set:

```
salt.utils.http.query(
    'http://example.com',
    decode_type='xml'
)
```

Once translated, the return dict from `query()` will include a dict called `dict`.

If the data is not to be translated using one of these methods, decoding may be turned off.

```
salt.utils.http.query(
    'http://example.com',
    decode=False
)
```

If decoding is turned on, and references to JSON or XML cannot be found, then this module will default to plain text, and return the undecoded data as `text` (even if `text` is set to `False`; see below).

The `query()` function can return the HTTP status code, headers, and/or text as required. However, each must individually be turned on.

```
salt.utils.http.query(
    'http://example.com',
    status=True,
    headers=True,
    text=True
)
```

The return from these will be found in the return dict as `status`, `headers` and `text`, respectively.

## Writing Return Data to Files

It is possible to write either the return data or headers to files, as soon as the response is received from the server, but specifying file locations via the `text_out` or `headers_out` arguments. `text` and `headers` do not need to be returned to the user in order to do this.

```
salt.utils.http.query(
    'http://example.com',
    text=False,
    headers=False,
```

```
text_out='/path/to/url_download.txt',
headers_out='/path/to/headers_download.txt',
)
```

## SSL Verification

By default, this function will verify SSL certificates. However, for testing or debugging purposes, SSL verification can be turned off.

```
salt.utils.http.query(
    'https://example.com',
    verify_ssl=False,
)
```

## CA Bundles

The `requests` library has its own method of detecting which CA (certificate authority) bundle file to use. Usually this is implemented by the packager for the specific operating system distribution that you are using. However, `urllib2` requires a little more work under the hood. By default, Salt will try to auto-detect the location of this file. However, if it is not in an expected location, or a different path needs to be specified, it may be done so using the `ca_bundle` variable.

```
salt.utils.http.query(
    'https://example.com',
    ca_bundle='/path/to/ca_bundle.pem',
)
```

## Updating CA Bundles

The `update_ca_bundle()` function can be used to update the bundle file at a specified location. If the target location is not specified, then it will attempt to auto-detect the location of the bundle file. If the URL to download the bundle from does not exist, a bundle will be downloaded from the cURL website.

**CAUTION:** The `target` and the `source` should always be specified! Failure to specify the `target` may result in the file being written to the wrong location on the local system. Failure to specify the `source` may cause the upstream URL to receive excess unnecessary traffic, and may cause a file to be download which is hazardous or does not meet the needs of the user.

```
salt.utils.http.update_ca_bundle(
    target='/path/to/ca-bundle.crt',
    source='https://example.com/path/to/ca-bundle.crt',
    opts=__opts__,
)
```

The `opts` parameter should also always be specified. If it is, then the `target` and the `source` may be specified in the relevant configuration file (master or minion) as `ca_bundle` and `ca_bundle_url`, respectively.

```
ca_bundle: /path/to/ca-bundle.crt
ca_bundle_url: https://example.com/path/to/ca-bundle.crt
```

If Salt is unable to auto-detect the location of the CA bundle, it will raise an error.

The `update_ca_bundle()` function can also be passed a string or a list of strings which represent files on the local system, which should be appended (in the specified order) to the end of the CA bundle file. This is useful in environments where private certs need to be made available, and are not otherwise reasonable to add to the bundle file.

```
salt.utils.http.update_ca_bundle(
    opts=__opts__,
    merge_files=[
        '/etc/ssl/private_cert_1.pem',
        '/etc/ssl/private_cert_2.pem',
        '/etc/ssl/private_cert_3.pem',
    ]
)
```

### Test Mode

This function may be run in test mode. This mode will perform all work up until the actual HTTP request. By default, instead of performing the request, an empty dict will be returned. Using this function with TRACE logging turned on will reveal the contents of the headers and POST data to be sent.

Rather than returning an empty dict, an alternate `test_url` may be passed in. If this is detected, then test mode will replace the `url` with the `test_url`, set `test` to `True` in the return data, and perform the rest of the requested operations as usual. This allows a custom, non-destructive URL to be used for testing when necessary.

### Execution Module

The `http` execution module is a very thin wrapper around the `salt.utils.http` library. The `opts` can be passed through as well, but if they are not specified, the minion defaults will be used as necessary.

Because passing complete data structures from the command line can be tricky at best and dangerous (in terms of execution injection attacks) at worse, the `data_file`, and `header_file` are likely to see more use here.

All methods for the library are available in the execution module, as kwargs.

```
salt myminion http.query http://example.com/restapi method=POST \
    username='larry' password='5700g3543v4r' headers=True text=True \
    status=True decode_type=xml data_render=True \
    header_file=/tmp/headers.txt data_file=/tmp/data.txt \
    header_render=True cookies=True persist_session=True
```

### Runner Module

Like the execution module, the `http` runner module is a very thin wrapper around the `salt.utils.http` library. The only significant difference is that because runners execute on the master instead of a minion, a target is not required, and default `opts` will be derived from the master config, rather than the minion config.

All methods for the library are available in the runner module, as kwargs.

```
salt-run http.query http://example.com/restapi method=POST \
    username='larry' password='5700g3543v4r' headers=True text=True \
    status=True decode_type=xml data_render=True \
    header_file=/tmp/headers.txt data_file=/tmp/data.txt \
    header_render=True cookies=True persist_session=True
```

## State Module

The state module is a wrapper around the runner module, which applies stateful logic to a query. All kwargs as listed above are specified as usual in state files, but two more kwargs are available to apply stateful logic. A required parameter is `match`, which specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text. In Python terms this looks like:

```
if match in html_text:
    return True
```

If more complex pattern matching is required, a regular expression can be used by specifying a `match_type`. By default this is set to `string`, but it can be manually set to `pcre` instead. Please note that despite the name, this will use Python's `re.search()` rather than `re.match()`.

Therefore, the following states are valid:

```
http://example.com/restapi:
  http.query:
    - match: 'SUCCESS'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_render: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_render: True
    - cookies: True
    - persist_session: True

http://example.com/restapi:
  http.query:
    - match_type: pcre
    - match: '(?i)succe[ss|ed]'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_render: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_render: True
    - cookies: True
    - persist_session: True
```

In addition to, or instead of a match pattern, the status code for a URL can be checked. This is done using the `status` argument:

```
http://example.com/:
  http.query:
    - status: '200'
```

If both are specified, both will be checked, but if only one is `True` and the other is `False`, then `False` will be returned. In this case, the comments in the return data will contain information for troubleshooting.

Because this is a monitoring state, it will return extra data to code that expects it. This data will always include `text` and `status`. Optionally, `headers` and `dict` may also be requested by setting the `headers` and `decode` arguments to `True`, respectively.

## Writing netapi modules

netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

*The full list of netapi modules*

## Configuration

All netapi configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherry.py:
  port: 8000
  debug: True
  ssl_cert: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

## The \_\_virtual\_\_ function

Like all module types in Salt, netapi modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

## The start function

The `start()` function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

## Multiple instances

New in version 2016.11.0.

`rest_cherry.py` and `rest_tornado` support running multiple instances by copying and renaming entire directory of those. To start the copied multiple netapi modules, add configuration blocks for the copied netapi modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied netapi module.

## Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.

## Loader “magic” methods

The loader makes the `__opts__` data structure available to any function in a netapi module.

---

## Architecture

---

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 16.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 16.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are ``hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of *file\_roots* and *pillar\_roots* need to be kept in sync with processes external to Salt as well

A tutorial on setting up multimaster with ``hot" masters is here:

*Multimaster Tutorial*

#### 16.1.2 Multimaster with Failover

Changing the *master\_type* parameter from *str* to *failover* will cause minions to connect to the first responding master in the list of masters. Every *master\_alive\_interval* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *master\_alive\_interval* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in [this tutorial](#)

`master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

### 16.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in [Salt Syndic](#).

### 16.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in [Salt Syndic](#).

## 16.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

### 16.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1 # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
# on the Syndic node
id: my_syndic
```

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

---

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

---

## 16.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

## 16.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.ping
minion_1:
  True
minion_2:
  True
minion_4:
  True
minion_3:
  True
```

## 16.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

## 16.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not know how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

**Note:** To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

---

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

---

**Note:** If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

---

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 16.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node `ret_port`
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

### 16.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

## 16.3 Using Salt at scale

The focus of this tutorial will be building a Salt infrastructure for handling large numbers of minions. This will include tuning, topology, and best practices.

For how to install the Salt Master please go here: [Installing saltstack](#)

**Note:** This tutorial is intended for large installations, although these same settings won't hurt, it may not be worth the complexity to smaller installations.

When used with minions, the term `many` refers to at least a thousand and `a few` always means 500.

For simplicity reasons, this tutorial will default to the standard ports used by Salt.

---

### 16.3.1 The Master

The most common problems on the Salt Master are:

1. too many minions authenticating at once
2. too many minions re-authenticating at once
3. too many minions re-connecting at once
4. too many minions returning at once
5. too few resources (CPU/HDD)

The first three are all ``thundering herd" problems. To mitigate these issues we must configure the minions to back-off appropriately when the Master is under heavy load.

The fourth is caused by masters with little hardware resources in combination with a possible bug in ZeroMQ. At least that's what it looks like till today ([Issue 118651](#), [Issue 5948](#), [Mail thread](#))

To fully understand each problem, it is important to understand, how Salt works.

Very briefly, the Salt Master offers two services to the minions.

- a job publisher on port 4505
- an open port 4506 to receive the minions returns

All minions are always connected to the publisher on port 4505 and only connect to the open return port 4506 if necessary. On an idle Master, there will only be connections on port 4505.

#### Too many minions authenticating

When the Minion service is first started up, it will connect to its Master's publisher on port 4505. If too many minions are started at once, this can cause a ``thundering herd". This can be avoided by not starting too many minions at once.

The connection itself usually isn't the culprit, the more likely cause of master-side issues is the authentication that the Minion must do with the Master. If the Master is too heavily loaded to handle the auth request it will time it out. The Minion will then wait `acceptance_wait_time` to retry. If `acceptance_wait_time_max` is set then the Minion will increase its wait time by the `acceptance_wait_time` each subsequent retry until reaching `acceptance_wait_time_max`.

#### Too many minions re-authenticating

This is most likely to happen in the testing phase of a Salt deployment, when all Minion keys have already been accepted, but the framework is being tested and parameters are frequently changed in the Salt Master's configuration file(s).

The Salt Master generates a new AES key to encrypt its publications at certain events such as a Master restart or the removal of a Minion key. If you are encountering this problem of too many minions re-authenticating against the Master,

you will need to recalibrate your setup to reduce the rate of events like a Master restart or Minion key removal (`salt-key -d`).

When the Master generates a new AES key, the minions aren't notified of this but will discover it on the next pub job they receive. When the Minion receives such a job it will then re-auth with the Master. Since Salt does minion-side filtering this means that all the minions will re-auth on the next command published on the master-- causing another ``thundering herd". This can be avoided by setting the

```
random_reauth_delay: 60
```

in the minions configuration file to a higher value and stagger the amount of re-auth attempts. Increasing this value will of course increase the time it takes until all minions are reachable via Salt commands.

### Too many minions re-connecting

By default the zmq socket will re-connect every 100ms which for some larger installations may be too quick. This will control how quickly the TCP session is re-established, but has no bearing on the auth load.

To tune the minions sockets reconnect attempts, there are a few values in the sample configuration file (default values)

```
recon_default: 1000
recon_max: 5000
recon_randomize: True
```

- `recon_default`: the default value the socket should use, i.e. 1000. This value is in milliseconds. (1000ms = 1 second)
- `recon_max`: the max value that the socket should use as a delay before trying to reconnect This value is in milliseconds. (5000ms = 5 seconds)
- `recon_randomize`: enables randomization between `recon_default` and `recon_max`

To tune this values to an existing environment, a few decision have to be made.

1. How long can one wait, before the minions should be online and reachable via Salt?
2. How many reconnects can the Master handle without a syn flood?

These questions can not be answered generally. Their answers depend on the hardware and the administrators requirements.

Here is an example scenario with the goal, to have all minions reconnect within a 60 second time-frame on a Salt Master service restart.

```
recon_default: 1000
recon_max: 59000
recon_randomize: True
```

Each Minion will have a randomized reconnect value between ``recon_default'` and ``recon_default + recon_max'`, which in this example means between 1000ms and 60000ms (or between 1 and 60 seconds). The generated random-value will be doubled after each attempt to reconnect (ZeroMQ default behavior).

Lets say the generated random value is 11 seconds (or 11000ms).

```
reconnect 1: wait 11 seconds
reconnect 2: wait 22 seconds
reconnect 3: wait 33 seconds
reconnect 4: wait 44 seconds
reconnect 5: wait 55 seconds
```

```
reconnect 6: wait time is bigger than 60 seconds (recon_default + recon_max)
reconnect 7: wait 11 seconds
reconnect 8: wait 22 seconds
reconnect 9: wait 33 seconds
reconnect x: etc.
```

With a thousand minions this will mean

```
1000/60 = ~16
```

round about 16 connection attempts a second. These values should be altered to values that match your environment. Keep in mind though, that it may grow over time and that more minions might raise the problem again.

### Too many minions returning at once

This can also happen during the testing phase, if all minions are addressed at once with

```
$ salt * disk.usage
```

it may cause thousands of minions trying to return their data to the Salt Master open port 4506. Also causing a flood of syn-flood if the Master can't handle that many returns at once.

This can be easily avoided with Salt's batch mode:

```
$ salt * disk.usage -b 50
```

This will only address 50 minions at once while looping through all addressed minions.

## 16.3.2 Too few resources

The masters resources always have to match the environment. There is no way to give good advise without knowing the environment the Master is supposed to run in. But here are some general tuning tips for different situations:

### The Master is CPU bound

Salt uses RSA-Key-Pairs on the masters and minions end. Both generate 4096 bit key-pairs on first start. While the key-size for the Master is currently not configurable, the minions keysize can be configured with different key-sizes. For example with a 2048 bit key:

```
keysize: 2048
```

With thousands of decryptions, the amount of time that can be saved on the masters end should not be neglected. See here for reference: [Pull Request 9235](#) how much influence the key-size can have.

Downsizing the Salt Master's key is not that important, because the minions do not encrypt as many messages as the Master does.

In installations with large or with complex pillar files, it is possible for the master to exhibit poor performance as a result of having to render many pillar files at once. This exhibit itself in a number of ways, both as high load on the master and on minions which block on waiting for their pillar to be delivered to them.

To reduce pillar rendering times, it is possible to cache pillars on the master. To do this, see the set of master configuration options which are prefixed with *pillar\_cache*.

---

**Note:** Caching pillars on the master may introduce security considerations. Be certain to read caveats outlined in the master configuration file to understand how pillar caching may affect a master's ability to protect sensitive data!

---

### The Master is disk IO bound

By default, the Master saves every Minion's return for every job in its job-cache. The cache can then be used later, to lookup results for previous jobs. The default directory for this is:

```
cachedir: /var/cache/salt
```

and then in the `/proc` directory.

Each job return for every Minion is saved in a single file. Over time this directory can grow quite large, depending on the number of published jobs. The amount of files and directories will scale with the number of jobs published and the retention time defined by

```
keep_jobs: 24
```

```
250 jobs/day * 2000 minions returns = 500,000 files a day
```

If no job history is needed, the job cache can be disabled:

```
job_cache: False
```

If the job cache is necessary there are (currently) 2 options:

- `ext_job_cache`: this will have the minions store their return data directly into a returner (not sent through the Master)
- `master_job_cache` (New in 2014.7.0): this will make the Master store the job data using a returner (instead of the local job cache on disk).

If a master has many accepted keys, it may take a long time to publish a job because the master must first determine the matching minions and deliver that information back to the waiting client before the job can be published.

To mitigate this, a key cache may be enabled. This will reduce the load on the master to a single file open instead of thousands or tens of thousands.

This cache is updated by the maintenance process, however, which means that minions with keys that are accepted may not be targeted by the master for up to sixty seconds by default.

To enable the master key cache, set `key_cache: 'sched'` in the master configuration file.

## 16.4 Multi Master Tutorial

As of Salt 0.16.0, the ability to connect minions to multiple masters has been made available. The multi-master system allows for redundancy of Salt masters and facilitates multiple points of communication out to minions. When using a multi-master setup, all masters are running hot, and any active master can be used to send commands out to the minions.

---

**Note:** If you need failover capabilities with multiple masters, there is also a MultiMaster-PKI setup available, that uses a different topology [MultiMaster-PKI with Failover Tutorial](#)

---

In 0.16.0, the masters do not share any information, keys need to be accepted on both masters, and shared files need to be shared manually or use tools like the git fileserver backend to ensure that the `file_roots` are kept consistent.

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

### 16.4.1 Summary of Steps

1. Create a redundant master server
2. Copy primary master key to redundant master
3. Start redundant master
4. Configure minions to connect to redundant master
5. Restart minions
6. Accept keys on redundant master

### 16.4.2 Prepping a Redundant Master

The first task is to prepare the redundant master. If the redundant master is already running, stop it. There is only one requirement when preparing a redundant master, which is that masters share the same private key. When the first master was created, the master's identifying key pair was generated and placed in the master's `pki_dir`. The default location of the master's key pair is `/etc/salt/pki/master/`. Take the private key, `master.pem`, and copy it to the same location on the redundant master. Do the same for the master's public key, `master.pub`. Assuming that no minions have yet been connected to the new redundant master, it is safe to delete any existing key in this location and replace it.

---

**Note:** There is no logical limit to the number of redundant masters that can be used.

---

Once the new key is in place, the redundant master can be safely started.

### 16.4.3 Configure Minions

Since minions need to be master-aware, the new master needs to be added to the minion configurations. Simply update the minion configurations to list all connected masters:

```
master:
  - saltmaster1.example.com
  - saltmaster2.example.com
```

Now the minion can be safely restarted.

---

**Note:** If the `ipc_mode` for the minion is set to TCP (default in Windows), then each minion in the multi-minion setup (one per master) needs its own `tcp_pub_port` and `tcp_pull_port`.

If these settings are left as the default 4510/4511, each minion object will receive a port 2 higher than the previous. Thus the first minion will get 4510/4511, the second will get 4512/4513, and so on. If these port decisions are unacceptable, you must configure `tcp_pub_port` and `tcp_pull_port` with lists of ports for each master. The length of these lists should match the number of masters, and there should not be overlap in the lists.

---

Now the minions will check into the original master and also check into the new redundant master. Both masters are first-class and have rights to the minions.

---

**Note:** Minions can automatically detect failed masters and attempt to reconnect to them quickly. To enable this functionality, set `master_alive_interval` in the minion config and specify a number of seconds to poll the masters for connection status.

If this option is not set, minions will still reconnect to failed masters but the first command sent after a master comes back up may be lost while the minion authenticates.

---

#### 16.4.4 Sharing Files Between Masters

Salt does not automatically share files between multiple masters. A number of files should be shared or sharing of these files should be strongly considered.

##### Minion Keys

Minion keys can be accepted the normal way using `salt-key` on both masters. Keys accepted, deleted, or rejected on one master will NOT be automatically managed on redundant masters; this needs to be taken care of by running `salt-key` on both masters or sharing the `/etc/salt/pki/master/{minions,minions_pre,minions_rejected}` directories between masters.

---

**Note:** While sharing the `/etc/salt/pki/master` directory will work, it is strongly discouraged, since allowing access to the `master.pem` key outside of Salt creates a *SERIOUS* security risk.

---

##### File\_Roots

The `file_roots` contents should be kept consistent between masters. Otherwise state runs will not always be consistent on minions since instructions managed by one master will not agree with other masters.

The recommended way to sync these is to use a fileserver backend like `gitfs` or to keep these files on shared storage.

---

**Important:** If using `gitfs/git_pillar` with the `cachedir` shared between masters using `GlusterFS`, `nfs`, or another network filesystem, and the masters are running Salt 2015.5.9 or later, it is strongly recommended not to turn off `gitfs_global_lock/git_pillar_global_lock` as doing so will cause lock files to be removed if they were created by a different master.

---

##### Pillar\_Roots

Pillar roots should be given the same considerations as `file_roots`.

---

## Master Configurations

While reasons may exist to maintain separate master configurations, it is wise to remember that each master maintains independent control over minions. Therefore, access controls should be in sync between masters unless a valid reason otherwise exists to keep them inconsistent.

These access control options include but are not limited to:

- `external_auth`
- `publisher_acl`
- `peer`
- `peer_run`

## 16.5 Multi-Master-PKI Tutorial With Failover

This tutorial will explain, how to run a salt-environment where a single minion can have multiple masters and fail-over between them if its current master fails.

The individual steps are

- setup the master(s) to sign its auth-replies
- setup minion(s) to verify master-public-keys
- enable multiple masters on minion(s)
- enable master-check on minion(s)

Please note, that it is advised to have good knowledge of the salt- authentication and communication-process to understand this tutorial. All of the settings described here, go on top of the default authentication/communication process.

### 16.5.1 Motivation

The default behaviour of a salt-minion is to connect to a master and accept the masters public key. With each publication, the master sends his public-key for the minion to check and if this public-key ever changes, the minion complains and exits. Practically this means, that there can only be a single master at any given time.

Would it not be much nicer, if the minion could have any number of masters (1:n) and jump to the next master if its current master died because of a network or hardware failure?

---

**Note:** There is also a MultiMaster-Tutorial with a different approach and topology than this one, that might also suite your needs or might even be better suited [Multi-Master Tutorial](#)

---

It is also desirable, to add some sort of authenticity-check to the very first public key a minion receives from a master. Currently a minions takes the first masters public key for granted.

### 16.5.2 The Goal

Setup the master to sign the public key it sends to the minions and enable the minions to verify this signature for authenticity.

### 16.5.3 Prepping the master to sign its public key

For signing to work, both master and minion must have the signing and/or verification settings enabled. If the master signs the public key but the minion does not verify it, the minion will complain and exit. The same happens, when the master does not sign but the minion tries to verify.

The easiest way to have the master sign its public key is to set

```
master_sign_pubkey: True
```

After restarting the salt-master service, the master will automatically generate a new key-pair

```
master_sign.pem
master_sign.pub
```

A custom name can be set for the signing key-pair by setting

```
master_sign_key_name: <name_without_suffix>
```

The master will then generate that key-pair upon restart and use it for creating the public keys signature attached to the auth-reply.

The computation is done for every auth-request of a minion. If many minions auth very often, it is advised to use `conf_master:master_pubkey_signature` and `conf_master:master_use_pubkey_signature` settings described below.

If multiple masters are in use and should sign their auth-replies, the signing key-pair `master_sign.*` has to be copied to each master. Otherwise a minion will fail to verify the masters public when connecting to a different master than it did initially. That is because the public keys signature was created with a different signing key-pair.

### 16.5.4 Prepping the minion to verify received public keys

The minion must have the public key (and only that one!) available to be able to verify a signature it receives. That public key (defaults to `master_sign.pub`) must be copied from the master to the minions pki-directory.

```
/etc/salt/pki/minion/master_sign.pub
```

```
DO NOT COPY THE master_sign.pem FILE. IT MUST STAY ON THE MASTER AND ONLY THERE!
```

When that is done, enable the signature checking in the minions configuration

```
verify_master_pubkey_sign: True
```

and restart the minion. For the first try, the minion should be run in manual debug mode.

```
salt-minion -l debug
```

Upon connecting to the master, the following lines should appear on the output:

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
[INFO ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

If the signature verification fails, something went wrong and it will look like this

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Failed to verify signature of public key
[CRITICAL] The Salt Master server's public key did not authenticate!
```

In a case like this, it should be checked, that the verification pubkey (master\_sign.pub) on the minion is the same as the one on the master.

Once the verification is successful, the minion can be started in daemon mode again.

For the paranoid among us, its also possible to verify the publication whenever it is received from the master. That is, for every single auth-attempt which can be quite frequent. For example just the start of the minion will force the signature to be checked 6 times for various things like auth, mine, *highstate*, etc.

If that is desired, enable the setting

```
always_verify_signature: True
```

### 16.5.5 Multiple Masters For A Minion

Configuring multiple masters on a minion is done by specifying two settings:

- a list of masters addresses
- what type of master is defined

```
master:
- 172.16.0.10
- 172.16.0.11
- 172.16.0.12
```

```
master_type: failover
```

This tells the minion that all the master above are available for it to connect to. When started with this configuration, it will try the master in the order they are defined. To randomize that order, set

```
master_shuffle: True
```

The master-list will then be shuffled before the first connection attempt.

The first master that accepts the minion, is used by the minion. If the master does not yet know the minion, that counts as accepted and the minion stays on that master.

For the minion to be able to detect if its still connected to its current master enable the check for it

```
master_alive_interval: <seconds>
```

If the loss of the connection is detected, the minion will temporarily remove the failed master from the list and try one of the other masters defined (again shuffled if that is enabled).

### 16.5.6 Testing the setup

At least two running masters are needed to test the failover setup.

Both masters should be running and the minion should be running on the command line in debug mode

```
salt-minion -l debug
```

The minion will connect to the first master from its master list

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
[INFO ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

A test.ping on the master the minion is currently connected to should be run to test connectivity.

If successful, that master should be turned off. A firewall-rule denying the minions packets will also do the trick.

Depending on the configured `conf_minion:master_alive_interval`, the minion will notice the loss of the connection and log it to its logfile.

```
[INFO ] Connection to master 172.16.0.10 lost
[INFO ] Trying to tune in to next master from master-list
```

The minion will then remove the current master from the list and try connecting to the next master

```
[INFO ] Removing possibly failed master 172.16.0.10 from list of masters
[WARNING ] Master ip address changed from 172.16.0.10 to 172.16.0.11
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.11
```

If everything is configured correctly, the new masters public key will be verified successfully

```
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
```

the authentication with the new master is successful

```
[INFO ] Received signed and verified master pubkey from master 172.16.0.11
[DEBUG ] Decrypting the current master AES key
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[INFO ] Authentication with master successful!
```

and the minion can be pinged again from its new master.

### 16.5.7 Performance Tuning

With the setup described above, the master computes a signature for every auth-request of a minion. With many minions and many auth-requests, that can chew up quite a bit of CPU-Power.

To avoid that, the master can use a pre-created signature of its public-key. The signature is saved as a base64 encoded string which the master reads once when starting and attaches only that string to auth-replies.

Enabling this also gives paranoid users the possibility, to have the signing key-pair on a different system than the actual salt-master and create the public keys signature there. Probably on a system with more restrictive firewall rules, without internet access, less users, etc.

That signature can be created with

```
salt-key --gen-signature
```

This will create a default signature file in the master pki-directory

```
/etc/salt/pki/master/master_pubkey_signature
```

It is a simple text-file with the binary-signature converted to base64.

If no signing-pair is present yet, this will auto-create the signing pair and the signature file in one call

```
salt-key --gen-signature --auto-create
```

Telling the master to use the pre-created signature is done with

```
master_use_pubkey_signature: True
```

That requires the file `master\_pubkey\_signature' to be present in the masters pki-directory with the correct signature.

If the signature file is named differently, its name can be set with

```
master_pubkey_signature: <filename>
```

With many masters and many public-keys (default and signing), it is advised to use the salt-masters hostname for the signature-files name. Signatures can be easily confused because they do not provide any information about the key the signature was created from.

Verifying that everything works is done the same way as above.

### 16.5.8 How the signing and verification works

The default key-pair of the salt-master is

```
/etc/salt/pki/master/master.pem  
/etc/salt/pki/master/master.pub
```

To be able to create a signature of a message (in this case a public-key), another key-pair has to be added to the setup. Its default name is:

```
master_sign.pem  
master_sign.pub
```

The combination of the master.\* and master\_sign.\* key-pairs give the possibility of generating signatures. The signature of a given message is unique and can be verified, if the public-key of the signing-key-pair is available to the recipient (the minion).

The signature of the masters public-key in master.pub is computed with

```
master_sign.pem  
master.pub  
M2Crypto.EVP.sign_update()
```

This results in a binary signature which is converted to base64 and attached to the auth-reply send to the minion.

With the signing-pairs public-key available to the minion, the attached signature can be verified with

```
master_sign.pub
master.pub
M2Cryptos EVP.verify_update().
```

When running multiple masters, either the signing key-pair has to be present on all of them, or the master\_pubkey\_signature has to be pre-computed for each master individually (because they all have different public-keys).

DO NOT PUT THE SAME master.pub ON ALL MASTERS FOR EASE OF USE.

---

## Minion Data Cache

---

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 17.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

### 17.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

## 18.1 Windows Software Repository

---

**Note:** In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See See the *Changes in Version 2015.8.0* for details.

---

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.install` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

### 18.1.1 Configuration

#### Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```

### Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

## 18.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

### Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

### Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.available_version firefox
{'firefox': {'15.0.1': 'Mozilla Firefox 15.0.1 (x86 en-US)',
             '16.0.2': 'Mozilla Firefox 16.0.2 (x86 en-US)',
             '17.0.1': 'Mozilla Firefox 17.0.1 (x86 en-US)'}}
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

## 18.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```

---

**Note:** `pkg.purge` just executes `pkg.remove` on Windows. At some point in the future `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

---

### 18.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: <https://github.com/saltstack/salt-winrepo-ng>
- Earlier releases: <https://github.com/saltstack/salt-winrepo>

By default, these repositories are mirrored to `/srv/salt/win/repo_ng` and `/srv/salt/win/repo`.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

### 18.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: [salt-winrepo](#) [salt-winrepo-ng](#)

---

**Note:** The newer software definition files are run through the salt's parser which allows for the use of jinja.

---

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

---

**Important:** `winrepo_remotes` was called `win_git_repos` in Salt versions earlier than 2015.8.0

---

Package definitions are pulled down from the online repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (`salt-winrepo`) and new minions (`salt-winrepo-ng`). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

---

**Important:** If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the msgpack file.

---

The next step (if you have older minions) is to create the msgpack file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

---

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

---

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

---

On older minions (older than 2015.8.0) this will copy the `winrepo.p` file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (`.sls`) down to the minion and then create the msgpack file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

---

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

---

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the msgpack file to be created successfully.

---

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotest` set the following in the master config file:

```
winrepo_remotest: []
```

---

### 18.1.6 Creating a Package Definition SLS File

The package definition file is a yaml file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
    full_name: Mozilla Firefox 17.0.1 (x86 en-US)
    locale: en_US
    reboot: False
```

---

```

install_flags: '-ms'
uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
uninstall_flags: '/S'
'16.0.2':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
  full_name: Mozilla Firefox 16.0.2 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'
'15.0.1':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
  full_name: Mozilla Firefox 15.0.1 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'

```

Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome. (<https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi>) When a new version is released, the url just points to the new version. To handle situations such as these, set the version to *latest*. Salt will install the version of Chrome at the URL and report that version. Here's an example:

```

chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    locale: en_US
    reboot: False

```

Available parameters are as follows:

**param str full\_name** The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
-----
7-Zip 9.20 (x64 edition):
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.8.76
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository the `full_name` will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```
test-2008:
-----
7zip:
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Maintenance Service:
  17.0.1
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
firefox:
  17.0.1
nsclient:
  0.3.9.328
```

---

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the

status can be verified when running `highstate`.

**Note:** It is still possible to successfully install packages using `pkg.install` even if they don't match. This can make troubleshooting difficult so be careful.

**param str installer** The path to the `.exe` or `.msi` to use to install the package. This can be a path or a URL. If it is a URL or a salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

**param str install\_flags** Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the installer is waiting for user input so these are important.

**param str uninstaller** The path to the program used to uninstall this software. This can be the path to the same `exe` or `msi` used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- `Software\Microsoft\Windows\CurrentVersion\Uninstall`
- `Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall`

**param str uninstall\_flags** Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the uninstaller is waiting for user input so these are important.

Here are some examples of installer and uninstaller settings:

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
    uninstall_flags: '/qn /norestart'
```

Alternatively the `uninstaller` can also simply repeat the URL of the `msi` file.

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: salt://win/repo/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
```

**param msiexec** This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations. Possible options are: `True`, `False` or path to `msiexec` on your system

**7zip:**

```
'9.20.00.0': installer: salt://win/repo/7zip/7z920-x64.msi full_name: 7-Zip
9.20 (x64 edition) reboot: False install_flags: '/qn /norestart' msiexec:
'C:WindowsSystem32msiexec.exe' uninstaller: salt://win/repo/7zip/7z920-x64.msi
uninstall_flags: '/qn /norestart'
```

**param str arch** This selects which `msiexec.exe` to use. Possible values: x86, x64

**param bool allusers** This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is True.

**param bool cache\_dir** If true, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

---

**Note:** Only applies to salt: installer URLs.

---

Here's an example for a software package that has dependent files:

```
sqlexpress:
  '12.0.2000.8':
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

**param bool use\_scheduler** If true, windows will use the task scheduler to run the installation. This is useful for running the salt installation itself as the installation process kills any currently running instances of salt.

**param str source\_hash** This tells salt to compare a hash sum of the installer

to the provided hash sum before execution. The value can be formatted as `hash_algorithm=hash_sum`, or it can be a URI to a file containing the hash sum. For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example of `source_hash` usage:

```
messageanalyzer:
  '4.0.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

**param bool reboot** Not implemented

**param str local** Not implemented

Examples can be found at <https://github.com/saltstack/salt-winrepo-ng>

### 18.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an *execution module* exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

### Custom Location for Repository SLS Files

If *file\_roots* has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The *winrepo.genrepo* function from the *winrepo* execution module will by default look for the filename specified by *winrepo\_cache\_file* within `C:\salt\srv\salt\win\repo`.

If the *file\_roots* parameter has been modified, then *winrepo\_dir* must be modified to fall within that path, at the proper relative path. For example, if the base environment in *file\_roots* points to `D:\foo`, and *winrepo\_source\_dir* is `salt://win/repo`, then *winrepo\_dir* must be set to `D:\foo\win\repo` to ensure that *winrepo.genrepo* puts the cache file into right location.

## 18.1.8 Config Options for Minions 2015.8.0 and Later

The *winrepo\_source\_dir* config parameter (default: `salt://win/repo`) controls where *pkg.refresh\_db* looks for the cache file (default: `winrepo.p`). This means that the default location for the winrepo cache file would be `salt://win/repo/winrepo.p`. Both *winrepo\_source\_dir* and *winrepo\_cache\_file* can be adjusted to match the actual location of this file on the Salt fileserver.

## 18.1.9 Config Options for Minions Before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cache file (the file generated by the *winrepo.genrepo* runner) at `salt://win/repo/winrepo.p`. If the cache file is in a different path on the salt fileserver, then *win\_repo\_cache\_file* will need to be updated to reflect the proper location.

## 18.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

On the master, the *winrepo.update\_git\_repos* runner has been updated to use either *pygit2* or *GitPython* to checkout the git repositories containing repo data. If *pygit2* or *GitPython* is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running *winrepo.update\_git\_repos*.

If neither *GitPython* nor *pygit2* are installed, then Salt will fall back to the pre-existing behavior for *winrepo.update\_git\_repos*, and a warning will be logged in the master log.

**Note:** Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

---

### Config Parameters Renamed

Many of the legacy `winrepo` configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

#### Master Config

| Old Name                              | New Name                       |
|---------------------------------------|--------------------------------|
| <code>win_repo</code>                 | <code>winrepo_dir</code>       |
| <code>win_repo_mastercachefile</code> | <code>winrepo_cachefile</code> |
| <code>win_gitrepos</code>             | <code>winrepo_remotes</code>   |

**Note:** `winrepo_cachefile` is no longer used by 2015.8.0 and later minions, and the `winrepo_dir` setting is replaced by `winrepo_dir_ng` for 2015.8.0 and later minions.

---

See [here](#) for detailed information on all master config options for the Windows Repo.

#### Minion Config

| Old Name                        | New Name                       |
|---------------------------------|--------------------------------|
| <code>win_repo</code>           | <code>winrepo_dir</code>       |
| <code>win_repo_cachefile</code> | <code>winrepo_cachefile</code> |
| <code>win_gitrepos</code>       | <code>winrepo_remotes</code>   |

See [here](#) for detailed information on all minion config options for the Windows Repo.

### pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner (and the corresponding `remote execution function` for standalone minions) now makes use of the same underlying code used by the `Git Fileserver Backend` and `Git External Pillar` to maintain and update its local clones of git repositories. If a compatible version of either `pygit2` (0.20.3 and later) or `GitPython` (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the `git.latest` state).

**Note:** If compatible versions of both `pygit2` and `GitPython` are installed, then Salt will prefer `pygit2`, to override this behavior use the `winrepo_provider` configuration parameter:

```
winrepo_provider: gitpython
```

The `winrepo execution module` (discussed above in the `Managing Windows Software on a Standalone Windows Minion` section) does not yet officially support the new `pygit2/GitPython` functionality, but if either `pygit2` or

`GitPython` is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run `winrepo.update_git_repos` to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (NOTE: `pygit2` only), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
- https://github.com/saltstack/salt-winrepo.git
- git@github.com:myuser/myrepo.git:
  - pubkey: /path/to/key.pub
  - privkey: /path/to/key
  - passphrase: myaw3s0m3pa$$phr4$3
- https://github.com/myuser/privaterepo.git:
  - user: mygithubuser
  - password: CorrectHorseBatteryStaple
```

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using `pygit2/GitPython`. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git
- https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git:
  - name: baz_junior
```

```
- https://github.com/foobar/baz:  
  - name: baz_the_third
```

### 18.1.11 Troubleshooting

#### Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

#### Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo  
salt winminion pkg.refresh_db
```

#### Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi windows installer provider" to have full list of installed packages. If you don't have this, salt-minion can't report some installed software.

#### How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

## 18.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

### 18.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a `'primary group'` property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the `'primary group'` property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

### 18.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow [issue 11801](#) for any changes to this behavior.

### 18.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. `username`, `mydomain\username`, `username@mydomain.tld` can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow [issue 11801](#) for any changes to this behavior.

### 18.2.4 Specifying the None group

Each Windows system has built-in `_None_` group. This is the default `'primary group'` for files for users not on a domain environment.

Unfortunately, the word `_None_` has special meaning in Python - it is a special value indicating `'nothing'`, similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chgrp C:\path\to\file "'None'"`.

### 18.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

### 18.2.6 Modifying security properties (ACLs) on files

There is no support in Salt for modifying ACLs, and therefore no support for changing file permissions, besides modifying the owner/user.

---

## Developing Salt

---

### 19.1 Overview

In its most typical use, Salt is a software application in which clients, called ``minions" can be commanded and controlled from a central command server called a ``master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, `salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

### 19.2 Salt Client

#### 19.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called `LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master\_event\_pub.ipc).

### 19.3 Salt Master

#### 19.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the `salt' CLI.

### 19.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 19.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish\_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 19.3.4 EventPublisher

The EventPublisher publishes events onto the event bus. It is bound to the following:

- IPC: master\_event\_pull.ipc
- IPC: master\_event\_pub.ipc

### 19.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker\_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 19.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

**The ReqServer is bound to the following:**

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 19.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1. A command is issued on the CLI. For example, ``salt my_minion test.ping``.
- 2) The ``salt`` command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in `ClearFuncs.publish()`.
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (`master_event_pull.ipc`) where the EventPublisher picks it up and distributes it to all connected event listeners on `master_event_pub.ipc`.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on `publish_pull.ipc`.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over `publish_pull`, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across `workers.ipc` to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (`master_event_pull.ipc`). (Again for the curious, this happens in `AESFuncs._return()`.)
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on `master_event_pub.ipc`). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

## 19.4 Salt Minion

### 19.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via ``salt-call`` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect `_back_` to a master defined in the minion config file. The connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

## 19.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_<unique_id>_pub.ipc` and `minion_event_<unique_id>_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

## 19.4.3 Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `'salt-call'` script run by a local user on the salt minion or they can come directly from a master.

## 19.4.4 Master Job Flow

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
  5. The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

## 19.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
  2. AESFuncs is used everywhere else.

## 19.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review [Writing Salt Documentation](#).

### 19.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the [Salt Coding Style](#) documentation for information about Salt's particular coding patterns.

Within the [Salt Coding Style](#) documentation, there is a section about running Salt's `.pylintrc` file. SaltStack recommends running the `.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository. Please see the [Linting](#) documentation for more information.

#### Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors [GitHub's own guide](#) and is well worth reading.

1. Fork [saltstack/salt](#) on GitHub.
2. Make a local clone of your fork.

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add [saltstack/salt](#) as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

4. Create a new branch in your clone.

---

**Note:** A branch should have one purpose. For example, ``Fix bug X," or ``Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.

---

If you're working on a bug or documentation fix, create your branch from the oldest release branch that contains the bug or requires the documentation update. See [Which Salt Branch?](#).

```
git fetch upstream
git checkout -b fix-broken-thing upstream/2016.3
```

If you're working on a feature, create your branch from the develop branch.

```
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary.

---

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

---

```
Fix broken things in file1 and file2

Fixes #31337

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:   path/to/file1
#   modified:   path/to/file2
```

If you get stuck, there are many introductory Git resources on <http://help.github.com>.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

---

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/2016.3 fix-broken-thing
git push -u origin fix-broken-thing
```

or

```
git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
(use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-

forward issue, will likely add extra commits to the pull request which were not part of your changes.

---

7. Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

8. Open a new pull request.

Click on `Pull Request` on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

- (a) If your branch is a fix for a release branch, choose that as the base branch (e.g. 2016.3),

<https://github.com/my-account/salt/compare/saltstack:2016.3...fix-broken-thing>

If your branch is a feature, choose `develop` as the base branch,

<https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature>

- (b) Review that the proposed changes are what you expect.
- (c) Write a descriptive comment. Include links to related issues (e.g. 'Fixes #31337!') in the comment field.
- (d) Click `Create pull request`.

9. Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

- (a) Make the new changes in your local clone on the same local branch.
- (b) Push the branch to GitHub again using the same commands as before.
- (c) New and updated commits will be added to the pull request automatically.
- (d) Feel free to add a comment to the discussion.

---

**Note:** Jenkins

Pull request against [saltstack/salt](#) are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <http://jenkins.saltstack.com/>.

---

### Which Salt branch?

GitHub will open pull requests against Salt's main branch, `develop`, by default. Ideally, features should go into `develop` and bug fixes and documentation changes should go into the oldest supported release branch affected by the bug or documentation update. See *[Sending a GitHub pull request](#)*.

If you have a bug fix or doc change and have already forked your working branch from `develop` and do not know how to rebase your commits against another branch, then submit it to `develop` anyway and we'll be sure to backport it to the correct place.

## 19.6.2 The current release branch

The current release branch is the most recent stable release. Pull requests containing bug fixes should be made against the release branch.

The branch name will be a date-based name such as 2016.3.

Bug fixes are made on this branch so that minor releases can be cut from this branch without introducing surprises and new features. This approach maximizes stability.

The Salt development team will “merge-forward” any fixes made on the release branch to the `develop` branch once the pull request has been accepted. This keeps the fix in isolation on the release branch and also keeps the `develop` branch up-to-date.

---

**Note:** Closing GitHub issues from commits

This “merge-forward” strategy requires that [the magic keywords to close a GitHub issue](#) appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the *commit* containing the magic text is merged into the default branch (`develop`). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request.

---

## 19.6.3 The `develop` branch

The `develop` branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the `develop` branch.

The Salt development team will back-port bug fixes made to `develop` to the current release branch if the contributor cannot create the pull request against that branch.

### Keeping Salt Forks in Sync

Salt is advancing quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
# For ssh github
git remote add upstream git@github.com:saltstack/salt.git

# For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin develop
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

### Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the [salt-users](#) mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### Backporting Pull Requests

If a bug is fixed on `develop` and the bug is also present on a currently-supported release branch it will need to be back-ported to all applicable branches.

---

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

---

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into `develop` (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into `develop`. And `upstream` is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.
2. Create a new branch for the back-port by reusing the same branch from the original pull request.  
Name the branch `bp-<NNNN>` and use the number of the original pull request.

```
git fetch upstream refs/pull/1234/head:bp-1234
git checkout bp-1234
```

3. Find the parent commit of the original pull request.

The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending `~1` to the end.

4. Rebase the new branch on top of the release branch.

- `<release-branch>` is the branch identified in step #1.
- `<orig-base>` is the SHA identified in step #3 -- don't forget to add `~1` to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to 2016.3 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

## Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mentionbot` file located in the root of the Salt repository.

## 19.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.warn_until(
            'Aluminum',
            'The \'foo\' argument has been deprecated and its '
            'functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 19.8 Dunder Dictionaries

Salt provides several special ``dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

### 19.8.1 `__opts__`

#### Available in

- All loader modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

---

**Note:** In many places in salt, instead of pulling raw data from the `__opts__` dict, configuration data should be pulled from the salt `get` functions such as `config.get`, aka - `__salt__['config.get']('foo:bar')` The `get` functions also allow for dict traversal via the `:` delimiter. Consider using `get` functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

---

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

## 19.8.2 `__salt__`

### Available in

- Execution Modules
- State Modules
- Returners
- Runners

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

---

**Note:** When used in runners, `__salt__` references other runner modules, and not execution modules.

---

## 19.8.3 `__grains__`

### Available in

- Execution Modules
- State Modules
- Returners
- External Pillar

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

## 19.8.4 `__pillar__`

### Available in

- Execution Modules
- State Modules
- Returners

The `__pillar__` dictionary contains the pillar for the respective minion.

## 19.8.5 `__context__`

`__context__` exists in state modules and execution modules.

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The `fileclient` authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new `fileclient` for each file that is to be copied down, one instance of the `fileclient` is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

## 19.9 External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

### 19.9.1 Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

### 19.9.2 Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
  - example_a: some argument
  - example_b:
    - argumentA
    - argumentB
  - example_c:
    keyA: valueA
    keyB: valueB
```

### 19.9.3 The Module

### 19.9.4 Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

### 19.9.5 Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `module-name.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

### 19.9.6 Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__( __opts__ ):
    # Do init work here
```

**Note:** The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

### 19.9.7 `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

### 19.9.8 ext\_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )           # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' ) # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' } ) # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note:** this function is called once for each minion that fetches its pillar data.

```
def ext_pillar( minion_id, pillar, *args, **kwargs ):

    my_pillar = {'external_pillar': {}}

    my_pillar['external_pillar'] = get_external_pillar_dictionary()

    return my_pillar
```

You can call `pillar` with the dictionary's top name to retrieve its data. From above example, `'external_pillar'` is the top dictionary name. Therefore:

```
salt-call '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__` A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__` A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` **Note**, runs on the *master*
- `__grains__` A dictionary of the grains of the minion making this pillar call.

### 19.9.9 Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {"arg":"value"}'
```

### 19.9.10 Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

## 19.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

---

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git `fetch` utility:

```
git fetch --tags upstream
```

---

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable `pkg` and `portage_config` functionality

---

**Note:** Using system Python modules in the `virtualenv`

To use already-installed python modules in `virtualenv` (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system `PYTHONPATH` at the time of `virtualenv` creation.

---

---

**Note:** Python development package

Be sure to install python-devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

---

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

---

Install Salt (and dependencies) into the virtualenv:

```
pip install M2Crypto # Don't install on Debian/Ubuntu (see below)
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt # the path to the salt git clone from above
```

---

**Note:** Installing M2Crypto

`swig` and `libssl-dev` are required to build M2Crypto. To fix the error command `'swig' failed with exit status 1` while installing M2Crypto, try installing it with the following command:

```
env SWIG_FEATURES="-cpperraswarn -includeall -D__uname -m`__ -I/usr/include/openssl"
→ pip install M2Crypto
```

---

Debian and Ubuntu systems have modified openssl libraries and mandate that a patched version of M2Crypto be installed. This means that M2Crypto needs to be installed via apt:

```
apt-get install python-m2crypto
```

---

This also means that pulling in the M2Crypto installed using apt requires using `--system-site-packages` when creating the virtualenv.

If you're using a platform other than Debian or Ubuntu, and you are installing M2Crypto via pip instead of a system package, then you will also need the gcc compiler.

---

**Note:** Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

---

**Note:** Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See [macOS Installation](#)

---

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

---

### 19.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. Uncomment and change the `pki: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`
4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. Uncomment and change the `pki: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
4. Uncomment and change the `master: salt` value to point at `localhost`.
5. Uncomment and change the `id:` value to something descriptive like ```saltdev```. This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

---

**Note:** Using `salt-call` with a *Standalone Minion*

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

---

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.ping
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcf7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, refer to the [macOS Installation](#) instructions.

## Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/
virtualenv/' \
-e ./salt # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

## Additional Options

If you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \  
-e ./salt # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \  
-e ./salt # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

## 19.10.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a `USE_SETUPTOOLS` environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

## 19.10.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The docs use `reStructuredText` for markup. See a live demo at <http://rst.ninjs.org/>.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

### 19.10.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See [here](#) for more information regarding the test suite.

### 19.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

## 19.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

### 19.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

**Approved** The issue has been validated and has all necessary information.

**Blocked** The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

**Under Review** The issue is having further validation done by a SaltStack engineer.

**<Sprint>** The issue is being actively worked on by a SaltStack engineer. Sprint milestones names are constructed from the chemical symbol of the next release's codename and the number of sprints until that release is made. For example, if the next release codename is `NEON` and there are five sprints until that release, the corresponding sprint milestone will be called `Ne 5`. See [<version-numbers>](#) for a discussion of Salt's release codenames.

## 19.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

### Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

**Feature** The issue is a request for new functionality including changes, enhancements, refactors, etc.

**Bug** The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.

**Duplicate** The issue is a duplicate of another feature request or bug report.

**Upstream Bug** The issue is a result of an upstream issue.

**Question** The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.

**Expected Behavior** The issue is a bug report of intended functionality.

### Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a **P1** label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

**P1** The issue will be seen by all users.

**P2** The issue will be seen by most users.

**P3** The issue will be seen by about half of users.

**P4** The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

### Severity

Severity labels are almost always only applied to issues labeled **Bug**.

**Blocker** The issue is blocking an impending release.

**Critical** The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.

**High Severity** The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.

**Medium Severity** The issue reports cosmetic items, formatting, spelling, colors, etc.

## Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- Execution Module
- File Servers
- Grains
- Multi-Master
- Packaging Related to packaging of Salt, not Salt's support for package management.
- Pillar
- RAET
- Returners
- Runners
- SPM
- Salt-API
- Salt-Cloud
- Salt-SSH
- Salt-Syndic
- State Module
- Tests
- Transport
- Windows
- ZMQ

## Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

**Core** The issue or pull request relates to code that is central or existential to Salt itself.

**Platform** The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.

**RIoT** The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.

**Console** The issue or pull request relates to the SaltStack enterprise console.

**Documentation** The issue or pull request relates to documentation.

## Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the `Blocked` milestone, it is very likely that it will only have a status label.

**Bugfix -back-port** The pull request needs to be back-ported to an older release branch. This is done by *recreating the pull request* against that branch. Once the back-port is completed, this label is replaced with a `Bugfix -[Done] back-ported` label. Normally, new features should go into the `develop` and bug fixes into the oldest supported release branch, see `<which-salt-branch>`.

**Bugfix -[Done] back-ported** The pull request has been back-ported to an older branch.

**Cannot Reproduce** The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

**Confirmed** The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.

**Fixed Pending Verification** The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

**Info Needed** The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

**Pending Changes** The pull request needs additional changes before it can be merged.

**Pending Discussion** The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a `Pending Changes` label.

**Won't Fix for Now** The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

## Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

### Minor Change

- Less than 64 lines changed, or

- Less than 8 core lines changed

**Medium Change**

- Less than 256 lines changed, or
- Less than 64 core lines changed

**Master Change**

- More than 256 lines changed, or
- More than 64 core lines changed

**Expert Change**

- Needs specialized, in-depth review

**Test Status**

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

**Lint** The pull request has passed all tests except for the code lint checker.

**Tests Passed** The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

**Other**

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

**Awesome** The pull request implements an especially well crafted solution, or a very difficult but necessary change.

**Help Wanted** The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.

**Needs Testcase** The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.

**Regression** The issue is a bug that breaks functionality known to work in previous releases.

**Story** The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.

**Stretch** The issue is an optional goal for the current sprint but may not be delivered.

**ZD** The issue is related to a Zendesk customer support ticket.

**<Release>** The issue is scheduled to be implemented by <Release>. See <version-numbers> for a discussion of Salt's release codenames.

## 19.12 Logging Internals

TODO

## 19.13 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

### 19.13.1 Execution Modules

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

For a list of all built in execution modules, click [here](#)

For information on writing execution modules, see [this page](#).

### 19.13.2 Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

### 19.13.3 State Modules

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

---

**Note:** State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

---

### 19.13.4 Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the *pam* module as an example.

### 19.13.5 Fileserver

The fileserver module system is used to create fileserver backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the *gitfs* module as an example.

### 19.13.6 Grains

Grain modules define extra routines to populate grains data. All defined public functions will be executed and **MUST** return a Python dict object. The dict keys will be added to the grains made available to the minion.

### 19.13.7 Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the *nested* module.

### 19.13.8 Pillar

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

### 19.13.9 Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the *py* renderer and as complex as *stateconf* and *pydsl*.

### 19.13.10 Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

### 19.13.11 Runners

Runners are purely master-side execution sequences.

### 19.13.12 Tops

Tops modules are used to convert external data sources into top file data for the state system.

### 19.13.13 Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

## 19.14 Package Providers

This page contains guidelines for writing package providers.

### 19.14.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

#### `list_pkgs`

This function should declare an empty dict, and then add packages to it by calling `pkg_resource.add_pkg`, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute `pkg_resource.sort_pkglist`. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',  
 'bar': '5.6.7-8'}
```

## latest\_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept `**kwargs`, in order to receive the `fromrepo` and `repo` keyword arguments from `pkg` states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

## version

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

## upgrade\_available

Deprecated and destined to be removed. For now, should just do the following:

```
return __salt__['pkg.latest_version'](name) != ''
```

## install

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call `pkg_resource.parse_targets` (see below). This function will convert the SLS input into a more easily parsed data structure. `pkg_resource.parse_targets` may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name,
                                                             pkgs,
                                                             sources)
```

Two values will be returned to the `install` function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If `name` was provided (and `pkgs` was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the `version` keyword argument was provided, then it should replace the `None` value in the dictionary.

- If `pkgs` was provided, then `name` is ignored, and the dictionary will contain one entry for each package in the `pkgs` list. The values in the dictionary will be `NONE` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the `pkg.installed` state for more info.
- If `sources` was provided, then `name` is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The `install` function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run `list_pkgs` to obtain a list of the installed packages. You should then return the output of `salt.utils.compare_dicts()`

```
return salt.utils.compare_dicts(old, new)
```

### remove

Removes the passed package and return a list of the packages removed.

## 19.14.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'  
__salt__['pkg.list_repos'](basedir)
```

### list\_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',  
      'config_key_2': 'config value 2',  
      'config_key_3': ['list item 1 (when appropriate)',  
                      'list item 2 (when appropriate)]}
```

### get\_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as `list_repos`, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

### del\_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

### mod\_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

## 19.14.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkg`, but `lowpkg` must never make calls to `pkg`. This affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

### list\_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

## verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],  
                                'type': 'config'}}
```

## file\_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the *file\_list* function name). However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],  
 'files': ['/etc/httpd',  
           '/etc/httpd/conf',  
           '/etc/httpd/conf.d',  
           '...SNIP...']}
```

## file\_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike *file\_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file\_list*.

```
{'errors': ['package apache is not installed'],  
 'packages': {'httpd': ['/etc/httpd',  
                       '/etc/httpd/conf',  
                       '...SNIP...'],  
             'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',  
                       '/boot/System.map-2.6.32-279.el6.x86_64',  
                       '...SNIP...']}}}
```

## 19.15 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the [new issue page](#) for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

---

**Note:** Please be certain to scrub any logs or SLS files for sensitive data!

---

## 19.16 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

### 19.16.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.

### 19.16.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

### 19.16.3 Return

The PUB/SUB system is a one way communication, so once a `publish` is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

## 19.17 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the [Transifex](#) website and [signup](#) for an account.

Once registered, head over to the [Salt Translation Project](#), and either click on **Request Language** if you can't find yours, or, select the language for which you wish to contribute and click **Join Team**.

[Transifex](#) provides some useful reading resources on their [support domain](#), namely, some useful articles [directed to translators](#).

### 19.17.1 Building A Localized Version of the Documentation

While you're working on your translation on [Transifex](#), you might want to have a look at how it's rendering.

#### Install The Transifex Client

To interact with the [Transifex](#) web service you will need to install the [transifex-client](#):

```
pip install transifex-client
```

#### Configure The Transifex Client

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
.scripts/setup-transifex-config
```

#### Download Remote Translations

There's a little script which simplifies the download process of the translations(which isn't that complicated in the first place). So, let's assume you're translating `pt_PT`, Portuguese(Portugal). To download the translations, execute from the `doc/` directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download `pt_PT`, Portuguese(Portugal), and `nl`, Dutch, you can use the helper script directly:

```
.scripts/download-translation-catalog pt_PT nl
```

#### Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the `pt_PT` example above:

```
make html SPHINXLANG=pt_PT
```

#### View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you've just build.

## 19.18 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my\_account>)
- a command line (CLI)
- git
- a text editor

### 19.18.1 Fork

In your browser, navigate to the [saltstack/salt](https://github.com/saltstack/salt) GitHub repository.

Click on Fork (<https://github.com/saltstack/salt/#fork-destination-box>).

---

**Note:** If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

---

### 19.18.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where <my\_account> is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `develop` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/develop` so that we will get all upstream changes when they happen.

```
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

### 19.18.3 Fetch

Fetch any upstream changes on the `develop` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

**Note:** For an explanation on pull vs pull --rebase and other excellent points, see [this article](#) by Mislav Marohnić.

---

### 19.18.4 Branch

Now we are ready to get to work. Consult the [sprint beginner bug list](#) and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `develop`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

### 19.18.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     '''
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not
→found')

def _get_cmd():
```

### 19.18.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

**Note:** If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

---

### 19.18.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

**Note:** If authentication over https does not work, you can alternatively setup `ssh keys`. Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

### 19.18.8 Merge

In your browser, navigate to the [new pull request](#) page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `develop` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

**Note:** Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:

```
https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret
```

### 19.18.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

<https://help.github.com/>

There are many topics covered by the Salt Developer documentation:

<https://docs.saltstack.com/en/latest/topics/development/index.html>

The contributing documentation presents more details on specific contributing topics:

<https://docs.saltstack.com/en/latest/topics/development/contributing.html>

## 19.19 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

### 19.19.1 Command line usage

See *salt-extend*

### 19.19.2 Choosing a template

The following templates are available:

#### **module**

Creates a new execution module within `salt/modules/{{module_name}}.py`

#### **module\_unit**

Creates a new execution module unit test suite within `tests/unit/modules/{{module_name}}_test.py`

#### **state**

Creates a new state module within `salt/states/{{module_name}}.py`

#### **state\_unit**

Creates a new state module unit test suite within `tests/unit/states/{{module_name}}_test.py`

### 19.19.3 Adding templates

1. Create a directory under `<src>/templates`
2. Create a file `template.yml` containing properties for
  - `description` - a description of the template
  - `questions` - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
    - `question` - The question to ask the user, as a string
    - `default` - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

#### **Example template.yml**

```
description: "Execution module"
questions:
  depending_libraries:
    question: "What libraries does this module depend upon?"
  virtual_name:
    question: "What module virtual name to use?"
    default: "{{module_name}}"
```

3. Create the files within `<src>/templates/<your template>` to match the target

**Note:** File names can contain Jinja 2 template syntax, e.g. `'{{module_name}}.py'`

### Example file in the template directory

```
print('Hello {{module_name}}')
__virtual__ = '{{__virtual_name__}}'
```

### Default context properties

The default context provides the following properties

- `description` - A description of the template
- `short_description` - A short description of the module as entered by the user
- `version` - The version name of the next release
- `module_name` - The module name as entered by the user
- `release_date` - The current date in the format `YYYY-MM-DD`
- `year` - The current year in the format `YYYY`

As well as any additional properties entered from the questions section of `template.yml`

## 19.19.4 API

### SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using `salt-extend`

**codeauthor** :email: Anthony Shaw <anthonyshaw@apache.org>

`salt.utils.extend.apply_template` (*template\_dir*, *output\_dir*, *context*)

Apply the template from the template directory to the output using the supplied context dict.

**Parameters**

- **src** (str) -- The source path
- **dst** (str) -- The destination path
- **context** (dict) -- The dictionary to inject into the Jinja template as context

`salt.utils.extend.run`(*extension=None, name=None, description=None, salt\_dir=None, merge=False, temp\_dir=None*)

A template factory for extending the salt ecosystem

#### Parameters

- **extension** (str) -- The extension type, e.g. 'module', 'state', if omitted, user will be prompted
- **name** (str) -- Python-friendly name for the module, if omitted, user will be prompted
- **description** (str) -- A description of the extension, if omitted, user will be prompted
- **salt\_dir** (str) -- The targeted Salt source directory
- **merge** (bool) -- Merge with salt directory, *False* to keep separate, *True* to merge trees.
- **temp\_dir** (str) -- The directory for generated code, if omitted, system temp will be used

## 19.20 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt's test suite works, be sure to check out the [Salt's Test Suite: An Introduction](#) tutorial.

### 19.20.1 Test Directory Structure

Salt's test suite is located in the `tests` directory in the root of Salt's codebase. The test suite is divided into two main groups:

- Integration Tests
- Unit Tests

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

#### Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the [Integration vs. Unit](#) section of the [testing tutorial](#) is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- Integration Test Documentation

## Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

### 19.20.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run *unit tests only*: `python tests/runtests.py --unit-tests`

- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py -n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `python tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the [Test Selection Options](#) documentation or the [Running Specific Tests](#) section of the *Salt's Test Suite: An Introduction* tutorial.

### Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the `runtests.py` script with `--unit` argument:

```
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

### Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

---

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

---

To run tests marked as destructive, set the `--run-destructive` flag:

```
python tests/runtests.py --run-destructive
```

### Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by

an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digital_ocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digital_ocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
  location: New York 1
```

---

**Note:** When providing credential information in cloud provider configuration files, do not include the single quotes.

---

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

### Running The Tests In A Docker Container

The test suite can be executed under a `docker` container using the `--docked` option flag. The `docker` container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
python tests/runtests.py --docked=ubuntu-12.04 -v
```

The full `docker` container repository can also be provided:

```
python tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt's [docker repository](#).

Custom `docker` containers can be provided by submitting a pull request against Salt's [docker Salt test containers repository](#).

### 19.20.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests

located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then be merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to <http://jenkins.saltstack.com>.

### Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: <https://github.com/saltstack/salt/blob/develop/tests/jenkins.py>

## 19.20.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

### Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

### Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

## Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `devel`op branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `devel`op branch, then the tests should be added there as well. However, if the feature was added to `devel`op some time ago and is already present in one or more release branches, please refer to the [Tests for Entire Files or Functions](#) section below for more details about where to submit tests for functions or files that do not already have tests.

## Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the [Which Salt Branch?](#) documentation in Salt's [Contributing](#) guide.

## Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `devel`op branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

---

**Note:** If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

---

## 19.21 raet

# RAET # Reliable Asynchronous Event Transport Protocol

See also:

[RAET Overview](#)

### 19.21.1 Protocol

Layering:

OSI Layers

7: Application: Format: Data (Stack to Application interface buffering etc) 6: Presentation: Format: Data (Encrypt-Decrypt convert to machine independent format) 5: Session: Format: Data (Interhost communications. Authentication. Groups) 4: Transport: Format: Segments (Reliable delivery of Message, Transactions, Segmentation, Error checking) 3: Network: Format: Packets/Datagrams (Addressing Routing) 2: Link: Format: Frames ( Reliable per frame communications connection, Media access controller ) 1: Physical: Bits (Transceiver communication connection not reliable)

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking, Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

### 19.21.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for ``packed" binary body

### 19.21.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n  
10 13 10 13 ADAD 1010 1101 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header

Finally is an optional tail block for error checking or encryption details

### 19.21.4 Header Fields

In UDP header

sh = source host sp = source port dh = destination host dp = destination port

In RAET Header

hk = header kind hl = header length

vn = version number

sd = Source Device ID dd = Destination Device ID cf = Corresponder Flag mf = Multicast Flag

si = Session ID ti = Transaction ID

sk = Service Kind pk = Packet Kind bf = Burst Flag (Send all Segments or Ordered packets without interleaved acks)

oi = Order Index dt = DateTime Stamp

sn = Segment Number sc = Segment Count

pf = Pending Segment Flag af = All Flag (Resent all Segments not just one)

nk = Auth header kind nl = Auth header length

bk = body kind bl = body length

tk = tail kind tl = tail length

fg = **flags packed (Flags) Default `00' hex string** 2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD flags

### 19.21.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

### 19.21.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID sid

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

### 19.21.7 Service Types or Modular Services

Four Service Types

1. **One or more maybe (unacknowledged repeat) maybe means no guarantee**
2. **Exactly one at most (ack with retries) (duplicate detection idempotent)** at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay
3. **Exactly one of sequence at most (sequence numbered)** Receiver requests retry of missing packet with same B1 or B2 retry type
4. **End to End (Application layer Request Response)** This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1. **Maybe one or more**
  - (a) **Fire and forget** no transaction either side
  - (b) **Repeat, no ack, no dupdet** repeat counter send side, no transaction on receive side
  - (c) **Repeat, no Ack, dupdet** repeat counter send side, dup detection transaction receive side
2. **More or Less Once**

(a) **retry finite, ack no dupdet** retry timer send side, finite number of retries ack receive side no dupdet

3. **At most Once**

(a) **retry finite, ack, dupdet** retry timer send side, finite number of retries ack receive side dupdet

4. **Exactly once**

(a) **ack retry** retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff

5. **Sequential sequence number**

(a) reorder escrow

(b) Segmented packets

6. request response to application layer

Service Features

1. repeats
2. ack retry transaction id
3. sequence number duplicate detection out of order detection sequencing
4. rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End

A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive

B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected

B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retries so no duplicates.

C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.

D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response.

Little advantage to B1 vs B2 not having duplicates.

So 4 service types

1. Maybe one or more (unacknowledged repeat)
2. Exactly One (At most one) (ack with retry) (duplicate detection idempotent)
3. One of Sequence (sequence numbered)
4. End to End

Also multicast or unicast

Modular Transaction Table

**Sender Side:** Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter  
Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence)  
Segmentation

**Receiver Side:** Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend Unsegmentation (request resends of missing segment)

## 19.22 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects **DO NOT NEED TO READ THIS DOCUMENT**, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

### 19.22.1 New Code Entry

All new SaltStack code should be submitted against either the `develop` branch or a point release branch, depending on the nature of the submission. Please see the *Which Salt Branch?* section of Salt's *Contributing* documentation or the Release Branching section below for more information.

### 19.22.2 Release Branching

SaltStack maintains two types of releases, **Feature Releases** and **Point Releases** (also commonly referred to as **Bugfix Releases**). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

#### Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on `develop`. All file changes relevant to the feature release will be completed in the `develop` branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the develop branch
# git push origin 2015.8
```

#### Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the *Which Salt Branch?* section of Salt's *Contributing* documentation.

Determining when a point release is going to be made is up to the project leader (Thomas Hatch). Generally point releases are made every 2-4 weeks or if there is a security fix they can be made sooner.

The point release is only designated by tagging the commit on the release branch with a release number using the existing convention (version 2015.8.1 is tagged with v2015.8.1). From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

## 19.23 Salt Conventions

### 19.23.1 Writing Salt Documentation

Salt's documentation is built using the [Sphinx](#) documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the <https://github.com/saltstack/salt/blob/develop/doc> subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

#### Style

The Salt project recommends the [IEEE style guide](#) as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The [NCBI style guide](#) is another very approachable resource.

#### Point-of-view

Use third-person perspective and avoid ``I'', ``we'', ``you'' forms of address. Identify the addressee specifically e.g., ``users should'', ``the compiler does'', etc.

#### Active voice

Use active voice and present-tense. Avoid filler words.

#### Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

```
This is a main heading  
=====
```

```
Paragraph.
```

```
This is an exciting sub-heading!  
-----
```

Paragraph.

## Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually ``and'', ``or'', or ``nor'') in a series of three or more terms. For example, a list of three countries might be punctuated either as ``France, Italy, and Spain" (with the serial comma), or as ``France, Italy and Spain" (without the serial comma)."

When writing a list that includes three or more items, the serial comma should always be used.

## Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

### Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```
def my_function(value):
    """
    Upper-case the given value

    Usage:

    .. code-block:: python

        val = 'a string'
        new_val = myfunction(val)
        print(new_val) # 'A STRING'

    :param value: a string
    :return: a copy of ``value`` that has been upper-cased
    """
    return value.upper()
```

### Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```
def my_function(value):
    """
    Upper-case the given value

    .. versionadded:: 2014.7.0

    <...snip...>
```

```
'''  
return value.upper()
```

For changes to a function:

```
def my_function(value, strip=False):  
    '''  
    Upper-case the given value  
  
    .. versionchanged:: 2016.3.0  
       Added a flag to also strip whitespace from the string.  
  
    <...snip...>  
    '''  
    if strip:  
        return value.upper().strip()  
    return value.upper()
```

### Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: *execution modules*, *state modules*, *renderer modules*. New modules must be added to the index manually.

1. Edit the file for the module type: *execution modules*, *state modules*, *renderer modules*, etc.
2. Add the new module to the alphabetized list.
3. *Build the documentation* which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

### Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

### Glossary entries

Link to glossary entries using the `term` role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a  
custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```

### Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index` directive above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system  
   see: Reactor; Event
```

Another method is to use the `index` role inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
```

```
-----
```

Paragraph.

## Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:
```

```
My page
```

```
=====
```

Paragraph.

Unique labels can be linked using the `ref` role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should *not* be used to link documents together.

## Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the :py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the :py:func:`file.managed <salt.states.file.managed>` function.
```

## Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master`, and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a single minion.
```

## Documentation Changes and Fixes

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt's main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt's *Contributing* page. You can read more about how to choose where to submit documentation fixes by reading the *Which Salt branch?* section.

For an explanation of how to submit changes against various branches, see the *Sending a GitHub pull request* section. Specifically, see the section describing how to `Create a new branch` and the steps that follow.

## Building the documentation

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.
2. Build the documentation using the provided Makefile or `.bat` file on Windows.

```
cd /path/to/salt/doc
make html
```

3. The generated documentation will be written to the `doc/_build/<format>` directory.
4. A useful method of viewing the HTML documentation locally is to start Python's built-in HTTP server:

```
cd /path/to/salt/doc/_build/html
python -m SimpleHTTPServer
```

Then pull up the documentation in a web browser at <http://localhost:8000/>.

## 19.23.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the ``saltstack-formulas'' organization on GitHub:

<https://github.com/saltstack-formulas>

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```
base:
  'web*':
    - apache
```

## Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

## Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install and configure GitFS.*
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
gitfs_remotes:
- https://github.com/saltstack-formulas/apache-formula
- https://github.com/saltstack-formulas/memcached-formula
```

**We strongly recommend forking a formula repository** into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

## Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

# or

mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

## Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

### Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
- epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

### Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
  'storage-*':
    - openstack.swift
```

### Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

### Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using *extend*, they can be made to watch other states with *The \_in versions of requisites*.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don't be shy to read through the source for each Formula!

## Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

## Writing Formulas

Each Formula is a separate repository in the [saltstack-formulas](#) organization on GitHub.

---

**Note:** Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the contributors team on the [saltstack-formulas](#) organization and help you transfer the repository over. Ping a SaltStack employee on IRC (`#salt` on Freenode) or send an email to the [salt-users](#) mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: <https://github.com/watching>.

---

## Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com:myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

## Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in *requisites*. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

## Use `module.function` notation

So-called ```short-declaration``` notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform ```short-decs``` into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

## Specify the `name` parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

## Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
```

```

file.managed:
  - name: /path/to/file.cfg
  - source: salt://path/to/file.cfg.template
  - template: mako

# Provide a description or explanation that did not fit within the state
# ID. For example:
#
# Update the application's last-deployed timestamp.
# This is a workaround until Bob configures Jenkins to automate RPM
# builds of the app.
cmd.run:
  # FIXME: Joe needs this to run on Windows by next quarter. Switch these
  # from shell commands to Salt's file.managed and file.replace state
  # modules.
  - name: |
      touch /path/to/file_last_updated
      sed -e 's/foo/bar/g' /path/to/file_environment
  - onchanges:
    - file: a_config_file

```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```

# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}

```

### Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

### Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *renderer* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.

- Salt's state system finally starts and executes on each ``chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the ``running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

### Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

### Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

### Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}
{# or #}
{% import_yaml 'path/to/file.yaml' as some_data %}
{# or #}
{% import_json 'path/to/file.json' as some_data %}
{# or #}
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}
{# or #}
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

## Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt.pillar.get('list_of_users', []) %}

{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```
{# ---- Bad example ---- #}

apache:
  pkg.installed:
    {% if grains.os_family == 'RedHat' %}
    - name: httpd
    {% elif grains.os_family == 'Debian' %}
    - name: apache2
    {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

apache:
  pkg.installed:
    - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
  'RedHat': 'httpd',
  'Debian': 'apache2',
}.get(grains.os_family) %}

apache:
  pkg.installed:
    - name: {{ name }}
```

Dictionaries are useful to effectively ``namespace'' a collection of variables. This is useful with parametrization

(discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```
{# ---- Bad example ---- #}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
    - context:
      {% if 'external_loadbalancer' in grains.roles %}
      ssl_termination: True
      {% elif 'internal_loadbalancer' in grains.roles %}
      ssl_termination: False
      {% endif %}

{# ---- Better example ---- #}

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}
```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

## Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's ``she-bang`` syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

/srv/salt/common\_configuration.sls:

```
common_users:
  user.present:
    - names: [larry, curly, moe]
```

/srv/salt/roles\_configuration:

```
#!/py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']

    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')

    return {
```

```

    'set_roles_grains': {
        'grains.present': [
            {'name': 'roles'},
            {'value': list(list_of_roles)},
        ],
    },
}

```

## Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```

{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}

```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

/srv/salt/php.sls:

```

php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tpl
    - template: jinja
    - context:
        php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}

```

/srv/pillar/php.sls:

```

php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'

```

/srv/salt/php.ini.tpl:

```

{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}

```

```
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

### Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increase the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}
```

### Organizing Pillar data

It is considered a best practice to make formulas expect **all** formula-related parameters to be placed under second-level lookup key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
  lookup:
    version: 5.7.11
```

### Collecting common values

Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

map.jinja:

```
{% set mysql = salt['grains.filter_by']({
  'default': {
    'server': 'mysql-server',
    'client': 'mysql-client',
    'service': 'mysql',
    'config': '/etc/mysql/my.cnf',
    'python': 'python-mysqldb',
  },
  'Debian': {
  },
  'RedHat': {
    'client': 'mysql',
    'service': 'mysqld',
    'config': '/etc/my.cnf',
    'python': 'MySQL-python',
  },
  'Gentoo': {
    'server': 'dev-db/mysql',
    'client': 'dev-db/mysql',
    'python': 'dev-python/mysql-python',
  },
},
merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

## Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in `filter_by` specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```
mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf
```

### Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```
{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty."' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```
foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""
```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

## When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

### Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

### Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml:`

```
Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
GlobalNamingResources:
  Resource:
    '@auth': Container
    '@description': User database that can be updated and saved
    '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
    '@name': UserDatabase
    '@pathname': conf/tomcat-users.xml
    '@type': org.apache.catalina.UserDatabase
# <...snip...>
```

`/srv/pillar/tomcat.sls:`

```
appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
        '@redirectPort': '8443'
# <...snip...>
```

`/srv/salt/tomcat/server_xml.sls:`

```
{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True)
%}
```

```

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish

```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off “serializers” (often as Jinja macros) that reformat a data structure to a specific config file format. For example, `‘Nginx vhosts’__` or the `‘php.ini’__`

`__`: [https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts\\_config.sls](https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts_config.sls) `__`: <https://github.com/saltstack-formulas/php-formula/blob/82e2cd3a/php/ng/files/php.ini>

### Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

`/srv/salt/app/deploy.sls:`

```

{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt.grains.get('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
table. #}
{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
        version: {{ app.version }}
    - onchanges:
        - git: deploy_application

```

`/srv/salt/app/defaults.yaml:`

```

appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master
appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4

```

## Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can `include` and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full `apache-formula` for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
  - require:
    - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
  - watch_in:
    - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The `mod_wsgi` state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

## Parameterization

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what

those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
    {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
{{ user.name }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

## Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

## Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
```

```
- source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
- template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

## Scripting

Remember that both State files and Pillar files can easily call out to Salt *execution modules* and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

## Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
|   |-- map.jinja
|   |-- init.sls
|   `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

[template-formula](#)

The `template-formula` repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

## README.rst

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===
```

Install and configure the F00 service.

.. **note::**

See the full `Salt Formulas installation and usage instructions`  
<<http://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>>

→ -.

**Available states**

=====

.. **contents::**

**:local:**

**``foo``**

-----

Install the ``foo`` package and enable the service.

**``foo.bar``**

-----

Install the ``bar`` package.

## CHANGELOG.rst

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the *CHANGELOG.rst* file:

CHANGELOG.rst:

**foo formula**

=====

0.0.2 (2013-01-01)

- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified

## Versioning

Formula are versioned according to Semantic Versioning, <http://semver.org/>.

**Note:** Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

---

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.

### Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

### 19.23.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

#### Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the `master.d` or `minion.d` directories.

#### Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

#### Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

#### Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

## Salt Common

The *salt-common* or *salt* package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since `salt-call` is the entry point to utilize the libs and is useful for all salt packages it is included in the *salt-common* package.

### Name

- *salt* OR *salt-common*

### Files

- *salt/\**
- *man/salt.7*
- *scripts/salt-call*
- *tests/\**
- *man/salt-call.1*

### Depends

- *Python 2.6-2.7*
- *PyYAML*
- *Jinja2*

## Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

### Name

- *salt-master*

### Files

- *scripts/salt-master*
- *scripts/salt*
- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*
- *pkg/<master init data>*
- *man/salt.1*

- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

## Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

## Name

- *salt-syndic*

## Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

## Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*

- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

### Name

- *salt-minion*

### Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

### Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

### Name

- *salt-ssh*

### Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud\**

## Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

## Name

- *salt-cloud*

## Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

## Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

## Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

## Name

- *salt-doc*

## Files

- *doc/\**

## Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

### 19.23.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every four to six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

#### Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 0.16 release as an example):

1. All open issues on the release milestone should be moved to the next release milestone. (e.g. from the 0.16 milestone to the 0.17 milestone)
2. Release notes should be created documenting the major new features and bugfixes in the release.
3. Create an annotated tag with only the major and minor version numbers, preceded by the letter v. (e.g. v0.16) This tag will reside on the `develop` branch.
4. Create a branch for the new release, using only the major and minor version numbers. (e.g. 0.16)
5. On this new branch, create an annotated tag for the first revision release, which is generally a release candidate. It should be preceded by the letter v. (e.g. v0.16.0rc1)
6. The release should be packaged from this annotated tag and uploaded to PyPI as well as the GitHub releases page for this tag.
7. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems. (note that release candidates should go in the testing repositories)
8. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.
9. Log into RTD and add the new release there. (Have to do it manually)

#### Maintenance and Bugfix Releases

Once a feature release branch has been cut from `develop`, the branch moves into a "feature freeze" state. The new release branch enters the `merge-forward` chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. On the release branch (i.e. 0.16), create an annotated tag for the revision release. It should be preceded by the letter v. (e.g. v0.16.2) Release candidates are unnecessary for bugfix releases.
2. The release should be packaged from this annotated tag and uploaded to PyPI.
3. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems.
4. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.

For more information about the difference between the `develop` branch and bugfix release branches, please refer to the *Which Salt Branch?* section of Salt's *Contributing* documentation.

### 19.23.5 Salt Coding Style

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be "Salty".

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

### Linting

Most Salt style conventions are codified in Salt's `.pylintrc` file. Salt's pylint file has two dependencies: `pylint` and `saltpylint`. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the `pylint` program as follows:

```
pylint --rcfile=/path/to/salt/.pylintrc salt/dir/to/lint
```

### Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

### Strings

Salt follows a few rules when formatting strings:

#### Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```
def foo():
    """
    A function that does things
    """
    name = 'A name'
    return name
```

#### Formatting Strings

All strings which require formatting should use the `.format` string method:

```
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6. Please do NOT use printf formatting.

### Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```
def bar():
    """
    Here lies a docstring with a newline after the quotes and is the salty
    way to handle it! Vertical code is the way to go!
    """
    return
```

BAD:

```
def baz():
    '''This is not ok!'''
    return
```

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```
def new_func(msg=''):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed.
    """
    print msg
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your *pull request* and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg='', signature=''):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed. Will be prepended with 'Greetings! '.
```

```
.. versionchanged:: 0.17.1

signature : None
    An optional signature.

.. versionadded 0.17.0
'''
print 'Greetings! {0}\n\n{1}'.format(msg, signature)
```

## Dictionaries

Dictionaries should be initialized using `{}` instead of `dict()`.

See [here](#) for an in-depth discussion of this topic.

## Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```
import os

def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is *DISCOURAGED*:

```
from os.path import join

def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```
from salt.exceptions import CommandExecutionError
```

## Absolute Imports

Although `absolute imports` seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

---

**Note:** An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

### Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```
import os

os.chmod(
    os.path.join(self.opts['sock_dir'],
                  'minion_event_pub.ipc'),
    448
)
```

Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```
def managed(name,
            source=None,
            source_hash='',
            user=None,
            group=None,
            mode=None,
            template=None,
            makedirs=False,
            context=None,
            replace=True,
            defaults=None,
            saltenv=None,
            backup='',
            **kwargs):
```

---

**Note:** Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

---

### Line Length

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line.

Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don't break it. Still, try to avoid passing that 120 characters limit and remember, **vertical is better... unless it isn't**

## Indenting

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn't differentiate from a new indent level.

Right:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

WRONG:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

Lining up the indent is also correct:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a [known conflict](#) between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in `~/.config/flake8`:

```
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper -- just replace all instances of ``flake8'` with ``pep8'`, including the filename.

## Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (<http://legacy.python.org/dev/peps/pep-0008/>) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

## 19.24 Salt code and internals

Reference documentation on Salt's internal code.

## 19.24.1 Contents

### salt.aggregation

### salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

**Note:** The following examples will be expressed in YAML for convenience's sake:

- !aggr-scalar will refer to Scalar python function
- !aggr-map will refer to Map python object
- !aggr-seq will refer for Sequence python object

### How to instructs merging

This yaml document has duplicate keys:

```
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

### Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

### Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

## Introspection

TODO: write this part

```
salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=<class
                                `salt.utils.aggregation.Map`>, sequence_class=<class
                                `salt.utils.aggregation.Sequence`>)
```

Merge obj\_b into obj\_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

```
class salt.utils.aggregation.Aggregate
```

Aggregation base.

```
class salt.utils.aggregation.Map(*args, **kws)
```

Map aggregation.

```
salt.utils.aggregation.Scalar(obj)
```

Shortcut for Sequence creation

```
>>> Scalar('foo') == Sequence(['foo'])
True
```

```
class salt.utils.aggregation.Sequence
```

Sequence aggregation.

## Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

**salt.exceptions**

This module is a central location for all salt exceptions

**exception salt.exceptions.AuthenticationError** (*message=''*)

If sha256 signature fails during decryption

**exception salt.exceptions.AuthorizationError** (*message=''*)

Thrown when runner or wheel execution fails due to permissions

**exception salt.exceptions.CommandExecutionError** (*message='', info=None*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

**exception salt.exceptions.CommandNotFoundError** (*message=''*)

Used in modules or grains when a required binary is not available

**exception salt.exceptions.EauthAuthenticationError** (*message=''*)

Thrown when eauth authentication fails

**exception salt.exceptions.FileLockError** (*msg, time\_start=None, \*args, \*\*kwargs*)

Used when an error occurs obtaining a file lock

**exception salt.exceptions.FileserverConfigError** (*message=''*)

Used when invalid fileserver settings are detected

**exception salt.exceptions.GitLockError** (*errno, strerror, \*args, \*\*kwargs*)

Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the *errno* param similar to an *OSError*, this exception class is *not* as subclass of *OSError*. This is done intentionally, so that this exception class can be caught in a *try/except* without being caught as an *OSError*.

**exception salt.exceptions.LoaderError** (*message=''*)

Problems loading the right renderer

**exception salt.exceptions.MasterExit**

Rise when the master exits

**exception salt.exceptions.MinionError** (*message=''*)

Minion problems reading uris such as salt:// or http://

**exception salt.exceptions.NotImplemented** (*message=''*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

**exception salt.exceptions.PkgParseError** (*message=''*)

Used when of the *pkg* modules cannot correctly parse the output from the CLI tool (*pacman*, *yum*, *apt*, *aptitude*, etc)

**exception salt.exceptions.PublishError** (*message=''*)

Problems encountered when trying to publish a command

**exception salt.exceptions.SaltCacheError** (*message=''*)

Thrown when a problem was encountered trying to read or write from the salt cache

**exception salt.exceptions.SaltClientError** (*message=''*)

Problem reading the master root key

**exception** `salt.exceptions.SaltClientTimeout` (*msg*, *jid=None*, \**args*, \*\**kwargs*)

Thrown when a job sent through one of the Client interfaces times out

Takes the `jid` as a parameter

**exception** `salt.exceptions.SaltCloudConfigError` (*message=''*)

Raised when a configuration setting is not found and should exist.

**exception** `salt.exceptions.SaltCloudException` (*message=''*)

Generic Salt Cloud Exception

**exception** `salt.exceptions.SaltCloudExecutionFailure` (*message=''*)

Raised when too much failures have occurred while querying/waiting for data.

**exception** `salt.exceptions.SaltCloudExecutionTimeout` (*message=''*)

Raised when too much time has passed while querying/waiting for data.

**exception** `salt.exceptions.SaltCloudNotFound` (*message=''*)

Raised when some cloud provider function cannot find what's being searched.

**exception** `salt.exceptions.SaltCloudPasswordError` (*message=''*)

Raise when virtual terminal password input failed

**exception** `salt.exceptions.SaltCloudSystemExit` (*message*, *exit\_code=1*)

This exception is raised when the execution should be stopped.

**exception** `salt.exceptions.SaltConfigurationError` (*message=''*)

Configuration error

**exception** `salt.exceptions.SaltDaemonNotRunning` (*message=''*)

Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

**exception** `salt.exceptions.SaltException` (*message=''*)

Base exception class; all Salt-specific exceptions should subclass this

**pack**()

Pack this exception into a serializable dictionary that is safe for transport via msgpack

**exception** `salt.exceptions.SaltInvocationError` (*message=''*)

Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

**exception** `salt.exceptions.SaltMasterError` (*message=''*)

Problem reading the master root key

**exception** `salt.exceptions.SaltNoMinionsFound` (*message=''*)

An attempt to retrieve a list of minions failed

**exception** `salt.exceptions.SaltRenderError` (*message*, *line\_num=None*, *buf=''*, *marker='<====='*, *trace=None*)

Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, `get_context` will be invoked to get the location of the error.

**exception** `salt.exceptions.SaltReqTimeoutError` (*message=''*)

Thrown when a salt master request call fails to return within the timeout

**exception** `salt.exceptions.SaltRunnerError` (*message=''*)

Problem in runner

**exception** `salt.exceptions.SaltSyndicMasterError` (*message=''*)

Problem while proxying a request in the syndication master

**exception** `salt.exceptions.SaltSystemExit` (*code=0, msg=None*)

This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

**exception** `salt.exceptions.SaltWheelError` (*message=''*)

Problem in wheel

**exception** `salt.exceptions.TimedProcTimeoutError` (*message=''*)

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

**exception** `salt.exceptions.TokenAuthenticationError` (*message=''*)

Thrown when token authentication fails

**exception** `salt.exceptions.VMwareApiError` (*message='', info=None*)

Used when representing a generic VMware API error

**exception** `salt.exceptions.VMwareConnectionError` (*message='', info=None*)

Used when the client fails to connect to either a VMware vCenter server or to a ESXi host

**exception** `salt.exceptions.VMwareObjectRetrievalError` (*message='', info=None*)

Used when a VMware object cannot be retrieved

**exception** `salt.exceptions.VMwareRuntimeError` (*message='', info=None*)

Used when a runtime error is encountered when communicating with the vCenter

**exception** `salt.exceptions.VMwareSaltError` (*message='', info=None*)

Used when a VMware object cannot be retrieved

**exception** `salt.exceptions.VMwareSystemError` (*message='', info=None*)

Used when representing a generic VMware system error

**function** `salt.exceptions.get_error_message` (*error*)

Get human readable message from Python Exception

## Salt opts dictionary

It is very common in the Salt codebase to see *opts* referred to in a number of contexts.

For example, it can be seen as `__opts__` in certain cases, or simply as *opts* as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of *opts* from scratch in order to have it available for a given function.

To do so, use the utility functions available in `salt.config`.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display *opts* for a master, the process is similar:

```
import salt.config
opts = salt.config.master_config('/etc/salt/master')
print(opts)
```

## Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's *excellent introduction to the topic* <<http://nedbatchelder.com/text/unipain/unipain.html>>.

Salt's basic workflow for Unicode handling is as follows:

- 1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.
2. Modules and various Salt pluggable systems use incoming data assuming Unicode.
  - 2.1) For Salt modules that query an API; the module should convert the data received from the API into Unicode.
  - 2.2) For Salt modules that shell out to get output; the module should convert data received into Unicode. (This does not apply if using the *cmd* execution module, which should handle this for you.
  - 2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.
3. When a function in a Salt module returns, it should return Unicode.
- 4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

## 19.25 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

### 19.25.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

<http://hubblestack.io/>

### 19.25.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

<https://github.com/zulily/alkali>

### 19.25.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

<https://github.com/zulily/buoyant>

### 19.25.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

<https://github.com/elasticdog/salt-sandbox>

### 19.25.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

<https://github.com/UtahDave/salt-vagrant-demo>

## 19.26 Salt's Test Suite: An Introduction

---

**Note:** This tutorial makes a couple of assumptions. The first assumption is that you have a basic knowledge of Salt. To get up to speed, check out the Salt Walkthrough.

The second assumption is that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

---

Salt comes with a powerful integration and unit test suite. The test suite allows for the fully automated run of integration and/or unit tests from a single interface.

Salt's test suite is located under the `tests` directory in the root of Salt's code base and is divided into two main types of tests: *unit tests* and *integration tests*. The `unit` and `integration` sub-test-suites are located in the `tests` directory, which is where the majority of Salt's test cases are housed.

### 19.26.1 Getting Set Up For Tests

There are a couple of requirements, in addition to Salt's requirements, that need to be installed in order to run Salt's test suite. You can install these additional requirements using the files located in the `salt/requirements` directory, depending on your relevant version of Python:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

## 19.26.2 Test Directory Structure

As noted in the introduction to this tutorial, Salt's test suite is located in the `tests` directory in the root of Salt's code base. From there, the tests are divided into two groups `integration` and `unit`. Within each of these directories, the directory structure roughly mirrors the directory structure of Salt's own codebase. For example, the files inside `tests/integration/modules` contains tests for the files located within `salt/modules`.

---

**Note:** `tests/integration` and `tests/unit` are the only directories discussed in this tutorial. With the exception of the `tests/runtests.py` file, which is used below in the *Running the Test Suite* section, the other directories and files located in `tests` are outside the scope of this tutorial.

---

### Integration vs. Unit

Given that Salt's test suite contains two powerful, though very different, testing approaches, when should you write integration tests and when should you write unit tests?

Integration tests use Salt masters, minions, and a syndic to test salt functionality directly and focus on testing the interaction of these components. Salt's integration test runner includes functionality to run Salt execution modules, runners, states, shell commands, salt-ssh commands, salt-api commands, and more. This provides a tremendous ability to use Salt to test itself and makes writing such tests a breeze. Integration tests are the preferred method of testing Salt functionality when possible.

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic. Unit tests should be used to test a function's exit point(s) such as any `return` or `raises` statements.

Unit tests are also useful in cases where writing an integration test might not be possible. While the integration test suite is extremely powerful, unfortunately at this time, it does not cover all functional areas of Salt's ecosystem. For example, at the time of this writing, there is not a way to write integration tests for Proxy Minions. Since the test runner will need to be adjusted to account for Proxy Minion processes, unit tests can still provide some testing support in the interim by testing the logic contained inside Proxy Minion functions.

## 19.26.3 Running the Test Suite

Once all of the *requirements* are installed, the `runtests.py` file in the `salt/tests` directory is used to instantiate Salt's test suite:

```
python tests/runtests.py [OPTIONS]
```

The command above, if executed without any options, will run the entire suite of integration and unit tests. Some tests require certain flags to run, such as destructive tests. If these flags are not included, then the test suite will only perform the tests that don't require special attention.

At the end of the test run, you will see a summary output of the tests that passed, failed, or were skipped.

The test runner also includes a `--help` option that lists all of the various command line options:

```
python tests/runtests.py --help
```

You can also call the test runner as an executable:

```
./tests/runtests.py --help
```

## Running Integration Tests

Salt's set of integration tests use Salt to test itself. The integration portion of the test suite includes some built-in Salt daemons that will spin up in preparation of the test run. This list of Salt daemon processes includes:

- 2 Salt Masters
- 2 Salt Minions
- 1 Salt Syndic

These various daemons are used to execute Salt commands and functionality within the test suite, allowing you to write tests to assert against expected or unexpected behaviors.

A simple example of a test utilizing a typical master/minion execution module command is the test for the `test_ping` function in the `tests/integration/modules/test.py` file:

```
def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function('test.ping'))
```

The test above is a very simple example where the `test.ping` function is executed by Salt's test suite runner and is asserting that the minion returned with a `True` response.

## Test Selection Options

If you look in the output of the `--help` command of the test runner, you will see a section called `Tests Selection Options`. The options under this section contain various subsections of the integration test suite such as `--modules`, `--ssh`, or `--states`. By selecting any one of these options, the test daemons will spin up and the integration tests in the named subsection will run.

```
./tests/runtests.py --modules
```

**Note:** The testing subsections listed in the `Tests Selection Options` of the `--help` output *only* apply to the integration tests. They do not run unit tests.

## Running Unit Tests

While `./tests/runtests.py` executes the *entire* test suite (barring any tests requiring special flags), the `--unit` flag can be used to run *only* Salt's unit tests. Salt's unit tests include the tests located in the `tests/unit` directory.

The unit tests do not spin up any Salt testing daemons as the integration tests do and execute very quickly compared to the integration tests.

```
./tests/runtests.py --unit
```

## Running Specific Tests

There are times when a specific test file, test class, or even a single, individual test need to be executed, such as when writing new tests. In these situations, the `--name` option should be used.

For running a single test file, such as the pillar module test file in the integration test directory, you must provide the file path using `.` instead of `/` as separators and no file extension:

```
./tests/runtests.py --name=integration.modules.pillar
./tests/runtests.py -n integration.modules.pillar
```

Some test files contain only one test class while other test files contain multiple test classes. To run a specific test class within the file, append the name of the test class to the end of the file path:

```
./tests/runtests.py --name=integration.modules.pillar.PillarModuleTest
./tests/runtests.py -n integration.modules.pillar.PillarModuleTest
```

To run a single test within a file, append both the name of the test class the individual test belongs to, as well as the name of the test itself:

```
./tests/runtests.py --name=integration.modules.pillar.PillarModuleTest.test_data
./tests/runtests.py -n integration.modules.pillar.PillarModuleTest.test_data
```

The `--name` and `-n` options can be used for unit tests as well as integration tests. The following command is an example of how to execute a single test found in the `tests/unit/modules/cp_test.py` file:

```
./tests/runtests.py -n unit.modules.cp_test.CpTestCase.test_get_template_success
```

## 19.26.4 Writing Tests for Salt

Once you're comfortable running tests, you can now start writing them! Be sure to review the *Integration vs. Unit* section of this tutorial to determine what type of test makes the most sense for the code you're testing.

---

**Note:** There are many decorators, naming conventions, and code specifications required for Salt test files. We will not be covering all of these specifics in this tutorial. Please refer to the testing documentation links listed below in the *Additional Testing Documentation* section to learn more about these requirements.

In the following sections, the test examples assume the `new` test is added to a test file that is already present and regularly running in the test suite and is written with the correct requirements.

---

## Writing Integration Tests

Since integration tests validate against a running environment, as explained in the *Running Integration Tests* section of this tutorial, integration tests are very easy to write and are generally the preferred method of writing Salt tests.

The following integration test is an example taken from the `test.py` file in the `tests/integration/modules` directory. This test uses the `run_function` method to test the functionality of a traditional execution module command.

The `run_function` method uses the integration test daemons to execute a `module.function` command as you would with Salt. The minion runs the function and returns. The test also uses [Python's Assert Functions](#) to test that the minion's return is expected.

```
def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function('test.ping'))
```

Args can be passed in to the `run_function` method as well:

```
def test_echo(self):
    """
    test.echo
    """
    self.assertEqual(self.run_function('test.echo', ['text']), 'text')
```

The next example is taken from the `tests/integration/modules/aliases.py` file and demonstrates how to pass kwargs to the `run_function` call. Also note that this test uses another salt function to ensure the correct data is present (via the `aliases.set_target` call) before attempting to assert what the `aliases.get_target` call should return.

```
def test_set_target(self):
    """
    aliases.set_target and aliases.get_target
    """
    set_ret = self.run_function(
        'aliases.set_target',
        alias='fred',
        target='bob')
    self.assertTrue(set_ret)
    tgt_ret = self.run_function(
        'aliases.get_target',
        alias='fred')
    self.assertEqual(tgt_ret, 'bob')
```

Using multiple Salt commands in this manner provides two useful benefits. The first is that it provides some additional coverage for the `aliases.set_target` function. The second benefit is the call to `aliases.get_target` is not dependent on the presence of any aliases set outside of this test. Tests should not be dependent on the previous execution, success, or failure of other tests. They should be isolated from other tests as much as possible.

While it might be tempting to build out a test file where tests depend on one another before running, this should be avoided. SaltStack recommends that each test should test a single functionality and not rely on other tests. Therefore, when possible, individual tests should also be broken up into singular pieces. These are not hard-and-fast rules, but serve more as recommendations to keep the test suite simple. This helps with debugging code and related tests when failures occur and problems are exposed. There may be instances where large tests use many asserts to set up a use case that protects against potential regressions.

**Note:** The examples above all use the `run_function` option to test execution module functions in a traditional master/minion environment. To see examples of how to test other common Salt components such as runners, salt-api, and more, please refer to the Integration Test Class Examples documentation.

---

### Destructive vs Non-destructive Tests

Since Salt is used to change the settings and behavior of systems, often, the best approach to run tests is to make actual changes to an underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

To write a destructive test, import and use the `destructiveTest` decorator for the test method:

```
import integration
from salttesting.helpers import destructiveTest

class PkgTest(integration.ModuleCase):
    @destructiveTest
    def test_pkg_install(self):
        ret = self.run_function('pkg.install', name='finch')
        self.assertSaltTrueReturn(ret)
        ret = self.run_function('pkg.purge', name='finch')
        self.assertSaltTrueReturn(ret)
```

### Writing Unit Tests

As explained in the *Integration vs. Unit* section above, unit tests should be written to test the *logic* of a function. This includes focusing on testing `return` and `raises` statements. Substantial effort should be made to mock external resources that are used in the code being tested.

External resources that should be mocked include, but are not limited to, APIs, function calls, external data either globally available or passed in through function arguments, file data, etc. This practice helps to isolate unit tests to test Salt logic. One handy way to think about writing unit tests is to “block all of the exits”. More information about how to properly mock external resources can be found in Salt’s Unit Test documentation.

Salt’s unit tests utilize Python’s mock class as well as `MagicMock`. The `@patch` decorator is also heavily used when “blocking all the exits”.

A simple example of a unit test currently in use in Salt is the `test_get_file_not_found` test in the `tests/unit/modules/cp_test.py` file. This test uses the `@patch` decorator and `MagicMock` to mock the return of the call to Salt’s `cp.hash_file` execution module function. This ensures that we’re testing the `cp.get_file` function directly, instead of inadvertently testing the call to `cp.hash_file`, which is used in `cp.get_file`.

```
@patch('salt.modules.cp.hash_file', MagicMock(return_value=False))
def test_get_file_not_found(self):
    """
    Test if get_file can't find the file.
    """
    path = 'salt://saltines'
    dest = '/srv/salt/cheese'
    ret = ''
    self.assertEqual(cp.get_file(path, dest), ret)
```

Note that Salt's `cp` module is imported at the top of the file, along with all of the other necessary testing imports. The `get_file` function is then called directly in the testing function, instead of using the `run_function` method as the integration test examples do above.

The call to `cp.get_file` returns an empty string when a `hash_file` isn't found. Therefore, the example above is a good illustration of a unit test "blocking the exits" via the `@patch` decorator, as well as testing logic via asserting against the `return` statement in the `if` clause.

There are more examples of writing unit tests of varying complexities available in the following docs:

- [Simple Unit Test Example](#)
- [Complete Unit Test Example](#)
- [Complex Unit Test Example](#)

---

**Note:** Considerable care should be made to ensure that you're testing something useful in your test functions. It is very easy to fall into a situation where you have mocked so much of the original function that the test results in only asserting against the data you have provided. This results in a poor and fragile unit test.

---

### 19.26.5 Checking for Log Messages

To test to see if a given log message has been emitted, the following pattern can be used

```
# Import logging handler
from salttesting.helpers import TestsLoggingHandler

# .. inside test
with TestsLoggingHandler() as handler:
    for message in handler.messages:
        if message.startswith('ERROR: This is the error message we seek'):
            break
    else:
        raise AssertionError('Did not find error message')
```

### 19.26.6 Automated Test Runs

SaltStack maintains a Jenkins server which can be viewed at <https://jenkins.saltstack.com>. The tests executed from this Jenkins server create fresh virtual machines for each test run, then execute the destructive tests on the new, clean virtual machine. This allows for the execution of tests across supported platforms.

### 19.26.7 Additional Testing Documentation

In addition to this tutorial, there are some other helpful resources and documentation that go into more depth on Salt's test runner, writing tests for Salt code, and general Python testing documentation. Please see the following references for more information:

- [Salt's Test Suite Documentation](#)
- [Integration Tests](#)
- [Unit Tests](#)
- [MagicMock](#)

- [Python Unittest](#)
- [Python's Assert Functions](#)

---

## Release Notes

---

See the version numbers page for more information about the version numbering scheme.

### 20.1 Latest Branch Release

Release Candidate

### 20.2 Previous Releases

#### 20.2.1 Salt 2016.11.0 Release Notes - Codename Carbon

##### New Features

##### Docker Introspection and Configuration

Major additions have been made to the Docker support in 2016.11.0. The new addition allows Salt to be executed within a Docker container without a minion running or installed in the container. This allows states to be run inside a container, but also all of Salt's remote execution commands to be run inside docker containers as well. This makes container introspection simple and powerful. See the tutorial on using this new feature here:

See Salt in Docker Containers.

##### Advanced Ceph Control

Our friends over at SUSE have delivered a powerful new tool to make the deployment of Ceph storage systems using Salt very easy. These new Ceph tools allow for a storage system to be easily defined using the new *ceph.quorum* state.

##### Thorium Additions and Improvements

The Thorium advanced reactor has undergone extensive testing and updates. These updates include many more Thorium states, a system for automating key management, the ability to use Thorium to easily replace old reactors and a great deal of stability and bug fixes.

## State Rollback Using Snapper

Rollback has been one of the most prevalent requests for Salt. We have researched it extensively and concluded that the only way to accomplish truly reliable rollback would be to execute it at the filesystem layer. To accomplish this we have introduced Snapper integration into Salt States.

Snapper is a tool which allows for simple and reliable snapshots of the filesystem to be made. With the new *snapper\_states* option set to *True* in the minion config a snapshot will be made before and after every Salt State run.

These snapshots can be viewed, managed and rolled back to via the *snapper* execution module.

## Preserve File Perms in File States

This feature has been requested for years, the ability to set a flag and use the same file permissions for files deployed to a minion as the permissions set to the file on the master. Just set the *keep\_mode* option on any file management state to *True*.

## Ponies!

We all agreed that cowsay was just not good enough, install the *ponysay* command and the new *pony* outputter will work. Fun for the whole family!

## Additional Features

- Minions can run in stand-alone mode to use beacons and engines without having to connect to a master. (Thanks @adelcast!)
- Added a `salt` runner to allow running salt modules via salt-run.

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

- Added SSL support to Cassandra CQL returner. SSL can be enabled by setting `ssl_options` for the returner. Also added support for specifying `protocol_version` when establishing cluster connection.
- The `mode` parameter in the *file.managed* state, and the `file_mode` parameter in the *file.recurse* state, can both now be set to `keep` and the minion will keep the mode of the file from the Salt fileserver. This works only with files coming from sources prefixed with `salt://`, or files local to the minion (i.e. those which are absolute paths, or are prefixed with `file://`). For example:

```
/etc/myapp/myapp.conf:
  file.managed:
    - source: salt://conf/myapp/myapp.conf
    - mode: keep

/var/www/myapp:
  file.recurse:
    - source: salt://path/to/myapp
    - dir_mode: 755
    - file_mode: keep
```

- The `junos` state module is now available. It has all the functions that are present in the `junos` execution module.

- The minion data cache is a pluggable data store now. It's configurable with `cache` option. Default is `localfs`.
- User names in `client_acl` support glob matching now.

### New Top File Merging Strategy for States

A new strategy called `merge_all` has been added to provide a new way of merging top file matches when executing a `highstate`. See the `top_file_merging_strategy` documentation for further information.

In addition, the same merging strategy was not functioning as documented. This has now been corrected. While this is technically a bugfix, we decided to hold a change in top file merging until a feature release to minimize user impact.

### Improved Archive Extraction Support

The `archive.extracted` state has been overhauled. Notable changes include the following:

- When enforcing ownership (with the `user` and/or `group` arguments), the `if_missing` argument no longer has any connection to which path(s) have ownership enforced. Instead, the paths are determined using the either the newly-added `archive.list` function, or the newly-added `enforce_ownership_on` argument.
- `if_missing` also is no longer required to skip extraction, as Salt is now able to tell which paths would be present if the archive were extracted. It should, in most cases, only be necessary in cases where a semaphore file is used to conditionally skip extraction of the archive.
- Password-protected ZIP archives are now detected before extraction, and the state fails without attempting to extract the archive if no password was specified.
- By default, a single top-level directory is enforced, to guard against 'tar-bombs'. This enforcement can be disabled by setting `enforce_toplevel` to `False`.
- The `tar_options` and `zip_options` arguments have been deprecated in favor of a single `options` argument.
- The `archive_format` argument is now optional. The ending of the `source` argument is used to guess whether it is a tar, zip or rar file. If the `archive_format` cannot be guessed, then it will need to be specified, but in many cases it can now be omitted.
- Ownership enforcement is now performed irrespective of whether or not the archive needed to be extracted. This means that the state can be re-run after the archive has been fully extracted to repair changes to ownership.

A number of new arguments were also added. See the docs `py:func:docs for the archive.extracted state <salt.states.archive.extracted>` for more information.

Additionally, the following changes have been made to the `archive` execution module:

- A new function (`archive.list`) has been added. This function lists the files/directories in an archive file, and supports a `verbose` argument that gives a more detailed breakdown of which paths are files, which are directories, and which paths are at the top level of the archive.
- A new function (`archive.is_encrypted`) has been added. This function will return `True` if the archive is a password-protected ZIP file, `False` if not. If the archive is not a ZIP file, an error will be raised.
- `archive.cmd_unzip` now supports passing a password, bringing it to feature parity with `archive.unzip`. Note that this is still not considered to be secure, and `archive.unzip` is recommended for dealing with password-protected ZIP archives.
- The default value for the `extract_perms` argument to `archive.unzip` has been changed to `True`.

## Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

---

**Note:** This improved functionality is also available in the 2016.3 (Boron) release cycle, starting with the 2016.3.5 release.

---

## Config Changes

The following default config values were changed:

- `gitfs_ssl_verify`: Changed from `False` to `True`
- `git_pillar_ssl_verify`: Changed from `False` to `True`
- `winrepo_ssl_verify`: Changed from `False` to `True`

## Grains Changes

- All core grains containing `VMWare` have been changed to `VMware`, which is the [official capitalization](#). Additionally, all references to `VMWare` in the documentation have been changed to `VMware` [issue 30807](#). Environments using versions of Salt before and after Salt 2016.11.0 should employ case-insensitive grain matching on these grains.

```
{% set on_vmware = grains['virtual'].lower() == 'vmware' %}
```

- On Windows the `cpu_model` grain has been changed to provide the actual cpu model name and not the cpu family.

Old behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
  Intel64 Family 6 Model 58 Stepping 9, GenuineIntel
```

New behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
  Intel(R) Core(TM) i7-3520M CPU @ 2.90GHz
```

## Beacons Changes

- The `loadavg` beacon now outputs averages as integers instead of strings. (Via [issue 31124](#).)

## Runner Changes

- Runners can now call out to *utility modules* via `__utils__`.
- `ref:Utility modules <writing-utility-modules>` (placed in `salt://_utils/`) are now able to be synced to the master, making it easier to use them in custom runners. A `saltutil.sync_utils` function has been added to the `saltutil runner` to facilitate the syncing of utility modules to the master.

## Pillar Changes

- Thanks to the new `saltutil.sync_utils` runner, it is now easier to get `ref:utility modules <writing-utility-modules>` synced to the correct location on the Master so that they are available in execution modules called from Pillar SLS files.

## Network Automation: NAPALM

Beginning with 2016.11.0, network automation is included by default in the core of Salt. It is based on a the [NAPALM](#) library and provides facilities to manage the configuration and retrieve data from network devices running widely used operating systems such: JunOS, IOS-XR, eOS, IOS, NX-OS etc. - see [the complete list of supported devices](#).

The connection is established via the *NAPALM proxy*.

In the current release, the following modules were included:

- `NAPALM grains` - Select network devices based on their characteristics
- *NET execution module* - Networking basic features
- *NTP execution module*
- *BGP execution module*
- *Routes execution module*
- *SNMP execution module*
- *Users execution module*
- *Probes execution module*
- *NTP peers management state*
- *SNMP configuration management state*
- *Users management state*

## Cisco NXOS Proxy Minion

Beginning with 2016.11.0, there is a proxy minion that can be used to configure nxos cisco devices over ssh.

- *Proxy Minion*
- *Execution Module*
- *State Module*

## Cisco Network Services Orchestrator Proxy Minion

Beginning with 2016.11.0, there is a proxy minion to use the Cisco Network Services Orchestrator as a proxy minion.

- *Proxy Minion*
- *Execution Module*
- *State Module*

## Junos Module Changes

- The following new functionalities were added to the junos module
  - facts - Displays the facts gathered during the connection.
  - shutdown - Shut down or reboot a device running Junos OS.
  - install\_config - Modify the configuration of a Junos device.
  - install\_os - Install Junos OS software package.
  - zeroize - Remove all configuration information on the Routing Engines and reset all key values on a device.
  - file\_copy - Copy file from proxy to the Junos device.

## Returner Changes

- Any returner which implements a *save\_load* function is now required to accept a *minions* keyword argument. All returners which ship with Salt have been modified to do so.

## Renderer Changes

Added the ability to restrict allowed renderers. Two new config parameters, `renderer_whitelist` and `renderer_blacklist` are introduced for this purpose.

## eAuth Changes

- External auth modules' `auth` method can return an ACL list for the given username instead of `True`. This list should be in the same format as described in the *eAuth documentation*. It will be used for the user instead of one set in master config.

Example of the `auth` method return that allows a user to execute functions in the `test` and `network` modules on the minions that match the `web*` target and allow access to `wheel` and `runner` modules:

```
[{'web*': ['test.*',  
          'network.*']},  
 '@wheel',  
 '@runner']
```

- External auth is supported by *salt-run* and *salt-key* now. Note that master must be started to use them with eAuth.

## External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See external module packaging tutorial for more information.

## Functionality Changes

- The `onfail` requisite now uses OR logic instead of AND logic. [issue 22370](#)
- The `consul` external pillar now strips leading and trailing whitespace. [issue 31165](#)
- The `win_system.py` state is now case sensitive for computer names. Previously computer names set with a state were converted to all caps. If you have a state setting computer names with lower case letters in the name that has been applied, the computer name will be changed again to apply the case sensitive name.
- The `mac_user.list_groups` function in the `mac_user` execution module now lists all groups for the specified user, including groups beginning with an underscore. In previous releases, groups beginning with an underscore were excluded from the list of groups.
- The `junos.call_rpc` function in the `junos` execution module can now be used to call any valid rpc. Earlier it used to call only `get_software_information`.
- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default `hash_type` is now `sha256` instead of `md5`. You will need to make sure both your master and minion share the same `hash_type`.
- Nodegroups consisting of a simple list of minion IDs can now also be declared as a `yaml` list. The below two examples are equivalent:

```
# Traditional way
nodegroups:
  - group1: L@host1,host2,host3

# New way (optional)
nodegroups:
  - group1:
    - host1
    - host2
    - host3
```

## New Azure ARM Cloud Driver

A new cloud driver has been added for Azure ARM, aka, the Azure Resource Manager. The older Azure driver is still required to work with the older Azure API. This new driver works with the newer ARM API, which is managed via the newer Azure Portal website.

## New Modules

### Beacons

- `salt.beacons.avahi_announce`
- `salt.beacons.bonjour_announce`

- *salt.beacons.haproxy*
- *salt.beacons.status*

## Clouds

- *salt.cloud.clouds.azurearm*

## Engines

- *salt.engines.hipchat*

## Modules

- *salt.modules.boto\_cloudwatch\_event*
- *salt.modules.celery*
- *salt.modules.ceph*
- *salt.modules.influx08*
- *salt.modules.inspectlib.entities*
- *salt.modules.inspectlib.fsdb*
- *salt.modules.inspectlib.kiwiproc*
- *salt.modules.inspector*
- *salt.modules.libcloud\_dns*
- *salt.modules.openstack\_mng*
- *salt.modules.servicenow*
- *salt.modules.testinframod*
- *salt.modules.win\_lgpo*
- *salt.modules.win\_pki*
- *salt.modules.win\_psget*
- *salt.modules.win\_snmp*
- *salt.modules.xbpspkg*

## Outputters

- *salt.output.pony*

## Pillar

- *salt.pillar.csvpillar*
- *salt.pillar.http\_json*
- *salt.pillar.makostack*

## Returners

- `salt.returners.zabbix_return`

## Runners

- `salt.runners.auth`
- `salt.runners.event`
- `salt.runners.smartos_vmadm`
- `salt.runners.vistara`

## SDB

- `salt.sdb.env`

## States

- `salt.states.boto_cloudwatch_event`
- `salt.states.csf`
- `salt.states.ethtool`
- `salt.states.influxdb08_database`
- `salt.states.influxdb08_user`
- `salt.states.libcloud_dns`
- `salt.states.snapper`
- `salt.states.testinframod`
- `salt.states.win_lgpo`
- `salt.states.win_pki`
- `salt.states.win_snmp`

## Thorium

- `salt.thorium.calc`
- `salt.thorium.key`
- `salt.thorium.runner`
- `salt.thorium.status`
- `salt.thorium.wheel`

## Deprecations

### General Deprecations

- env to saltenv

All occurrences of `env` and some occurrences of `__env__` marked for deprecation in Salt 2016.11.0 have been removed. The new way to use the salt environment setting is with a variable called `saltenv`:

```
def fcn(msg='', env='base', refresh=True, saltenv='base', **kwargs):
```

has been changed to

```
def fcn(msg='', refresh=True, saltenv='base', **kwargs):
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that also accepts arbitrary keyword arguments, then a new warning informs the user that `env` is no longer used if it is found. This new warning will be removed in Salt Nitrogen.

```
def fcn(msg='', refresh=True, saltenv='base', **kwargs):
```

```
# will result in a warning log message  
fcn(msg='add more salt', env='prod', refresh=False)
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that does not accept arbitrary keyword arguments, then python will issue an error.

```
def fcn(msg='', refresh=True, saltenv='base'):
```

```
# will result in a python TypeError  
fcn(msg='add more salt', env='prod', refresh=False)
```

- If `env` (or `__env__`) is supplied as a positional argument to a function, then undefined behavior will occur, as the removal of `env` and `__env__` from the function's argument list changes the function's signature.

```
def fcn(msg='', refresh=True, saltenv='base'):
```

```
# will result in refresh evaluating to True and saltenv likely not being a  
↳string at all  
fcn('add more salt', 'prod', False)
```

- Deprecations in `minion.py`:

- The `salt.minion.parse_args_and_kwargs` function has been removed. Please use the `salt.minion.load_args_and_kwargs` function instead.

### Cloud Deprecations

- The `vsphere` cloud driver has been removed. Please use the `vmware` cloud driver instead.
- The `private_ip` option in the `linode` cloud driver is deprecated and has been removed. Use the `assign_private_ip` option instead.
- The `create_dns_record` and `delete_dns_record` functions are deprecated and have been removed from the `digital_ocean` driver. Use the `post_dns_record` function instead.

## Execution Module Deprecations

- The `blockdev` execution module had four functions removed:

- `dump`
- `tune`
- `resize2fs`
- `wipe`

The `disk` module should be used instead with the same function names.

- The `boto_vpc` execution module had two functions removed, `boto_vpc.associate_new_dhcp_options_to_vpc` and `boto_vpc.associate_new_network_acl_to_subnet` in favor of more concise function names, `boto_vpc.create_dhcp_options` and `boto_vpc.create_network_acl`, respectively.
- The `data` execution module had `getval` and `getvals` functions removed in favor of one function, `get`, which combines the functionality of the removed functions.
- File module deprecations:
  - The `contains_regex_multiline` function was removed. Use `file.search` instead.
  - Additional command line options for `file.grep` should be passed one at a time. Please do not pass more than one in a single argument.
- The `lxc` execution module has the following changes:
  - The `run_cmd` function was removed. Use `lxc.run` instead.
  - The `nic` argument was removed from the `lxc.init` function. Use `network_profile` instead.
  - The `clone` argument was removed from the `lxc.init` function. Use `clone_from` instead.
  - passwords passed to the `lxc.init` function will be assumed to be hashed, unless `password_encrypted=False`.
  - The `restart` argument for `lxc.start` was removed. Use `lxc.restart` instead.
  - The old style of defining `lxc` containers has been removed. Please use keys under which LXC profiles should be configured such as `lxc.container_profile.profile_name`.
- The `env` and `activate` keyword arguments have been removed from the `install` function in the `pip` execution module. The use of `bin_env` replaces both of these options.
- `reg` execution module

Functions in the `reg` execution module had misleading and confusing names for dealing with the Windows registry. They failed to clearly differentiate between hives, keys, and name/value pairs. Keys were treated like value names. There was no way to delete a key.

New functions were added in 2015.5 to properly work with the registry. They also made it possible to edit key default values as well as delete an entire key tree recursively. With the new functions in place, the following functions have been deprecated:

- `read_key`
- `set_key`
- `create_key`
- `delete_key`

Use the following functions instead:

- for `read_key` use `read_value`
  - for `set_key` use `set_value`
  - for `create_key` use `set_value` with no `vname` and no `vdata`
  - for `delete_key` use `delete_key_recursive`. To delete a value, use `delete_value`.
- The `hash_hostname` option was removed from the `salt.modules.ssh` execution module. The `hash_known_hosts` option should be used instead.
  - The `human_readable` option was removed from the `uptime` function in the `status` execution module. The function was also updated in 2015.8.9 to return a more complete offering of uptime information, formatted as an easy-to-read dictionary. This updated function replaces the need for the `human_readable` option.
  - The `persist` kwarg was removed from the `win_useradd` execution module. This option is no longer supported for Windows. `persist` is only supported as part of user management in UNIX/Linux.
  - The `zpool_list` function in the `zpool` execution module was removed. Use `list` instead.

### Outputter Module Deprecations

- The `compact` outputter has been removed. Set `state_verbose` to `False` instead.

### Runner Module Deprecations

- The `grains.cache` runner no longer accepts `outputter` or `minion` as keyword arguments. Users will need to specify an outputter using the `--out` option. `tgt` is replacing the `minion` kwarg.
- The `fileservers` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- The `jobs` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- `virt` runner module:
  - The `hyper` kwarg was removed from the `init`, `list`, and `query` functions. Use the `host` option instead.
  - The `next_hyper` function was removed. Use the `next_host` function instead.
  - The `hyper_info` function was removed. Use the `host_info` function instead.

### State Module Deprecations

- The `env` and `activate` keyword arguments were removed from the `installed` function in the `pip` state module. The use of `bin_env` replaces both of these options.
- `reg` state module

The `reg` state module was modified to work with the new functions in the execution module. Some logic was left in the `reg.present` and the `reg.absent` functions to handle existing state files that used the final key in the name as the value name. That logic has been removed so you now must specify value name (`vname`) and, if needed, value data (`vdata`).

For example, a state file that adds the version value/data pair to the `Software\Salt` key in the `HKEY_LOCAL_MACHINE` hive used to look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
  reg.present:
    - value: 2016.3.1
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

A state file for removing the same value added above would have looked like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
  reg.absent:
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
  reg.absent:
    - vname: version
```

This new structure is important as it allows salt to deal with key default values which was not possible before. If `vname` is not passed, salt will work with the default value for that hivekey.

Additionally, since you could only delete a value from a the state module, a new function (`key_absent`) has been added to allow you to delete a registry key and all subkeys and name/value pairs recursively. It uses the new `delete_key_recursive` function.

For additional information see the documentation for the `reg` execution and state modules.

- `lxc` state module: The following functions were removed from the `lxc` state module:
  - `created`: replaced by the `present` state.
  - `started`: replaced by the `running` state.
  - `cloned`: replaced by the `present` state. Use the `clone_from` argument to set the name of the clone source.
- The `hash_hostname` option was removed from the `salt.states.ssh_known_hosts` state. The `hash_known_hosts` option should be used instead.
- The `always kwarg` used in the `built` function of the `pkgbuild` state module was removed. Use `force` instead.

## Utils Module Deprecations

- The use of `jid_dir` and `jid_load` were removed from the `salt.utils.jid`. `jid_dir` functionality for `job_cache` management was moved to the `local_cache` returner. `jid_load` data is now retrieved from the `master_job_cache`.
- `ip_in_subnet` function in `salt.utils.network.py` has been removed. Use the `in_subnet` function instead.
- The `iam` utils module had two functions removed: `salt.utils.iam.get_iam_region` and `salt.utils.iam.get_iam_metadata` in favor of the `aws` utils functions `salt.utils.aws.get_region_from_metadata` and `salt.utils.aws.creds`, respectively.

## 20.2.2 Salt 2016.11.1 Release Notes

Version 2016.11.1 is a bugfix release for *2016.11.0*.

### Changes for v2016.11.0..v2016.11.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-12-09T21:54:17Z

Statistics:

- Total Merges: 89
- Total Issue references: 55
- Total PR references: 155

Changes:

- **PR #38182:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-09T21:25:47Z
  - **PR #38177:** (*vutny*) Correct *cp.get\_file\_str* docstring and add integration tests
  - **PR #38163:** (*Ch3LL*) enabled ec2 cloud tests
  - **PR #38153:** (*vutny*) Master config includes may contain errors and be safely skipped
  - 23c0393 Merge pull request #38182 from rallytime/merge-2016.11
  - 627242a Merge branch `2016.3` into `2016.11`
    - \* 65b2ad7 Merge pull request #38163 from Ch3LL/enabled\_ec2\_cloud
      - be74c45 enabled ec2 cloud tests
    - \* b63f74e Merge pull request #38177 from vutny/fix-cp-get-file-str
      - a449980 Correct *cp.get\_file\_str* docstring and add integration tests
    - \* 7596313 Merge pull request #38153 from vutny/master-includes-error-tolerance
      - cd0154e Master config includes may contain errors and be safely skipped
- **PR #38158:** (*cachedout*) Fix type problem in *grains.filter\_by* @ 2016-12-09T21:24:40Z
  - **ISSUE #38094:** (*bartuss7*) TypeError: object of type `float` has no len() in *grains.filter\_by* | refs: #38158
  - 8355adc Merge pull request #38158 from cachedout/issue\_38094
  - e8196e2 Lint, remove set literal
  - 9f4ebb3 Fix type problem in *grains.filter\_by*
- **PR #38156:** (*terminalmage*) Remove *rtag* when windows minion refreshes early in state @ 2016-12-09T21:15:01Z
  - **ISSUE #38090:** (*jf*) *pkg.installed* does not seem to refresh the repo database, no matter what | refs: #38113 #38156
  - 31a157d Merge pull request #38156 from terminalmage/fix-windows-refresh
  - 258bd4c Remove *rtag* when windows minion refreshes early in state
- **PR #38183:** (*cro*) Fix bad set operations when setting up securitygroups in AWS. @ 2016-12-09T21:12:10Z
  - **ISSUE #37981:** (*tazaki*) Salt-cloud ec2 vpc securitygroupid always returning default | refs: #38183
  - **PR #37891:** (*isbm*) *rsync* port to 2015.8

- c638952 Merge pull request #38183 from cro/fix\_37891
- 0527d6f Fix bad set operations when setting up securitygroups in AWS. Fixes #37891.
- fc95045 Reset socket default timeout to None (fixes daemons\_tests failures) (#38181)
  - PR #38181: (*rallytime*) Reset socket default timeout to None (fixes daemons\_tests failures)
- PR #38148: (*whiteinge*) Remove ssh\_async from NetapiClient clients; it is not implemented @ 2016-12-09T18:49:42Z
  - 7ccbadd Merge pull request #38148 from whiteinge/no-ssh-async-client
  - cb58cd4 Remove ssh\_async from NetapiClient clients; it is not implemented
- PR #38160: (*terminalmage*) Update information about xz-utils in archive state/module docs @ 2016-12-09T18:34:03Z
  - 8d4e194 Merge pull request #38160 from terminalmage/update-archive-docs
  - 8e4ad3c Update information about xz-utils in archive state/module docs
- PR #38164: (*techhat*) Add Azure ARM docs for 2016.11.0 @ 2016-12-09T18:00:22Z
  - ISSUE #38024: (*Ch3LL*) 2016.11.0 release notes missing azure arm reference | refs: #38164
  - 05136f0 Merge pull request #38164 from techhat/azuredocs
  - 71b787e Add Azure ARM docs for 2016.11.0
- PR #38173: (*rallytime*) Bump some win\* module deprecations from Nitrogen to Oxygen @ 2016-12-09T16:57:29Z
  - e3c858c Merge pull request #38173 from rallytime/update-win-deprecation-versions
  - 09a50b2 Bump some win\* module deprecations from Nitrogen to Oxygen
- PR #38036: (*terminalmage*) archive.extracted: fix problems with overwrite arg @ 2016-12-08T19:08:41Z
  - PR #37889: (*isbm*) Allow overwrite archives extraction | refs: #38036
  - 827bf59 Merge pull request #38036 from terminalmage/archive-extracted-override
  - a1c70c7 archive.extracted: fix problems with overwrite arg
- PR #38133: (*terminalmage*) Fix edge case in creation of trans tar for salt-thin @ 2016-12-08T17:47:26Z
  - 50773a5 Merge pull request #38133 from terminalmage/zd1067
  - 71e0bd0 Fix edge case in creation of trans tar for salt-thin
- PR #38138: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T20:15:56Z
  - PR #38134: (*rallytime*) Skip daemon unit tests when running on Python 2.6
  - 6026cb2 Merge pull request #38138 from rallytime/merge-2016.11
  - 28b56ea Merge branch `2016.3' into `2016.11'
  - 86091db Skip daemon unit tests when running on Python 2.6 (#38134)
- PR #38130: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T20:11:19Z
  - ISSUE #38091: (*tjyang*) [WARNING ] salt.loaded.int.module.zenoss.\_\_virtual\_\_() is wrongly returning None. | refs: #38102
  - ISSUE #36707: (*do3meli*) slow FreeBSD sysctl module with test=true | refs: #36794
  - PR #38104: (*rallytime*) Back-port #36794 to 2016.3

- PR #38102: (*rallytime*) Add False + msg tuple return if requests is missing for zenoss module
- PR #36794: (*do3meli*) FreeBSD sysctl module now handels config\_file parameter in show method | refs: #38104
- 90478ef Merge pull request #38130 from rallytime/merge-2016.11
- 4d7d9ab Merge branch `2016.3' into `2016.11'
  - \* d3d98fd4 Merge pull request #38102 from rallytime/fix-38091
    - 4f79d5a Add False + msg tuple return if requests is missing for zenoss module
  - \* 8c8cbc2 Merge pull request #38104 from rallytime/bp-36794
    - c906c8a Pylint fixes
    - da3ebf8 FreeBSD sysctl module now handels config\_file parameter in show method
- 1a42e24 Fix beacon index (#38129)
  - PR #38129: (*Ch3LL*) Fix beacon index
- bbd9cab Add versionadded tags for network module funcs (#38127)
  - PR #38127: (*rallytime*) Add versionadded tags for network module funcs
- PR #38043: (*MTecknology*) Debian networking fix @ 2016-12-07T17:32:18Z
  - ISSUE #38042: (*MTecknology*) [2016.11.0] Invalid interfaces file produced by debian\_ip module | refs: #38043
  - fd06bab Merge pull request #38043 from MTecknology/2016.11
  - 6d5e132 Removing trailing whitespace from previous commit
  - f882674 Adding some options that are valid for inet6 blocks.
  - 81cb688 Better check for dual stack.
  - 525c746 May Cthulhu take mercy on my soul for this commit.
  - 300ca60 I guess this makes the previous commit a bit redundant, but I'm not sure if I want to remove it.
  - 6e7fc39 This now seems absurdly obvious, but I'm not ruling out that I'll break everything.
  - 82d2b89 Rolling back unit test.
  - b3edbcf Adding larger and more complete debian\_ip unit test.
  - 3afd7b6 Adding the valid/documented `slaves' option.
  - b6b1adc Typo: missing closing parenthesis
  - 756e41c Fixing a typo; line should not be commented
  - 32a1374 Corrects expected return value
  - 88f9d9f Mostly whitespace & comment changes
  - 41ffb8d Removing redundant line
  - 3a81686 Ensure iface\_dict not being populated will not produce a stacktrace
  - 4de2cb2 Corrects regression in debian\_ip/debian\_eth.jinja
- PR #38107: (*cachedout*) Status beacon should raise proper exception @ 2016-12-07T17:21:49Z
  - PR #38088: (*dmurphy18*) Updated to match formulas and allow for missing functions | refs: #38107
  - 4b9a7f2 Merge pull request #38107 from cachedout/supercede\_38088

- 73d7248 Change to log.debug per Tom
- da135b1 Fix docs
- 792b422 Pylint fix
- 88e03bb Fix typo
- a8ce153 Status beacon should raise proper exception
- **PR #38101:** (*loregordon*) Clarifies file.replace behavior on symlinks @ 2016-12-07T13:27:11Z
  - da8f5ac Merge pull request #38101 from lorengordon/file-replace-note
  - 345990f Clarifies file.replace behavior on symlinks
- **PR #38113:** (*terminalmage*) Revert changes to refresh tag for pkg states @ 2016-12-07T13:11:14Z
  - **ISSUE #38090:** (*jf*) pkg.installed does not seem to refresh the repo database, no matter what | refs: #38113 #38156
  - d47761f Merge pull request #38113 from terminalmage/issue38090
  - 9f347df Revert changes to refresh tag for pkg states
- **PR #38120:** (*Da-Juan*) Fix status beacon config default values @ 2016-12-07T13:08:33Z
  - **ISSUE #37976:** (*t0nyhays*) Error when status beacon fires (2016.11.0) | refs: #38120
  - d4c34e0 Merge pull request #38120 from Da-Juan/2016.11
  - 7e4a35e Fix status beacon config default values
- **PR #38114:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T12:45:04Z
  - **ISSUE #38037:** (*dmurphy18*) pkg.latest and yumpkg.latest\_version return incorrect package versions 2016.3 and 2016.11 | refs: #38045
  - **ISSUE #37939:** (*Talkless*) file.comment always report changes in test=True mode | refs: #38039
  - **ISSUE #35342:** (*morganwillcock*) win\_pkg: refresh\_db doesn't remove cached items which have been renamed or removed | refs: #38083
  - **PR #38083:** (*twangboy*) Only delete .sls files from winrepo-ng [DO NOT MERGE FORWARD]
  - **PR #38059:** (*rallytime*) Call exec\_test for the Syndic daemon in tests.unit.daemons\_test.py
  - **PR #38057:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38059
  - **PR #38045:** (*terminalmage*) yumpkg.py: don't include non-upgrade versions found by ``yum list available``
  - **PR #38039:** (*rallytime*) Check to see if a line is already commented before moving on
  - **PR #38034:** (*cachedout*) Modify daemons test to use multiprocessing | refs: #38059
  - 6868089 Merge pull request #38114 from rallytime/merge-2016.11
  - fec9dec Merge branch `2016.3` into `2016.11`
    - \* fbc8776 Merge pull request #38083 from twangboy/fix\_refresh\_db
      - 978af6d Remove only .sls files from the cached winrepo-ng
    - \* 9dcfdee Merge pull request #38059 from rallytime/daemons-test-fix
      - eb372b2 Add missing ``not`` statement: The last syndic test should assertFalse()
      - 4e10f8e Call exec\_test for the Syndic daemon in tests.unit.daemons\_test.py

- \* 9cd42b9 Merge pull request #38039 from rallytime/fix-37939
  - 1da7aac Update unit tests to account for additional file.search call
  - 8a685b1 Check to see if a line is already commented before moving on
  - f2c0455 Write an integration test demonstrating the issue
- \* a34a763 Merge pull request #38045 from terminalmage/issue38037
  - 6528950 Simplify logic for matching desired pkg arch with actual pkg arch
  - 3babbed yumpkg.py: don't include non-upgrade versions found by ``yum list available''
- PR #38109: (*gtmanfred*) mode needs to be an integer @ 2016-12-07T11:58:24Z
  - b9920e5 Merge pull request #38109 from gtmanfred/2016.11
  - 7546760 mode needs to be an integer
- PR #38103: (*rallytime*) Back-port #37283 to 2016.11 @ 2016-12-06T23:12:59Z
  - PR #37283: (*jeanpralo*) Handle docker-compose up to version 1.9.0 | refs: #38103
  - PR #37215: (*mschneider82*) removed version check | refs: #37283

  - 6f0f70c Merge pull request #37764 from cloudflare/NET-UPDATE
  - c3f0202 Replace feature and doc fixes

### 20.2.3 Salt 2016.11.2 Release Notes

Version 2016.11.2 is a bugfix release for *2016.11.0*.

#### Security Fixes

CVE-2017-5192: local\_batch client external authentication not respected

The `LocalClient.cmd_batch()` method client does not accept `external_auth` credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the `root` user.

CVE-2017-5200: Salt-api allows arbitrary command execution on a salt-master via Salt's `ssh_client`

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone upgrade to 2016.11.2 as soon as possible.

#### Changes for v2016.11.1..v2016.11.2

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

  - ISSUE #36148: (*alex-zel*) Eauth error with openLDAP groups | refs: #38406 #38406
  - 179d385 Merge pull request #38406 from alex-zel/fix-eauth-groups-permissions

- 6b9e9d8 Fix eauth error with openLDAP/389 directory server groups
- **PR #38619:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-01-06T17:51:19Z
  - **ISSUE #37498:** (*githubcdr*) service.restart salt-minion fails on Ubuntu 14.04.5 LTS | refs: #38587
  - **PR #38601:** (*terminalmage*) pillar.get: Raise exception when merge=True and default is not a dict
  - **PR #38600:** (*terminalmage*) Avoid errors when sudo\_user is set (2016.3 branch)
  - **PR #38598:** (*terminalmage*) Avoid errors when sudo\_user is set | refs: #38599 #38600
  - **PR #38589:** (*tobithiel*) State Gem: fix incorrect warning about missing rvm/rbenv
  - **PR #38587:** (*rallytime*) Change daemontools \_\_virtualname\_\_ from service to daemontools
  - **PR #38567:** (*pass-by-value*) Create queue if one doesn't exist
  - 82e9b3d Merge pull request #38619 from rallytime/merge-2016.11
  - 0efb2d8 Merge branch `2016.3' into `2016.11'
    - \* da676ce Merge pull request #38601 from terminalmage/pillar-get
      - 8613d72 pillar.get: Raise exception when merge=True and default is not a dict
    - \* 224fc77 Merge pull request #38600 from terminalmage/issue38459-2016.3
      - 8a45b13 Avoid errors when sudo\_user is set
    - \* a376970 Merge pull request #38589 from tobithiel/fix\_rvm\_rbenv\_warning
      - 9ec470b State Gem: fix incorrect warning about missing rvm/rbenv
    - \* 02e6a78 Merge pull request #38567 from pass-by-value/pgjsonb\_queue\_changes\_2016.3
      - 67879eb Create queue if one doesn't exist
    - \* 0889cbd Merge pull request #38587 from rallytime/fix-37498
      - 2a58809 Change daemontools \_\_virtualname\_\_ from service to daemontools
- **PR #38612:** (*sjorge*) network.ifacestartswith throws exception on Solaris-like platforms @ 2017-01-06T17:20:32Z
  - f64e003 Merge pull request #38612 from sjorge/2016.11-solaris-ifacestartswith
  - 26fae54 network.ifacestartswith throws exception on Solaris-like platforms
- **PR #38615:** (*sjorge*) add note related to issue #37027 @ 2017-01-06T16:38:34Z
  - **ISSUE #37027:** (*sjorge*) Solaris FQDN/UQDN and documentation/consistency | refs: #38615 #38615
  - 5820cee Merge pull request #38615 from sjorge/2016.11-solarisdocs
  - fbdd32f add note related to issue #37027
- **PR #38598:** (*terminalmage*) Avoid errors when sudo\_user is set | refs: #38599 #38600 @ 2017-01-05T23:16:22Z
  - a27fdb4 Merge pull request #38598 from terminalmage/issue38459
  - b37f7ff Avoid errors when sudo\_user is set
- **PR #38599:** (*terminalmage*) archive.extracted: Prevent traceback when state.single cannot be run @ 2017-01-05T23:16:11Z
  - **PR #38598:** (*terminalmage*) Avoid errors when sudo\_user is set | refs: #38599 #38600
  - d6b7019 Merge pull request #38599 from terminalmage/archive-results-handling
  - 9aceb81 archive.extracted: Prevent traceback when state.single cannot be run

- PR #38520: (*basdusee*) Fix issue #38517, added time.sleep(1) at line 227 in slack.py @ 2017-01-05T20:35:08Z
  - ISSUE #38517: (*basdusee*) Slack.py engine 100% CPU load due to missing time.sleep(1) | refs: #38520
  - d486b42 Merge pull request #38520 from basdusee/fix-issue-38517
  - e3a883c Small fix on the fix regarding indentation
  - 8adeae6 Fix issue #38517, added time.sleep(1) at line 227 in slack.py engine.
- PR #38577: (*mirceaulinic*) Fix function headers as per #38499 @ 2017-01-05T18:41:33Z
  - ISSUE #38485: (*wasabi222*) bgp.config not working | refs: #38499
  - PR #38499: (*mirceaulinic*) Fix #38485 | refs: #38577
  - 0706cde Merge pull request #38577 from cloudflare/PREP-2016.11.2
  - 62bee3c Fix function headers as per #38499
- PR #38578: (*mirceaulinic*) [2016.11] Port 5123f11 from develop into 2016.11.2 @ 2017-01-05T18:11:12Z
  - 55d1747 Merge pull request #38578 from cloudflare/PORT-5123f1
  - dea7866 Update net.load\_template doc: 2016.11.2
- PR #38584: (*rallytime*) Allow memusage beacon to load on Windows @ 2017-01-05T18:08:30Z
  - ISSUE #38462: (*g-shockfx*) Can't add beacon memusage on Windows | refs: #38584 #38584
  - be69baf Merge pull request #38584 from rallytime/fix-38462
  - 1fe945d Allow memusage beacon to load on Windows
- PR #38570: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38585 @ 2017-01-05T14:28:38Z
  - ISSUE #38353: (*Ch3LL*) salt-cloud gce specifying | refs: #38542 #38542
  - ISSUE #38187: (*curiositycasualty*) username/password saved as cleartext when using URIs with user:pass@ format | refs: #38541
  - ISSUE #30454: (*favoretti*) Using yaml serializer inside jinja template results in unicode being prepended by '!python/unicode' | refs: #38554 #38554 #30481
  - PR #38562: (*rallytime*) Update arch installation docs with correct package name
  - PR #38560: (*Ch3LL*) fix api logfile | refs: #38585
  - PR #38554: (*multani*) Fix YAML deserialization of unicode
  - PR #38542: (*Ch3LL*) fix gce image bug
  - PR #38541: (*techhat*) Strip user:pass from cached URLs
  - PR #38536: (*UtahDave*) add note about pyVmmomi locale workaround
  - PR #38531: (*rallytime*) Back-port #33601 to 2016.3
  - PR #33601: (*mchugh19*) Fix slack engine to run on python2.6 | refs: #38531
  - PR #30481: (*basepi*) Add yaml\_safe jinja filter | refs: #38554
  - 14b643f Merge pull request #38570 from rallytime/merge-2016.11
  - 30f14d1 Merge branch '2016.3' into '2016.11'
  - 7b74436 Merge pull request #38562 from rallytime/arch-install-docs
    - \* 8b1897a Update arch installation docs with correct package name
  - 0186070 Merge pull request #38560 from Ch3LL/fix\_api\_log

- \* 1b45e96 fix api logfile
- 0056620 Merge pull request #38531 from rallytime/bp-33601
  - \* c36cb39 remove the unnecessary double trigger
  - \* 3841449 fix spacing lint error
  - \* 8c1defc Remove unnecessary type from alias commands. Deduplicate alias handling to autodetect function selection. Add error reporting to slack connectivity problems. Cleanup slack's unicode conversion
  - \* c2f23bc Fix slack engine to run on python2.6
- 50242c7 Merge pull request #38541 from techhat/issue38187
  - \* eae3a43 Strip user:pass from cached URLs
- 325dc56 Merge pull request #38554 from multani/fix/30454
  - \* 2e7f743 yaml: support unicode serialization/deserialization
  - \* df76113 jinja: test the ``yaml`` filter with ordered dicts
  - \* f7712d4 Revert ``Add yaml\_safe filter``
- 4ddbc2e add note about pyVmomi locale workaround (#38536)
- 1c951d1 fix gce image bug (#38542)
- **PR #38509:** (*mostafahussein*) Stop request from being processed if bad ip @ 2017-01-04T20:05:44Z
  - 9a1550d Merge pull request #38509 from mostafahussein/2016.11
  - 8847289 remove commented code
  - 420817a Stop request from being processed if bad ip
- **PR #38522:** (*kkoppel*) Fix usage of salt.utils.http.query in slack\_notify.call\_hook @ 2017-01-04T20:04:57Z
  - **ISSUE #38518:** (*kkoppel*) slack\_notify.call\_hook returns tracebacks | refs: #38522
  - bc07d42 Merge pull request #38522 from kkoppel/fix-issue-38518
  - ff1e7f0 Fix usage of salt.utils.http.query in slack\_notify.call\_hook
- **PR #38527:** (*rbjorklin*) salt-api no longer forces the default timeout | refs: #38585 #38585 #38585 @ 2017-01-04T17:10:15Z
  - **ISSUE #38524:** (*rbjorklin*) salt-api seems to ignore rest\_timeout since 2016.11.0 | refs: #38527 #38585
  - 42fef27 Merge pull request #38527 from rbjorklin/api-timeout-fix
  - 0202f68 salt-api no longer forces the default timeout
- **PR #38529:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-01-04T17:06:57Z
  - **ISSUE #38472:** (*jinn*) file.managed Unable to manage file: `hash\_type` (2016.3.4) | refs: #38503
  - **ISSUE #38449:** (*swalladge*) Parsing issues in *list\_tab* (salt/modules/cron.py) | refs: #38487
  - **ISSUE #38438:** (*jf*) file.line with mode=delete breaks on empty file | refs: #38467
  - **ISSUE #38282:** (*sash-kan*) file.managed fails when file (which contains utf-characters in the name) exists | refs: #38415
  - **ISSUE #38209:** (*limited*) Accepting a minion causes tornado to exit | refs: #38474
  - **ISSUE #37684:** (*thusoy*) State execution duration is timezone-dependent | refs: #38491

- PR #38503: (*jinm*) Hash type fallback for file management
- PR #38491: (*gtmanfred*) Use UTC for timing in case timezone changes
- PR #38487: (*gtmanfred*) Fix crontab issues with spaces
- PR #38474: (*cachedout*) Allow an existing ioloop to be passed to salt-key
- PR #38467: (*gtmanfred*) file.line fail with mode=delete
- PR #38457: (*bshelton229*) Stops git.latest checking for local changes in a bare repo
- PR #38434: (*slinn0*) Make sysctl.persist fail when failing to set a value into the running kernel
- PR #38421: (*rallytime*) Update deprecation notices to the correct version
- PR #38420: (*rallytime*) Removed various deprecation notices from salt/modules/\* files | refs: #38421
- PR #38419: (*Ch3LL*) fix scsci docs example
- PR #38415: (*terminalmage*) file.managed: Fix failure when filename contains unicode chars
- PR #38385: (*dragon788*) Use unambiguous long names with double dashes
- 1895eb7 Merge pull request #38529 from rallytime/merge-2016.11
- 85f4702 Merge branch `2016.3' into `2016.11'
  - \* ec60f9c Merge pull request #38487 from gtmanfred/2016.3
    - 048b9f6 add test
    - c480c11 allow spaces in cron env
    - c529ec8 allow crons to have multiple spaces
  - \* c5ba11b Merge pull request #38491 from gtmanfred/timing
    - 79368c7 Use UTC for timing in case timezone changes
  - \* 86f0aa0 Merge pull request #38503 from jinm/issue\_38472\_jinm
    - 0cd9df2 Hash type fallback for file management
  - \* ed2ba4b Merge pull request #38457 from bshelton229/git-latest-head-bug
    - 558e7a7 Stops git.latest checking for local changes in a bare repo
  - \* 36e21b2 Merge pull request #38385 from dragon788/2016.3-double-dash
    - 86c4b56 Newline for lint compat
    - 9d9b686 Address review comments, consistency of quotes
    - df9bd5e Use unambiguous long names with double dashes
  - \* 59f2560 Merge pull request #38474 from cachedout/key\_loop
    - de50453 Allow an existing ioloop to be passed to salt-key
  - \* 3d0c752 Merge pull request #38467 from gtmanfred/2016.3
    - 7b7c6b3 file.line fail with mode=delete
  - \* 940025d Merge pull request #38434 from slinn0/issue\_38433\_fixes
    - 22af87a Fixes for <https://github.com/saltstack/salt/issues/38433>
  - \* e5eb512 Update deprecation notices to the correct version (#38421)
  - \* 9ce5331 file.managed: Fix failure when filename contains unicode chars (#38415)

- \* 2cdb59d Merge pull request #38419 from Ch3LL/fix\_doc\_scsci
  - 234043b fix scsci docs example
- PR #38539: (*twangboy*) Fix DSC LCM Config int checks @ 2017-01-04T16:56:27Z
  - ec4f118 Merge pull request #38539 from twangboy/dsc\_int\_checks
  - 5657fd1 Add repr flag for str
  - aea4219 Fix DSC LCM Config int checks
- PR #38549: (*meaksh*) Adding multiple SUBVOLUME support and some fixes to the Snapper module @ 2017-01-04T15:32:30Z
  - 53449c8 Merge pull request #38549 from meaksh/2016.11-snapper-multiple-subvolumen-support
  - ef26e93 Some fixes and pylint
  - 1e6ba45 Fixes pre/post snapshot order to get the inverse status
  - 68d5475 Fixing Snapper unit tests for SUBVOLUME support
  - e9919a9 Removing possible double '/' from the file paths
  - 8b4f87f Updating and fixing the documentation
  - edea452 Raises ``CommandExecutionError`` if snapper command fails
  - 3841e11 Only include diff in the state response if *include\_diff* is True
  - 7803e77 Adds multiple SUBVOLUME support to the Snapper module
- d43beab Move boto\_vpc.describe\_route\_table deprecation version to Oxygen (#38545)
  - PR #38545: (*rallytime*) Move boto\_vpc.describe\_route\_table deprecation version to Oxygen
- PR #38471: (*twangboy*) Fix Problem with win\_service module @ 2017-01-01T20:30:21Z
  - 5e80104 Merge pull request #38471 from twangboy/fix\_win\_service
  - 810471b Fix problem with some services getting access denied
- PR #38499: (*mirceaulinic*) Fix #38485 | refs: #38577 @ 2017-01-01T17:42:15Z
  - ISSUE #38485: (*wasabi222*) bgp.config not working | refs: #38499
  - 0a09049 Merge pull request #38499 from cloudflare/FIX-38485
  - 1801813 Fix #38485
- PR #38501: (*mvdwalle*) Do not assume every object is a server @ 2017-01-01T17:37:57Z
  - 13f0b80 Merge pull request #38501 from mvdwalle/fix-gogrid-list-password
  - bd7dee9 Do not assume every object is a server
- PR #38461: (*anlutro*) Improvements/fixes to capacitor task change detection @ 2016-12-29T17:08:47Z
  - aa0c843 Merge pull request #38461 from alprs/fix-kapacitor\_changes
  - 52721e9 clean up and fix tests
  - 8648775 if task is not defined, it's not up to date
  - c3ab954 improvements/fixes to capacitor task change detection
- PR #38473: (*twangboy*) Change OSX/OS X to macOS where possible @ 2016-12-29T16:35:11Z
  - 2c51eb9 Merge pull request #38473 from twangboy/osx\_to\_macos

- e96bfe8 Change OSX/OS X to macOS where possible
- **PR #38412:** (*bbinet*) Update PillarStack stack.py to latest upstream version @ 2016-12-28T19:28:40Z
  - 2497fb5 Merge pull request #38412 from bbinet/pillarstack-updates
  - b66b4bd Fix lint violations in stack.py
  - 6a30fe6 Update PillarStack stack.py to latest upstream version
- **PR #38456:** (*twangboy*) Gate Windows Specific Salt Utils @ 2016-12-28T18:44:33Z
  - 5395d32 Merge pull request #38456 from twangboy/gate\_win\_utils
  - d34d110 Fix lint, fix boto module
  - c201111 Gate Windows Utils
- **PR #38428:** (*gqgunhed*) fixed typo: lq command-line syntax @ 2016-12-27T15:42:02Z
  - 7c77991 Merge pull request #38428 from gqgunhed/fix\_lq\_typo
  - d79d682 fixed typo: lq command-line syntax
- **PR #38444:** (*loregordon*) Adds new import required for *extract\_hash* @ 2016-12-27T15:37:20Z
  - **ISSUE #38443:** (*loregordon*) 2016.11 breaks file.managed on Windows | refs: #38444
  - **ISSUE #34101:** (*windoverwater*) archive.extracted breakage due to 2016.3.0 upgrade from 2015.8.10 | refs: #37368
  - **PR #37368:** (*terminalmage*) Overhaul archive.extracted state | refs: #38444
  - f5984d0 Merge pull request #38444 from loregordon/issue-38443
  - b2925ad Adds new import required for *extract\_hash*
- **PR #38167:** (*cachedout*) Kill pkg\_resources for CLI tools [DO NOT MERGE] @ 2016-12-22T22:11:22Z
  - **ISSUE #38071:** (*luochun-95*) remote execute is very slow | refs: #38167
  - 4c4f07c Merge pull request #38167 from cachedout/no\_pkg\_resources
  - ec69017 Remove debugging
  - f28e33b Remove from all but salt cli
  - bb3af72 Remove from salt-call
  - c676846 Kill pkg\_resources for CLI tools
- **PR #38417:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-22T19:00:44Z
  - **ISSUE #38372:** (*fanirama*) Issue with cron.file. Source: salt://path/to/crontab\_file not found | refs: #38398
  - **PR #38407:** (*terminalmage*) Improve pillar documentation
  - **PR #38398:** (*terminalmage*) Fix call to file.get\_managed in cron.file state
  - **PR #38390:** (*meaksh*) Add ``try-restart`` to fix autorestarting on SUSE systems
  - **PR #38382:** (*heewa*) Fix http.query when result has no text
  - **PR #38221:** (*UtahDave*) Fix default returner
  - 2fc8c15 Merge pull request #38417 from rallytime/merge-2016.11
  - efb8a8d Merge branch `2016.3` into `2016.11`
  - 2725352 Improve pillar documentation (#38407)

- 423b1fd Merge pull request #38398 from terminalmage/issue38372
  - \* c80dbaa Fix call to file.get\_managed in cron.file state
- 5a33d1e Fix http.query when result has no text (#38382)
- b74b5c7 Merge pull request #38390 from meaksh/2016.3-fix-try-restart-for-autorestarting-on-SUSE-systems
  - \* de6ec05 add try-restart to fix autorestarting on SUSE systems
- 2c3a397 Merge pull request #38221 from UtahDave/fix\_default\_returner
  - \* 3856407 remove a blank line to satisfy linter
  - \* 9c248aa validate return opt, remove default.
  - \* 8bb37f9 specify allowed types and default for ``returner``
  - \* 11863a4 add examples of default minion returners
  - \* e7c6012 add support for default returners using *return*
- PR #38342: (*scthi*) Bugfix ext pillar nodegroups @ 2016-12-22T16:47:42Z
  - bbc149c Merge pull request #38342 from scthi/bugfix-ext-pillar-nodegroups
  - dba315c ext-pillar nodegroups works for all minions now.
- PR #38403: (*terminalmage*) git\_pillar: Document the transition from env to saltenv in the jinja context @ 2016-12-22T16:34:48Z
  - 453476d Merge pull request #38403 from terminalmage/document-saltenv
  - 0a72e0f git\_pillar: Document the transition from env to saltenv in the jinja context
- PR #38354: (*gmacon*) Use --all when calling pip.py @ 2016-12-20T20:40:21Z
  - ISSUE #38253: (*gmacon*) There was no error installing package `setuptools` although it does not show when calling `pip.freeze`. | refs: #38354
  - 12436ef Merge pull request #38354 from gmacon/pip-freeze-all
  - dca24b2 Use --all when calling pip.py
- PR #38348: (*rallytime*) Update autodoc topics for new modules added in 2016.11 @ 2016-12-20T20:36:20Z
  - 68430b1 Merge pull request #38348 from rallytime/mod-docs-2016.11
  - b31c241 Add `__iter__` and next options to doc/conf.py
  - b8c1609 Revert ``Move import/error messaging logic for snapper module into `__virtual__()```
  - 640db5b Move import/error messaging logic for snapper module into `__virtual__()`
  - 366271f Add snapper to state index doc module list
  - 135d254 Remove netapi autodoc files: they should not be added as their doc structure is different
  - 0006139 Update autodoc topics for new modules added in 2016.11
- PR #38377: (*DmitryKuzmenko*) Implementation and docs for Consul key-value store plugin for minion data cache. @ 2016-12-20T20:36:02Z
  - 6ee7b2b Merge pull request #38377 from DSRCorporation/features/consul\_cache
  - 6fb4430 Configuration options and documentation for Consul data cache plugin.
  - dad748f Data cache plugin configuration documentation.

- c7209cd Consul data cache plugin.
- PR #38373: (*rallytime*) Back-port #38212 to 2016.11 @ 2016-12-20T20:35:09Z
  - PR #38212: (*disaster123*) ZMQ: add an option for zmq.BACKLOG to salt master (zmq\_backlog) | refs: #38373
  - f6d1b55 Merge pull request #38373 from rallytime/bp-38212
  - 52fc6da ZMQ: add an option for zmq.BACKLOG to salt master (zmq\_backlog)
- PR #38374: (*mirceaulinic*) NAPALM proxy module: Fix optional\_args key issue @ 2016-12-20T20:34:59Z
  - 69c3f19 Merge pull request #38374 from cloudflare/FIX-NAPALM-PROXY
  - 4416931 Fix optional\_args key issue
- PR #38073: (*ezh*) 2016.11 @ 2016-12-20T14:51:11Z
  - ISSUE #38048: (*ezh*) [2016.11.0] Salt-cloud throws TypeError exception | refs: #38073
  - 530f495 Merge pull request #38073 from doublescoring/2016.11
  - 42d3d26 [38073] Fix test assertion
  - 9b37ead Fix broken os.write without string.encode

  - 5e8bf57 python3 compatibility and fix pylint
  - e0df047 remove empty strings from list but not ones with one empty space char
- PR #38277: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-15T18:09:10Z
  - PR #38256: (*rallytime*) [2016.3] Bump latest release version to 2016.11.1
  - PR #38254: (*terminalmage*) Also check if pillarenv is in opts
  - PR #38248: (*meaksh*) Successfully exit of salt-api child processes when SIGTERM is received
  - a748e84 Merge pull request #38277 from rallytime/merge-2016.11
  - 49a3355 Merge branch `2016.3' into `2016.11'
  - fc9e1df Merge pull request #38248 from meaksh/salt-api-successfully-close-child-processes
    - \* ee6eae9 Successfully exit of salt-api child processes when SIGTERM.
  - 3c718ed Merge pull request #38254 from terminalmage/check-pillarenv
    - \* fa9ad31 Also check if pillarenv is in opts
  - 6b9060c [2016.3] Bump latest release version to 2016.11.1 (#38256)
- PR #38232: (*rallytime*) Strip final `e' in key cmd to correct ``deleteed" misspelling @ 2016-12-15T10:38:49Z
  - ISSUE #38231: (*tjuup*) Typo: salt-key deleteed | refs: #38232
  - 0af343e Merge pull request #38232 from rallytime/fix-38231
  - 26e1ee3 Strip final `e' in key cmd to correct ``deleteed" misspelling
- PR #38236: (*gtmanfred*) SELINUXTYPE should not be changed @ 2016-12-15T10:37:06Z
  - ISSUE #38200: (*sebw*) selinux.mode doesn't return any output and doesn't persist | refs: #38236
  - 6c1ca9d Merge pull request #38236 from gtmanfred/2016.11
  - d1b070c clean up selinux unit test
  - 96eabd4 SELINUXTYPE should not be changed

- **PR #38262:** (*terminalmage*) Fix archive.extracted when --strip or --strip-components is in the options @ 2016-12-15T08:57:18Z
  - **ISSUE #38228:** (*vquiering*) archive.extracted with options and user/group | refs: #38262
  - fd32dc3 Merge pull request #38262 from terminalmage/issue38228
  - 6442f8a Add tests for --strip/--strip-components
  - c502e68 Detect --strip/--strip-components in tar options and handle properly
  - e957705 Add strip\_components arg to archive.list
- **PR #38264:** (*mirceaulinic*) Port #37862 into 2016.11 @ 2016-12-15T08:51:20Z
  - **PR #37862:** (*mirceaulinic*) [2016.11.1] Docstring fixes and new features for napalm\_network | refs: #38264
  - b232bd8 Merge pull request #38264 from cloudflare/PORT-37862
  - 28bbb73 Import from napalm\_base instead of napalm
  - 0a675af Vice-versa docstring
  - 09c5017 More docfix
  - 215b8f3 Lint cleanup
- 56a8fa3 Add 2016.11.2 release notes (#38260)
  - **PR #38260:** (*rallytime*) Add 2016.11.2 release notes
- 702d462 [2016.11] Bump latest release version to 2016.11.1 (#38257)
  - **PR #38257:** (*rallytime*) [2016.11] Bump latest release version to 2016.11.1
- 82b1b77 Correct an inaccurate warning when top\_file\_merging\_strategy == merge\_all (#38233)
  - **PR #38233:** (*terminalmage*) Correct an inaccurate warning when top\_file\_merging\_strategy == merge\_all
- **PR #38234:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-13T18:28:02Z
  - **PR #38224:** (*whiteinge*) Allow CORS OPTIONS requests to be unauthenticated
  - **PR #38223:** (*whiteinge*) Add root\_dir to salt-api file paths
  - **PR #38213:** (*rallytime*) Skip test\_cert\_info tls unit test on pyOpenSSL upstream errors
  - **PR #38198:** (*vutny*) Add missing requirements for running unit tests: libcloud and boto3
  - **PR #37272:** (*vutny*) Get default logging level and log file from default opts dict | refs: #38223
  - ba62fcf Merge pull request #38234 from rallytime/merge-2016.11
  - 6a327d1 Merge branch `2016.3' into `2016.11'
  - 004e46a Merge pull request #38198 from vutny/unit-tests-require-libcloud-boto3
    - \* a6098ba Remove note about SaltTesting installation, now it is in the requirements
    - \* 004bff1 Add missing requirements for running unit tests: libcloud and boto3
  - 9d497bc Merge pull request #38213 from rallytime/skip-tls-test
    - \* bdb807f Skip test\_cert\_info tls unit test on pyOpenSSL upstream errors
  - 203109d Merge pull request #38224 from whiteinge/cors-options-unauthed
    - \* de4d322 Allow CORS OPTIONS requests to be unauthenticated
  - 721a5fe Merge pull request #38223 from whiteinge/salt-api-root\_dirs

- \* bbf390 Add root\_dir to salt-api file paths
- PR #38205: (rallytime) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-12T18:13:18Z
  - ISSUE #38162: (747project) git\_pillar does not detect changes to remote repository when told to update | refs: #38191
  - PR #38194: (vutny) Document the requirements for running ZeroMQ-based integration tests
  - PR #38191: (terminalmage) Clarify the fact that git\_pillar.update does not fast-forward
  - PR #38185: (rallytime) Back-port #38181 to 2016.3
  - PR #38181: (rallytime) Reset socket default timeout to None (fixes daemons\_tests failures) | refs: #38185
  - 7ead1ed Merge pull request #38205 from rallytime/merge-2016.11
  - e31f97c Merge branch `2016.3' into `2016.11'
  - 70f7d22 Merge pull request #38191 from terminalmage/issue38162
    - \* 1ae543a Clarify the fact that git\_pillar.update does not fast-forward
  - 28171cb Merge pull request #38194 from vutny/integration-test-requirements-doc
    - \* e9f419f Document the requirements for running ZeroMQ-based integration tests
  - a4ef037 Merge pull request #38185 from rallytime/bp-38181
  - 609f814 Reset socket default timeout to None (fixes daemons\_tests failures)
- PR #38203: (rallytime) Back-port #38188 to 2016.11 @ 2016-12-12T17:48:51Z
  - PR #38188: (tsaridas) fix for push\_dir in different OS | refs: #38203 #38207 #38207
  - 669409d Merge pull request #38203 from rallytime/bp-38188
  - 50d3200 removing not needed join
  - 7af708e fix for push\_dir in different OS

## 20.2.4 Salt 2016.11.3 Release Notes

Version 2016.11.3 is a bugfix release for *2016.11.0*.

### Changes for v2016.11.2..v2016.11.3

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2017-02-22T23:01:16Z

Statistics:

- Total Merges: 139
- Total Issue references: 78
- Total PR references: 217

Changes:

- PR #39536: (twangboy) Namespace `status' functions in `win\_status' @ 2017-02-21T23:45:31Z
  - PR #39005: (cro) Ungate the status.py module and raise unsupported errors in functions not executable on Windows. | refs: #39536

- 40f72db Merge pull request #39536 from twangboy/fix\_win\_status
- d5453e2 Remove unused import (lint)
- 837c32e Remove list2cmdline
- c258cb3 Streamline wmic command returns for easier parsing
- 6d2cf81 Fix `ping\_master` function
- d946d10 Namespace `status` functions in `win\_status`
- **PR #39534:** (*rallytime*) Fix breakage in aptpkg and dpkg execution modules @ 2017-02-21T20:31:15Z
  - **PR #39418:** (*anlutro*) Allow aptpkg.info\_installed on package names that aren't installed | refs: #39534
  - dc8f578 Merge pull request #39534 from rallytime/fix-pkg-function-specs
  - d34a8fe Fix breakage in aptpkg and dpkg execution modules
- 1d0d7b2 Upgrade SaltTesting to run test suite for 2016.11 and add SaltPyLint (#39521)
  - **ISSUE #34712:** (*richardscollin*) Salt Test Suite Error - develop | refs: #37366
  - **PR #39521:** (*vutny*) Upgrade SaltTesting to run test suite for 2016.11 and add SaltPyLint
  - **PR #37366:** (*eradman*) dev\_python\*.txt: use current SaltTesting and SaltPyLint modules | refs: #39521
- **PR #39370:** (*twangboy*) Gate win\_osinfo and winservice @ 2017-02-17T23:53:58Z
  - e4c7168 Merge pull request #39370 from twangboy/gate\_win\_utils
  - 167cdb3 Gate windows specific imports, add \_\_virtual\_\_
  - e67387d Add option to return a Non instantiated class
  - 315b0cc Clarify return value for win\_osinfo
  - 994314e Fix more docs
  - 2bbe3cb Fix some docs
  - 4103563 Merge branch `gate\_win\_utils` of <https://github.com/twangboy/salt> into gate\_win\_utils
    - \* 24c1bd0 Remove extra newlines
  - 82a86ce Add helper function for winservice
  - 0051b5a Put the win\_osinfo classes in a helper function
  - 4e08534 Gate win\_osinfo and winservice better
- **PR #39486:** (*twangboy*) Remove orphaned function list\_configurable\_policies @ 2017-02-17T22:21:50Z
  - a3e71b6 Merge pull request #39486 from twangboy/win\_remove\_orphaned
  - 1328055 Remove orphaned function list\_configurable\_policies
- **PR #39418:** (*anlutro*) Allow aptpkg.info\_installed on package names that aren't installed | refs: #39534 @ 2017-02-17T18:34:19Z
  - 87b269f Merge pull request #39418 from alprs/fix-aptpkg\_info\_nonexistent\_pkg
  - 246bf1e add failhard argument to various apt pkg functions
- **PR #39438:** (*mirceaulinic*) file.get\_managed: refetch source when file hashsum is changed @ 2017-02-17T17:58:29Z
  - e816d6c Merge pull request #39438 from cloudflare/fix\_39422
  - 8453800 file.get\_managed: refetch cached file when hashsum chnaged

- **PR #39432:** (*dmaziuk*) Quick and dirty fix for GECOS fields with more than 3 commas @ 2017-02-17T17:57:30Z
  - **ISSUE #39203:** (*dmaziuk*) salt.users gecos field | refs: #39432 #39432
  - a5fe8f0 Merge pull request #39432 from dmaziuk/issue39203
  - 41c0463 Remove #
  - 4f877c6 Quick and dirty fix for GECOS fields with more than 3 commas
- **PR #39484:** (*corywright*) The Reactor docs should use pillar='{}' instead of `pillar={}` @ 2017-02-17T17:50:57Z
  - 3665229 Merge pull request #39484 from corywright/fix-reactor-docs-pillar-keyword-args
  - cc90d0d The Reactor docs should use pillar='{}' instead of `pillar={}`
- **PR #39456:** (*twangboy*) Add salt icon to buildenv directory @ 2017-02-16T22:47:58Z
  - 2e3a9c5 Merge pull request #39456 from twangboy/win\_fix\_icon
  - 8dd915d Add salt icon to buildenv directory
- **PR #39462:** (*twangboy*) Use url\_path instead of url\_data.path @ 2017-02-16T22:44:18Z
  - 63adc03 Merge pull request #39462 from twangboy/win\_fix\_fileclient
  - a96bc13 Use url\_path instead of url\_data.path
- **PR #39458:** (*rallytime*) Fix more warnings in doc build @ 2017-02-16T21:45:52Z
  - e9b034f Merge pull request #39458 from rallytime/fixup-more-doc-build-warnings
  - e698bc3 Fix more warnings in doc build
- **PR #39437:** (*sakateka*) Fixes about saltfile @ 2017-02-16T20:32:15Z
  - e4f8c2b Merge pull request #39437 from sakateka/fixes\_about\_saltfile
  - ab68524 less pylint: salt/utlils/parsers.py
  - 9e7d9dc Revert ``pylint: salt/utlils/parsers.py``
  - f3f129c document ~/.salt/Saltfile
  - 33f3614 pylint: salt/utlils/parsers.py
  - 0f36e10 expand config\_dir and `~/.salt/Saltfile' as last resort
- 1acf00d add 2016.11.3 changelog to release notes (#39451)
  - **PR #39451:** (*Ch3LL*) add 2016.11.3 changelog to release notes
- **PR #39448:** (*gtmanfred*) Add release notes for cisco proxy minions added in Carbon @ 2017-02-16T17:29:48Z
  - **ISSUE #38032:** (*meggiebot*) Add missing Carbon docs | refs: #39448
  - 8e2cbd2 Merge pull request #39448 from gtmanfred/2016.11
  - 3172e88 Add release notes for cisco proxy minions added in Carbon
- **PR #39428:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-02-16T00:01:15Z
  - **PR #39409:** (*terminalmage*) salt.filesserver.roots: Fix regression in symlink\_list
  - **PR #39400:** (*meaksh*) Prevents `OSError' exception in case certain job cache path doesn't exist
  - **PR #39380:** (*joe-niland*) Quote numeric user names so pwd.getpwnam handles them properly
  - **PR #39362:** (*dincamihai*) Add cp.push test
  - **PR #39339:** (*cro*) Add link to external pillar documentation for clarification.

- PR #39337: (*terminalmage*) Don't re-walk the roots fileservers in `symlink_list()` | refs: #39409
- PR #39316: (*terminalmage*) Document the upstream RedHat bug with their `pygit2` package
- PR #39300: (*terminalmage*) Replace more usage of `str.format` in the loader
- PR #39227: (*terminalmage*) Loader optimization | refs: #39300
- 070904b Merge pull request #39428 from rallytime/merge-2016.11
- 2acb188 Change `path` value from a tuple to a list
- 6d78adb Merge branch `2016.3' into `2016.11'
  - \* 4ff13ac salt.filesserver.roots: Fix regression in `symlink_list` (#39409)
  - \* 8b8ab8e Merge pull request #39362 from dincamihai/cp-push-test-2016.3
    - 91383c5 Add `cp.push` test
  - \* 4b726f9 Merge pull request #39380 from joe-niland/quote-numeric-usernames
    - c2edfdd Quote numeric user names so `pwd.getpwnam` handles them properly
  - \* 1116d32 Merge pull request #39400 from meaksh/2016.3-fix-local-cache-issue
    - e7e559e Prevents `OSError` exception in case path doesn't exist
  - \* 6c854da Merge pull request #39300 from terminalmage/loader-optimization
    - d3e5d15 Replace more usage of `str.format` in the loader
  - \* 5286b5f Merge pull request #39337 from terminalmage/issue34428
    - a7d2135 Don't re-walk the roots fileservers in `symlink_list()`
  - \* ce781de Merge pull request #39339 from cro/pillar\_filetree\_doc
    - 410810c Clarification on external pillar usage.
  - \* fa30143 Document the upstream RedHat bug with their `pygit2` package (#39316)
- PR #39429: (*rallytime*) Back-port #39364 to 2016.11 @ 2017-02-15T21:27:21Z
  - ISSUE #39360: (*bbinet*) `file.symlink` should not try to set ownership to `root:root` | refs: #39364
  - PR #39364: (*gtmanfred*) set default user variable to the user `cmd` runs as | refs: #39429
  - 54a572e Merge pull request #39429 from rallytime/bp-39364
  - 157f4dc set default user variable to the user `cmd` runs as
- PR #39424: (*twangboy*) Fix problem with too many connection attempts in Windows @ 2017-02-15T18:51:35Z
  - 881ebf2 Merge pull request #39424 from twangboy/win\_fix\_dos
  - d3f7dd7 Add `sleep` to `eval_master`
- PR #39419: (*The-Loeki*) Backport Salt-SSH IPv6 fixes to 2016.11 @ 2017-02-15T17:33:13Z
  - ISSUE #30561: (*jfindlay*) salt-ssh fails with IPv6 address | refs: #39419 #38831
  - ISSUE #22984: (*tomasfejfar*) salt-ssh problem possibly related to ipv6 | refs: #39419 #38831
  - PR #38877: (*The-Loeki*) Salt-SSH client: Don't overwrite `self.host` w/IPv6 brackets | refs: #39419 #39419
  - PR #38831: (*The-Loeki*) Salt-SSH deal with raw IPv6 addresses | refs: #39419 #39419 #38877
  - 4787235 Merge pull request #39419 from The-Loeki/bp-ssh-ipv6
  - 4fc5626 Don't overwrite `self.host` w/IPv6 brackets

- dd12234 Salt-SSH deal with raw IPv6 addresses
- PR #39379: (*terminalmage*) win\_pkg: remove all installed versions when no explicit version passed @ 2017-02-14T18:41:28Z
  - 878946d Merge pull request #39379 from terminalmage/issue34821
  - fd9ab8e Remove extra newline
  - 5871825 win\_pkg: remove all installed versions when no explicit version passed
- PR #39392: (*anlutro*) Make sure OrderedDict order is preserved in nested output @ 2017-02-14T17:50:15Z
  - caffef8 Merge pull request #39392 from alprs/fix-nested\_output\_ordered\_dict
  - 625a770 make sure OrderedDict order is preserved in output
- PR #39378: (*dmurphy18*) Update make\_repo in debbuild.py execution module to utilize timeout @ 2017-02-14T17:10:15Z
  - f2459e3 Merge pull request #39378 from dmurphy18/deb\_pkg\_fix
  - 4bd47cc Updated all make\_repo loops to use timeout value for retries
- PR #39369: (*rallytime*) Back-port #37338 to 2016.11 @ 2017-02-13T21:41:19Z
  - ISSUE #39358: (*Kimamisa*) Backport the RDS fix in Carbon | refs: #39369
  - PR #37338: (*bailsman*) Fix wait\_status in boto\_rds.create() | refs: #39369
  - 99554d9 Merge pull request #39369 from rallytime/bp-37338
  - 2e7f6e8 Fix wait\_status in boto\_rds.create()
- PR #39303: (*kstreee*) Removes a redundant test case after removed `batch` in `netapi`. @ 2017-02-13T19:55:46Z
  - 03ab8b1 Merge pull request #39303 from kstreee/fix-testcase-rm-batch-in-netapi
  - 51972d0 Removes a redundant test case after removed `batch` in `netapi`.
- PR #39315: (*Ch3LL*) improve salt-run salt.cmd test @ 2017-02-13T19:00:14Z
  - 60640f7 Merge pull request #39315 from Ch3LL/fix\_run\_salt\_test
  - b3cbc5a improve salt-run salt.cmd test
- PR #39311: (*morganwillcock*) win\_system: return False from a skipped reboot @ 2017-02-13T18:59:11Z
  - ISSUE #39243: (*morganwillcock*) win\_system.reboot: can return True without rebooting | refs: #39311
  - 2ca63a9 Merge pull request #39311 from morganwillcock/skip-reboot
  - 0f3abb6 Clarify success for shutdown function
  - dcb4d05 win\_system: return False from a skipped reboot
- PR #39346: (*joe-niland*) Ignore non-HTTP IIS bindings @ 2017-02-13T18:18:36Z
  - 082105f Merge pull request #39346 from joe-niland/handle-iis-bindings
  - 8d5afdb win\_iis module: list\_sites - when retrieving bindings, ignore bindings whose protocols do not have host headers
- PR #39361: (*gtmanfred*) make sure both variables are strings. @ 2017-02-13T17:20:17Z
  - ISSUE #39321: (*mgresser*) Grain matching failing where grain value is an INT | refs: #39361
  - a3a9a8e Merge pull request #39361 from gtmanfred/2016.11
  - ee2275a make sure both variables are strings.

- 2021f5b Add creation/configuration of Salt PKI dirs to hacking docs (#39341)
  - PR #39341: (*eliasp*) Add creation/configuration of Salt PKI dirs to hacking docs
- PR #39317: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-02-10T23:07:32Z
  - ISSUE #39220: (*lvg01*) state file.line skips leading spaces in content with mode:ensure and indent:False | refs: #39221 #39221 #39221 #39221
  - ISSUE #38595: (*yue9944882*) Redis ext job cache occurred error | refs: #38610 #38610
  - ISSUE #36913: (*terminalmage*) Support custom refsspecs in GitFS | refs: #39210
  - PR #39313: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
  - PR #39299: (*rallytime*) Back-port #38610 to 2016.3
  - PR #39297: (*cro*) Add doc to recommend pgjsonb for master job caches
  - PR #39296: (*sergeizv*) Whitespace fix in docs Makefile
  - PR #39295: (*sergeizv*) Fix typo
  - PR #39294: (*sergeizv*) Fix link in proxyminion guide
  - PR #39293: (*sergeizv*) Grammar fix
  - PR #39286: (*terminalmage*) Allow minion/CLI saltenv/pillarenv to override master when compiling pillar
  - PR #39280: (*terminalmage*) Add warning for Dulwich removal
  - PR #39221: (*lvg01*) Fix bug 39220
  - PR #39210: (*terminalmage*) salt.utils.gitfs: remove dulwich support, make refsspecs configurable | refs: #39280
  - PR #38610: (*yue9944882*) Fix #38595 - Unexpected error log from redis retuner in master's log | refs: #39299
  - ce1f01f Merge pull request #39317 from rallytime/merge-2016.11
  - c1df446 Merge branch `2016.3' into `2016.11'
  - 9de559f Merge pull request #39313 from rallytime/merge-2016.3
    - \* 0b8dddf Merge branch `2015.8' into `2016.3'
    - \* fc551bc Merge pull request #39293 from sergeizv/grammar-fix
      - 70f2b58 Rewrap paragraph
      - e6ab517 Grammar fix
    - \* 8a1b456 Merge pull request #39295 from sergeizv/typo-fix
      - 5d9f36d Fix typo
    - \* cfaafec Merge pull request #39296 from sergeizv/whitespace-fix
      - 1d4c1dc Whitespace fix in docs Makefile
    - \* 0b4dcf4 Merge pull request #39294 from sergeizv/fix-link
      - 04bde6e Fix link in proxyminion guide
  - dd3ca0e Fix #38595 - Unexpected error log from redis retuner in master's log (#39299)
  - f16027d Merge pull request #39297 from cro/pg\_returner\_docs
    - \* 28bac64 Typo

- \* 19fedcd Add doc to recommend pgjsonb for master job caches
- 77e50ed Merge pull request #39286 from terminalmage/fix-pillarenv-precedence
  - \* 3cb9833 Allow minion/CLI saltenv/pillarenv to override master when compiling pillar
- 5244041 Merge pull request #39221 from lvg01/fix-bug-39220
  - \* e8a41d6 Removes to early content stripping (stripping is already done when needed with ident:true), fixes #39220
  - \* a4b169e Fixed wrong logic, fixes #39220
- 5a27207 Add warning for Dulwich removal (#39280)
- PR #38464: (ezh) [38451] Fix file.replace 2016.11 @ 2017-02-09T23:07:49Z
  - ISSUE #38451: (ezh) 2016.11 file.replace has multiple errors under python 3 | refs: #38464
  - ISSUE #2016: (seanchannel) status.custom failing on any arguments
  - c3c621a Merge pull request #38464 from doublescoring/fix-2016.11-38451
  - 81f0337 [38451] Fix few bugs after review
  - 1bdab25 [38451] Fix pylint W1699(incompatible-py3-code)
  - 3bfc654 [38451] Fix file.replace to make it suitable to python 3
- PR #39291: (terminalmage) Add note about using saltenv jinja var in pillar top files @ 2017-02-09T21:43:50Z
  - 6365211 Merge pull request #39291 from terminalmage/pillar-docs
  - fbd551e Add note about using saltenv jinja var in pillar top files
- PR #39281: (twangboy) Require VCRedist on 2008R2 and below instead of 2008 @ 2017-02-09T17:59:57Z
  - a496ec2 Merge pull request #39281 from twangboy/win\_installer
  - ef50787 Capitalize the `r` for 2008R2
  - 1b6bd63 Require VCRedist on 2008R2 and below instead of 2008
- PR #39264: (rallytime) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-02-09T17:10:14Z
  - ISSUE #38856: (fhaynes) salt-cloud throws an exception when ec2 does not return encoding | refs: #39228
  - ISSUE #38697: (fboismenu) On Windows, ip.get\_all\_interfaces returns at most 2 DNS/WINS Servers | refs: #38793

  - 7118eff Avoid KeyError: `multiprocessing'
- PR #39083: (*lomeroc*) Backport #36336 to 2016.11 @ 2017-02-06T18:50:52Z
  - ISSUE #38782: (*lomeroc*) win\_lgpo unable to find some Administrative Template policies | refs: #39083 #39090 #38783
  - ISSUE #38761: (*DaveOHenry*) Cannot apply state that contains lgpo.set | refs: #39083 #39088
  - ISSUE #38689: (*lomeroc*) win\_lgpo state fails to set single policy due to case sensitive check | refs: #39083 #39084 #38690
  - ISSUE #38100: (*skjaro*) Problem with win\_lgpo.py in salt 2016.11.0 | refs: #38779 #39083 #39089
  - ISSUE #21485: (*lorenogordon*) Feature Request: Manage Windows Local Security Policy Settings | refs: #36336
  - PR #36336: (*lomeroc*) add additional static policies to computer configuration policy class | refs: #39083
  - 91c25bd Merge pull request #39083 from lomeroc/bp-36336
  - 03e5319 Merge branch `2016.11' into bp-36336
  - 981ec89 update command line example to correct policy name
  - e2574da Fix/Add documentation, 80 char line lengths
  - 5e94a30 add additional static policies to computer configuration policy class duplicate code cleanup/misc code efficiencies
- PR #39153: (*nicholasmhughes*) Fix selinux.mode state config file handling @ 2017-02-06T18:37:34Z
  - 3045507 Merge pull request #39153 from nicholasmhughes/fix-selinux.mode-config-predictability
  - 8d8ba9c added the new getconfig function to the test
  - a6a24e1 Addressed edge case when attempting to set the config file to `Disabled'. The state should only check the file, since the in-memory setting won't disappear until after reboot.
  - 6858658 The selinux.mode state only checked the current status of SELinux in memory (getenforce) when determining if changes needed to be made. The /etc/selinux/config file could have a different value, and it would not be changed. This commit enhances idempotency of the state in regards to both the in-memory and configuration file enforcement of SELinux.
- PR #39159: (*clinta*) Csr crl passphrase @ 2017-02-06T18:36:05Z
  - ISSUE #38081: (*haraldrudell*) x509 state or module cannot generate password protected private keys | refs: #39159

- 7b5eb17 Merge pull request #39159 from clinta/csr-crl-passphrase
- cf548ac Remove unnecessary pass
- 4ebf7a3 Remove unnecessary pass statement
- 6a80469 fix csr bugs and pep8
- 36dcf5f only overwrite if overwrite option is specified
- 403000d recreate cert on bad password
- 6497094 passphrase for crl
- 3ef809f passphrase for csr
- **PR #39162:** (*meaksh*) Adding more function to Snapper module @ 2017-02-06T18:33:53Z
  - b240468 Merge pull request #39162 from meaksh/snapper-module-improvements
  - f950732 pylint fixes
  - aa2f990 Removing extra spaces
  - 9d6a33f Adds `snapper.create\_config` unit tests
  - d38ed50 Adds `snapper.modify\_snapshots` unit tests
  - d5496cc Adds `snapper.delete\_snapshots` unit tests
  - 3eeeb60 Snapper: Adding support for creating configurations
  - 041e54d Snapper: Adding support for snapshot metadata modification
  - eaf5de9 Snapper: Adding support for deleting snapshots
- **PR #39171:** (*techhat*) Raise an error for a disk size that is too small @ 2017-02-06T18:19:46Z
  - **ISSUE #38370:** (*tjyang*) Salt-Cloud: There was a query error: Required field ``deviceChange" not provided (not @optional) | refs: #39171
  - 6f9251e Merge pull request #39171 from techhat/issue38370
  - ec57a39 Typo
  - 2ed2932 Clean up debug logs
  - 6712826 Raise an error for a disk size that is too small
- **PR #39179:** (*mcalmer*) fix error parsing @ 2017-02-06T17:57:00Z
  - 036f36d Merge pull request #39179 from mcalmer/fix-dockerng-error-parsing
  - 6750ccd fix error parsing
- **PR #39189:** (*morganwillcock*) Fix NetBSD sockstat parsing @ 2017-02-06T17:28:08Z
  - 30f8315 Merge pull request #39189 from morganwillcock/sockstat
  - 344d13e Fix NetBSD sockstat example
  - 64b6931 Fix NetBSD sockstat parsing
- **PR #39141:** (*UtahDave*) Don't overwrite the minion\_ids var that was passed @ 2017-02-03T20:56:25Z
  - **ISSUE #38003:** (*morganwillcock*) salt.runners.cache functions seem to ignore minion targeting parameter | refs: #39141 #39141
  - 6a97041 Merge pull request #39141 from UtahDave/fix\_cache\_lookup\_ZD1187
  - 0340614 return all minions' grains if no tgt

- f833bf3 Don't overwrite the minion\_ids var that was passed
- PR #39164: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-02-03T17:57:07Z
  - ISSUE #39118: (*bobrik*) Minion ipv6 option is not documented
  - ISSUE #38704: (*nasenbaer13*) Archive extracted fails when another state run is queued | refs: #38705
  - ISSUE #2016: (*seanchannel*) status.custom failing on any arguments
  - ISSUE #3: (*thatch45*) libvirt module
  - ISSUE #1: (*thatch45*) Enable regex on the salt cli
  - PR #39146: (*gtmanfred*) update vmware getting started doc
  - PR #39145: (*garethgreenaway*) [2016.3] Fix when targeting via pillar with Salt syndic
  - PR #39131: (*bobrik*) Clarify ipv6 option for minion and interface for master, closes #39118
  - PR #39116: (*terminalmage*) Don't abort pillar.get with merge=True if default is None
  - PR #39077: (*terminalmage*) Apply fix from #38705 to 2016.3 branch
  - PR #38804: (*alexbleotu*) Second attempt to fix prepending of root\_dir to paths
  - PR #38705: (*nasenbaer13*) Fix for #38704 archive extracted and dockerio states | refs: #39076
  - d19cee7 Merge pull request #39164 from rallytime/merge-2016.11
  - 6504bb6 Merge branch '2016.3' into '2016.11'
    - \* 9de08af Apply fix from #38705 to 2016.3 branch (#39077)
    - \* da3053e update vmware getting started doc (#39146)
    - \* e78ca0f Fixing a weird edge case when using salt syndics and targeting via pillar. Without this fix the master of masters ends up in an infinite loop since the data returned from the minions is differently structured than if a sync was not in use. (#39145)
    - \* cd8077a Merge pull request #38804 from alexbleotu/root\_dir\_fix-2016\_3-gh
      - b3bdd3b Add missing whiteline
      - c7715ac Merge pull request #3 from cro/ab\_rootdirfix
      - e8cbafa When running testsuite, salt.sypaths.ROOT\_DIR is often empty.
      - b12dd44 Merge pull request #1 from cro/ab\_rootdirfix
      - bffc537 Remove extra if statements (rstrip will check for the presence anyway).
      - 97521b3 Second attempt to fix prepending of root\_dir to paths
    - \* 6ffeda3 Clarify ipv6 option for minion and interface for master, closes #39118 (#39131)
    - \* 646b9ea Don't abort pillar.get with merge=True if default is None (#39116)
- PR #39152: (*twangboy*) Remove files not needed by salt-minion @ 2017-02-03T17:11:11Z
  - ed12512 Merge pull request #39152 from twangboy/win\_installer
  - 5ff8a14 Fix problem deleting files
  - 4524dd4 Remove files not needed by salt-minion
- 8c0dc91 correct issue when running get with return\_not\_configured=True (#39085)
  - ISSUE #38691: (*lomeroy*) win\_lgpo module throws a key error when run with return\_not\_configured=True | refs: #39085

- PR #39085: (*lomerioe*) Backport #38666 to 2016.11
- 26eea61 have `_in_range_inclusive` function attempt to convert a string to an int for the test (allow string based numbers to be verified to be in range). Specifically, this allows the `CachedLogonsCount` policy to be set (stored in the registry as a `REG_SZ` and specified as a string number when passed to the module) (#39086)
  - PR #39086: (*lomerioe*) Backport #38165 to 2016.11
  - PR #38165: (*lomerioe*) have `_in_range_inclusive` function attempt to convert a string to an i... | refs: #39086
- PR #38970: (*gtmanfred*) when using `local_cache` we have to pass the list of minions @ 2017-02-02T19:24:39Z
  - ISSUE #38241: (*frogunder*) `mine.get` and `salt-ssh` gives error message | refs: #38970
  - 4eec641 Merge pull request #38970 from *gtmanfred*/2016.11
  - ebb9df3 when using `local_cache` we have to pass the list of minions
- 75da6f4 Fix `archive.list` on Windows (#39128)
  - ISSUE #39110: (*morganwillcock*) `archive.extracted`: 2016.11.2 returns state failure for some zip formats, if already extracted | refs: #39128
  - PR #39128: (*terminalmage*) Fix `archive.list` on Windows
- f2c309a Back-port #36714 to 2016.11 (#39133)
  - ISSUE #36712: (*dmitrievav*) `s3.put` function does not create s3 bucket | refs: #36714
  - PR #39133: (*rallytime*) Back-port #36714 to 2016.11
  - PR #36714: (*dmitrievav*) `s3.put` can't create s3 bucket | refs: #39133
- 8b34fcd correct checking of `policy_class` to compare with `lower()` version of the specified string (#39084)
  - ISSUE #38689: (*lomerioe*) `win_lgpo` state fails to set single policy due to case sensitive check | refs: #39083 #39084 #38690
  - PR #39084: (*lomerioe*) Backport #38690 to 2016.11
  - PR #38690: (*lomerioe*) correct checking of `policy_class` to compare with `lower()` version of t... | refs: #39084
- 8ce928f Backport #38779 to 2016.11 (#39089)
  - ISSUE #38100: (*skjaro*) Problem with `win_lgpo.py` in salt 2016.11.0 | refs: #38779 #39083 #39089
  - PR #39089: (*lomerioe*) Backport #38779 to 2016.11
  - PR #38779: (*lomerioe*) `win_lgpo` handle errors when ``encoding="unicode" exists in ADMX file` | refs: #39089
- 8a00ecf update `adml` text search to use ``starts-with'` as some policies text has trailing spaces (#39090)
  - ISSUE #38782: (*lomerioe*) `win_lgpo` unable to find some Administrative Template policies | refs: #39083 #39090 #38783
  - PR #39090: (*lomerioe*) Backport #38783 to 2016.11
  - PR #38783: (*lomerioe*) Perform a ``starts-with"` search to match ADML text names | refs: #39090
- 9dcc9f correctly handle scenario when ``storeAsText"` is True on a `decimal/longDecimal` element object (#39088)
  - ISSUE #38761: (*DaveOHenry*) Cannot apply state that contains `lgpo.set` | refs: #39083 #39088
  - PR #39088: (*lomerioe*) Backport #37262 to 2016.11
  - PR #37262: (*lomerioe*) correct issues in `win_lgpo` module | refs: #39088

- **PR #39122:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-02-01T21:41:59Z
  - **PR #39091:** (*terminalmage*) Run test\_valid\_docs in batches
  - **PR #39081:** (*terminalmage*) Move fileclient tests to tests/integration/fileserver/fileclient\_test.py
  - **PR #39067:** (*rallytime*) Bump openstack deprecation notice to Oxygen
  - 50d72da Merge pull request #39122 from rallytime/merge-2016.11
  - a782b00 Merge branch `2016.3' into `2016.11'
  - cc9b69b Merge pull request #39091 from terminalmage/update-test-valid-docs
    - \* d76f038 add debug logging for batch vars
    - \* b4afea2 Don't fail test if data is empty
    - \* b3a5d54 Account for trimmed value in `salt -d' output
    - \* 909916c Run test\_valid\_docs in batches

  - 5fe6db6 Merge pull request #38850 from techhat/stripcache
  - 109cb62 Remove .p from test
  - 534aa3f Strip .p from cache file names

## 20.2.5 Salt 2016.11.4 Release Notes

Version 2016.11.4 is a bugfix release for 2016.11.0.

## AIX Fixes

Added module execution support for user and group Added module execution support for timezone Added module execution support for network and status Added module execution support for beacon.status Added module execution support for disk.iostat

## Minion Data Cache Fixes

Added Memcache booster for the minion data cache. Memcache is an additional cache layer that keeps a limited amount of data fetched from the minion data cache for a limited period of time in memory that makes cache operations faster. It doesn't make much sense for the `localfs` cache driver but helps for more complex drivers like `consul`. For more details see `memcache_expire_seconds` and other `memcache_*` options in the master config reverence.

## Salt-Cloud Fixes

2016.11.0 added support for templating userdata files for the `ec2` driver, using the `renderer` option from the master config file. However, as the default renderer first evaluates jinja templating, followed by loading the data as a YAML dictionary, this results in unpredictable results when userdata files are comprised of non-YAML data (which they generally are).

2016.11.4 fixes this by only templating the `userdata_file` when it is explicitly configured to do so. This is done by adding a new optional parameter to the cloud profile called `userdata_template`. This option is used in the same way as the `template` argument in `file.managed` states, it is simply set to the desired templating renderer:

```
my-ec2-config:
  # Pass userdata to the instance to be created
  userdata_file: /etc/salt/my-userdata-file
  userdata_template: jinja
```

If no `userdata_template` option is set in the cloud profile, then salt-cloud will check for the presence of the master configuration parameter `userdata_renderer`. If this is also not set, then no templating will be performed on the `userdata_file`.

In addition, the other cloud drivers which support setting a `userdata_file` (`azurearm`, `nova`, and `openstack`) have had templating support added to bring them to feature parity with the `ec2` driver's implementation of the `userdata_file` option.

## Changes for v2016.11.3..v2016.11.4

Changes:

- **PR #40685:** (*Ch3LL*) Fix errno code for filecache test for other operating systems. @ 2017-04-14T16:54:25Z
  - 77028a6 Merge pull request #40685 from Ch3LL/fix\_mac\_file

- 9ea6e8b remove io and change to EROFS
- 688791f remove try-except and change errno
- e30afc4 add exception type
- acf333d change errno code for fileclient test
- **PR #40689:** (*jbadson*) Fixes bug that prevents syslog returner from working under Python 2.6 @ 2017-04-14T10:45:13Z
  - **ISSUE #40688:** (*jbadson*) Syslog returner does not work with Python 2.6 | refs: #40689 #40689
  - bc70772 Merge pull request #40689 from jbadson/fix-syslog-returner
  - e5a3a7d Fixes bug that prevents syslog returner from working under Python 2.6
- **PR #40690:** (*thor*) Fixes #40658: even clearer and working(!) Tomcat version handling @ 2017-04-14T10:44:02Z
  - **ISSUE #40658:** (*sebw*) State tomcat.war\_deployed regression when WAR filename contains version | refs: #40690
  - 983d35a Merge pull request #40690 from thor/2016.11-tomcat
  - 09145ea Fixes unindexed strfmt curly braces for python 2.6
  - b78fc46 Fixes #40658: clearer version handling
- **PR #40686:** (*twangboy*) Fix `salt-minion` service for Win 10 Creators Update 1703 @ 2017-04-13T20:00:12Z
  - 3cd9a50 Merge pull request #40686 from twangboy/fix\_service
  - b6ac4aa Fix service for win10 update
- **PR #40675:** (*gtmanfred*) use loader for getting war version @ 2017-04-13T19:58:30Z
  - ad4d683 Merge pull request #40675 from gtmanfred/2016.11
  - a61fc82 use loader for war extraction
- **PR #40680:** (*rallytime*) Back-port #40598 to 2016.11 @ 2017-04-13T19:58:16Z
  - **ISSUE #38497:** (*chrisLeeTW*) local\_batch client ignore external auth | refs: #40598
  - **PR #40598:** (*mchugh19*) Ensure batch uses passed eauth token or credentials | refs: #40680
  - 7ea526f Merge pull request #40680 from rallytime/bp-40598
  - cc1643e Fix netapi lint
  - e790930 re-add batch support to cherrypy saltapi
  - 6eec04b pop out of kwargs
  - 260dd84 Create eauth dict for passing into batch class
  - 5fb8190 Ensure batch uses passed eauth token or credentials
- **PR #40681:** (*cachedout*) Allow status beacon to run on all operating systems @ 2017-04-13T19:33:10Z
  - db68df2 Merge pull request #40681 from cachedout/status\_beacon
  - ecbb0d1 Allow status beacon to run on all operating systems
- **PR #40678:** (*Ch3LL*) fix test\_fstype test for mac @ 2017-04-13T19:20:32Z
  - 39dd6e2 Merge pull request #40678 from Ch3LL/fix\_mac\_fstype
  - 6072498 fix test\_fstype test for mac
- **PR #40665:** (*rallytime*) Back-port #35665 to 2016.11 @ 2017-04-12T21:06:36Z

- PR #35665: (*sthrasher*) Speed up /jobs for salt-api when run under cherrypy. | refs: #40665
- 6df76f6 Merge pull request #40665 from rallytime/bp-35665
- 0f897b2 Switch from comprehension to logic used in jobs runner. This makes it easier to deal with potential unicode in returns.
- 78dd629 Fix compat issues with /jobs return values.
- 4778bc7 Speed up /jobs for salt-api when run under cherrypy.
- PR #40666: (*gtmanfred*) make sure userdata is always defined in ec2 @ 2017-04-12T21:06:00Z
  - 3e41a24 Merge pull request #40666 from gtmanfred/userdata
  - 5e92fd0 make sure userdata is always defined in ec2
- PR #40662: (*twangboy*) Backport msi-conformant-version function @ 2017-04-12T18:49:23Z
  - b245abb Merge pull request #40662 from twangboy/backport\_msi\_versioning
  - 8258328 Backport msi-conformant-version function
- PR #40551: (*terminalmage*) Fix four issues in archive.extracted state @ 2017-04-12T18:37:52Z
  - ISSUE #39868: (*amontalban*) archive.extracted issue when source\_hash\_update=True and extracted files does not exist | refs: #40551 #40551
  - 92b5f03 Merge pull request #40551 from terminalmage/issue39868
  - a722ca9 archive.extracted: also cleanup fileclient's cached location
  - 5ea1f60 Fix mocking in unit tests
  - 8dfa51f Moar fixes for source\_hash\_update
  - 7103707 Remove unnecessary versionadded lines
  - a717881 Just get a hash for the source archive
  - 9da4eb1 Check hash of cached source against source\_hash before downloading archive
  - ad24faa Fix three issues in archive.extracted state
- PR #40637: (*twangboy*) Add unicode\_literals import @ 2017-04-12T16:55:03Z
  - 0638418 Merge pull request #40637 from twangboy/fix\_unicode\_issues
  - 021783d Add unicode\_literals import
- PR #40651: (*twangboy*) Fix status.diskusage for Windows on Py3 @ 2017-04-12T16:21:29Z
  - 491661f Merge pull request #40651 from twangboy/fix\_diskusage\_py3
  - 7c5079e Correct capitalization problem with api call
- PR #40631: (*gtmanfred*) if grain is defined as None still convert in append @ 2017-04-12T16:19:16Z
  - ISSUE #40624: (*sumeetisp*) Issue - grains.append | refs: #40631
  - 3aabd85 Merge pull request #40631 from gtmanfred/grains
  - b0bd99c add comment and unit test
  - b21bc75 if grain is defined as None still convert in append
- PR #40629: (*aabognah*) Fixing issue # 40167 @ 2017-04-11T22:45:08Z
  - ISSUE #40167: (*alias454*) file.replace diff results output showing additional characters | refs: #40629
  - 3737289 Merge pull request #40629 from aabognah/fix-bug-40167

- 28f7744 Fixing issue # 40167 with file.replace where the diff output does not display correctly.
- PR #40646: (*twangboy*) Keep network.py execution module @ 2017-04-11T22:03:02Z
  - 2a22bea Merge pull request #40646 from twangboy/fix\_win\_network
  - 0f7a81c Keep network.py execution module
- PR #40645: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-04-11T20:59:13Z
  - ISSUE #39778: (*Talkless*) pkgrepo.managed state always report changes with test=True on APT system | refs: #40571
  - PR #40638: (*rallytime*) Back-port #40571 to 2016.3
  - PR #40571: (*terminalmage*) pkgrepo.managed: properly handle comments for debian | refs: #40638
  - e1f5a5d Merge pull request #40645 from rallytime/merge-2016.11
  - 8de6497 Merge branch `2016.3' into `2016.11'
    - \* 2ae9eaa Merge pull request #40638 from rallytime/bp-40571
      - 2d1c4be pkgrepo.managed: properly handle comments for debian
- PR #40642: (*DmitryKuzmenko*) Correctly resolve relative cache path to absolute. @ 2017-04-11T20:43:57Z
  - ISSUE #40594: (*anlutro*) salt-ssh file.recurse adds a lot of unwanted directories | refs: #40642 #40642
  - ISSUE #38458: (*duk3luk3*) salt-ssh uses sudo to create cache dir, later fails to access it | refs: #40442
  - PR #40442: (*gtmanfred*) allow file\_client to figure out cachedir | refs: #40642 #40642
  - 6c4ae3c Merge pull request #40642 from DSRCorporation/bugs/40594\_ssh\_cachedir
  - 055256c Correctly resolve relative cache path to absolute.
- PR #40609: (*gtmanfred*) stat\_file when keep is set, instead of mirroring all file permissions @ 2017-04-11T18:48:47Z
  - ISSUE #40075: (*afletch*) salt-ssh temporary files - insecure permissions | refs: #40609
  - 8492cef Merge pull request #40609 from gtmanfred/2016.11
  - 6e34c2b stat file when placing it on server instead of caching
- PR #40620: (*mateiw*) SUSE specific changes to salt-api.service @ 2017-04-11T14:45:00Z
  - 05ac613 Merge pull request #40620 from mateiw/2016.11-suse-saltapi-service
  - ee911a7 suse specific changes to salt-api.service
- PR #40614: (*gtmanfred*) add retries on authentications of the salt minion reconnecting @ 2017-04-10T22:42:16Z
  - ISSUE #39463: (*githubcdr*) Transport TCP minions don't reconnect/recover | refs: #40614
  - b0a2414 Merge pull request #40614 from gtmanfred/tcp
  - a86b101 add retries on authentications of the salt minion reconnecting
- PR #40606: (*kaszuba*) Use correct exec\_driver in dockerng.sls module @ 2017-04-10T22:25:31Z
  - f7e121a Merge pull request #40606 from kaszuba/fix-dockerng-sls
  - 3a0d61f Use correct exec\_driver in dockerng.sls module
- PR #40615: (*rallytime*) Call out to \_pki\_minions() once, rather than in a loop in \_check\_list\_minions() @ 2017-04-10T22:22:18Z

- ISSUE #39863: (*daswathn*) Salt-Master not responding when the list of minions are high after upgrade to 2016.11.2 | refs: #40615
- PR #34920: (*cachedout*) Key cache | refs: #40615
- b6cf948 Merge pull request #40615 from rallytime/fix-39863
- 1a9f03a Call out to `_pki_minions()` once, rather than in a loop in `_check_list_minions()`
- PR #40588: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-04-07T19:30:14Z
  - PR #40567: (*terminalmage*) Allow `pillar.get` to merge list as well as dictionaries
  - PR #40562: (*terminalmage*) Fix `dockerng _get_client()` regression | refs: #40563 #40563
  - PR #40552: (*terminalmage*) Don't use `__opts__.get()` for `hash_type`
  - PR #40548: (*Ch3LL*) Fix `vultrpy`
  - PR #40481: (*terminalmage*) Backport auth and custom registry fixes from #40480 to 2016.3 branch | refs: #40562 #40563
  - 4fa58be Merge pull request #40588 from rallytime/merge-2016.11
  - 5a419b8 Merge branch `2016.3' into `2016.11'
  - 83f6d3d Merge pull request #40567 from terminalmage/fix-pillar-get-merge-lists
    - \* cb4db56 Allow `pillar.get` to merge list as well as dictionaries
  - a8304cd Merge pull request #40552 from terminalmage/fix-hash-type-refs
    - \* 8c61f33 Don't use `__opts__.get()` for `hash_type`
  - 705e1d8 Merge pull request #40562 from terminalmage/fix-get-client
    - \* 7f1ef72 Fix `dockerng _get_client()` regression
  - 00f8ef0 Merge pull request #40548 from Ch3LL/fix\_vultrpy
    - \* 7710355 check for salt install fail on vultur test
    - \* aae3d14 fix vultr cloud race condition to match on 0\*
- PR #40575: (*rallytime*) Back-port #40559 to 2016.11 @ 2017-04-07T15:42:26Z
  - PR #40559: (*jinm*) Fix v3 for <https://github.com/saltstack/salt/issues/38472> | refs: #40575
  - 3d07f63 Merge pull request #40575 from rallytime/bp-40559
  - 8280e52 Fix v3 for <https://github.com/saltstack/salt/issues/38472>
- PR #40576: (*rallytime*) Back-port #40573 to 2016.11 @ 2017-04-07T15:20:11Z
  - PR #40573: (*ardakuyumcu*) Fix typo in IAM state for managed policies | refs: #40576
  - 9041ca2 Merge pull request #40576 from rallytime/bp-40573
  - 1218080 Fix typo in IAM state for managed policies
- PR #40563: (*terminalmage*) Merge-forward 2016.3 -> 2016.11 @ 2017-04-07T15:08:20Z
  - ISSUE #40279: (*pstengel*) Salt fails to enable/disable services using `systemd` | refs: #40306
  - ISSUE #39892: (*The-Loeki*) Salt-SSH reflects certain minion's `opts` as master `opts` for rendering | refs: #40534
  - ISSUE #31363: (*eykd*) `git.latest` with `force_clone` fails when it can't create a target directory that already exists

- PR #40562: (*terminalmage*) Fix dockerng \_get\_client() regression | refs: #40563 #40563
- PR #40534: (*terminalmage*) Check master's ssh\_minion\_opts for fileserver/pillar values and ignore them
- PR #40505: (*gtmanfred*) update docs for logging handlers
- PR #40481: (*terminalmage*) Backport auth and custom registry fixes from #40480 to 2016.3 branch | refs: #40562 #40563
- PR #40480: (*terminalmage*) Improved Docker auth handling and other misc. Docker improvements
- PR #40306: (*terminalmage*) Don't use context caching for gathering systemd services
- f8bc423 Merge pull request #40563 from terminalmage/merge-2016.3-2016.11
- 0c608d7 Add client\_args\_mock back to test
- a7a78da remove unused imports
- a6d68f5 Merge remote-tracking branch `upstream/2016.3' into merge-2016.3-2016.11
  - \* 0918311 Don't mark files that already were deleted as errors
  - \* 51d88a1 Merge branch `zer0def-fix-31363` into 2016.3
    - 7f3cbd5 Merge branch `fix-31363` of <https://github.com/zer0def/salt> into zer0def-fix-31363
    - 3c750c2 Changed rm\_rf's argument to actually remove intended file. (refs #31363)
    - 9ed85f3 Remove directory content instead of directory itself when using *force\_clone* in *git.latest* state. (refs #31363)
  - \* cfba4cb Merge pull request #40534 from terminalmage/issue39892
    - ad88c58 Check master's ssh\_minion\_opts for fileserver/pillar values and ignore them
  - \* 8da27c9 Merge pull request #40306 from terminalmage/issue40279
    - 57ace1f Merge branch `issue40279` of <https://github.com/terminalmage/salt> into issue40279
    - 8bcd1a Remove unused import for lint
    - 808ad76 systemd.py: when getting all services, don't repeat gathering of systemd services
    - 2d219af Don't use context caching for gathering systemd services
  - \* 97caac4 Merge pull request #40481 from terminalmage/docker-auth-handling-2016.3
    - dcef1e0 Make sure we keep the cached client when clearing context
    - 1e2a04c Backport auth and custom registry fixes from #40480 to 2016.3 branch
  - \* e62603d Merge pull request #40505 from gtmanfred/2016.3
    - 6e2f908 update docs for logging handlers
- PR #40571: (*terminalmage*) pkgrepo.managed: properly handle comments for debian | refs: #40638 @ 2017-04-06T21:55:46Z
  - ISSUE #39778: (*Talkless*) pkgrepo.managed state always report changes with test=True on APT system | refs: #40571
  - fd757ff Merge pull request #40571 from terminalmage/issue39778
  - 1916104 pkgrepo.managed: properly handle comments for debian
- PR #40572: (*rallytime*) Clean out kwargs dict in cloud.action before calling cloud driver function @ 2017-04-06T21:53:40Z
  - ISSUE #40278: (*UtahDave*) cloud.action giving errors on 2016.11.1 | refs: #40572

- b1698e8 Merge pull request #40572 from rallytime/fix-40278
- c978486 Clean out kwargs dict in cloud.action before calling cloud driver function
- PR #39882: (*smarsching*) Fix handling of trailing newlines on Windows @ 2017-04-06T21:12:24Z
  - ISSUE #39842: (*smarsching*) File module removes trailing newline on Windows | refs: #39882
  - 62d8ad2 Merge pull request #39882 from smarsching/issue-39842
  - d485d1a Fix context for `_splitlines_preserving_trailing_newline`.
  - 76cb7bf Fix trailing newlines on Windows (#39842).
- PR #40451: (*isbm*) Fileclient testcase (2016.11) @ 2017-04-06T19:53:31Z
  - ae13de6 Merge pull request #40451 from isbm/isbm-fileclient-testcase-2016.11
  - 74c6555 Add space before in-lint comment for lint
  - 35fcb8b Fix race condition on cache directory creation
  - aba9449 Lintfix (Py3 code compat)
  - 9f9dc6e Add unit test case for fileclient
- PR #40564: (*techhat*) Update Azure ARM docs @ 2017-04-06T18:17:32Z
  - ISSUE #40084: (*podstava*) profile fields in azurearm salt-cloud need to be actualized to sources | refs: #40564
  - 74366c5 Merge pull request #40564 from techhat/azuredocs
  - 08d071b Update Azure ARM docs
- PR #40543: (*rallytime*) Add the `fingerprint_hash_type` option to ssh state and module @ 2017-04-05T21:21:16Z
  - ISSUE #40005: (*vutny*) `ssh_known_hosts.present` does not support SHA256 key fingerprints | refs: #40543
  - cb9dcb1 Merge pull request #40543 from rallytime/fix-40005
  - 1ef81e6 Add the `fingerprint_hash_type` option to ssh state and module
- PR #40540: (*DmitryKuzmenko*) A quick fix for Cache has no `list` attribute. @ 2017-04-05T18:50:18Z
  - PR #40494: (*rallytime*) [develop] Merge forward from 2016.11 to develop | refs: #40540 #40540
  - 3f06955 Merge pull request #40540 from DSRCorporation/bugs/40494\_merge\_forward\_cache\_list\_fix
  - c0fd563 A quick fix for Cache has no `list` attribute.
- PR #40464: (*terminalmage*) salt-cloud: Do not pass `userdata_file` through yaml renderer @ 2017-04-05T17:32:07Z
  - ISSUE #32662: (*anlutro*) salt-cloud: allow templating of EC2 userdata, similar to deploy script | refs: #32698
  - PR #32698: (*techhat*) Allow EC2 userdata to be templated | refs: #40464
  - 28fc048 Merge pull request #40464 from terminalmage/userdata-renderer
  - 84ee693 Nova and openstack don't accept base64-encoded userdata
  - 73f4c43 Allow for `userdata_template` to be disabled in a `cloud_profile`
  - 78b4798 Update `compile_template` test to use StringIO
  - 5f7c561 Properly handle renderers which return StringIO objects

- d551b0d Bring in salt.utils.stringio from develop branch
- 6a6ef0a Move userdata templating to salt.utils.cloud
- b440d0c Update 2016.11.4 release notes for userdata\_renderer -> userdata\_template
- a6183d9 Preserve windows newlines in salt.template.compile\_template()
- 04f02df Try to read compiled template as StringIO
- 79cc253b Only template the userdata\_file if explicitly configured to do so
- b580654 Update cloud docs to reflect userdata\_renderer -> userdata\_template
- a6064fb Rename userdata\_renderer -> userdata\_template in master config docs
- 50f2b28 Remove userdata\_renderer value
- cc2186f Add templating support for other cloud drivers that support userdata\_file
- be8d34c ec2: Add support for using userdata\_renderer to template userdata\_file
- eddbd41 Openstack did not have templating support for userdata\_file before 2016.11.4
- a85a416 Add userdata\_renderer fix info to 2016.11.4 release notes
- 1111887 Add documentation for userdata\_renderer
- 9ee2dcf Add userdata\_renderer master config param
- **PR #40530:** (*dmurphy18*) Update release information for 2016.11.4 for additional AIX support @ 2017-04-05T16:20:22Z
  - 990bde4 Merge pull request #40530 from dmurphy18/aix\_docupd
  - fd93caf Added further support for functionality on AIX for 2016.11.4
  - 17b5891 Update release information for new AIX support
- **PR #40528:** (*dmurphy18*) Allow for nightly build designations in Salt versions @ 2017-04-04T20:34:26Z
  - 4d93269 Merge pull request #40528 from dmurphy18/salt\_nightlybuild
  - d62a119 Allow for nightly build designations in Salt versions
- **PR #40465:** (*rallytime*) Artifactory Execution & State Module: Fixup Error Handling @ 2017-04-04T20:12:21Z
  - **ISSUE #37699:** (*gstachowiak*) Artifactory state. Incorrect timeout error reporting. | refs: #40465
  - 0ed3852 Merge pull request #40465 from rallytime/fix-37699
  - 8f084f7 Update unit test to look for actual string comment
  - ef664b4 Artifactory State: Only wrap main function call to module in try/except and wrap exc comment in str()
  - f1015e3 Artifactory Module: catch URLErrors as well as HTTPErrors
- **PR #40497:** (*DmitryKuzmenko*) Memcache documentation and minor updates. @ 2017-04-04T19:55:18Z
  - **ISSUE #39275:** (*yhekma*) Cache backend gets hit a lot | refs: #40429 #40497
  - **PR #40429:** (*DmitryKuzmenko*) MemCache - a minion data cache booster. | refs: #40468 #40468 #40497
  - 7a04ed2 Merge pull request #40497 from DSRCorporation/features/39275\_memcache
  - 82c45b1 Memcache documentation and minor updates.
- **PR #40504:** (*rallytime*) Group checks for failhard setting in () in state.check\_failhard function @ 2017-04-04T19:53:48Z

- ISSUE #38683: (*gstachowiak*) require/order/failhard combination error | refs: #40504
- d654de5 Merge pull request #40504 from rallytime/fix-38683
- ede4c28 Group checks for failhard setting in () in state.check\_failhard function
- PR #40503: (*thatch45*) first pass at adding support for pycryptodome installed as @ 2017-04-04T19:39:02Z
  - 4d5d7d9 Merge pull request #40503 from thatch45/2016.11
  - e21fd54 fix lint on the lint ignores...
  - 6011324 pycryptodome adds RSA to the key header which the openssl
  - 206dec6 fix the cryptodome version lookup for the versions report
  - d3b7709 good catch
  - 31c6a10 first pass at adding support for pycryptodome installed as
- PR #40525: (*dmurphy18*) Add support for disk.iostat on AIX @ 2017-04-04T19:31:41Z
  - 0dd92c6 Merge pull request #40525 from dmurphy18/aix\_dskioostat
  - 7125372 Added support on AIX for disk.iostat
- PR #40496: (*rallytime*) Back-port #40415 to 2016.11 @ 2017-04-04T17:19:39Z
  - PR #40415: (*defanator*) Fix boto\_vpc.create\_route() to work with interface\_id | refs: #40496
  - a6291b1 Merge pull request #40496 from rallytime/bp-40415
  - f8b3006 Fix boto\_vpc.create\_route() to work with interface\_id
- PR #40468: (*techhat*) Add \_\_func\_alias\_\_ back in @ 2017-04-04T17:02:43Z
  - ISSUE #39275: (*yhekma*) Cache backend gets hit a lot | refs: #40429 #40497
  - PR #40429: (*DmitryKuzmenko*) MemCache - a minion data cache booster. | refs: #40468 #40468 #40497
  - 3eb8e0b Merge pull request #40468 from techhat/cachealias
  - 6ec0baa Swap around aliases
  - 76e54a2 Add \_\_func\_alias\_\_ back in
- PR #39109: (*bdrung*) Fix top\_file\_merging\_strategy warning if env\_order is set @ 2017-04-04T14:20:56Z
  - ISSUE #29104: (*adithep*) Merging Order warning | refs: #39109
  - 8c0befa Merge pull request #39109 from bdrung/fix-merge-order-warning
  - fbf8fcf Simplify \_get\_envs() by using list comprehensions
  - 74a3b06 Fix top\_file\_merging\_strategy warning if env\_order is set
  - ec219b5 Remove duplicate client\_envs variable definitions
- 85b9bb4 Fix label for RST link
- 16e19ea Merge branch `thatch45-rand\_m\_doc' into 2016.11
  - 6279f7c fix do to pre correct on python randome function
  - 66b9515 Fix up the doc for failover clarity
- PR #40495: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-04-03T18:36:16Z
  - ISSUE #37322: (*kiemlicz*) master\_tops generating improper top file | refs: #40427
  - PR #40427: (*terminalmage*) Clarify the master\_tops documentation

- 02a1f64 Merge pull request #40495 from rallytime/merge-2016.11
- 8111909 Merge branch `2016.3' into `2016.11'
- 3d45a00 Merge pull request #40427 from terminalmage/clarify-master-tops-docs
  - \* bda781d Grammar fix
  - \* 0d7b0c4 Improve the master\_tops documentation
  - \* d27340a Add saltutil.sync\_tops runner func
- PR #40466: (*dmurphy18*) Support for execution module status on AIX @ 2017-04-01T00:28:51Z
  - ac82972 Merge pull request #40466 from dmurphy18/aix\_status
  - 7c0b30d Support for AIX
- PR #40429: (*DmitryKuzmenko*) MemCache - a minion data cache booster. | refs: #40468 #40468 #40497 @ 2017-03-31T20:21:00Z
  - ISSUE #39275: (*yhekma*) Cache backend gets hit a *lot* | refs: #40429 #40497
  - fdb0250 Merge pull request #40429 from DSRCorporation/features/39275\_memcache
  - 4475d17 In-memory minion data cache.
- PR #40442: (*gtmanfred*) allow file\_client to figure out cachedir | refs: #40642 #40642 @ 2017-03-31T20:14:27Z
  - ISSUE #38458: (*duk3luk3*) salt-ssh uses sudo to create cache dir, later fails to access it | refs: #40442
  - 31d4e69 Merge pull request #40442 from gtmanfred/salt-ssh
  - 8367735 allow file\_client to figure out cachedir
- PR #40456: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-31T17:51:11Z
  - ISSUE #39854: (*Foxlik*) quoted space in authorized\_keys confuses ssh.py | refs: #39855
  - PR #40379: (*rallytime*) Create a unit test for the \_replace\_auth\_key function in the ssh module
  - PR #40371: (*terminalmage*) Fix path handling for masterless gitfs on Windows
  - PR #39855: (*Foxlik*) Use regular expression instead of split when replacing authorized\_keys | refs: #40379
  - 0cfd18 Merge pull request #40456 from rallytime/merge-2016.11
  - 0da4c46 Merge branch `2016.3' into `2016.11'
  - c26f4cc Merge pull request #40371 from terminalmage/pr-40344
    - \* a8bcaa7 Force use of posixpath when joining salt fileserver paths in gitfs
    - \* cafa08d Add ability for salt.utils.path\_join to force the use of posixpath
  - df9df82 Merge pull request #40379 from rallytime/tests-for-39855
    - \* 96259d6 Lint fix
    - \* 4f7ac14 Create a unit test for the \_replace\_auth\_key function in the ssh module
- PR #40443: (*gtmanfred*) prepend ssh\_log\_file with root\_dir @ 2017-03-31T09:23:46Z
  - 8617be9 Merge pull request #40443 from gtmanfred/sshlog
  - 7f6046d prepend ssh\_log\_file with root\_dir
- PR #40376: (*nmadhok*) Backporting changes in vmware cloud driver from develop branch to 2016.11 branch @ 2017-03-30T22:35:13Z
  - 132d8b7 Merge pull request #40376 from nmadhok/2016.11

- dd62310 Adding unit tests for vmware\_test
- 36edf0a Add additional VMware related exceptions
- 034ef30 Remove old vmware unit tests
- 7c14488 Backporting changes in vmware cloud driver from develop branch to 2016.11 branch
- PR #40387: (*redbaron4*) More complete fix for 39692 @ 2017-03-30T22:29:05Z
  - ISSUE #39692: (*djsly*) tuned module and state are broken on 7.3 families. | refs: #39719 #39768 #40387 #40387
  - dfaa670 Merge pull request #40387 from redbaron4/fix-39692
  - 77a40a0 Lint fixes
  - 8c1adfa More complete fix for 39692
- PR #40404: (*roaldnefs*) Fix for fixtures in the.djangomod module @ 2017-03-30T22:26:09Z
  - ISSUE #7287: (*dragozov*) django.loaddata treats fixture list as arguments and prepends ``--" for each | refs: #40404 #40404
  - 313d216 Merge pull request #40404 from roaldnefs/fix-djangomod-loaddata
  - 92285cb Fix for fixtures in the.djangomod module
- PR #40416: (*lorenegordon*) Adds some missing file functions on Windows @ 2017-03-30T22:22:44Z
  - 5379899 Merge pull request #40416 from lorenegordon/win-file-funcs
  - 8edaf25 Adds some missing file functions on Windows
- PR #40418: (*lorenegordon*) Closes handle to temporary file before returning the path @ 2017-03-30T22:22:03Z
  - ISSUE #40417: (*lorenegordon*) temp.file does not close the file handle | refs: #40418
  - 1f5d6b8 Merge pull request #40418 from lorenegordon/close-temp-file
  - 7baf280 Closes handle to temporary file before returning the path
- PR #40430: (*twangboy*) Fix logic for \_\_virtual\_\_ in win\_dsc and win\_psget @ 2017-03-30T22:06:16Z
  - 5c78d55 Merge pull request #40430 from twangboy/fix\_virtual
  - 08e95ce Add logging on \_\_virtual\_\_ failures
  - 43ecb1a Fix logic for \_\_virtual\_\_
- PR #40431: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-30T21:37:39Z
  - ISSUE #40396: (*aesdana*) rabbitmq module fails on version comparison if version contains debian\_revision | refs: #40407
  - PR #40424: (*terminalmage*) Fix open filehandles
  - PR #40407: (*aesdana*) Added split to cut off debian\_revision from rabbitmq-server version
  - PR #40399: (*terminalmage*) Add docker-py version to the versions report
  - PR #40391: (*Ch3LL*) initial commit of the 2016.3.7 release notes
  - PR #40368: (*Ch3LL*) [2016.3] Bump previous version to 2016.3.6
  - b855f29 Merge pull request #40431 from rallytime/merge-2016.11
  - d5576d7 Merge branch `2016.3' into `2016.11'
  - b6770fd Merge pull request #40407 from aesdana/fix\_rabbitmq\_version\_check

- \* 4c0763f Added split to cut off debian\_revision from rabbitmq-server version Fixes #40396
- d4fb45d Merge pull request #40424 from terminalmage/fix-open-filehandle
  - \* 6625126 Fix open filehandles
- 8708096 Merge pull request #40399 from terminalmage/docker-py\_version
  - \* 14c6575 Add docker-py version to the versions report
- ff1266b Merge pull request #40391 from Ch3LL/2016.3.7\_release\_notes
  - \* f532ec5 initial 2016.3.7 release notes
- 96bf942 Merge pull request #40368 from Ch3LL/bump\_version\_3
  - \* a02fa7d [2016.3] Bump previous version to 2016.3.6
- **PR #40401:** (*roaldnefs*) fix Ubuntu notation in docs/faq.rst @ 2017-03-29T20:28:31Z
  - 7d900d3 Merge pull request #40401 from roaldnefs/fix-doc-faq
  - 21f161f fix Ubuntu notation in docs/faq.rst
- **PR #40390:** (*rallytime*) Back-port #37795 to 2016.11 @ 2017-03-29T19:05:12Z
  - **ISSUE #29028:** (*kevins9*) state.sls fails to render state with pillar data: Jinja variable `dict object` has no attribute | refs: #37795
  - **PR #37795:** (*jettero*) please tell me where is the "error: `dict` object has no ..." | refs: #40390
  - 70a3f96 Merge pull request #40390 from rallytime/bp-37795
  - 1ba1557 Pylint fix
  - ec65924 please tell me where is the ``error: `dict` object has no attribute `seek`" ??
- **PR #40395:** (*rallytime*) Handle AttributeError for dockerng\_mod.docker attempt fails and docker is installed @ 2017-03-29T17:47:11Z
  - f8fbfff Merge pull request #40395 from rallytime/catch-attribute-error-docker-test
  - 99c8dcc Handle AttributeError for dockerng\_mod.docker attempt fails and docker is installed
- **PR #40362:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-28T22:50:32Z
  - **PR #40264:** (*meaksh*) Makes sure ``gather\_job\_timeout` is an Integer
  - d7d3d68 Merge pull request #40362 from rallytime/merge-2016.11
  - 4f1543c Merge branch `2016.3` into `2016.11`
    - \* 1381f97 Merge pull request #40264 from meaksh/2016.3-gather\_job\_timeout-fix
      - 68dcae Makes sure ``gather\_job\_timeout` is an integer
- **PR #40372:** (*zer0def*) Fixes related to cache directory argument changes in pip>=6. @ 2017-03-28T22:48:41Z
  - 2febd05 Merge pull request #40372 from zer0def/pip-cache-fixes
  - d68067f Merge remote-tracking branch `main/2016.11` into pip-cache-fixes
  - 4f23a23 Fixed the `test_install_download_cache_argument_in_resulting_command` to accomodate introduced cache directory argument fixes and renamed it to `test_install_download_cache_dir_arguments_in_resulting_command`.
  - 9d0f94e Fixed unnecessary API changes introduced with suggested changes.
- **PR #40369:** (*Ch3LL*) [2016.11] Bump previous version to 2016.3.6 @ 2017-03-28T18:50:39Z

- 6162698 Merge pull request #40369 from Ch3LL/bump\_version\_11
- 7597d96 [2016.11] Bump previous version to 2016.3.6
- PR #40333: (*gtmanfred*) fix some test=True comments @ 2017-03-28T16:11:01Z
  - ISSUE #40322: (*Whissi*) ssh\_auth.absent: Wrong comment when test=True | refs: #40333
  - ISSUE #40321: (*Whissi*) state.alternatives: Wrong comment when test=True | refs: #40333
  - 2d2cb5b Merge pull request #40333 from gtmanfred/2016.11
  - 5596620 fix some test=True comments
- PR #40347: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-28T02:39:31Z
  - PR #40345: (*twangboy*) Fix osx build
  - PR #40338: (*UtahDave*) Upstream cherryppy moved to Github from Bitbucket
  - bb37f13 Merge pull request #40347 from rallytime/merge-2016.11
  - e77e86d Merge branch `2016.3' into `2016.11'
  - 17ab1da Merge pull request #40345 from twangboy/fix\_osx\_build
    - \* 3207d67 Fix osx build
  - 7ab1049 Merge pull request #40338 from UtahDave/fix\_cherryppy\_ssl\_error\_link
    - \* 280b501 Upstream cherryppy moved to Github from Bitbucket
- PR #40346: (*cachedout*) Revert ``Fixes related to cache directory argument changes in pip>=6." @ 2017-03-27T23:17:29Z
  - PR #40332: (*zer0def*) Fixes related to cache directory argument changes in pip>=6. | refs: #40346
  - a572b46 Merge pull request #40346 from saltstack/revert-40332-pip-cache-fixes
  - b4753d1 Revert ``Fixes related to cache directory argument changes in pip>=6."`
- PR #40326: (*L4rS6*) Update mount state documentation (Fixes: #40296) @ 2017-03-27T23:15:53Z
  - ISSUE #40296: (*L4rS6*) Wrong documentation in mount.mounted | refs: #40326
  - a91bab8 Merge pull request #40326 from L4rS6/update-mount-state-doc
  - a717c52 Update mount state documentation (Fixes: #40296)
- PR #40328: (*L4rS6*) Fixes wrong compared extra\_mount\_ignore\_fs\_keys key. @ 2017-03-27T23:14:22Z
  - ca2980c Merge pull request #40328 from L4rS6/fix-mount-state-extra-ignore-fs-key
  - f0f68b9 Fixes wrong compared extra\_mount\_ignore\_fs\_keys key.
- PR #40329: (*isbm*) Merge tops (backport) @ 2017-03-27T23:13:47Z
  - 3a6c5d0 Merge pull request #40329 from isbm/isbm-merge-tops-201611
  - a762c9e Merge output from master\_tops
- PR #40285: (*rallytime*) Dockerng unit tests fixes: isolate global variables @ 2017-03-27T23:05:03Z
  - 2b7b2f1 Merge pull request #40285 from rallytime/docker-test-fixes
  - 0f263a5 Mock out the get\_client\_args mocks in the dockerng module tests more aggressively
  - f1352fe Add one more dockerng.version mock that was missed previously
  - 0d31d2c Add a couple more patches for docker.version information

- a9c5eeb Clean up dockerng unit tests to avoid global variables and fixup some patching
- **PR #40341:** (*twangboy*) Fix service.create, fix docs @ 2017-03-27T21:46:19Z
  - 01efc84 Merge pull request #40341 from twangboy/fix\_win\_service
  - 6736457 Docs for create
  - 652cf08 Fix service.create, fix docs
- **PR #40332:** (*zer0def*) Fixes related to cache directory argument changes in pip>=6. | refs: #40346 @ 2017-03-27T21:01:15Z
  - 8eabcca Merge pull request #40332 from zer0def/pip-cache-fixes
  - 7976840 Fixes related to cache directory changes in pip>=6.
- **PR #40337:** (*Ch3LL*) Add archive.extracted with use\_cmd\_unzip argument @ 2017-03-27T21:00:23Z
  - ceba1b9 Merge pull request #40337 from Ch3LL/add\_unzip\_test
  - 8b21b4c add use\_cmd\_unzip test
- **PR #40312:** (*rallytime*) Update minion data cache documentation @ 2017-03-27T20:56:55Z
  - a192597 Merge pull request #40312 from rallytime/cache-docs
  - 5363e0b Update minion data cache documentation
- **PR #40315:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-27T15:11:25Z
  - **PR #40300:** (*meaksh*) Fixes 'timeout' and 'gather\_job\_timeout' kwargs parameters for 'local\_batch' client
  - 7f16754 Merge pull request #40315 from rallytime/merge-2016.11
  - c65d602 Merge branch '2016.3' into '2016.11'
    - \* 7c21153 Merge pull request #40300 from meaksh/2016.3-adding-timeouts-parameters-to-cmd\_batch
      - 9174e6f Fixes testing opts dict for batch unit tests
      - b1de79a Adds custom 'timeout' and 'gather\_job\_timeout' to 'local\_batch' client
- **PR #40313:** (*techhat*) Add minimum and maximum to calls to calc @ 2017-03-27T14:54:15Z
  - a9a73bf Merge pull request #40313 from techhat/calcref
  - 7106a86 Use named kwargs
  - 822f3b8 Add minimum and maximum to calls to calc
- **PR #40277:** (*eldadru*) Fixing boto\_rds.py delete() wait\_for\_deletion, if statement was inco... @ 2017-03-24T22:29:25Z
  - **ISSUE #40247:** (*eldadru*) boto\_rds.delete wait\_for\_deletion checks rds status incorrectly and always loop until timeout | refs: #40277
  - 9d0762d Merge pull request #40277 from eldadru/Fix-40247-boto\_rds-delete-wait-for-deletion-failure
  - 3c15a32 Fixing boto\_rds.py delete() wait\_for\_deletion, if statement was incorrectly checking the return value of boto\_rds.py exists() method.
- **PR #40280:** (*bewing*) Clean up temporary file in net.load\_template @ 2017-03-24T22:27:04Z
  - **PR #40273:** (*bewing*) Clean up temporary file in net.load\_template | refs: #40280
  - 6c29c81 Merge pull request #40280 from bewing/bp\_40273

- f028e93 Clean up temporary file in net.load\_template
- PR #40310: (*gtmanfred*) add warning when no host/dns record is found for fqdn\_ip @ 2017-03-24T21:55:20Z
  - ISSUE #37972: (*ebauman*) salt-run execution for master with no AAAA record adds significant execution time | refs: #40310
  - 839b620 Merge pull request #40310 from gtmanfred/2016.11
  - cff027d add warning when no host/dns record is found for fqdn
- PR #40288: (*dmurphy18*) Execution module network support for AIX @ 2017-03-24T20:10:36Z
  - eb86d55 Merge pull request #40288 from dmurphy18/aix\_network
  - b53a95d Further update to us in similar to review comments
  - 59c0bdc Updated for review comments
  - 031c945 Execution module network support for AIX
- PR #40308: (*rallytime*) Back-port #38835 to 2016.11 @ 2017-03-24T19:00:46Z
  - PR #38835: (*UtahDave*) Cache docs | refs: #40308
  - 4928026 Merge pull request #40308 from rallytime/bp-38835
  - 3ba50d3 add info about what is cached
  - 77e8f6a fix config example
  - 61f2fa9 Add documentation for the Minion data cache
- PR #40287: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-24T16:50:23Z
  - ISSUE #40251: (*sergeizv*) Cloud roster doesn't work | refs: #40201

  - 6caedb0 Change imports for dockerng tests
- PR #40189: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-21T18:02:51Z
  - PR #40182: (*terminalmage*) Add support for ``stopped" state to dockerng's mod\_watch
  - PR #40171: (*Ch3LL*) additional PRs/issues for 2016.3.6 release notes
  - PR #40159: (*cro*) Turn on sign\_pub\_messages by default.
  - PR #40122: (*meaksh*) Adding ``pkg.install downloadonly=True" support to yum/dnf execution module
  - PR #40120: (*sergeizv*) gce: Exclude GCENodeDriver objects from \_expand\_node result
  - 0b512f9 Merge pull request #40189 from rallytime/merge-2016.11
  - a55c413 Merge branch `2016.3' into `2016.11'
    - \* d4e6c58 Merge pull request #40182 from terminalmage/dockerng-mod\_watch-stopped
      - 4629a26 Add support for ``stopped" state to dockerng's mod\_watch
    - \* a0b4082 Merge pull request #40171 from Ch3LL/2016.3.6\_release
      - 9c6d8d8 additional PRs/issues for 2016.3.6 release notes
    - \* 33ba782 Merge pull request #40120 from sergeizv/gce-expand-node-fix
      - 9d0fbe7 gce: Exclude GCENodeDriver objects from \_expand\_node result

- \* 4884397 Merge pull request #40122 from meaksh/2016.3-yum-downloadonly-support
  - 067f3f7 Adding downloadonly support to yum/dnf module
- \* 60e1d4e Merge pull request #40159 from cro/sign\_pub
  - e663b76 Fix small syntax error
  - 0a0f46f Turn on sign\_pub\_messages by default. Make sure messages with no `sig` are dropped with error when sign\_pub\_messages is True.
- PR #40034: (*sp1r*) Disallow modification of jobs from pillar with schedule execution module @ 2017-03-21T16:36:34Z
  - ISSUE #39779: (*sp1r*) Pillar scheduling is broken | refs: #40034
  - ISSUE #38523: (*MorphBonehunter*) schedule not changed on pillar update after minion restart | refs: #40034
  - ISSUE #36134: (*Ch3LL*) carbon: multi-master with failover does not failover when master goes down | refs: #36437
  - PR #36437: (*DmitryKuzmenko*) Keep the schedule jobs in ONE place. | refs: #40034 #40034
  - d9cb222 Merge pull request #40034 from sp1r/fix-pillar-scheduling
  - 595f786 fix evaluating jobs when ``pillar" is missing in opts
  - 9d5db19 fix initial data structure for schedule tests
  - d3a2489 schedule tests to ensure pillar jobs are not modified
  - 27385ff added a check ensuring schedule is a dict before merging
  - 14d7191 Fixes #39779
- PR #40160: (*eldadru*) Fix this issue: <https://github.com/saltstack/salt/issues/40073>, descr... @ 2017-03-20T21:37:43Z
  - 257c862 Merge pull request #40160 from eldadru/fix-issue-40073-boto-rds-describe-empty-dict
  - 954c871 Fix this issue: <https://github.com/saltstack/salt/issues/40073>, describe return dictionary returned empty , probably as result of incorrect past merge (see discussion on issue)
- PR #40162: (*rallytime*) Make sure the tornado web server is stopped at the end of the test class @ 2017-03-20T20:35:21Z
  - aec5041 Merge pull request #40162 from rallytime/archive-integration-test-fixes
  - dd193cc Make sure the tornado web server is stopped at the end of the test class
- PR #40158: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-20T20:34:23Z
  - ISSUE #39995: (*frogunder*) Head of Develop - Multimaster error | refs: #40141
  - ISSUE #39118: (*bobrik*) Minion ipv6 option is not documented | refs: #39289
  - PR #40141: (*bobrik*) Use the first address if cannot connect to any
  - PR #40123: (*twangboy*) Adds support for inet\_pton in Windows to network util
  - PR #39289: (*bobrik*) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141
  - 461e15f Merge pull request #40158 from rallytime/merge-2016.11
  - 88f3ebd Remove extra ``connect" kwarg caught by linter
  - f4d4768 Merge branch `2016.3' into `2016.11'

- \* 28e4fc1 Merge pull request #40123 from twangboy/win\_fix\_network
  - 06dfd55 Adds support for inet\_pton in Windows to network util
- \* 35ddb79 Merge pull request #40141 from bobrik/fallback-resolve
  - af1545d Use the first address if cannot connect to any
- PR #40165: (*rallytime*) Don't try to run the dockerng unit tests if docker-py is missing @ 2017-03-20T20:33:19Z
  - b235f09 Merge pull request #40165 from rallytime/gate-docker-unit-tests
  - f32d8a8 Don't try to run the dockerng unit tests if docker-py is missing
- PR #40085: (*mirceaulinic*) VRF arg and better doc for ping and traceroute @ 2017-03-20T19:48:57Z
  - db9fb58 Merge pull request #40085 from cloudflare/fix-ping-tr
  - 6cbdd61 Strip trailing whitespaces
  - 897a2a3 VRF arg and better doc for ping and traceroute
- PR #40095: (*skizunov*) dns\_check should not try to connect when connect=False @ 2017-03-17T17:31:42Z
  - 3bac06f Merge pull request #40095 from skizunov/develop2
  - 880790f dns\_check should not try to connect when connect=False
- PR #40096: (*skizunov*) When building up the `master\_uri\_list`, do not try to connect @ 2017-03-17T17:13:41Z
  - 31da90e Merge pull request #40096 from skizunov/develop3
  - eb9a0a6 When building up the `master\_uri\_list`, do not try to connect
- PR #40111: (*eldadru*) Fixing simple issue 40081 - the key parameter of the method create ov... @ 2017-03-17T17:00:03Z
  - 5303386 Merge pull request #40111 from eldadru/fix-issue-40081-boto-rds-create-overwritten-key-parameter
  - 78b5d11 Fixing simple issue 40081 - the key parameter of the method create overwritten by internal loop.
- PR #40118: (*rallytime*) Add CLI Example for dockerng.get\_client\_args @ 2017-03-17T16:34:13Z
  - d2e376e Merge pull request #40118 from rallytime/cli-example
  - bb496bb Add CLI Example for dockerng.get\_client\_args
- PR #40097: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-17T15:17:08Z
  - PR #40090: (*rallytime*) Back-port #40056 to 2016.3
  - PR #40059: (*terminalmage*) Fix traceback when virtualenv.managed is invoked with nonexistant user
  - PR #40057: (*cachedout*) More mentionbot blacklists
  - PR #40056: (*thatch45*) update mention bot blacklist | refs: #40090
  - baef500 Merge pull request #40097 from rallytime/merge-2016.11
  - ef1ff38 Merge branch `2016.3` into `2016.11`
  - 116201f Merge pull request #40059 from terminalmage/fix-virtualenv-traceback
    - \* e3cfd29 Fix traceback when virtualenv.managed is invoked with nonexistant user
  - a01b52b Merge pull request #40090 from rallytime/bp-40056
    - \* ae012db update mention bot blacklist

- d1570bb Merge pull request #40057 from cachedout/ollie\_blacklist
  - \* 0ac2e83 Merge branch `2016.3' into ollie\_blacklist
  - \* 5592c68 More mentionbot blacklists
- PR #40077: (*mirceaulinic*) Fix #39771 (Empty `__proxy__` dunder inside scheduler) @ 2017-03-16T20:56:02Z
  - ISSUE #39771: (*mirceaulinic*) Empty `__proxy__` dunder inside scheduler
  - 9ef3e07 Merge pull request #40077 from cloudflare/fix-39771
  - cd319e7 Add proxy kwarg to scheduler
  - c6e6dd1 ProxyMinion: correctly build the scheduler
- PR #40088: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-16T19:58:44Z
  - ISSUE #40036: (*oogali*) UnboundLocalError: local variable `ifcfg' referenced before assignment | refs: #40053
  - ISSUE #40011: (*tsaridas*) salt-minion does not shutdown properly 2016.11.3 rh6 | refs: #40041
  - PR #40070: (*Ch3LL*) update 2016.3.6 release notes with additional PR's
  - PR #40053: (*gtmanfred*) Update `rh_ip.py`
  - PR #40041: (*terminalmage*) Fix transposed lines in `salt.utils.process`
  - PR #40038: (*velom*) correctly parse ``pkg_name===version'` from pip freeze
  - PR #40018: (*meaksh*) Allows overriding ``timeout'` and ``gather_job_timeout'` to ``manage.up'` runner call | refs: #40072
  - b12720a Merge pull request #40088 from rallytime/merge-2016.11
  - 626bd03 Merge branch `2016.3' into `2016.11'
  - d36bdb1 Merge pull request #40070 from Ch3LL/2016.3.6\_release
    - \* a1f8b49 update 2016.3.6 release notes with additional PR's
  - 8dcffc7 Merge pull request #40018 from meaksh/2016.3-handling-timeouts-for-manage.up-runner
    - \* 9f5c3b7 Allows to set custom timeouts for ``manage.up'` and ``manage.status'`
    - \* 2102d9c Allows to set ``timeout'` and ``gather_job_timeout'` via kwargs
  - 22fc529 Merge pull request #40038 from velom/fix-pip-freeze-parsing
    - \* 3fae91d correctly parse ``pkg_name===version'` from pip freeze
  - 3584f93 Merge pull request #40053 from saltstack/rh\_ip\_patch
    - \* 219947a Update `rh_ip.py`
  - 837432d Merge pull request #40041 from terminalmage/issue40011
    - \* 5b5d1b3 Fix transposed lines in `salt.utils.process`
- PR #40055: (*rallytime*) Update ``yaml'` code-block references with ``jinja'` where needed @ 2017-03-16T16:30:38Z
  - 703ab23 Merge pull request #40055 from rallytime/doc-build-warnings
  - 72d16c9 Update ``yaml'` code-block references with ``jinja'` where needed
- PR #40072: (*meaksh*) [2016.11] Allows overriding ``timeout'` and ``gather_job_timeout'` to ``manage.up'` runner call @ 2017-03-16T15:31:46Z

- PR #40018: (*meaksh*) Allows overriding ``timeout'` and ``gather_job_timeout'` to ``manage.up'` runner call | refs: #40072
- e73a1d0 Merge pull request #40072 from meaksh/2016.11-handling-timeouts-for-manage.up-runner
- 40246d3 Allows to set custom timeouts for ``manage.up'` and ``manage.status'`
- ad232fd Allows to set ``timeout'` and ``gather_job_timeout'` via kwargs
- PR #40045: (*terminalmage*) Fix error when `chhome` is invoked by `user.present` state in Windows @ 2017-03-15T19:00:41Z
  - 2f28ec2 Merge pull request #40045 from terminalmage/fix-windows-user-present
  - 359af3b Fix error when `chhome` is invoked by `user.present` state in Windows
- PR #40047: (*rallytime*) Back-port #40000 to 2016.11 @ 2017-03-15T17:47:37Z
  - PR #40000: (*skizunov*) Fix exception in `salt-call` when `master_type` is ``disable'` | refs: #40047
  - 4067625 Merge pull request #40047 from rallytime/bp-40000
  - 11766c7 Fix exception in `salt-call` when `master_type` is ``disable'`
- PR #40023: (*jeanpralo*) We need to match on `.p` not just strip ``p'` otherwise it will remove a... @ 2017-03-14T23:14:56Z
  - 86f7195 Merge pull request #40023 from jeanpralo/fix-minions-cant-finish-by-char-p
  - d7b0c8a We need to match on `.p` not just strip ``p'` otherwise it will remove any `p` from the string even if we have no dot
- PR #40025: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-14T23:14:33Z
  - ISSUE #39942: (*Foxlik*) Web Documentation not in sync with release 2016.11.3 | refs: #39994

    - 65b2396 Restore ipv6 connectivity and ``master: <ip>:<port>' support
- PR #39932: (*rallytime*) Cherry-pick the beacon fixes made in #39930 to 2016.11 @ 2017-03-10T00:21:09Z
  - ISSUE #38121: (*Da-Juan*) Beacon configuration doesn't work as a list | refs: #39932 #39930
  - PR #39930: (*s0undt3ch*) Moar Py3 and a fix for #38121 | refs: #39932
  - 899e037 Merge pull request #39932 from rallytime/cp-beacon-fixes
  - 4a52cca Pylint fixes
  - 4627c4e Code cleanup and make sure the beacons config file is deleted after testing

- c7fc09f Support the new list configuration format.
- be06df9 Remove *\*args*, *\*\*kwargs*. Not needed, not useful.
- 4a24282 These tests aren't even using mock!
- 6408b12 These tests are not destructive
- 50e51b5 The beacons configuration is now a list. Handle it!
- **PR #39933:** (*hkrist*) Fixed rawfile\_json returner output format. @ 2017-03-10T00:20:52Z
  - 2e68ede Merge pull request #39933 from hkrist/fix-rawfile\_json\_returner-format
  - 4d0ddcd Fixed rawfile\_json returner output format. It outputted python object instead of standard json.
- **PR #39934:** (*dmurphy18*) Correct comment lines output from execution module's host.list\_hosts @ 2017-03-10T00:20:14Z
  - fb0dc33 Merge pull request #39934 from dmurphy18/fix\_host\_list
  - e7b9a45 Correct comment lines output got list\_hosts
- **PR #39900:** (*twangboy*) Namespace the line function properly in win\_file @ 2017-03-09T22:19:12Z
  - a6f88d0 Merge pull request #39900 from twangboy/win\_fix\_line
  - 462bdec Namespace the line function properly in win\_file
- **PR #39910:** (*rallytime*) Back-port #37743 to 2016.11 @ 2017-03-09T22:16:58Z
  - **ISSUE #37741:** (*discountbin*) Check in file.replace state for ignore\_if\_missing | refs: #37743 #39910
  - **PR #37743:** (*discountbin*) Adding check for ignore\_if\_missing param when calling \_check\_file. | refs: #39910
  - 77ecff4 Merge pull request #39910 from rallytime/bp-37743
  - ca306c0 Replace pass with updated comment for return
  - 1a78878 Adding check for ignore\_if\_missing param when calling \_check\_file.
- **PR #39770:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2017-03-09T22:00:17Z
  - **ISSUE #33187:** (*usbportnoy*) Deploy to jboss TypeError at boss7.py:469 | refs: #39761
  - **PR #39761:** (*cachedout*) Properly display error in jboss7 state
  - **PR #39728:** (*rallytime*) [2016.3] Bump latest release version to 2016.11.3
  - **PR #39619:** (*terminalmage*) Add a function to simply refresh the grains
  - c2d4d17 Merge pull request #39770 from rallytime/merge-2016.11
  - dbaea3d Remove extra refresh reference that snuck in
  - d9f48ac Don't shadow refresh\_pillar
  - d86b03d Remove manual refresh code from minion.py
  - a7e419e Scrap event-based approach for refreshing grains
  - 776a943 Merge branch `2016.3' into `2016.11'
    - \* a24da31 Merge pull request #39761 from cachedout/issue\_33187
      - c2df29e Properly display error in jboss7 state
    - \* 0888bc3 Merge pull request #39728 from rallytime/update-release-ver-2016.3
      - c9bc8af [2016.3] Bump latest release version to 2016.11.3

- \* b52dbec Merge pull request #39619 from terminalmage/zd1207
  - c7dfb49 Fix mocking for grains refresh
  - 7e0ced3 Properly hand proxy minions
  - 692c456 Add a function to simply refresh the grains
- PR #39872: (*techhat*) Add installation tips for azurearm driver @ 2017-03-07T23:18:04Z
  - 801ff28 Merge pull request #39872 from techhat/fixdocs
  - 35440c5 Add installation tips for azure
  - 2a1ae0b Change example master in azure docs
- PR #39837: (*terminalmage*) Fix regression in archive.extracted when it runs file.directory @ 2017-03-07T04:09:51Z
  - 6d0f15c Merge pull request #39837 from terminalmage/more-issue39751
  - 0285ff3 Fix regression in archive.extracted when it runs file.directory
- PR #39858: (*techhat*) Reorder keys that were being declared in the wrong place @ 2017-03-07T03:51:56Z
  - 68752a2 Merge pull request #39858 from techhat/statuskey
  - 507a4f7 Reorder keys that were being declared in the wrong place
- PR #39862: (*rallytime*) Back-port #38943 to 2016.11 @ 2017-03-07T03:34:40Z
  - ISSUE #38830: (*danielmotaite*) salt-ssh: vault fails to use config | refs: #38943
  - PR #38943: (*thatch45*) When we generate the pillar we should send in the master opts | refs: #39862
  - 49c8faa Merge pull request #39862 from rallytime/bp-38943
  - e21b16c try it with a different init sequence
  - 92cac0f make it a deepcopy
  - 58cb8cd make sure to copy the top dict reference since we are moding it
  - a0b671e When we generate the pillar we should send in the master opts
- PR #39852: (*rallytime*) Back-port #39651 to 2016.11 @ 2017-03-06T21:18:34Z
  - PR #39651: (*DennisHarper*) Checking Instance when calling a function that can return None | refs: #39852
  - 8ecc719 Merge pull request #39852 from rallytime/bp-39651
  - bb5ddbe Checking instance exists in master.\_get\_cached\_minion\_data when cache.fetch returns None
  - 79f2a7c Update \_\_init\_\_.py
  - e2a2329 Checking instance exists in master.\_get\_cached\_minion\_data when cache.fetch returns None

  - ff6f63e Checking instance exists in master.\_get\_cached\_minion\_data when cache.fetch returns None
  - 855f875 Checking instance exists in master.\_get\_cached\_minion\_data when cache.fetch returns None
- PR #39851: (*rallytime*) Back-port #39104 to 2016.11 @ 2017-03-06T21:17:43Z
  - ISSUE #39052: (*githubcdr*) Minion restart very slow since 2016.11.2 | refs: #39104
  - PR #39104: (*githubcdr*) Do not use name resolving for --notrim check | refs: #39851
  - 897275a Merge pull request #39851 from rallytime/bp-39104

- 6539dbd Do not use name resolving for --notrim check
- **PR #39799:** (*Ch3LL*) Fix deleteed message when key is deleted @ 2017-03-03T05:17:43Z
  - **ISSUE #38231:** (*tjuup*) Typo: salt-key deleteed | refs: #39799
  - d0440e2 Merge pull request #39799 from Ch3LL/fix\_salt\_key\_msg
  - 8346682 Fix deleteed message when key is deleted
- **PR #39472:** (*whiteinge*) Update \_reformat\_low to not run kwarg dicts through parse\_input @ 2017-03-02T17:46:20Z
  - **ISSUE #38962:** (*gstachowiak*) Broken /jobs in salt-api in salt 2016.11.1 (Carbon) | refs: #39472
  - **PR #32005:** (*Ashald*) Bugfix: *RunnerClient* keyword argument values processing
  - 9f70ad7 Merge pull request #39472 from whiteinge/\_reformat\_low-update
  - d11f538 Add RunnerClient test for old/new-style arg/kwarg parsing
  - ec377ab Reenable skipped RunnerClient tests
  - 27f7fd9 Update \_reformat\_low to run arg through parse\_input
  - 5177153 Revert parse\_input change from #32005
- **PR #39727:** (*terminalmage*) salt.modules.state: check gathered pillar for errors instead of in-memory pillar @ 2017-03-02T17:06:43Z
  - 7dfc4b5 Merge pull request #39727 from terminalmage/issue39627
  - 3bb0ebd Update tests for PR 39727
  - c334b59 salt.modules.state: check gathered pillar for errors instead of in-memory pillar
  - 97dd8a1 Ensure that ext\_pillar begins with pillar\_override if ext\_pillar\_first is True
  - f951266 Add log message for successful makostack processing
- **PR #39776:** (*mirceaulinic*) WIP: Save \_schedule.conf under <proxy ID> dir @ 2017-03-02T16:27:45Z
  - **ISSUE #39775:** (*mirceaulinic*) Proxy *mine\_interval* config ignored | refs: #39776 #39935
  - 965f474 Merge pull request #39776 from cloudflare/proxy-schedule
  - 35b8b8f Save \_schedule.conf under <minion ID> dir
- **PR #39788:** (*cachedout*) Disable one API test that is flaky @ 2017-03-02T16:17:31Z
  - 555f147 Merge pull request #39788 from cachedout/disable\_api\_test
  - 523e377 Disable one API test that is flaky
- **PR #39762:** (*terminalmage*) Fix regression in file.get\_managed @ 2017-03-02T02:59:34Z
  - 793979c Merge pull request #39762 from terminalmage/issue39751
  - 64db0b8 Add integration tests for remote file sources
  - f9f894d Fix regression in file.get\_managed when skip\_verify=True
  - 28651a6 Remove next(iter()) extraction
- **PR #39767:** (*rallytime*) Back-port #38316 to 2016.11 @ 2017-03-02T02:54:57Z
  - **ISSUE #35088:** (*Modulus*) salt/cloud/ec2.py encoding problems. | refs: #37912
  - **PR #38316:** (*mlalpo*) salt utils aws encoding fix | refs: #39767
  - **PR #37912:** (*attiasr*) fix encoding problem aws responses | refs: #38316 #38316

- 91a9337 Merge pull request #39767 from rallytime/bp-38316
- 1dcf018 requests api says Response.encoding can sometimes be None <http://docs.python-requests.org/en/master/api/#requests.Response.encoding> and result.text.encode() doesn't accept None and expects a string.
- PR #39768: (*rallytime*) Back-port #39719 to 2016.11 @ 2017-03-02T02:54:40Z
  - ISSUE #39692: (*djsly*) tuned module and state are broken on 7.3 families. | refs: #39719 #39768 #40387 #40387
  - PR #39719: (*Seb-Solon*) Support new version of tuned-adm binary | refs: #39768
  - 4a01bd6 Merge pull request #39768 from rallytime/bp-39719
  - d7cb70f Enh: Support new version of tuned-adm binary
- PR #39760: (*Ch3LL*) Initial 2016.11.4 Release Notes Doc @ 2017-03-01T18:43:39Z
  - 780457f Merge pull request #39760 from Ch3LL/2016.11.4\_notes
  - 1853c99 add initial 2016.11.4 release notes
- PR #39731: (*twangboy*) Add docs for Kwargs in pkg.refresh\_db @ 2017-02-28T22:02:59Z
  - 0147f78 Merge pull request #39731 from twangboy/win\_pkg\_docs
  - 423e6f7 Add docs for Kwargs in pkg.refresh\_db
- PR #39734: (*garthgreenaway*) Missing parameter in the schedule.add function @ 2017-02-28T20:43:08Z
  - ISSUE #39710: (*huangfupeng*) schedule.add parameter can not use "after" | refs: #39734
  - fce2d18 Merge pull request #39734 from garthgreenaway/39710\_missing\_schedule\_add\_parameter
  - 63eb610 Per #39710, missing parameter in the schedule.add function
- PR #39729: (*rallytime*) [2016.11] Bump latest release version to 2016.11.3 @ 2017-02-28T18:08:25Z
  - 7b4865c Merge pull request #39729 from rallytime/update-release-ver-2016.11
  - b5a7111 [2016.11] Bump latest release version to 2016.11.3

## 20.2.6 Salt 2016.3.0 Release Notes - Codename Boron

### Known Issues

**Warning:** Some Salt Masters may need to apply a patch for Default Job Cache to prevent a possible crash

An issue exists that prevents the Salt master from cleaning the default job cache. This issue can cause an over-consumption of resources resulting in a crash. 2016.3.0 Salt masters should apply the patch in **:PR: `33555`**. This issue will be addressed in 2016.3.1.

- [issue 33516](#): When upgrading from 2015.8.10 to 2016.3.0 on centos7/redhat7 salt-minion must be restarted twice.
- [issue 33517](#): SPM does not work on amazon linux 2015 in 2016.3.0.

### Backwards-incompatible Changes

- The default path for the *extension\_modules* master config option has been changed. Prior to this release, the location was a directory named `extmods` in the Salt cachedir. On most platforms, this would put the *extension\_modules* directory in `/var/cache/salt/extmods`. It has been moved one directory down, into the master cachedir. On most platforms, this is `/var/cache/salt/master/extmods`. Most users won't have to worry about this, but those who have been manually placing custom runners into `/var/cache/salt/extmods/runners`, or outputters into `/var/cache/salt/extmods/output`, etc. will be affected by this. To transition, it is recommended not to simply move the `extmods` directory into `/var/cache/salt/master`, but to copy the custom modules into the salt fileserver under `salt://_runners`, `salt://_output`, etc. and sync them using the functions in the new *saltutil runner*.
- The `pkg.check_db` function has been removed for yum/dnf.

### Core Changes

- The `onchanges` requisite now fires if **any** watched state changes. [issue 19592](#).
- The `ext_pillar` functions **must** now accept a minion ID as the first argument. This stops the deprecation path started in Salt 0.17.x. Before this minion ID first argument was introduced, the minion ID could be retrieved accessing `__opts__['id']` losing the reference to the master ID initially set in `opts`. This is no longer the case, `__opts__['id']` will be kept as the master ID.
- Custom types can now be synced to the master using the new *saltutil runner*. Before, these needed to manually be placed under the *extension\_modules* directory. This allows custom modules to easily be synced to the master to make them available when compiling Pillar data. Just place custom runners into `salt://_runners`, custom outputters into `salt://_output`, etc. and use the functions from the *saltutil runner* to sync them.
- The `client_acl` configuration options were renamed to `publisher_acl`.
- Added a new `--config-dump` option ([issue 26639](#)).
- TCP Transport presence events were updated to work with a NAT ([PR 30629](#)).
- A *minion\_pillar\_cache* setting was added to save rendered pillar data to cachedir for later use when `file_client` is set to `local` ([PR 30428](#)).
- Added the ability for binary data (such as a license key) to be distributed via pillar using the *file.managed* ([issue 9569](#)).
- Scheduled jobs now include `success` and `retcode` ([issue 24237](#)).
- The `saltversioninfo` grain was changed from a string to a list to enable reading values by index. ([PR 30082](#)).
- A *pillar\_merge\_lists* option was added to enable recursively merging pillar lists by aggregating them instead of replacing them ([PR 30062](#)).
- Grain values reported by Debian 8 (jessie) when `lsb-release` is installed were updated for consistency ([PR 28649](#)).

- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default directory for deploying the salt-thin tarball has changed for salt-ssh. It is now `/var/tmp` instead of `/tmp`. Users may also wish to delete any directories in `/tmp` ending with `_salt/`. ([issue 32771](#))

### External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See external module packaging tutorial for more information.

### Cloud Changes

- Refactored the OpenNebula driver and added numerous `--function` and `--action` commands to enhance Salt support for image, template, security group, virtual network and virtual machine management in OpenNebula.
- Added execution/state modules to support the deployment of AWS cognito identity pools ([PR 31094](#)).
- Added ability to set tags and listener policies on a AWS ELB ([PR 27552](#)).

### Platform Changes

- Renamed modules related to macOS. The following module filenames were changed. The virtual name remained unchanged.
- [PR #30558](#): renamed `osxdesktop.py` to `mac_desktop.py`
- [PR #30557](#): renamed `macports.py` to `mac_ports.py`
- [PR #30556](#): renamed `darwin_sysctl.py` to `mac_sysctl.py`
- [PR #30555](#): renamed `brew.py` to `mac_brew.py`
- [PR #30552](#): renamed `darwin_pkgutil.py` to `mac_pkgutil.py`

### Package Support

- Ubuntu Xenial: Packages for Ubuntu Xenial (16.04) are available for 2016.3.0 and onwards. See [repo.saltstack.com](http://repo.saltstack.com) for more information. Note that Xenial comes with Debian's packaged version of Salt 2015.8.8 and official [repo.saltstack.com](http://repo.saltstack.com) packages are available for 2015.8 releases beginning with Salt 2015.8.11.

### Proxy Minion Changes

The deprecated config option `enumerate_proxy_minions` has been removed.

As mentioned in earlier documentation, the `add_proxymodule_to_opts` configuration variable defaults to `False` in this release. This means if you have proxymodules or other code looking in `__opts__['proxymodule']` you will need to set this variable in your `/etc/salt/proxy` file, or modify your code to use the `__proxy__` injected variable.

The `__proxyenabled__` directive now only applies to grains and proxy modules themselves. Standard execution modules and state modules are not prevented from loading for proxy minions.

Support has been added to Salt's loader allowing custom proxymodules to be placed in `salt://_proxy`. Proxy minions that need these modules will need to be restarted to pick up any changes. A corresponding utility function, `saltutil.sync_proxymodules`, has been added to sync these modules to minions.

Enhancements in grains processing have made the `__proxyenabled__` directive somewhat redundant in dynamic grains code. It is still required, but best practices for the `__virtual__` function in grains files have changed. It is now recommended that the `__virtual__` functions check to make sure they are being loaded for the correct proxytype, example below:

```
def __virtual__():
    """
    Only work on proxy
    """
    try:
        if salt.utils.is_proxy() and \
            __opts__['proxy']['proxytype'] == 'ssh_sample':
            return __virtualname__
    except KeyError:
        pass

    return False
```

The try/except block above exists because grains are processed very early in the proxy minion startup process, sometimes earlier than the proxy key in the `__opts__` dictionary is populated.

Grains are loaded so early in startup that no dunder dictionaries are present, so `__proxy__`, `__salt__`, etc. are not available. Custom grains located in `/srv/salt/_grains` and in the salt install grains directory can now take a single argument, `proxy`, that is identical to `__proxy__`. This enables patterns like

```
def get_ip(proxy):
    """
    Ask the remote device what IP it has
    """
    return {'ip': proxy['proxymodulename.get_ip']()}}
```

Then the grain `ip` will contain the result of calling the `get_ip()` function in the proxymodule called `proxymodulename`.

Proxy modules now benefit from including a function called `initialized()`. This function should return `True` if the proxy's `init()` function has been successfully called. This is needed to make grains processing easier.

Finally, if there is a function called `grains` in the proxymodule, it will be executed on proxy-minion startup and its contents will be merged with the rest of the proxy's grains. Since older proxy-minions might have used other methods to call such a function and add its results to grains, this is config-gated by a new proxy configuration option called `proxy_merge_grains_in_module`. This defaults to `False` in this release. It will default to `True` in the release after next. The next release is codenamed **Carbon**, the following is **Nitrogen**.

The example proxy minions `rest_sample` and `ssh_sample` have been updated to reflect these changes.

## Syndic Updates

A major performance and management issue was found and fixed in the syndic. This makes the Salt Syndic substantially more reliable and performant. Please make sure that the syndic and the master of masters which syndics attach to are updated, otherwise the syndic fixes alone can cause minor performance issues with older master of masters. Please update masters first, then syndics. Minions do not need to be updated for this fix to work.

## Module Changes

- *file execution module*: `show_diff` is deprecated in favor of `show_changes`. (PR 30988)
- *reg execution module*:
  - Removed the following deprecated functions from the `reg` module (PR 30956):
    - \* `read_key`
    - \* `set_key`
    - \* `create_key`
    - \* `delete_key`
  - Removed `force` parameter from `reg state` module
  - Fixed virtual function in `state`
  - Improved error information for `reg.delete_value` function
- *jboss7 execution module*: `deployed` function was decoupled from Artifactory by removing Artifactory-specific functionality. Note that the changes in some of the function arguments break existing state files, see [issue 30515](#) and [PR 3080](#) for details.
- *pkg state module*: The `wait` function was removed, the functionality was replaced with the `onchanges requisite` (PR 30297).
- *firewalld state module*: A `permanent` argument was added `add_port`. Note that `permanent` defaults to `True`, which changes previous behavior (PR 30275). A `bind` function was also added that allows binding zones to interfaces and sources (PR 29497).
- *journald beacon module*: The event string was updated to include a tag. Note this this might impact existing reactors based on this beacon. (PR 30116).
- *postgres\_privileges state module*: The default value of the `prepend` argument was changed from `None` to `public`.
- *zenoss execution module*: The `add_device` function was updated with a default value of `1000` for `prod_state` to match the documentation (PR 28924).
- The `etcd` execution module, `state` module, `returner` module, and `util` module were refactor (PR 28599). This refactor changes error returns for several functions (primarily edge cases):
  - `get`: Used to return `''` on key-not-found. Now returns `None`.
  - `set`: Used to return `''` on issues setting keys. Now returns `None`.
  - `ls`: Used to return `{path: {}}` on key-not-found. Now returns `None`.
  - `Tree`: Used to return `{}` on key-not-found. Now returns `None`.
- *smartos\_virt execution module*: Updated to use most of the new `smartos_vmadm` (PR 28284).
- *apache\_conf state module*, *apache\_module state module*, and *apache\_site state module*: the `enable` and `disable` functions were renamed to `enabled` and `disabled`, respectively. In [PR 33562](#), these functions were readded and properly deprecated and will be removed in Salt Nitrogen. This fix will be available in 2016.3.1. As a workaround, try

```
apache_module.enable{{ 'd' if grains.saltversioninfo == [2016, 3, 0] else '' }}
```

## New Features

### Thorium - Provisional New Reactor

The 2016.3 release introduces the new Thorium Reactor. This reactor is an experimental new feature that implements a flow programming interface using the salt state system as the engine. This means that the Thorium reactor uses a classic state tree approach to create a reactor that can aggregate event data from multiple sources and make aggregate decisions about executing reactions.

This feature is both experimental and provisional, it may be removed and APIs may be changed. This system should be considered as ambitious as the Salt State System in that the scope of adding a programmable logic engine of this scale into the event systems is non trivial.

See Thorium Complex Reactor.

### Improved Mac OS Support

### Improved Solaris Support

A lot of work was done to improve support for SmartOS. This work also resulted in improvements for Solaris and illumos as SmartOS.

- rewrite of *vmadm module* (SmartOS)
- rewrite of *imgadm module* (SmartOS)
- deprecation of *virt module* in favor of *vmadm* (SmartOS)
- implemented *smartos state* (SmartOS)
- improved *zpool module* add SmartOS, illumos and Solaris support
- improved *zfs module* add SmartOS, illumos and Solaris support
- implemented *zpool state*
- implemented *zfs state* implemented *solaris\_system* system module to provide better Solaris support (PR 30519)
- other minor fixes to grains, localmod, ...

### Tornado Transport

---

**Important:** The Tornado Transport wire protocol was changed in 2016.3, making it incompatible with 2015.8 (PR 29339).

---

### Windows DSC Integration (Experiemental)

### Dimension Data Cloud Support

A SaltStack Cloud driver for [Dimension Data Public Cloud](#), provides the driver functionality to service automation for any of the Dimension Data Public Cloud locations:

- Deploy new virtual machines

- List and query virtual machine images
- Destroy and query virtual machines

Documentation of the Dimension Data SaltStack integration is found on [developer.dimensiondata.com](http://developer.dimensiondata.com)

### Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Blackouts are enabled using a special pillar key, `minion_blackout` set to True.

See *Minion Blackout*.

### Splunk Returner

A Splunk Returner that uses HTTP Event Collector is now available ([PR 30718](#)).

### SQLCiper Pillar Module

Support was added for retrieving pillar data via queries to SQLCiper databases ([PR 29782](#)).

### New Modules

The following list contains a link to the new modules added in this release.

#### Beacons

- `beacons.adb`
- `beacons.glxinfo`
- `beacons.memusage`
- `beacons.network_settings`
- `beacons.proxy_example`
- `beacons.salt_proxy`

#### Engines

- `engines.docker_events`
- `engines.redis_sentinel`
- `engines.slack`
- `engines.sqs_events`
- `engines.thorium`

## Execution Modules

- `modules.bcach`
- `modules.beacons`
- `modules.boto_cloudtrail`
- `modules.boto_datapipeline`
- `modules.boto_iot`
- `modules.boto_lambda`
- `modules.boto_s3_bucket`
- `modules.chronos`
- `modules.cyttest`
- `modules.dockercompose`
- `modules.dsc`
- `modules.ethtool`
- `modules.github`
- `modules.infoblox`
- `modules.iwtools`
- `modules.jenkins`
- `modules.linux_ip`
- `modules.mac_assistive`
- `modules.mac_brew`
- `modules.mac_defaults`
- `modules.mac_desktop`
- `modules.mac_keychain`
- `modules.mac_pkgutil`
- `modules.mac_ports`
- `modules.mac_power`
- `modules.mac_service`
- `modules.mac_shadow`
- `modules.mac_softwareupdate`
- `modules.mac_sysctl`
- `modules.mac_system`
- `modules.mac_timezone`
- `modules.mac_xattr`
- `modules.marathon`
- `modules.minion`
- `modules.openvswitch`

- `modules.opkg`
- `modules.philips_hue`
- `modules.proxy`
- `modules.pushbullet`
- `modules.restartcheck`
- `modules.s6`
- `modules.salt_proxy`
- `modules.ssh_package`
- `modules.ssh_service`
- `modules.sysfs`
- `modules.vboxmanage`
- `modules.win_certutil`
- `modules.win_dism`
- `modules.win_dism`
- `modules.win_license`
- `modules.win_iis`
- `modules.win_task`
- `modules.zabbix`

#### **Pillar**

- `pillar.http_yaml`
- `pillar.stack`

#### **Proxy**

- `proxy.chronos`
- `proxy.junos`
- `proxy.marathon`
- `proxy.phillips_hue`
- `proxy.ssh_sample`

#### **Roster**

- `roster.range`

## States

- *states.apache\_conf*
- *states.apache\_site*

## 20.2.7 Salt 2016.3.1 Release Notes

Version 2016.3.1 is a bugfix release for *2016.3.0*.

### Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

### Changes for v2016.3.0..v2016.3.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-06-08T22:43:50Z

Total Merges: 87

Changes:

- PR #33866: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33860: (*cachedout*) Allow socket closes when the socket is disconnected
- b183a36 Set master and cloud to log level warning (#33861)
- PR #33698: (*opdude*) Vsphere fixes
- PR #33771: (*twangboy*) Additional functionality to win\_dism.py
- PR #33851: (*ticosax*) [dockerng] Add support for edge case when *Cmd* and *Entrypoint* can't be blanked
- PR #33821: (*cachedout*) Restore default log level to warning
- PR #33767: (*amontalban*) Fix #33604 implementation when `geom disk list` does not output rotat...
- PR #33806: (*cachedout*) Work around upstream cherry-py bug
- PR #33776: (*danslimmon*) Fixed ACL user comparison. Resolves #33754.
- PR #33763: (*abednarik*) Insert --no-refresh before install in Zypper.
- PR #33764: (*terminalmage*) Merge instead of update pillar overrides
- PR #33772: (*danslimmon*) Fixed spelling of ``through"
- PR #33651: (*cachedout*) Restore grains context to renderers
- PR #33757: (*cachedout*) Reminder not to return non-serializable data from states
- PR #33670: (*rallytime*) Handle non-ascii package names in state.format\_log
- PR #33723: (*rallytime*) Back-port #33641 to 2016.3
- PR #33748: (*ticosax*) HostConfig has been introduced by docker api version 1.15
- PR #33745: (*eliasp*) Typo (*privilages* → *privileges*)
- PR #33562: (*jfindlay*) states.apache\_\*: readd and deprecate enable and disable
- PR #33659: (*danslimmon*) Added test mode to states.dockerng. Resolves #33632.
- PR #33696: (*clburlison*) Update mac native package for upcoming release
- PR #33710: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- e87c310 backport #33599 to 2016.3 (#33682)
- 377556a Undo \_\_repr\_\_() and \_\_str\_\_() parts of d5a7dcc (#33688)

- 778b290 Remove explicit PW column default from mysql\_user (#33690)
- PR #33680: (*rallytime*) Back-port #32942 to 2016.3
- PR #33677: (*twangboy*) Pass kwargs to cmd.run
- PR #33648: (*terminalmage*) salt.modules.pkgng: Fix incorrect usage of \_pkg()
- PR #33646: (*jfindlay*) Fix more tmp paths on MacOS
- PR #33656: (*cachedout*) Fix indentation error in minion.py
- PR #33637: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- b7230bd Back-port #33613 to 2016.3 (#33638)
- PR #33606: (*danslimmon*) Fixed ini.options\_absent. Resolves #33590.
- PR #33604: (*kev009*) Fix #33578 disks grain
- 259529e Use correct state name in libvirt formula doc (#33631)
- PR #33603: (*sjorge*) allow esky packages to be build on base64 2015Q4
- PR #33576: (*tomlaredo*) Fix #33565 (typo causes invalid syntax)
- PR #33549: (*thatch45*) Fix for #33530
- PR #33538: (*anlutro*) Fix a KeyError if group is provided but not user in cmd states
- PR #33550: (*jacobhammons*) Fixes display of thorium docs
- PR #33509: (*twangboy*) Detect System Architecture for Mac Build
- PR #33522: (*jfindlay*) rework modules.mac\_brew.latest\_version to work around brew version inconsistency
- PR #33519: (*jacobhammons*) New doc site layout, 2016.3.0 release note known issue additions
- PR #33508: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33505: (*twangboy*) Fix build script where pip didn't work
- PR #33076: (*cachedout*) Avoid second grains load on windows multiprocessing

## 20.2.8 Salt 2016.3.2 Release Notes

Version 2016.3.2 is a bugfix release for *2016.3.0*.

### Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

### Changes for v2016.3.1..2016.3.2

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-07-27T15:47:45Z

Statistics:

- Total Merges: 198

Changes:

- PR #34946: (*anlutro*) Fix virtualenv behavior when requirements files are in subdirectories
- PR #34957: (*sjmh*) Don't fall through to checking auth entries
- PR #34971: (*cachedout*) Increase timeout for grains test
- PR #34951: (*vutny*) Fix #34873
- PR #34935: (*rallytime*) Avoid UnboundLocalError in beacons module
- PR #34956: (*cachedout*) Increase all run\_script timeouts to 30s
- PR #34933: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34916: (*cachedout*) Master performance improvement
- PR #34911: (*cachedout*) Backport #34906
- PR #34906: (*cachedout*) Set timeout for run\_salt in test suite
- PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list\_upgrades
- PR #34915: (*abednarik*) Update service\_rh provider to exclude XenServer >= 7.
- PR #34926: (*rallytime*) Lint #34923
- PR #34923: (*eliasp*) Handle exception when no Slack API key was provided
- PR #34910: (*cachedout*) Fix grains error on proxy minions
- PR #34864: (*jmacfar*) Check for version in list of installed versions
- PR #34902: (*rallytime*) Back-port #34878 to 2016.3
- PR #34878: (*abednarik*) Add VirtuozzoLinux is yumpkg enable list.
- PR #34901: (*rallytime*) Add VirtuozzoLinux to the list of enabled distros for rpm.py
- PR #34900: (*rallytime*) Add VirtuozzoLinux to enabled platforms list in rh\_service.py
- PR #34887: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force\_reset=False
- PR #34862: (*thatch45*) Fix salt-ssh cacheing issue
- PR #34859: (*cachedout*) Fix wheel test
- PR #34632: (*eliasp*) Try to create the log directory when not present yet
- PR #34854: (*rallytime*) Remove string\_types import from state compiler
- PR #34865: (*thatch45*) This needs discussion, since this breaks SUSE
- PR #34858: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34847: (*cachedout*) Add an option to skip the verification of client\_acl users
- PR #34833: (*rallytime*) Back-port #28521 to 2015.8
- PR #34828: (*thatch45*) Fix #34648
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #34823: (*rallytime*) Back-port #25276 to 2015.8
- PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low
- PR #28521: (*gongled*) SPM: packaging doesn't work in Python 2.6. Fixed.
- PR #25276: (*jacobhammons*) copy spm.1 man page during setup

- PR #34852: (*rallytime*) Skip GCE unit tests - causes test suite to hang
- PR #34844: (*vutny*) Fix getting total available memory without *psutil* installed
- PR #34837: (*thatch45*) Fix #34345
- PR #34838: (*thatch45*) Check if a valid value is passed to *unlyif/unless*
- PR #34840: (*thatch45*) update the state wrapper to include *show\_low\_sls*
- PR #34842: (*sjorge*) 2016.3 zpool cleanup and fixes
- PR #34770: (*aphor*) zpool state module needs support for disk vdev #34762
- PR #34825: (*thatch45*) keep this beacon from stack tracing at the loader
- PR #34824: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34818: (*jtand*) Skip mysql state test if *mysqladmin* is not available
- PR #34803: (*junovitch*) salt/state.py: set `'chunk['order'] = 0' with 'order: first'; fixes '#24744' _`
- PR #34642: (*jtand*) Check that *mysqladmin* exists before running mysql integration tests
- PR #34670: (*isbm*) Add `'osmajorrelease'` grain (2016.3)
- PR #34683: (*cachedout*) Fix publisher leak
- PR #34791: (*sjorge*) salt.state.zpool tweaks
- PR #34784: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34773: (*randomed*) Bugfix: Startup states on minions are not being written to mysql returner
- PR #34754: (*cachedout*) Disable test
- PR #34751: (*cachedout*) Remove unneeded config test
- PR #34741: (*rallytime*) Back-port #34726 to 2015.8
- PR #34726: (*martinhoefling*) Always loop over updated keys in non recursive update
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34756: (*jacobhammons*) Rebuild man pages
- PR #34746: (*rallytime*) Update azure lib dep to match the one in *cloud.clouds.msazure*
- PR #34744: (*jtand*) Test valid docs fix
- PR #34740: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34721: (*rallytime*) Add *output\_file* option to master config docs
- PR #34607: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34739: (*cachedout*) Remove unneeded config test
- PR #34607: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34722: (*rallytime*) Various spelling fixes
- PR #34714: (*sjmh*) Fix ldap auth for function matches
- PR #34720: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34695: (*isbm*) Bugfix: Zypper *pkg.list\_products* returns False on some empty values (2015.8)
- PR #34689: (*Azidburn*) fix second run problems with *pkg.installed* using sources
- PR #34682: (*jfindlay*) update 2015.8.11 release notes

- PR #34707: (*rallytime*) Add versionadded to ``special" option in cron.present state
- PR #34696: (*isbm*) Bugfix: Zypper *pkg.list\_products* returns False on some empty values (2016.3)
- PR #34702: (*farcaller*) Fixed *dockerng.list\_tags*
- PR #34681: (*rallytime*) Back-port #34549 to 2016.3
- PR #34549: (*Inveracity*) fixes multiple values in mof configuration
- PR #34679: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34676: (*cachedout*) Revert ``Modify lodaer global test to use populated dunderers"
- PR #34651: (*rallytime*) Lint 34644
- PR #34647: (*cachedout*) Adjust the mine test a little bit to give it a better chance of success
- PR #34644: (*cachedout*) Cleanup loader errors
- PR #34642: (*jtand*) Check that *mysqldadmin* exists before running *mysql* integration tests
- PR #34618: (*jtand*) Network state integration test *test=True*
- PR #34601: (*loregordon*) Clarifies the proper way to reference states
- PR #34605: (*gtmanfred*) catch error if no dns domains exist
- PR #34557: (*jacobweinstock*) handle *jboss* cli expression type in the parsing of output
- PR #34652: (*rallytime*) Spelling fixes found in *sqlite3* pillar docs
- PR #34565: (*Ch3LL*) add *num\_cpus* grain to *freebsd*
- PR #34621: (*jtand*) Suse Leap doesn't have `man'
- PR #34619: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34617: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34593: (*rallytime*) Back-port #33851 to 2015.8
- PR #34592: (*jtand*) Update github IP for *ssh* state integration tests
- PR #34591: (*jtand*) Gate *docker* unit test to check for *docker*
- PR #34590: (*oeuftete*) [2015.8] *dockerng*: When sorting list *actual\_data*, make it a list
- PR #34584: (*rallytime*) [2015.5] Avoid circular imports when calling *salt.utils* functions
- PR #34560: (*terminalmage*) Add a bunch of documentation on getting files from other environments
- PR #34545: (*terminalmage*) Handle cases where *Docker Remote API* returns an empty *ExecutionDriver*
- PR #34531: (*terminalmage*) Support *ignore\_epoch* argument in version comparisons
- PR #33851: (*ticosax*) [*dockerng*] Add support for edge case when *Cmd* and *Entrypoint* can't be blanked
- PR #34585: (*rallytime*) [2016.3] Avoid *salt.utils* circular imports when using ``from"
- PR #34616: (*jacobhammons*) Adds a mock required for the network settings beacon
- PR #34553: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34546: (*rallytime*) Rename *unit.states.boto\_secgroup* to *unit.states.boto\_secgroup\_test*
- PR #34537: (*rallytime*) Rename *tests.unit.simple* to *tests.unit.simple\_test*
- PR #34527: (*rallytime*) [2015.8] Update bootstrap script to latest stable
- PR #34521: (*cachedout*) Prevent many errors in the test suite in loader tests

- PR #34518: (*terminalmage*) Fix pkg.latest integration test for non-LTS ubuntu
- PR #34507: (*AAbouZaid*) Fix wrong order of retention\_policy\_exists.
- PR #34569: (*eliasp*) Minor doc fixes for PostgreSQL states
- PR #34524: (*terminalmage*) yumpkg: Avoid spurious logging in pkg.upgrade
- PR #34490: (*cachedout*) Fix master crash on ctl-c for long-running job
- PR #34520: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34513: (*cachedout*) Lower the log level for modules which cannot be loaded to trace
- PR #34505: (*terminalmage*) Improve top file merging documentation
- PR #34503: (*rallytime*) Rename some unit test files by adding \_test
- PR #34498: (*rallytime*) Use -O in the wget example in the bootstrap tutorial for the develop branch
- PR #34492: (*zer0def*) Gracefully handle non-XML output in GlusterFS execution module.
- PR #34489: (*jtand*) Use skipTest for network state integration test
- PR #34488: (*rallytime*) Update dnsmasq.get\_config docs to use correct config\_file param.
- PR #34499: (*gtmanfred*) remove unnecessary block parsing ip adrs for nova
- PR #34468: (*twangboy*) Use Python 2.7.12 for Windows Build
- PR #34493: (*twangboy*) Use Python 2.7.12 for Mac Build
- PR #34486: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34467: (*rallytime*) Back-port #34457 to 2015.8
- PR #34462: (*terminalmage*) Use --always when available to git describe
- PR #34457: (*ryan-lane*) Only access key metadata if we found key metadata
- PR #34455: (*cro*) Forgot reference to inotify
- PR #34432: (*twangboy*) Fix file.append
- PR #34429: (*terminalmage*) Skip version checking for targeted packages in pkg.latest state
- PR #34459: (*terminalmage*) Ignore retcode when formatting highstate output
- PR #34463: (*terminalmage*) states/git: pass required cwd parameter to git.describe.
- PR #34466: (*rallytime*) Back-port #34436 to 2016.3
- PR #34436: (*artxki*) Fix #34395 Nonfunctional default\_password in states.postgres\_user.present
- PR #34453: (*jtand*) Arch linux does not have osrelease or osmajorrelease grains
- PR #34456: (*thatch45*) Be more careful when making the SMinion
- PR #34452: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34451: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34435: (*cachedout*) Backport change to integraiton test suite
- PR #34426: (*cro*) Document that inotify is Linux only
- PR #34401: (*terminalmage*) Use rpmdev-vercmp as a fallback for version comparison on RHEL5
- PR #34366: (*steveuweber*) Update service.py
- PR #34427: (*twangboy*) Automated signing fixes for Ubuntu 16.04, 14.04, 12.04 (for dmurphy)

- PR #34400: (*cachedout*) Fix uninitialized value
- PR #34404: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34392: (*cro*) Clarify that salt-cloud doesn't get installed by bootstrap
- PR #34377: (*terminalmage*) Optimize pkg integration tests and add a couple new tests
- PR #34373: (*jtand*) Network state integration test
- PR #34292: (*twangboy*) Fix runas function for System Account
- PR #34388: (*rallytime*) Back-port #34378 to 2016.3
- PR #34378: (*adelcast*) network\_settings.py: fix documentation
- PR #34352: (*cro*) Esxi dvs
- PR #34386: (*rallytime*) Beacon network docs
- PR #34376: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34368: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34344: (*rallytime*) Back-port #34324 to 2015.8
- PR #34342: (*rallytime*) Back-port #34316 to 2015.8
- PR #34324: (*cachedout*) Test custom grains matcher
- PR #34316: (*edgan*) Making salt-ssh pass proper return codes for jinja rendering errors
- PR #34252: (*gtmanfred*) return list of nodes for lxc driver when called directly
- PR #34365: (*sjorge*) fixes computenode\_\* grains on SmartOS compute nodes
- PR #34353: (*cro*) Remove proxy check and additional GetConnection--this makes the proxy...
- PR #34348: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34339: (*terminalmage*) Revert py3modernize lint changes
- PR #34335: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34325: (*terminalmage*) Remove unnecessarily-disabled sanity check
- PR #34323: (*jacobhammons*) Doc clarifications to file modules, addition of new *profile* log lev...
- PR #34319: (*rallytime*) Back-port #34244 to 2015.8
- PR #34313: (*rallytime*) [2015.5] Update to latest bootstrap script v2016.06.27
- PR #34312: (*rallytime*) [2015.8] Update to latest bootstrap script v2016.06.27
- PR #34307: (*rallytime*) Fix test example in integration testing docs
- PR #34306: (*ghedo*) Fix iptables.flush state: Do not force `filter' table when flushing
- PR #34244: (*the-glu*) Typo in dockerio doc
- PR #34343: (*rallytime*) Back-port #34256 to 2016.3
- PR #34256: (*tmehlinger*) detect running from master in State.event method
- PR #34338: (*themalkolm*) Add listen/listen\_in support to stateconf.py
- PR #34283: (*sjorge*) 2016.3 mount vfstab support
- PR #34322: (*Ch3LL*) add osmajorrelease grain for raspbian
- PR #34337: (*clinta*) Change merge-if-exists logic to properly report changes

- PR #34300: (*vutny*) Make apache.configfile state handle the Options list correctly
- PR #34333: (*rallytime*) Back-port #33734 to 2016.3
- PR #34304: (*rallytime*) Back-port #33734 to 2016.3
- PR #33734: (*glomium*) modules/rabbitmq.py version checking had a logical error
- PR #34330: (*clinta*) fix #34329
- PR #34318: (*rallytime*) Back-port #32182 to 2016.3
- PR #32182: (*dongweiming*) Fix psutil.cpu\_times unpack error
- PR #34311: (*rallytime*) [2016.3] Update to latest bootstrap script v2016.06.27
- PR #34284: (*rallytime*) Don't require `domain` to be present before checking fqdn\_ip\* grains
- PR #34296: (*sjorge*) 2016.3 status module now works on Solaris like platforms
- PR #34281: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34274: (*clinta*) Don't escape source before calling managed
- PR #34258: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34257: (*rallytime*) Use `config\_dir` setting instead of CONFIG\_DIR in gpg renderer
- PR #34233: (*thegoodduke*) ipset: fix the comment containing blank
- PR #34232: (*thegoodduke*) ipset: fix comment containing blank
- PR #34225: (*richardscollin*) Fix win\_system.set\_system\_date\_time
- PR #34271: (*opdude*) Fixed symlinks on windows where the slashes don't match
- PR #34254: (*sjorge*) Fix for #14915
- PR #34259: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34136: (*meaksh*) Fixed behavior for SUSE OS grains in 2015.8
- PR #34134: (*meaksh*) Fixed behavior for SUSE OS grains in 2016.3
- PR #34093: (*terminalmage*) Catch CommandExecutionError in pkg states
- PR #33903: (*meaksh*) Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
- PR #34134: (*meaksh*) Fixed behavior for SUSE OS grains in 2016.3
- PR #33903: (*meaksh*) Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
- PR #34159: (*christoe*) Fixes to the win\_task module
- PR #34223: (*peterdemin*) Fixed typo in filtering LDAP's potential\_ous
- PR #34239: (*vutny*) file.find module: fix handling of broken symlinks
- PR #34229: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34218: (*terminalmage*) Fix a pair of gitfs bugs
- PR #34208: (*lomeroe*) fix regression from #33681 which causes pulling a list of s3 objects ...
- PR #34206: (*terminalmage*) Change target for dockerng assuming default status to Nitrogen release
- PR #34188: (*terminalmage*) Clarify pkg.list\_repo\_pkgs docstring for held packages
- PR #34182: (*rallytime*) Handle child PIDs differently depending on the availability of psutils
- PR #33942: (*cachedout*) ZD 762

- PR #33681: (*rallytime*) Back-port #33599 to 2015.8
- PR #33599: (*lomeroc*) Fix s3 large file download
- PR #34214: (*rallytime*) Update saltutil.wheel docs to specify remote vs local minion behavior
- PR #34209: (*lomeroc*) fix regression in s3.query from #33682
- PR #33682: (*lomeroc*) backport #33599 to 2016.3
- PR #33599: (*lomeroc*) Fix s3 large file download
- PR #34222: (*cachedout*) Lint 34200
- PR #34200: (*secumod*) Fix parted module set CLI example
- PR #34197: (*eliasp*) Make `module.ssh.recv_known_host()` more resilient against hosts not returning a key
- PR #34201: (*DarkKnightCZ*) Suffix temp file with `.sr1` and add mandatory argument when executing PowerShell script
- PR #34198: (*DarkKnightCZ*) Don't use binary mode for `cmdmod.exec_code`
- PR #34198: (*DarkKnightCZ*) Don't use binary mode for `cmdmod.exec_code`
- PR #34172: (*dmurphy18*) Support for building with local packages on Debian and Ubuntu
- PR #34194: (*vutny*) Correct the docstrings formatting in `pkgbuild` modules and state
- PR #34056: (*vutny*) Make `rpmbuild` module work on non-RPM based GNU/Linux systems
- PR #34186: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34184: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34179: (*terminalmage*) Raise the correct exception when `gitfs` lockfile is empty
- PR #34178: (*terminalmage*) Remove unnecessary comment
- PR #34176: (*rallytime*) Back-port #34103 to 2015.8
- PR #34175: (*rallytime*) Back-port #34128 to 2015.8
- PR #34174: (*rallytime*) Back-port #34066 to 2015.8
- PR #34165: (*mcalmer*) fix `salt --summary` to count not responding minions correctly
- PR #34141: (*jtand*) Fixed `boto_vpc_test` failure
- PR #34128: (*bebehei*) doc: add missing dot
- PR #34103: (*morganwillcock*) Fix `diskusage` beacon
- PR #34077: (*rallytime*) Add some grains targeting tests
- PR #34066: (*complexsplit*) Typo fix
- PR #33474: (*cachedout*) Fix `diskusage` beacon
- PR #34173: (*rallytime*) Update docs to match `log_level` default
- PR #34095: (*rallytime*) Back-port #32396 to 2016.3
- PR #32396: (*eradman*) Unbreak `cron.file`
- PR #34108: (*l2ol33rt*) Make `dockerng.absent` state honor `test=true`
- PR #34133: (*rallytime*) Back-port #34057 to 2016.3
- PR #34057: (*ajacoutot*) `_active_mounts_opensd`: unbreak output for special filesystems

- PR #34156: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34142: (*isbm*) Move log message from INFO to DEBUG.
- PR #34100: (*terminalmage*) Update documentation on ``refresh" behavior in pkg states
- PR #34072: (*jfindlay*) modules.pkg int tests: skip refresh\_db upon error
- PR #34110: (*garethgreenaway*) Fixes to git module & state module related to identity file
- PR #34138: (*rallytime*) Update package dep note to systemd-python for RHEL7 install
- PR #34166: (*vutny*) Fix YAML indentation in Apache state docstrings
- PR #34098: (*terminalmage*) Restore old refresh logic
- PR #34087: (*bbinet*) Encourage to report issues to upstream PillarStack project
- PR #34075: (*jfindlay*) modules.inspectlib.kiwiproc: import gate lxml
- PR #34056: (*vutny*) Make rpmbuild module work on non-RPM based GNU/Linux systems
- PR #34073: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34069: (*rallytime*) Add a test to check for disconnected minion messaging
- PR #34051: (*tegbert*) Fixed a bug in the consul.py module that was preventing services
- PR #34048: (*terminalmage*) RFC: proposed fix for multiple filesver updates in masterless runs
- PR #34045: (*jacobhammons*) Updated latest release version
- PR #34030: (*vutny*) More YAML indentation fixes in state module examples
- PR #34020: (*twangboy*) Always make changes to minion config if set (2015.8)
- PR #34018: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34011: (*rallytime*) Back-port #33948 and #34009 to 2015.8
- PR #34009: (*rallytime*) Back-port #33948 to 2016.3 + add log message
- PR #34005: (*rallytime*) Lint fix for #34000
- PR #34003: (*vutny*) states.file: fix indentation in YAML examples
- PR #34002: (*lorenegordon*) Remove loader test for pam module
- PR #34000: (*cachedout*) Fix incorrectly written test
- PR #33990: (*jacobhammons*) Adds links to several current Salt-related projects
- PR #33985: (*rallytime*) Write some more simple batch command tests
- PR #33984: (*jfindlay*) Add docs and tests to disk state
- PR #33983: (*twangboy*) Clarify the *account\_exists* parameter
- PR #33953: (*whiteinge*) Add loader.utils() example to calling minion\_mods
- PR #33951: (*jfindlay*) modules.gem int tests: more fixes
- PR #33948: (*cachedout*) Save an entire minion cache traversal on each master pub
- PR #33904: (*rallytime*) Back-port #33806 to 2015.5
- PR #33880: (*terminalmage*) pkg.uptodate: Pass kwargs to pkg.list\_upgrades
- PR #33806: (*cachedout*) Work around upstream cherryppy bug
- PR #33684: (*jfindlay*) add acl unit tests

- PR #34010: (*terminalmage*) Do not cache remote files if they are already cached
- PR #34009: (*rallytime*) Back-port #33948 to 2016.3 + add log message
- PR #33948: (*cachedout*) Save an entire minion cache traversal on each master pub
- PR #33941: (*cachedout*) Don't call `os.getppid()` on Windows
- PR #34067: (*jacobhammons*) Fixes doc refresh bug on chrome mobile.
- PR #34050: (*rallytime*) Back-port #34026 to 2016.3
- PR #34026: (*bensherman*) removed method that doesn't exist
- PR #33987: (*isbm*) inspectlib cleanup
- PR #34042: (*sjorge*) fix #34038
- PR #34025: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34044: (*jacobhammons*) Updated latest release to 2016.3.1
- PR #34014: (*jnhmcknight*) fix launch config creation params
- PR #34021: (*twangboy*) Always make changes to minion config if set (2016.3)
- PR #34031: (*eliasp*) `states.postgres_privileges` expects a real list, not a comma-separated string
- PR #33995: (*jacobhammons*) Understanding Jinja topic, Jinja doc issues.
- PR #33900: (*amendlik*) Document sudo policy for gitfs post-recieve hook
- PR #33980: (*twangboy*) Use full path to `python.exe`
- PR #33993: (*s0undt3ch*) Call `sys.exit()` instead of `exit()`
- PR #33976: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33962: (*jacobhammons*) Adds a ``Generated on <timestamp>'' line to the html footer
- PR #33952: (*rallytime*) Add base argument to salt-ssh grains wrapper for `filter_by` func
- PR #33946: (*rallytime*) Back-port #33698 to 2015.8
- PR #33942: (*cachedout*) ZD 762
- PR #33698: (*opdude*) Vsphere fixes
- PR #33912: (*abalashov*) `utils/schedule.py:handle_func()` - Fix for accessing returner configur...
- PR #33945: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33936: (*rallytime*) Add `connecting_settings` to `boto_elb` state attributes list
- PR #33917: (*techhat*) Wait for up to a minute for `sync_after_install`
- PR #33888: (*jfindlay*) random.org checks
- PR #33877: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33833: (*terminalmage*) Support syncing pillar modules to masterless minions
- PR #33829: (*terminalmage*) Update `versionchanged` directive
- PR #33814: (*terminalmage*) Support extraction of XZ archives in `archive.extracted` state
- PR #33778: (*sodium-chloride*) Fix minor docstring issues
- PR #33765: (*cachedout*) Correct issue with ping on rotate with minion cache
- PR #33726: (*jtand*) `glance.warn_until` shouldn't be checked for a doc string

- PR #33611: (*rolffokkens*) 2015.5
- PR #33960: (*mecarus*) Fix mongo get\_load to return full mongo record instead of non-existent 'load' key
- PR #33961: (*jacobhammons*) 2016.3.0 known issues update
- PR #33908: (*ticosax*) [boto\_lambda] handle omitted Permissions parameter
- PR #33896: (*DmitryKuzmenko*) Don't deep copy context dict values.
- PR #33905: (*rallytime*) Back-port #33847 to 2016.3
- PR #33910: (*cachedout*) Ensure tht pillar have freshest grains
- PR #33870: (*rallytime*) Add note about Xenial packages to 2016.3.0 release notes
- PR #33847: (*whiteinge*) Add docs for arg/kwarg eauth matching
- PR #33076: (*cachedout*) Avoid second grains load on windows multiprocessing
- PR #29153: (*DmitryKuzmenko*) ACL limit args

### 20.2.9 Salt 2016.3.3 Release Notes

Version 2016.3.3 is a bugfix release for *2016.3.0*.

#### Known Issues

*issue 36055*: Salt Cloud events (`salt/cloud`) are not generated on the master event bus when provisioning cloud systems.

*Bootstrap Issue #973*: `python-futures` is not installed when installing from a git tag on RedHat-based distributions. `Python futures` is needed when running Salt with the TCP transport. This is fixed on the `develop` branch of the [salt-bootstrap repo](#) and the fix will be included in the upcoming release of salt-bootstrap, but is a bug in the bootstrap release that ships with this version of Salt. Please see the [salt-bootstrap repo](#) for more information on how to update your bootstrap version.

#### Changes for v2016.3.2..2016.3.3

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

*Generated at: 2016-08-19T16:17:34Z*

Total Merges: 134

Changes:

- PR #35580: (*twangboy*) Fix mac\_service attempts to parse non-plist files
- PR #35586: (*hu-dabao*) Fix 35420, add run\_on\_start in build\_schedule\_item
- PR #35583: (*terminalmage*) Fix localemod tests
- PR #35579: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35577: (*terminalmage*) Unit file changes for 2015.8.12, 2016.3.3
- PR #35571: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35566: (*rallytime*) Back-port #35545 to 2015.8
- PR #35546: (*whiteinge*) Salt api eauth fail gracefully

- PR #35545: (*hu-dabao*) [fix-35384](#), fix `cmd.run` unless
- PR #35540: (*rallytime*) Whitespace fix for 2015.8
- PR #35525: (*UtahDave*) add missing glob import
- PR #35510: (*terminalmage*) Better systemd integration
- PR #35492: (*terminalmage*) Clarify `config.get` docstring
- PR #35483: (*gtmanfred*) use `__utils__` in `salt.cloud`
- PR #35573: (*rallytime*) Back-port [#33337](#) to 2016.3
- PR #33337: (*mzupan*) adding the `()` to make changes work
- PR #35572: (*terminalmage*) Fix poor formatting in pkg state docs
- PR #35545: (*hu-dabao*) [fix-35384](#), fix `cmd.run` unless
- PR #35489: (*rallytime*) Back-port [#35463](#) to 2016.3
- PR #35463: (*skizunov*) Make `auth_timeout` user configurable again
- PR #35538: (*thatch45*) Treat python XML as an optdep
- PR #35526: (*thatch45*) Always deploy the thin to `/var/tmp`
- PR #35522: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35513: (*cachedout*) Might be a good idea to be able to download the software we make
- PR #35512: (*cachedout*) Fixup 35419
- PR #35508: (*terminalmage*) Add Carbon to versionadded for `git.diff`
- PR #35497: (*deepakhj*) Fixes spacing in requirements files
- PR #35302: (*Ch3LL*) Add job cache test
- PR #35516: (*rallytime*) Back-port [#34441](#) to 2016.3
- PR #34441: (*markuskramerlgitt*) Copy and delete silently, do not list each file
- PR #35517: (*rallytime*) Back-port [#34502](#) to 2016.3
- PR #34502: (*markuskramerlgitt*) Windows installer build scripts will exit on error
- PR #35429: (*tankywoo*) Fix iptables target options with no arguments
- PR #35495: (*rallytime*) Use correct deprecated notation instead of a warning for `apache_module.enable` state function.
- PR #35498: (*rallytime*) Add supported templates list to all template doc references in file state
- PR #35406: (*rallytime*) Provide links to the renderers in the template docs
- PR #35360: (*rallytime*) Add all template registry templates to `file.managed` docs
- PR #35487: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35486: (*rallytime*) Update bootstrap script to latest stable (2016.08.16)
- PR #35476: (*cachedout*) Fixup SSH bug where `sudo` without `sudo` user would break
- PR #35471: (*terminalmage*) `win_pkg`: Fix traceback when package is not installed
- PR #35460: (*rallytime*) [2015.8] Update bootstrap script to latest stable (2016.08.15)
- PR #35459: (*thatch45*) Ensure that output for `salt-ssh` gets back

- PR #35453: (*theothergraham*) fixes #34279 - disk cache ttl expiry
- PR #35451: (*isbm*) Bugfix: zypper mod repo unchanged
- PR #35448: (*isbm*) Add ignore\_repo\_failure option to suppress zypper's exit code 106 on ...
- PR #35413: (*cachedout*) Resolve path issues with cp.push
- PR #35446: (*cachedout*) Make salt-client aware of edge-case where saltutil might be broken
- PR #35449: (*dkruger*) aptpkg will specify --install-recommends if enabled by the SLS
- PR #35467: (*rallytime*) Back-port #33518 to 2016.3
- PR #35235: (*rallytime*) Back-port #33518 to 2016.3
- PR #33518: (*tonybaloney*) Fix libcloud bug #33367
- PR #35461: (*rallytime*) [2016.3] Update bootstrap script to latest stable (2016.08.15)
- PR #35456: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35442: (*cachedout*) Fix cp.push\_dir pushing empty dirs
- PR #35436: (*cachedout*) Minor doc fixup
- PR #35132: (*sjorge*) fixes , causing lots of mayham (onchange) with 2016.3.2 for me
- PR #35447: (*ticosax*) [dockerng] RepoTags can be also be None with docker 1.12
- PR #35308: (*farcaller*) Actually fixed dockerng.list\_tags
- PR #34702: (*farcaller*) Fixed dockerng.list\_tags
- PR #35427: (*cachedout*) Correct errant call to argspec from master. Fix ext\_job\_cache.
- PR #35428: (*cachedout*) Resolve stacktrace logged by highstate outputter if sls cannot be found
- PR #35412: (*s0undt3ch*) Only allow one sync read to happen at a time.
- PR #35406: (*rallytime*) Provide links to the renderers in the template docs
- PR #35360: (*rallytime*) Add all template registry templates to file.managed docs
- PR #35393: (*deniszh*) No need to run ddns update every time
- PR #35407: (*hu-dabao*) [Fix-35094] None will not be added to grains which generate [none]
- PR #35411: (*eliasp*) modules.event.send(): Prevent backtrace for masterless Minions
- PR #35395: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35394: (*rallytime*) Back-port #34573 to 2015.8
- PR #35359: (*terminalmage*) Clean up open filehandles
- PR #35357: (*twangboy*) Fix file.recurse with clean: True on Windows (2015.8)
- PR #35339: (*isbm*) Bugfix: Prevent continuous restart, if a dependency wasn't installed
- PR #34573: (*cedwards*) Update freebsd.rst
- PR #35373: (*cachedout*) Raise SaltRenderError on bad requisite
- PR #35352: (*twangboy*) Fix file.recurse with clean: True on Windows (2016.3)
- PR #35356: (*jfindlay*) document log levels and warn on all logging below info
- PR #35358: (*twangboy*) Update libsodium deps
- PR #35360: (*rallytime*) Add all template registry templates to file.managed docs

- PR #35362: (*rallytime*) Correct deprecation version tags
- PR #35361: (*rallytime*) Blockdev deprecations
- PR #25267: (*jfindlay*) Disk module improvements
- PR #24893: (*The-Loeki*) Contribution: Disk module improvements
- PR #35347: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35325: (*kev009*) Fix freebsd netstat route on fbsd 10+
- PR #35323: (*thatch45*) Fix issue with bad error check in salt-vt
- PR #35309: (*terminalmage*) file.recurse: Do not convert octal mode string to int
- PR #35301: (*bobrik*) Pass port to ssh.check\_known\_host, closes #35264
- PR #35334: (*cachedout*) Restore random\_master functionality
- PR #35331: (*hu-dabao*) fix 35165, salt-run jobs.exit\_success jid is broken
- PR #35318: (*rallytime*) Remove legacy compat docs in mysql pillar since the code was removed already
- PR #30913: (*jtand*) Deprecated code removed.
- PR #35329: (*hu-dabao*) sys.doc will skip all not connected minions
- PR #35306: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35290: (*terminalmage*) Resolve a couple bugs in orchestration output
- PR #35229: (*lubyou*) Ignore import error for pwd module in mac\_shadow
- PR #35227: (*isbm*) Isbm osfinger ubuntu fix
- PR #35286: (*hu-dabao*) fix 34425, a bug that sys.doc cannot output format
- PR #35275: (*rallytime*) Back-port #35213 to 2016.3
- PR #35213: (*gtmanfred*) add identity v3 support to openstack driver
- PR #35278: (*dmurphy18*) Increase timeout for signing to 10 seconds when signing rpm packages
- PR #35276: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35271: (*bobrik*) Default state\_output\_profile to True everywhere, closes #35166
- PR #35249: (*terminalmage*) Fix regression in git.latest
- PR #35245: (*rallytime*) Back-port #35039 to 2015.8
- PR #35241: (*terminalmage*) Ensure max recursion in gitfs results in no blob object being returned.
- PR #35240: (*derekmaciel*) Backport #35225 to 2015.8
- PR #35236: (*rallytime*) Back-port #35119 to 2015.8
- PR #35233: (*terminalmage*) Do not attempt to get fqdn\_ip{4,6} grains when ipv{4,6} grains are empty
- PR #35225: (*derekmaciel*) Add missing documentation for pkg.installed
- PR #35211: (*cachedout*) Alternative sudo users for salt-ssh
- PR #35202: (*multani*) doc: fix broken links in the test documentation page
- PR #35119: (*derekmaciel*) Assume two EVRs are equal if E and V are equal but one R is missing.
- PR #35039: (*whiteinge*) Add saltenv support to module.run
- PR #35274: (*rallytime*) Lint fixes for 2016.3 branch

- PR #35232: (*theredcat*) fix rabbitmq version detection using a package-agnostic version
- PR #35269: (*meaksh*) Checksum validation for zypper pkg.download in 2016.3 and develop
- PR #35197: (*vutny*) Make *pkgbuild.repo* state recognize *createrepo* command return code
- PR #35178: (*cro*) Add `append_minionid_config_dirs` option
- PR #35259: (*cachedout*) Fixup 35253
- PR #35253: (*abednarik*) Fix `disk.wipe` missing option.
- PR #35253: (*abednarik*) Fix `disk.wipe` missing option.
- PR #35206: (*hu-dabao*) Make the log level back to warning for unclassified exc
- PR #35196: (*isbm*) Deprecate `status.uptime` one version later
- PR #35207: (*eliasp*) Handle exceptions in `_get_virtual()` and in `_get_virtual()` consumers
- PR #35232: (*theredcat*) fix rabbitmq version detection using a package-agnostic version
- PR #35244: (*rallytime*) Back-port #31677 to 2016.3
- PR #31677: (*miihael*) Return correct value for services that must be enabled in Systemd
- PR #35182: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35174: (*rallytime*) Back-port #35146 to 2015.8
- PR #35173: (*rallytime*) Back-port #35135 to 2015.8
- PR #35146: (*cachedout*) Don't discard running beacons config when listing beacons
- PR #35145: (*jacobhammons*) doc version update to 2015.8.11, updates to release notes
- PR #35135: (*rallytime*) Add missing CLI Examples to `aws_sqs` module funcs
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #35150: (*rallytime*) Start release notes for 2016.3.3
- PR #35157: (*hu-dabao*) master returned from func should be a string as designed so far
- PR #35147: (*jacobhammons*) doc version updated to 2016.3.2
- PR #35136: (*s0undt3ch*) Don't restart processes if the manager is not set to restart them
- PR #35133: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35114: (*terminalmage*) Add clarification docs on a common `git_pillar` misconfiguration
- PR #35043: (*rallytime*) Start release notes file for 2015.8.12
- PR #34768: (*hrumph*) Fixes #34767
- PR #35120: (*kstreee*) The `'_handle_event_socket_recv'` function in Salt Api is missing first data of stream.
- PR #35131: (*rallytime*) Back-port #35011 to 2016.3
- PR #35011: (*nishigori*) Fix docstring for code-block of `rst`
- PR #35110: (*hu-dabao*) Do not return job status back to master for `master_alive` and `master_failback` schedules
- PR #35104: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35066: (*jfindlay*) `returners.postgres_local_cache`: do not log in `__virtual__`
- PR #35050: (*terminalmage*) [orchestration] Properly handle runner/wheel funcs which accept a `'saltdev'` argument

- PR #35026: (*cachedout*) Expressly deny a minion if a key cannot be found
- PR #35024: (*bobrik*) Cache systemd unit update check per unit, closes #34927
- PR #35105: (*rallytime*) Update 2016.3.0 release notes with repo.saltstack.com Xenial pkg availability
- PR #33870: (*rallytime*) Add note about Xenial packages to 2016.3.0 release notes
- PR #35059: (*vutny*) Add *fun\_args* field to events generated by execution of Master modules
- PR #34955: (*lubyu*) force *dism* to always output english text
- PR #35078: (*jacobweinstock*) added missing non-keyword argument *skip\_verify* to *\_\_get\_artifact* func...
- PR #35008: (*hu-dabao*) Fix multimaster failover on more than two masters and failback behaviour
- PR #35055: (*galet*) #33536 *pkgrepo.managed* does not disable a yum repo with ``disabled: True``
- PR #35039: (*whiteinge*) Add *saltenv* support to *module.run*
- PR #35046: (*eliasp*) Prevent backtrace in *salt.states.network*
- PR #35054: (*lubyu*) Only fail user lookup if the user parameter is required
- PR #35029: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35000: (*rallytime*) Back-port #33875 and #34999 to 2015.8
- PR #34994: (*rallytime*) Back-port #34835 to 2015.8
- PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in *salt-ssh*
- PR #33875: (*jmesquita*) Fix naive fileservers map diff algorithm
- PR #35021: (*terminalmage*) Don't add `!` to *strerror* when passed string ends in `?` or `!`
- PR #34983: (*eliasp*) *modules.slack.post\_message*: Allow sending messages to direct-message ...
- PR #34996: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34991: (*cachedout*) SSH timeout
- PR #34976: (*cachedout*) Refine errors in client
- PR #34831: (*thatch45*) If the thin does not match, then redeploy, don't error
- PR #34987: (*eliasp*) *salt.states.slack*: check correct result attribute
- PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in *salt-ssh*
- PR #34988: (*rallytime*) Update release notes with new changes
- PR #34946: (*anlutro*) Fix *virtualenv* behavior when requirements files are in subdirectories
- PR #34957: (*sjmh*) Don't fall through to checking auth entries
- PR #34971: (*cachedout*) Increase timeout for grains test
- PR #34951: (*vutny*) Fix #34873
- PR #34935: (*rallytime*) Avoid *UnboundLocalError* in *beacons* module
- PR #34894: (*rallytime*) [develop] Merge forward from 2016.3 to develop
- PR #34956: (*cachedout*) Increase all *run\_script* timeouts to 30s
- PR #34933: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34916: (*cachedout*) Master performance improvement
- PR #34911: (*cachedout*) Backport #34906

- PR #34906: (*cachedout*) Set timeout for run\_salt in test suite
- PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list\_upgrades
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34915: (*abednarik*) Update service\_rh provider to exclude XenServer >= 7.
- PR #34926: (*rallytime*) Lint #34923
- PR #34923: (*eliasp*) Handle exception when no Slack API key was provided
- PR #34910: (*cachedout*) Fix grains error on proxy minions
- PR #34864: (*jmacfar*) Check for version in list of installed versions
- PR #34902: (*rallytime*) Back-port #34878 to 2016.3
- PR #34878: (*abednarik*) Add VirtuozzoLinux is yumpkg enable list.
- PR #34901: (*rallytime*) Add VirtuozzoLinux to the list of enabled distros for rpm.py
- PR #34900: (*rallytime*) Add VirtuozzoLinux to enabled platforms list in rh\_service.py
- PR #34887: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force\_reset=False
- PR #34862: (*thatch45*) Fix salt-ssh cacheing issue
- PR #34859: (*cachedout*) Fix wheel test
- PR #34632: (*eliasp*) Try to create the log directory when not present yet
- PR #34854: (*rallytime*) Remove string\_types import from state compiler
- PR #34865: (*thatch45*) This needs discussion, since this breaks SUSE
- PR #34858: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34847: (*cachedout*) Add an option to skip the verification of client\_acl users
- PR #34833: (*rallytime*) Back-port #28521 to 2015.8
- PR #34828: (*thatch45*) Fix #34648
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #34823: (*rallytime*) Back-port #25276 to 2015.8
- PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low
- PR #28521: (*gongled*) SPM: packaging doesn't work in Python 2.6. Fixed.
- PR #25276: (*jacobhammons*) copy spm.1 man page during setup
- PR #34852: (*rallytime*) Skip GCE unit tests - causes test suite to hang

### 20.2.10 Salt 2016.3.4 Release Notes

Version 2016.3.4 is a bugfix release for *2016.3.0*.

### Known Issues

The Salt Minion does not clean up files in `/tmp` when rendering templates. This potentially results in either running out of disk space or running out of inodes. Please see [Issue #37541](#) for more information. This bug was fixed with [Pull Request #37540](#), which will be available in the 2016.3.5 release of Salt.

The release of the `bootstrap-salt.sh` script that is included with 2016.3.4 release has a bug in it that fails to install salt correctly for git installs using tags in the 2015.5 branch. This bug has not been fixed in the `salt-bootstrap` repository yet, but the [previous bootstrap release](#) (v2016.08.16) does not contain this bug.

### Changes

- The `disk.wipe` execution module function has been modified so that it correctly wipes a disk.
- Add ability to clone from a snapshot to the VMWare salt-cloud driver.
- Add ability to specify disk backing mode in the VMWare salt cloud profile.

### Changes for v2016.3.3..v2016.3.4

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Changes:

- [PR #37282](#): (*thatch45*) add cpub to raet event for compat
- [PR #37278](#): (*jfindlay*) update 2016.3.4 release notes
- [PR #37252](#): (*vutny*) Set logging level to `info` for message about init system detection
- [47290d8](#) Update man pages for the 2016.3 branch ([#37259](#))
- [PR #37257](#): (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- [PR #37254](#): (*DmitryKuzmenko*) Bugs/37191 minion hangs
- [PR #37218](#): (*darkalia*) [Issue #37187](#) Do not parse first `/proc/1/cmdline` binary if it's not `*b...`
- [PR #37239](#): (*Ch3LL*) Fix cloud tests timeout
- [PR #37244](#): (*rallytime*) Update bootstrap release to 2016.10.25
- [PR #37245](#): (*rallytime*) Back-port [#36334](#) to 2016.3
- [PR #37233](#): (*rallytime*) Back-port [#37154](#) to 2016.3
- [PR #37232](#): (*rallytime*) Back-port [#37153](#) to 2016.3
- [PR #37228](#): (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- [PR #37213](#): (*cachedout*) More salttesting fixes
- [PR #37207](#): (*cachedout*) Correct documentation for `mine_functions`
- [PR #37208](#): (*cachedout*) Give multimion a process manager and its own destroy method
- [PR #37206](#): (*cachedout*) Address transport test hang
- [PR #37179](#): (*isbm*) Fix Salt-API ssh crash (2016.3)
- [PR #37183](#): (*gtmanfred*) load tags should reference the actual load tags

- PR #37188: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- d7e28d2 Pylint fix for 2016.3 (#37186)
- PR #37175: (*cachedout*) Fix test hang
- PR #37144: (*DmitryKuzmenko*) Bugs/36866 salt minion communication broken 2016.3
- PR #37158: (*jfindlay*) add mock for *status.uptime* unit test
- PR #37161: (*rallytime*) Back-port #37098 to 2016.3
- PR #37159: (*rallytime*) Back-port #37107 to 2016.3
- PR #37163: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 2bc5ded Allow the minion test daemons a couple of tries to connect to the master (#37150)
- ec7ad9e Add note about salt-bootstrap known issue for 2016.3.4 (#37152)
- PR #37135: (*AaronM-Cloudtek*) Fix example signing policy in salt.states.x509 docs
- PR #37140: (*vutny*) pkgbuild.repo: fix GPG signing with *use\_passphrase=False*
- PR #37071: (*vutny*) pkgbuild.repo: add *timeout* parameter for waiting passphrase prompt
- PR #37115: (*DmitryKuzmenko*) Backport/36720 fix race condition
- PR #37119: (*jfindlay*) log.setup: only assign user if defined
- f22c686 fix digital ocean image name in profile (#37126)
- 4263849 add 2016.3.4 release notes (#37125)
- PR #37120: (*rallytime*) Back-port #36246 to 2016.3
- PR #37103: (*cachedout*) Remove unnecessary sleep from unit.utils.process\_test.TestProcessMana...
- PR #36823: (*terminalmage*) Update debian systemd unit files to use default KillMode, Type=notify
- PR #37030: (*isbm*) Fix status.uptime for Solaris 9, 10 and 11.
- PR #37101: (*rallytime*) [2016.3] Merge forward from 2016.3 to carbon
- PR #36958: (*twangboy*) Fix bug where cmd.powershell fails to return
- PR #37086: (*cachedout*) Make salt-call a first-class citizen for multi-master
- PR #36898: (*clinta*) X509 fixes
- PR #37025: (*cro*) Make salt.utils.minion.\_check\_cmdline work on OSes without /proc.
- PR #37050: (*twangboy*) Fix service state for Windows (DO NOT MERGE FORWARD)
- PR #37076: (*jfindlay*) Document proxy settings
- PR #37081: (*terminalmage*) Fix archive.extracted remote source\_hash verification
- PR #37064: (*cachedout*) Unify job check in scheduler
- PR #37072: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37049: (*terminalmage*) Further clarification on new grains docs from #37028
- PR #37057: (*rallytime*) [2016.3] Update salt.utils.cloud references to `__utils__` for cache funcs
- PR #36977: (*twangboy*) Remove whitespace from string commands
- PR #37048: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37028: (*damon-atkins*) Update topics/grains doco, about considerations before adding a Grain

- PR #37012: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 519e1dc opkg: Support ignore\_epoch argument in version comparisons (#37007)
- PR #36808: (*gtmanfred*) allow for closing stuff in beacons
- a02868b Make helper funcs private (#36993)
- PR #36986: (*jfindlay*) modules.archive.unzip: zipfile is stdlib
- PR #36981: (*rallytime*) Skip pkg.upgrades test on distros other than Suse in 2016.3
- PR #36755: (*terminalmage*) systemd.py: check retcode for service availability in systemd >= 231
- PR #36750: (*terminalmage*) Add the CLI client and pub\_data as class attributes
- PR #36241: (*hrumph*) Fixes #36240
- PR #36950: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36948: (*rallytime*) Back-port #36943 to 2016.3
- PR #36946: (*rallytime*) Back-port #36892 to 2016.3
- PR #36945: (*rallytime*) Back-port #35199 to 2016.3
- 7565ed6 Fix versionadded (#36949)
- 4d8fb03 return opennebula errors to user (#36930)
- PR #36929: (*rallytime*) [yumpkg] Skip test\_pkg\_upgrade\_has\_pending\_upgrades if there are no upgrades
- 288f437 [2016.3] Remove "Targeting with Executions" section from docs (#36926)
- PR #36915: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 0ebf7a4 modules: debian\_ip: override params early to fix diff (#36820)
- a23ce84 states.schedule: splay is not ordereddict (#36894)
- PR #36885: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 1c0ba80 salt-ssh: Try "command -v" before falling back to "which" (#36889)
- 85eea4d fileclient: Change queryarg comparison from None to simple boolean check (#36830)
- PR #36853: (*rallytime*) Back-port #33939 to 2016.3
- PR #36852: (*rallytime*) Back-port #36743 to 2016.3
- PR #36844: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36835: (*jfindlay*) unify and expand beacon documentation
- PR #36789: (*maximeguillet*) Fix behavior of psql -c option with postgresql 9.6
- PR #36797: (*cachedout*) Error on reaction with missing SLS file
- PR #36803: (*gtmanfred*) do not load libvirt pillar if certtool is unavailable
- PR #36815: (*BenoitKnecht*) Fix glance.image\_present state
- PR #36754: (*terminalmage*) Base rpmdev-vercmp comparison result on retcode
- PR #36785: (*cachedout*) Fixup merge forward #36728
- PR #36768: (*gtmanfred*) add \_\_utils\_\_ to vultr cloud provider
- PR #36764: (*cachedout*) Another bit of detection for failed pip tests
- PR #36747: (*jfindlay*) modules.archive integration tests: check for gzip, rar

- PR #36744: (*cachedout*) Fix issue where test suite could hang on shutdown
- PR #36696: (*cro*) pass `__proxy__` in `state.sls_id`
- PR #36716: (*vutny*) `salt.modules.ini_manage`: fix creating options in empty file
- PR #36724: (*rallytime*) Back-port #36628 to 2016.3
- PR #36725: (*rallytime*) Back-port #36643 to 2016.3
- PR #36726: (*rallytime*) Back-port #36722 to 2016.3
- 48d2b01 fix python26 archive zip module (#36719)
- PR #36699: (*cachedout*) Fix error in test
- PR #36670: (*jackywu*) fix bug for including loopback addr
- PR #36694: (*lorenegordon*) Exposes `ignore_if_missing` to `file.replace` state module
- PR #36686: (*jfindlay*) log levels doc: try long form table
- PR #36690: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36680: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36659: (*terminalmage*) Support dynamic env in new-style `git_pillar`
- PR #36538: (*clinta*) daemon-reload on call to `service.available`
- PR #36616: (*cro*) Zypper fix test
- PR #36621: (*terminalmage*) Fix shadowed builtins
- PR #36636: (*rallytime*) Back-port #36618 to 2016.3
- PR #36648: (*jfindlay*) Integration tests for archive execution module
- PR #36650: (*rallytime*) Revert ``Pr 36386``
- PR #36646: (*rallytime*) Provide an error message when invalid transport is set
- PR #36635: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36620: (*rallytime*) Don't allow mercurial states to return True with errors
- PR #36622: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36520: (*twangboy*) Fix `cmd.script` runas for Windows
- PR #36564: (*DmitryKuzmenko*) Improve and fix `_check_cache_minions`
- PR #36606: (*danlsgiga*) Add support for ACL Tokens in `consul_pillar` with the option `consul.token`
- PR #36613: (*slinn0*) Remove `file.check_managed_changes` when not needed (backport of PR #36589 to 2016.3)
- PR #36609: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36595: (*cachedout*) Remove tests which no longer apply
- PR #36594: (*cachedout*) Update bootstrap docs to recent versions of Ubuntu
- PR #36585: (*twangboy*) Add `pyOpenSSL` to req file for Windows
- f205d5f Fix `salt.utils.rm_rf` to delete files too (#36572)
- PR #36495: (*cro*) Fix `pkg.upgrade` for zypper
- PR #36539: (*jfindlay*) Prefer `archive.cmd_unzip`
- PR #36546: (*rallytime*) Mercurial Module: Pass the `identity_path` portion as own arg

- PR #36555: (*DmitryKuzmenko*) Bugs/35480 master shutdown
- PR #36542: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 5548ed7 Back-port #36435 to 2016.3 (#36532)
- fe377b3 Be explicit about the salt.utils.templates import (#36535)
- fcc50c9 Wrap the entire GrainsAppendTestCase class with destructiveTest (#36537)
- PR #36529: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36483: (*dmurphy18*) Isolate sun IPv6 fix to Sun OS only
- PR #36280: (*alertedsnake*) Feature/2016.3 better postgresql grants
- PR #36508: (*twangboy*) Fix chocolatey
- PR #36519: (*terminalmage*) Rewrite minionfs walkthrough
- PR #36505: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36496: (*cachedout*) Add repr to namespacedict
- PR #36474: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36478: (*rallytime*) Add the ``bash" option to the ``code-block"directive.
- PR #36484: (*terminalmage*) Fix for temp files being left over by salt-cloud execution
- PR #36486: (*terminalmage*) Improve the rebase docs in contributing guidelines
- PR #36455: (*twangboy*) Update docs for Windows
- PR #36459: (*cachedout*) Pr 36426
- PR #36442: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36310: (*thatch45*) Fix bug where the client will destroy the loop
- PR #36394: (*oba11*) fix account\_id in boto\_iam and get\_region in boto\_sns
- PR #36424: (*jfindlay*) skip some mac\_timezone tests
- PR #36428: (*terminalmage*) A couple fixes for Antergos Linux
- PR #36425: (*whiteinge*) Check for dictionary explicitly since we're accessing it as one
- PR #36199: (*thatch45*) skip all failhards if test=True
- PR #36418: (*rallytime*) Back-port #36246 to 2016.3
- PR #36419: (*rallytime*) Back-port #36329 to 2016.3
- PR #36420: (*rallytime*) Back-port #36365 to 2016.3
- PR #36413: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36305: (*gtmanfred*) cache query args with url as well
- PR #36389: (*cachedout*) Pr 36386
- 5737b1c Update versionadded and release notes (#36352)
- PR #36369: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- fbbe9ec Quote postgres privilege target names (#36249)
- 9451141 set \_\_virtualname\_\_ to `service` (#36330)
- fee3be4 Use infoblox\_\* values if present in arguments (#36339)

- 19eb848 remove help message from glance module (#36345)
- a4bbd5e Add resize2fs unit test from blockdev\_test to disk\_test (#36346)
- PR #36350: (*terminalmage*) Add note about yumpkg.check\_db removal in Boron
- PR #36344: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 3a37fe5 merge error overwrites correct ssh\_host with stale data in ip\_address (#36312)
- PR #36299: (*rallytime*) Gate the pkg.group\_installed state test: not all pkg modules have group\_install
- b3aac0e Back-port #36273 to 2016.3 (#36295)
- 7296179 Back-port #36124 to 2016.3 (#36296)
- PR #36297: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 7684ebd Filter out pub kwargs from cloud runner (#36178)
- PR #36238: (*pass-by-value*) Add ability to clone from a snapshot to salt-cloud vmware driver
- a0bbb0f Integration tests fixes for 2016.3 (#36263)
- PR #36264: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35688: (*cachedout*) Splat serializer default configs into the serializer kwargs
- PR #36025: (*mirceaulinic*) Potential fix for #36021
- 449c298 Fix timezones states on OS X (#36183)
- PR #36235: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36137: (*cachedout*) Allow highstate outputter to show all results
- 1b12940 Docs clarification for module sync and state.apply (#36217)
- PR #36184: (*DmitryKuzmenko*) Disable signal handling while handling signal
- PR #36203: (*xiaoanyunfei*) fix owner of MultiprocessingLoggingQueue
- b586ed7 if the backend stack traces when it should return an empty string (#36193)
- PR #36188: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35907: (*rallytime*) Catch CommandExecutionError when the group in group\_installed doesn't exist
- PR #36068: (*rallytime*) Remove grains type deprecation warning from 2016.3
- PR #36152: (*cachedout*) Remove unnecessary unpack
- PR #36158: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 3445a33 Remove unclosed backticks in walkthrough doc (#36170)
- PR #36161: (*jacobhammons*) Adds #36055 to release notes
- PR #36139: (*meaksh*) Fixing unit tests for 2016.3
- PR #36143: (*multani*) doc: fix doc formatting for salt.states.mount
- PR #36070: (*rallytime*) Use \_\_utils\_\_ instead of salt.utils.cloud in opennebula driver
- PR #36089: (*terminalmage*) Support running git states / remote exec funcs as a different user in Windows
- PR #35923: (*kstreee*) Fixes a bug that Ctrl-c not working on Salt CLI.
- PR #36078: (*thatch45*) Failhard test=True fix
- PR #34529: (*Ch3LL*) Add skip\_verify for archive.extracted

- **PR #36073:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- a86e36c Add docs for new kwargs added to the wheel key module (#36040)
- 2934fc1 Doc cherryppy deemphasize urlencoded (#36047)
- **PR #36039:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 1d90c42 Back-port #35824 to 2016.3 (#36038)
- 65b6734 catch unicode encoding errors in json outputter (#36033)
- 822481e modules.service: Do not default to OpenRC on Gentoo, also allow systemd (#36010)
- b68d293 fix redis\_return's clean\_old\_jobs. (#36014)
- 95591c2 Add documentation about salt\_interface to EC2 docs (#36015)
- **PR #36019:** (*meaksh*) Back-port #36000 to 2016.3
- b9fc51a Fix error when profiling is turned on and minions don't return (#36028)
- 20a361d Add include\_\* kwargs to the \*\_dict key functions (#36030)
- **PR #36024:** (*DmitryKuzmenko*) Don't subscribe to events if not sure it would read them.
- **PR #36023:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- **PR #36004:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- **PR #35952:** (*twangboy*) Load UserProfile when using RunAs (2016.3)
- **PR #35959:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- **PR #35955:** (*jacobhammons*) Version docs to 2016.3.3
- 9910b9c Fix incremental doc builds - OS X, postgres returner, tcp transport doc updates (#35865)
- 24f9d33 Speed up FreeBSD pkg install process for pkg.latest since pkg command by default tries to update repository DB on each search: (#35904)
- b87e4f1 Salt Cloud: add centos default user for official CentOS AMIs (#35931)
- 580e0d4 Mention that docker image names must be given with repository (#35926)
- **PR #35868:** (*rallytime*) Add more helpful return messages for drac runner
- **PR #35903:** (*rallytime*) [2016.3] Merge forward from 2015.8 into 2016.3
- **PR #35855:** (*vutny*) [REGRESSION] salt-cloud: fix path to Salt Master socket dir
- **PR #35881:** (*whiteinge*) Add fail-safe in case Salt gives us data we can't serialize
- 9679266 Add engines to list of extension module options in master config docs (#35864)
- 40bcb7d Fix IAM roles statement to be boto version specific in sqs\_events (#35861)
- ee45a88 Fix doc formatting for sqs\_events engine example config (#35860)
- **PR #35859:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- **PR #35849:** (*theredcat*) Fix potential infinite loop with no error when using recursive makedirs
- **PR #35682:** (*vutny*) [BACKPORT] Fix empty *fun\_agrs* field in Reactor generated events
- **PR #35792:** (*DmitryKuzmenko*) Reconnect syndic to event bus if master disappeared.
- **PR #35817:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- b89f455 fix 34241, webutil.useradd\_all is deprecated (#35788)

- 2be5daf Bump the deprecation warning in pkgrepo state to Nitrogen (#35810)
- 083d836 Fix misuse of HTTP credentials in modjk execution module (#35796)
- 0247867 Adds mock for tornado.locks (#35807)
- e4dfc21 Trivial documentation spelling fix (#35800)
- PR #35763: (*isbm*) Sphinx crash: documentation config fix
- cd90052 Documentation spelling fixes (#35773)
- PR #35767: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35753: (*rallytime*) Fixup the unit.client\_test.LocalClientTestCase.test\_cmd\_subset from #35720
- dab8428 Add versionadded for enabled function in apache\_module state (#35732)
- PR #35737: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35729: (*cachedout*) Remove docs mocks for msgpack and psutils
- PR #35628: (*jf*) Fix user.present state reporting for groups when remove\_groups=false
- PR #35696: (*xiaoanyunfei*) fix maximum recursion depth bug
- PR #35720: (*hu-dabao*) fix 20575, make subset really return random subset
- PR #35700: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35634: (*hu-dabao*) fix 34922, StopIteration should not throw exception out
- PR #35679: (*twangboy*) Revert to vcredist 12 (2013)
- PR #35662: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 64974c8 Backport #35627 to 2016.3 (#35661)
- PR #35615: (*hu-dabao*) fix 35591, verify the acl file exist before proceed
- PR #35485: (*cro*) Cassandra returner bugfixes and documentation.
- PR #35520: (*morganwillcock*) Check for all success return codes in win\_dism state
- PR #35616: (*xbglowx*) Remove duplicate auth\_tries in minion docs
- PR #35552: (*DmitryKuzmenko*) Syndic fix: don't strip `retcode` and `success` from events.
- PR #35559: (*Jlin317*) Fix highstate outputter when it's given multiple results
- PR #35605: (*rallytime*) Back-port #32739 to 2016.3
- PR #35606: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3

### 20.2.11 Salt 2016.3.5 Release Notes

Version 2016.3.5 is a bugfix release for *2016.3.0*.

#### Security Fixes

CVE-2017-5192: local\_batch client external authentication not respected

The `LocalClient.cmd_batch()` method client does not accept `external_auth` credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the `root` user.

CVE-2017-5200: Salt-api allows arbitrary command execution on a salt-master via Salt's `ssh_client`

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2016.3 branch upgrade to a patched release as soon as possible.

### Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

### Changes for v2016.3.4..v2016.3.5

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

  - [3d2fefe](#) Make sure the pidfile and log\_file values are overridden by api opts
  - [1f6b540](#) Make sure the pidfile and log\_file values are overridden by api opts
  - [04d307f](#) salt-api no longer forces the default timeout

- **PR #38707:** (*alexbleotu*) Fixed prepending of root\_dir override to the other paths | refs: #38796 @ 2017-01-17T15:40:13Z
  - 0fb6bb7 Merge pull request #38707 from alexbleotu/root\_dir\_fix-gh
  - 0bac8c8 Fixed prepending of root\_dir override to the other paths
- **PR #38774:** (*vutny*) DOCS: add C++ compiler installation on RHEL required for bundled 0mq @ 2017-01-17T15:21:00Z
  - 96c9dc1 Merge pull request #38774 from vutny/dev-test-docs
  - 4620dc4 DOCS: add C++ compiler installation on RHEL required for bundled 0mq
- **PR #38749:** (*vutny*) pkg build modules throw better exception message if keyid wasn't found @ 2017-01-17T02:13:08Z
  - aedfbb7 Merge pull request #38749 from vutny/pkg-build-better-exception-msg
  - 53f2be5 pkg build modules throw better exception message if keyid wasn't found
- **PR #38743:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2017-01-17T01:46:01Z
  - **ISSUE #20:** (*thatch45*) Sort sys.doc output
  - **ISSUE #19:** (*thatch45*) Sending a faulty command kills all the minions!
  - **PR #38731:** (*rallytime*) Various follow up fixes
  - **PR #38602:** (*terminalmage*) Fix failing unit.states.boto\_vpc\_test.BotoVpcRouteTableTestCase.test\_present\_with\_routes
  - 8466b34 Merge pull request #38743 from rallytime/merge-2016.3
  - d24776f Merge branch `2015.8' into `2016.3'
  - 6869621 Merge pull request #38731 from rallytime/merge-2015.8
    - \* 9eb191b Pylint fix
    - \* b910499 Various follow up fixes
    - \* e8309a6 Add release notes for 2015.8.13
    - \* f881f36 Merge pull request #20 from rallytime/2015.8.12\_follow\_up-batch-tests
      - 3428232 Clean up tests and docs for batch execution
    - \* c80b20b Merge pull request #19 from whiteinge/batchclient
      - 3d8f3d1 Remove batch execution from NetapiClient and Saltnado
    - \* 97b0f64 Lintfix
    - \* d151666 Add explanation comment
    - \* 62f2c87 Add docstring
    - \* 9b0a786 Explain what it is about and how to configure that
    - \* 5ea3579 Pick up a specified roster file from the configured locations
    - \* 3a8614c Disable custom rosters in API
    - \* c0e5a11 Add roster disable flag
  - e9c59e9 Merge pull request #38602 from terminalmage/fix-boto-test
    - \* 3424a10 Fix failing unit.states.boto\_vpc\_test.BotoVpcRouteTableTestCase.test\_present\_with\_routes

- **PR #38723:** (*rallytime*) Remove ```event_publisher_pub_hwm``` and ```salt_event_pub_hwm``` from `config/__init__.py` @ 2017-01-15T18:36:14Z
  - **ISSUE #38674:** (*jackywu*) There is no code to use parameter ```event_publisher_pub_hwm``` in saltstack-2016.3 | refs: #38723
  - **PR #29294:** (*skizunov*) ZeroMQ no longer required when transport is TCP | refs: #38723 #38723
  - a642cde Merge pull request #38723 from rallytime/fix-38674
  - 706c885 Remove ```event_publisher_pub_hwm``` and ```salt_event_pub_hwm``` from `config/__init__.py`
- **PR #38669:** (*rallytime*) Update bootstrap script version to latest release @ 2017-01-15T18:03:27Z
  - fc545af Merge pull request #38669 from rallytime/update-bootstrap-script
  - 78ba76e Update bootstrap script version to latest release
- **PR #38693:** (*twangboy*) Update jinja2 to 2.9.4 @ 2017-01-15T14:40:46Z
  - 50d417f Merge pull request #38693 from twangboy/update\_jinja
  - e0c7e55 Update jinja2 to 2.9.4
- **PR #38739:** (*vutny*) DOCS: correct examples of running test suite @ 2017-01-15T14:35:47Z
  - f4233bb Merge pull request #38739 from vutny/fix-runtests-doc
  - b872bb6 DOCS: correct examples of running test suite
- 51d4707 DOCS: add links to File State Backups page where necessary (#38735)
  - **PR #38735:** (*vutny*) DOCS: add links to File State Backups page where necessary
- 6d3717b Proofread jinja\_to\_execution\_module tutorial (#38720)
  - **PR #38720:** (*dereckson*) Proofread jinja\_to\_execution\_module tutorial
- **PR #38647:** (*gtmanfred*) Allow novaclient to use keystoneauth1 sessions for authentication @ 2017-01-10T17:48:26Z
  - **ISSUE #36548:** (*abonillasuse*) openstack auth with nova driver | refs: #38647
  - 7b850d4 Merge pull request #38647 from gtmanfred/nova
  - 5be9b60 add documentation about using keystoneauth for v3
  - 7b657ca add the ability to use keystone v2 and v3
  - 5646ae1 add ability to use keystoneauth to authenticate in nova driver
- **PR #38650:** (*rallytime*) Remove the installation instructions for out-of-date community ppa @ 2017-01-10T17:47:45Z
  - **ISSUE #38648:** (*ericuldall*) No release file error from PPA on Ubuntu | refs: #38650
  - **ISSUE #38572:** (*COLABORATI*) ppa:saltstack/salt failure | refs: #38650
  - **ISSUE #34504:** (*AvinashDeluxeVR*) Installation documentation for Ubuntu server and Windows minion leads the user to use different salt versions. | refs: #38650
  - 383768d Merge pull request #38650 from rallytime/remove-ubuntu-ppa-docs
  - 30429b2 Remove the installation instructions for out-of-date community ppa
- **PR #38657:** (*DmitryKuzmenko*) Publish the ```data``` field content for Syndic events @ 2017-01-10T16:59:33Z
  - **ISSUE #38087:** (*UtahDave*) The ```data``` field in the return from a minion below a syndic is wrapped in an extra ```data``` field. | refs: #38657

- 7d9f56e Merge pull request #38657 from DSRCorporation/bugs/38087\_syndic\_event\_format\_fix
- 594c33f Publish the `data` field content for Syndic events
- PR #38649: (*Ch3LL*) fix unit.modules.file\_test @ 2017-01-10T16:44:45Z

  - 5e58b32 Merge pull request #37358 from Firewire2002/2016.3.3\_issue37355
  - 910da18 fixed typo
  - 4fbc5dd fixed wrong renamed variable and spaces
  - 92366e6 issue #37355
  - 7dc87ab issue #37355
  - 2878180 issue #37355
- PR #35390: (*alexandr-orlov*) Returns back missed proper grains dictionary for file module @ 2017-01-06T18:02:13Z
  - 6c2fe61 Merge pull request #35390 from alexandr-orlov/2016.3
  - cd5ae17 fxd missed proper grains dictionary
- PR #38618: (*rallytime*) Back-port #38579 to 2016.3 @ 2017-01-06T17:37:56Z
  - ISSUE #38558: (*multani*) pillar.get(".", default=var, merge=true) updates default value | refs: #38579 #38579
  - PR #38579: (*zwo-bot*) Fix #38558 - pillar.get with default= ...,merge=true influence subsequent calls of pillar.get | refs: #38618
  - 2579cfa Merge pull request #38618 from rallytime/bp-38579
  - 2052ece Add copy import
  - 2c8845a add test for pillar.get() + default value
  - c2f98d2 ticket 38558: add unit test, deepcopy() only if necessary
  - 30ae0a1 added deepcopy of default if merge=True

- **PR #38601:** (*terminalmage*) pillar.get: Raise exception when merge=True and default is not a dict @ 2017-01-05T23:15:51Z
  - da676ce Merge pull request #38601 from terminalmage/pillar-get
  - 8613d72 pillar.get: Raise exception when merge=True and default is not a dict
- **PR #38600:** (*terminalmage*) Avoid errors when sudo\_user is set (2016.3 branch) @ 2017-01-05T20:57:09Z
  - **PR #38598:** (*terminalmage*) Avoid errors when sudo\_user is set | refs: #38600
  - 224fc77 Merge pull request #38600 from terminalmage/issue38459-2016.3
  - 8a45b13 Avoid errors when sudo\_user is set
- **PR #38589:** (*tobithiel*) State Gem: fix incorrect warning about missing rvm/rbenv @ 2017-01-05T20:12:15Z
  - a376970 Merge pull request #38589 from tobithiel/fix\_rvm\_rbenv\_warning
  - 9ec470b State Gem: fix incorrect warning about missing rvm/rbenv
- **PR #38567:** (*pass-by-value*) Create queue if one doesn't exist @ 2017-01-05T18:46:11Z
  - 02e6a78 Merge pull request #38567 from pass-by-value/pgjsonb\_queue\_changes\_2016.3
  - 67879eb Create queue if one doesn't exist
- **PR #38587:** (*rallytime*) Change daemontools \_\_virtualname\_\_ from service to daemontools @ 2017-01-05T18:06:01Z
  - **ISSUE #37498:** (*githubcdr*) service.restart salt-minion fails on Ubuntu 14.04.5 LTS | refs: #37748 #38587
  - 0889cbd Merge pull request #38587 from rallytime/fix-37498
  - 2a58809 Change daemontools \_\_virtualname\_\_ from service to daemontools
- **PR #38562:** (*rallytime*) Update arch installation docs with correct package name @ 2017-01-04T20:04:28Z
  - 7b74436 Merge pull request #38562 from rallytime/arch-install-docs
  - 8b1897a Update arch installation docs with correct package name
- **PR #38560:** (*Ch3LL*) fix api logfile | refs: #38585 @ 2017-01-04T19:03:17Z
  - 0186070 Merge pull request #38560 from Ch3LL/fix\_api\_log
  - 1b45e96 fix api logfile
- **PR #38531:** (*rallytime*) Back-port #33601 to 2016.3 @ 2017-01-04T16:56:53Z
  - **PR #33601:** (*mchugh19*) Fix slack engine to run on python2.6 | refs: #38531
  - 0056620 Merge pull request #38531 from rallytime/bp-33601
  - c36cb39 remove the unnecessary double trigger
  - 3841449 fix spacing lint error
  - 8c1defc Remove unnecessary type from alias commands. Deduplicate alias handling to autodetect function selection. Add error reporting to slack connectivity problems. Cleanup slack's unicode conversion
  - c2f23bc Fix slack engine to run on python2.6
- **PR #38541:** (*techhat*) Strip user:pass from cached URLs @ 2017-01-04T15:39:57Z
  - **ISSUE #38187:** (*curiositycasualty*) username/password saved as cleartext when using URIs with user:pass@ format | refs: #38541
  - 50242c7 Merge pull request #38541 from techhat/issue38187

- eae3a43 Strip user:pass from cached URLs
- PR #38554: (*multani*) Fix YAML deserialization of unicode @ 2017-01-04T15:31:16Z
  - ISSUE #30454: (*favoretti*) Using yaml serializer inside jinja template results in unicode being prepended by '!python/unicode' | refs: #38554 #38554 #30481
  - PR #30481: (*basepi*) Add yaml\_safe jinja filter | refs: #38554
  - 325dc56 Merge pull request #38554 from multani/fix/30454
  - 2e7f743 yaml: support unicode serialization/deserialization
  - df76113 jinja: test the `yaml` filter with ordered dicts
  - f7712d4 Revert `Add yaml\_safe filter`
- 4ddb2e add note about pyVmomi locale workaround (#38536)
  - PR #38536: (*UtahDave*) add note about pyVmomi locale workaround
- 1c951d1 fix gce image bug (#38542)
  - ISSUE #38353: (*Ch3LL*) salt-cloud gce specifying | refs: #38542 #38542
  - PR #38542: (*Ch3LL*) fix gce image bug
- PR #38487: (*gtmanfred*) Fix crontab issues with spaces @ 2017-01-01T20:33:29Z
  - ISSUE #38449: (*swalladge*) Parsing issues in *list\_tab* (salt/modules/cron.py) | refs: #38487
  - ec60f9c Merge pull request #38487 from gtmanfred/2016.3
  - 048b9f6 add test
  - c480c11 allow spaces in cron env
  - c529ec8 allow crons to have multiple spaces
- PR #38491: (*gtmanfred*) Use UTC for timing in case timezone changes @ 2017-01-01T20:30:57Z
  - ISSUE #37684: (*thusoy*) State execution duration is timezone-dependent | refs: #38491
  - c5ba11b Merge pull request #38491 from gtmanfred/timing
  - 79368c7 Use UTC for timing in case timezone changes
- PR #38503: (*jinnm*) Hash type fallback for file management @ 2017-01-01T17:36:51Z
  - ISSUE #38472: (*jinnm*) file.managed Unable to manage file: `hash\_type` (2016.3.4) | refs: #38503
  - 86f0aa0 Merge pull request #38503 from jinnm/issue\_38472\_jinnm
  - 0cd9df2 Hash type fallback for file management
- PR #38457: (*bshelton229*) Stops git.latest checking for local changes in a bare repo @ 2016-12-30T14:28:47Z
  - ed2ba4b Merge pull request #38457 from bshelton229/git-latest-head-bug
  - 558e7a7 Stops git.latest checking for local changes in a bare repo
- PR #38385: (*dragon788*) Use unambiguous long names with double dashes @ 2016-12-29T17:10:48Z
  - 36e21b2 Merge pull request #38385 from dragon788/2016.3-double-dash
  - 86c4b56 Newline for lint compat
  - 9d9b686 Address review comments, consistency of quotes
  - df9bd5e Use unambiguous long names with double dashes

- **PR #38474:** (*cachedout*) Allow an existing ioloop to be passed to salt-key @ 2016-12-29T16:28:51Z
  - **ISSUE #38209:** (*limited*) Accepting a minion causes tornado to exit | refs: #38474
  - 59f2560 Merge pull request #38474 from cachedout/key\_loop
  - de50453 Allow an existing ioloop to be passed to salt-key
- **PR #38467:** (*gtmanfred*) file.line fail with mode=delete @ 2016-12-28T20:00:33Z
  - **ISSUE #38438:** (*jf*) file.line with mode=delete breaks on empty file | refs: #38467
  - 3d0c752 Merge pull request #38467 from gtmanfred/2016.3
  - 7b7c6b3 file.line fail with mode=delete
- **PR #38434:** (*slinn0*) Make sysctl.persist fail when failing to set a value into the running kernel @ 2016-12-27T15:37:53Z
  - 940025d Merge pull request #38434 from slinn0/issue\_38433\_fixes
  - 22af87a Fixes for <https://github.com/saltstack/salt/issues/38433>
- e5eb512 Update deprecation notices to the correct version (#38421)
  - **PR #38421:** (*rallytime*) Update deprecation notices to the correct version
  - **PR #38420:** (*rallytime*) Removed various deprecation notices from salt/modules/\* files | refs: #38421
- 9ce5331 file.managed: Fix failure when filename contains unicode chars (#38415)
  - **ISSUE #38282:** (*sash-kan*) file.managed fails when file (which contains utf-characters in the name) exists | refs: #38415
  - **PR #38415:** (*terminalmage*) file.managed: Fix failure when filename contains unicode chars
- **PR #38419:** (*Ch3LL*) fix scsci docs example @ 2016-12-22T18:57:51Z
  - 2cdb59d Merge pull request #38419 from Ch3LL/fix\_doc\_scsci
  - 234043b fix scsci docs example
- 2725352 Improve pillar documentation (#38407)
  - **PR #38407:** (*terminalmage*) Improve pillar documentation
- **PR #38398:** (*terminalmage*) Fix call to file.get\_managed in cron.file state @ 2016-12-22T16:46:14Z
  - **ISSUE #38372:** (*fanirama*) Issue with cron.file. Source: salt://path/to/crontab\_file not found | refs: #38398
  - 423b1fd Merge pull request #38398 from terminalmage/issue38372
  - c80dbaa Fix call to file.get\_managed in cron.file state
- 5a33d1e Fix http.query when result has no text (#38382)
  - **PR #38382:** (*heewa*) Fix http.query when result has no text
- **PR #38390:** (*meaksh*) Add ``try-restart`` to fix autorestarting on SUSE systems @ 2016-12-21T16:06:24Z
  - b74b5c7 Merge pull request #38390 from meaksh/2016.3-fix-try-restart-for-autorestarting-on-SUSE-systems
  - de6ec05 add try-restart to fix autorestarting on SUSE systems
- **PR #38221:** (*UtahDave*) Fix default returner @ 2016-12-20T20:34:36Z
  - 2c3a397 Merge pull request #38221 from UtahDave/fix\_default\_returner
  - 3856407 remove a blank line to satisfy linter

- 9c248aa validate return opt, remove default.
- 8bb37f9 specify allowed types and default for ``returner``
- 11863a4 add examples of default minion returners
- e7c6012 add support for default returners using *return*
- **PR #38288:** (*terminalmage*) archive.extracted: don't try to cache local sources (2016.3 branch) @ 2016-12-18T13:07:11Z
  - 09d9cff Merge pull request #38288 from terminalmage/archive-extracted-local-source-2016.3
  - 845e3d0 Update tests to reflect change in cache behavior
  - 5a08d7c archive.extracted: don't try to cache local sources (2016.3 branch)
- **PR #38312:** (*cro*) Backport feature allowing proxy config to live in pillar OR /etc/salt/proxy @ 2016-12-18T12:39:01Z
  - bf37667 Merge pull request #38312 from cro/proxy\_config\_in\_cfg
  - 2006c40 Typo
  - 689d95b Backport feature allowing proxy config to live in pillar OR /etc/salt/proxy.
- **PR #38320:** (*rallytime*) Cleanup doc internal markup references @ 2016-12-18T12:31:28Z
  - **ISSUE #12788:** (*whiteinge*) Comb through docs to replace :doc: roles with :ref: | refs: #38320
  - c83db5a Merge pull request #38320 from rallytime/cleanup-doc-refs
  - 62978cb Don't check the doc/conf.py file for doc markup refs
  - 770e732 Add a unit test to search for new doc markup refs
  - 5c42a36 Remove ":doc:" references from all doc/topics/installation/\* files
  - 23bce1c Remove ":doc:" references from all doc/topics/releases/\* files
  - 4aafa41 Remove ":doc:" references from a bunch of doc/\* files
  - 02bfe79 Remove more ":doc:" references from doc/\* files
  - 6e32267 Remove ":doc:" references in salt/\* files
- 6367ca7 Add nick to args for create\_multi (#38281)
  - **PR #38281:** (*mikejford*) Add nick to args for create\_multi
- **PR #38313:** (*dragon788*) 2016.3 chocolatey fix @ 2016-12-16T17:20:39Z
  - **ISSUE #38290:** (*dragon788*) Need to use machine automation friendly output | refs: #38313
  - 235682b Merge pull request #38313 from dragon788/2016.3-chocolatey-fix
  - 1f5fc17 Use machine readable output for list
  - cdbd2fb Added limit-output to eliminate false packages
- **PR #38279:** (*rallytime*) Add docs for syndic\_wait setting @ 2016-12-15T18:30:31Z
  - **ISSUE #38174:** (*NickDubelman*) [syndic] Why can't a syndic node signal when all of it's minions have returned? | refs: #38279
  - **ISSUE #32400:** (*rallytime*) Document Default Config Values | refs: #38279
  - 9e78ddc Merge pull request #38279 from rallytime/fix-38174
  - 4a62d01 Add docs for syndic\_wait setting

- **PR #38248:** (*meaksh*) Successfully exit of salt-api child processes when SIGTERM is received @ 2016-12-15T09:16:27Z
  - fc9e1df Merge pull request #38248 from meaksh/salt-api-successfully-close-child-processes
  - ee6eae9 Successfully exit of salt-api child processes when SIGTERM.
- **PR #38254:** (*terminalmage*) Also check if pillarenv is in opts @ 2016-12-15T09:10:24Z
  - 3c718ed Merge pull request #38254 from terminalmage/check-pillarenv
  - fa9ad31 Also check if pillarenv is in opts
- 6b9060c [2016.3] Bump latest release version to 2016.11.1 (#38256)
  - **PR #38256:** (*rallytime*) [2016.3] Bump latest release version to 2016.11.1
- **PR #38198:** (*vutny*) Add missing requirements for running unit tests: libcloud and boto3 @ 2016-12-13T14:12:20Z
  - 004e46a Merge pull request #38198 from vutny/unit-tests-require-libcloud-boto3
  - a6098ba Remove note about SaltTesting installation, now it is in the requirements
  - 004bff1 Add missing requirements for running unit tests: libcloud and boto3
- **PR #38213:** (*rallytime*) Skip test\_cert\_info tls unit test on pyOpenSSL upstream errors @ 2016-12-13T12:05:01Z
  - 9d497bc Merge pull request #38213 from rallytime/skip-tls-test
  - bdb807f Skip test\_cert\_info tls unit test on pyOpenSSL upstream errors
- **PR #38224:** (*whiteinge*) Allow CORS OPTIONS requests to be unauthenticated @ 2016-12-13T12:02:30Z
  - 203109d Merge pull request #38224 from whiteinge/cors-options-unauthed
  - de4d322 Allow CORS OPTIONS requests to be unauthenticated
- **PR #38223:** (*whiteinge*) Add root\_dir to salt-api file paths @ 2016-12-13T07:44:19Z
  - **PR #37272:** (*vutny*) Get default logging level and log file from default opts dict | refs: #38223
  - 721a5fe Merge pull request #38223 from whiteinge/salt-api-root\_dirs
  - bfbf390 Add root\_dir to salt-api file paths
- **PR #38191:** (*terminalmage*) Clarify the fact that git\_pillar.update does not fast-forward @ 2016-12-12T09:45:48Z
  - **ISSUE #38162:** (*747project*) git\_pillar does not detect changes to remote repository when told to update | refs: #38191
  - 70f7d22 Merge pull request #38191 from terminalmage/issue38162
  - 1ae543a Clarify the fact that git\_pillar.update does not fast-forward
- **PR #38194:** (*vutny*) Document the requirements for running ZeroMQ-based integration tests @ 2016-12-12T09:42:11Z
  - 28171cb Merge pull request #38194 from vutny/integration-test-requirements-doc
  - e9f419f Document the requirements for running ZeroMQ-based integration tests
- **PR #38185:** (*rallytime*) Back-port #38181 to 2016.3 @ 2016-12-09T22:27:44Z
  - **PR #38181:** (*rallytime*) Reset socket default timeout to None (fixes daemons\_tests failures) | refs: #38185
  - a4ef037 Merge pull request #38185 from rallytime/bp-38181
  - 609f814 Reset socket default timeout to None (fixes daemons\_tests failures)

- **PR #38163:** (*Ch3LL*) enabled ec2 cloud tests @ 2016-12-09T18:01:57Z
  - 65b2ad7 Merge pull request #38163 from Ch3LL/enabled\_ec2\_cloud
  - be74c45 enabled ec2 cloud tests
- **PR #38177:** (*vutny*) Correct *cp.get\_file\_str* docstring and add integration tests @ 2016-12-09T16:55:35Z
  - b63f74e Merge pull request #38177 from vutny/fix-cp-get-file-str
  - a449980 Correct *cp.get\_file\_str* docstring and add integration tests
- **PR #38153:** (*vutny*) Master config includes may contain errors and be safely skipped @ 2016-12-08T17:43:34Z
  - 7596313 Merge pull request #38153 from vutny/master-includes-error-tolerance
  - cd0154e Master config includes may contain errors and be safely skipped
- 86091db Skip daemon unit tests when running on Python 2.6 (#38134)
  - **PR #38134:** (*rallytime*) Skip daemon unit tests when running on Python 2.6
- **PR #38102:** (*rallytime*) Add False + msg tuple return if requests is missing for zenoss module @ 2016-12-07T13:24:37Z
  - **ISSUE #38091:** (*tjyang*) [WARNING ] salt.loaded.int.module.zenoss.\_\_virtual\_\_() is wrongly returning None. | refs: #38102
  - d3d98fd4 Merge pull request #38102 from rallytime/fix-38091
  - 4f79d5a Add False + msg tuple return if requests is missing for zenoss module
- **PR #38104:** (*rallytime*) Back-port #36794 to 2016.3 @ 2016-12-07T13:23:48Z
  - **ISSUE #36707:** (*do3meli*) slow FreeBSD sysctl module with test=true | refs: #36794
  - **PR #36794:** (*do3meli*) FreeBSD sysctl module now handels config\_file parameter in show method | refs: #38104
  - 8c8cbc2 Merge pull request #38104 from rallytime/bp-36794
  - c906c8a Pylint fixes
  - da3ebf8 FreeBSD sysctl module now handels config\_file parameter in show method
- **PR #38083:** (*twangboy*) Only delete .sls files from winrepo-ng [DO NOT MERGE FORWARD] @ 2016-12-06T14:13:35Z
  - **ISSUE #35342:** (*morganwillcock*) win\_pkg: refresh\_db doesn't remove cached items which have been renamed or removed | refs: #38083
  - fbc8776 Merge pull request #38083 from twangboy/fix\_refresh\_db
  - 978af6d Remove only .sls files from the cached winrepo-ng
- **PR #38059:** (*rallytime*) Call exec\_test for the Syndic daemon in tests.unit.daemons\_test.py @ 2016-12-04T04:18:41Z
  - **PR #38057:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38059
  - **PR #38034:** (*cachedout*) Modify daemons test to use multiprocessing | refs: #38059
  - 9dcfdee Merge pull request #38059 from rallytime/daemons-test-fix
  - eb372b2 Add missing ``not'' statement: The last syndic test should assertFalse()
  - 4e10f8e Call exec\_test for the Syndic daemon in tests.unit.daemons\_test.py
- **PR #38039:** (*rallytime*) Check to see if a line is already commented before moving on @ 2016-12-02T20:08:35Z

- ISSUE #37939: (*Talkless*) file.comment always report changes in test=True mode | refs: #38039
- 9cd42b9 Merge pull request #38039 from rallytime/fix-37939
- 1da7aac Update unit tests to account for additional file.search call
- 8a685b1 Check to see if a line is already commented before moving on
- f2c0455 Write an integration test demonstrating the issue
- PR #38045: (*terminalmage*) yumpkg.py: don't include non-upgrade versions found by ``yum list available" @ 2016-12-02T20:07:38Z
  - ISSUE #38037: (*dmurphy18*) pkg.latest and yumpkg.latest\_version return incorrect package versions 2016.3 and 2016.11 | refs: #38045
  - a34a763 Merge pull request #38045 from terminalmage/issue38037
  - 6528950 Simplify logic for matching desired pkg arch with actual pkg arch
  - 3babbcd yumpkg.py: don't include non-upgrade versions found by ``yum list available"
- 6724fe4 Modify daemons test to use multiprocessing (#38034)
  - PR #38034: (*cachedout*) Modify daemons test to use multiprocessing | refs: #38059
- PR #37995: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-30T20:12:55Z
  - PR #37978: (*terminalmage*) Add clarifying language to ext\_pillar\_first docs
  - 6942d5d Merge pull request #37995 from rallytime/merge-2016.3
  - b44e179 Merge branch `2015.8' into `2016.3'
    - \* 7a7e367 Merge pull request #37978 from terminalmage/ext\_pillar\_first-docs
      - 61ed9a8 Add clarifying language to ext\_pillar\_first docs
- cd66c17 fix broken yaml code block (#38002)
  - PR #38002: (*laleocen*) fix broken yaml code block
- PR #37912: (*attiasr*) fix encoding problem aws responses @ 2016-11-30T18:10:30Z
  - ISSUE #35088: (*Modulus*) salt/cloud/ec2.py encoding problems. | refs: #37912
  - 3dd45fb Merge pull request #37912 from attiasr/fix\_aws\_response\_encoding
  - ba4ec4e use Requests result encoding to encode the text
  - abe4eb3 fix encoding problem aws responses
- PR #37950: (*vutny*) Set default Salt Master address for a Syndic (like for a Minion) @ 2016-11-30T18:09:04Z
  - 69a74a4 Merge pull request #37950 from vutny/fix-starting-up-syndic
  - 7d9bc9a syndic\_master: correct default value, documentation and example config
  - 92a7c7e Set default Salt Master address for a Syndic (like for a Minion)
- 7f269bc Add clarification on expr\_form usage and future deprecation (#37964)
  - PR #37964: (*terminalmage*) Add clarification on expr\_form usage and future deprecation
- 1001987 Catch possible exception from lsb\_release (#37962)
  - ISSUE #37867: (*tobiasBora*) Bug into lsb\_release that crash salt | refs: #37962
  - PR #37962: (*cachedout*) Catch possible exception from lsb\_release
- 330021c Handle empty tokens safely (#37961)

- ISSUE #37945: (*gstachowiak*) Missing exception handling in salt.master.Maintenance. Process never completes. | refs: #37961
- PR #37961: (*cachedout*) Handle empty tokens safely
- PR #37272: (*vutny*) Get default logging level and log file from default opts dict | refs: #38223 @ 2016-11-28T23:04:20Z
  - ea46639 Merge pull request #37272 from vutny/fix-getting-default-logging-opts
  - e5ce523 Fix description in the Salt Syndic usage info
  - 518a3dd Add unit tests for Salt parsers processing logging options
  - 83d6a44 Add *ssh\_log\_file* option to master config and documentation
  - c8a0915 Fix configuration example and documentation for *syndic\_log\_file* option
  - e64dd3e Correct default attributes for various parser classes
  - 82a2e21 Fix default usage string for Salt command line programs
  - 45dfffa2 Fix reading and updating logfile and pidfile config options for Salt API
  - f47253c Fix reading and applying Salt Cloud default configuration
  - fad5bec Work with a copy of default opts dictionaries
  - b7c2481 Fix *log\_level\_logfile* config value type
  - 1bd76a1 Fix setting temporary log level if CLI option omitted
  - 121848c Fix obtaining *log\_granular\_levels* config setting
  - 44cf07f Make CLI options take precedence for setting up logfile\_logger
  - 61afaf1 Fix setting option attributes when processing *log\_level* and *log\_file*
  - 3c60e23 Fix processing of *log\_level\_logfile* config setting
  - 55a0af5 Use attribute functions for getting/setting options and config values
  - c25f2d0 Fix getting Salt API default logfile option
  - f242237 Remove processing of unused and undocumented *cli\_\*\_log\_\** config options
  - 2065e83 Get default logging level and file from default opts dict
- PR #37925: (*kontrolld*) Fix missing ipv6 options centos network @ 2016-11-28T22:38:43Z
  - f2f957d Merge pull request #37925 from kontrolld/add-ipv6-centos-network
  - ac2b477 Adding IPv6 functionality for CentOS /etc/sysconfig/network
- PR #37899: (*DmitryKuzmenko*) Clear functions context in schedule tasks for ZeroMQ. @ 2016-11-28T22:23:45Z
  - ISSUE #37059: (*basepi*) Beacon fileserver operations cause scheduled jobs with fileserver operations to hang | refs: #37899
  - c07ad11 Merge pull request #37899 from DSRCorporation/bugs/37059\_schedule\_task\_hang
  - 9497748 Clear functions context in schedule tasks for ZeroMQ.
- PR #37928: (*techhat*) Don't modify self.opts directly @ 2016-11-28T21:07:40Z
  - ISSUE #37737: (*b-harper*) python client api CloudClient multiple calls needed | refs: #37928
  - a55519d Merge pull request #37928 from techhat/issue37737
  - a09a60e Don't modify self.opts directly

- **PR #37929:** (*gtmanfred*) add list\_nodes\_min to nova driver @ 2016-11-28T21:05:40Z
  - 9d17f1c Merge pull request #37929 from gtmanfred/2016.3
  - c7d2c73 add list\_nodes\_min to nova driver
- **PR #37926:** (*kontrollld*) Fixes no IPv6 functionality in /etc/sysconfig/network @ 2016-11-28T20:40:00Z
  - 3bb743b Merge pull request #37926 from kontrollld/fix-ipv6-centos-network
  - 3ed42e5 updated
  - 3b3bc4f Fixes no IPv6 functionality in /etc/sysconfig/network
- **PR #37921:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-28T19:54:40Z
  - **PR #37918:** (*rallytime*) [2015.8] Update version numbers in doc config for 2016.11.0 release
  - **PR #37914:** (*terminalmage*) Update earlier release channels' docs with Carbon release notes
  - 271170a Merge pull request #37921 from rallytime/merge-2016.3
  - 523a67c Merge branch `2015.8' into `2016.3'
    - \* 4cdc6cf Update earlier release channels' docs with Carbon release notes (#37914)
    - \* d31491a [2015.8] Update version numbers in doc config for 2016.11.0 release (#37918)
- **PR #37924:** (*cachedout*) Update test for new gem ver @ 2016-11-28T18:17:53Z
  - 6cd6429 Merge pull request #37924 from cachedout/fix\_gem\_states
  - 894cca3 Update test for new gem ver
- **PR #37916:** (*rallytime*) [2016.3] Update version numbers in doc config for 2016.11.0 release @ 2016-11-28T17:09:08Z
  - c35ba1f Merge pull request #37916 from rallytime/doc-update-2016.3
  - bd40592 [2016.3] Update version numbers in doc config for 2016.11.0 release
- **PR #37785:** (*AaronM-Cloudtek*) respect trailing dot in ddns name parameter @ 2016-11-28T14:02:10Z
  - **ISSUE #37287:** (*AaronM-Cloudtek*) salt.states.ddns.present: `NS' record type always returns as changed | refs: #37785
  - e13a248 Merge pull request #37785 from Cloudtek/ddns-respect-trailing-dot
  - 262e3b3 respect trailing dot in ddns name parameter
- **PR #37895:** (*fj40crawler*) Change return value for salt/states/augeas.py to be True instead of N... @ 2016-11-28T13:49:27Z
  - **ISSUE #37870:** (*fj40crawler*) salt.states.augeas.change returns None when test=True | refs: #37895
  - c03b389 Merge pull request #37895 from fj40crawler/fix-augeas-return-for-test
  - ddc238d Fixed augeas\_test.py to match True v.s. None for test\_change\_in\_test\_mode
  - ef75c45 Merge branch `2016.3' of github.com:saltstack/salt into fix-augeas-return-for-test
  - b0fe0cd Change return value for salt/states/augeas.py to be True instead of None for cases where salt is run with test=True. Fixes #37870
- **PR #37907:** (*Talkless*) Fix server trust in test run of svn.latest @ 2016-11-28T13:47:39Z
  - fd3c31e Merge pull request #37907 from Talkless/patch-2
  - 072a319 Fix server trust in test run of svn.latest

- **PR #37896:** (*toanju*) rh networking: add missing values @ 2016-11-27T10:30:35Z
  - f39fdf4 Merge pull request #37896 from toanju/2016.3
  - c953041 rh networking: add missing values
- **PR #37886:** (*bdrung*) Fix various spelling mistakes @ 2016-11-25T02:59:36Z
  - ea935c5 Merge pull request #37886 from bdrung/fix-typos
  - 9a51ba5 Fix various spelling mistakes
- **PR #37736:** (*dhaines*) handle semodule version >=2.4 (#37732) and fix typo @ 2016-11-24T01:44:20Z
  - **ISSUE #37732:** (*dhaines*) list\_semod() (from modules/selinux.py) incompatible with policycoreutils-2.5 (RHEL 7.3) | refs: #37736
  - 371b0a8 Merge pull request #37736 from dhaines/issue-37732
  - 7ef590a Update selinux.py
  - 516a67e fix indexing error
  - 4e49c1e fix typo
  - b16f2d8 handle semodule version >=2.4 (#37732) and fix typo
- **PR #37797:** (*clan*) check count of columns after split @ 2016-11-24T01:28:59Z
  - 87aeb66 Merge pull request #37797 from clan/extfs
  - acf0f96 check count of columns after split
- **PR #37762:** (*twangboy*) Add pre\_versions to chocolatey.installed @ 2016-11-24T01:27:29Z
  - f7c7109 Merge pull request #37762 from twangboy/fix\_chocolatey\_state
  - 9696b6d Use keyword args instead of relying on ordering
  - 398eaa0 Add pre\_versions to the available arguments
- **PR #37866:** (*meaksh*) Backport #37149 #36938 and #36784 to 2016.3 @ 2016-11-23T21:54:17Z
  - **PR #37857:** (*meaksh*) Backport #37149 and #36938 to 2015.8 | refs: #37866
  - **PR #37856:** (*meaksh*) Backport #36784 to 2015.8 | refs: #37866
  - **PR #37149:** (*dincamihai*) Fix pkg.latest\_version when latest already installed | refs: #37866 #37857
  - **PR #36938:** (*wanparo*) acl.delfacl: fix position of -X option to setfacl | refs: #37866 #37857
  - **PR #36784:** (*moio*) OS grains for SLES Expanded Support | refs: #37866 #37856
  - 56baa92 Merge pull request #37866 from meaksh/2016.3-bp-37149-36938-36784
  - 9d8d578 Fix pkg.latest\_version when latest already installed
  - ffca0d4 - acl.delfacl: fix position of -X option to setfacl
  - 3dfed6b Adjust linux\_acl unit test argument ordering
  - f185ecd core.py: quote style fixed
  - 8404d13 Setting up OS grains for SLES Expanded Support (SUSE's Red Hat compatible platform)
- **PR #37863:** (*rallytime*) Back-port #36893 to 2016.3 @ 2016-11-23T17:09:09Z
  - **ISSUE #32829:** (*tyhunt99*) Dockerng appears to not be using docker registries pillar data | refs: #36893 #36893
  - **PR #36893:** (*tyhunt99*) add option to force a reauth for a docker registry | refs: #37863

- d0cc7f0 Merge pull request #37863 from rallytime/bp-36893
- 4c70534 Add versionadded to reauth option in dockerng module
- 5ca2c38 added documentation for the new reauth option in docker registry configuration
- 5b0c11a add option to force a reauth for a docker registry
- b17a118 add multiline encryption documentation to nacl (#37847)
  - PR #37847: (*laleocen*) add multiline encryption documentation to nacl
- aa37487 add missing chloginclass (#37827)
  - ISSUE #37787: (*elyulka*) user.present state fails to change loginclass on FreeBSD | refs: #37827
  - PR #37827: (*silenius*) add missing chloginclass
- 0e74bad Update branch refs to more relevant branch (#37826)
  - PR #37826: (*rallytime*) Update branch refs to more relevant branch
  - PR #37822: (*laleocen*) add documentation for multiline encryption using nacl | refs: #37826
- 6a9b49c Add ``names" option to file state docs: point users to highstate doc examples (#37823)
  - ISSUE #19269: (*markuskramerigitt*) Undocumented feature *names*: of *file.directory* | refs: #37823
  - PR #37823: (*rallytime*) Add ``names" option to file state docs: point users to highstate doc examples
- aaf587d Clarify keystone.user\_present password state docs with default behavior (#37821)
  - ISSUE #15697: (*arthurlogilab*) keystone.user\_present should not re-set the password when user exists | refs: #37821
  - PR #37821: (*rallytime*) Clarify keystone.user\_present password state docs with default behavior
- c300863 Add some dependency documentation to libvirt docs (#37820)
  - ISSUE #5999: (*pille*) libvirt.keys does not work | refs: #37820
  - PR #37820: (*rallytime*) Add some dependency documentation to libvirt docs
- PR #37772: (*bdrung*) Support initializing OpenSSL 1.1 @ 2016-11-21T20:28:51Z
  - 485270f Merge pull request #37772 from bdrung/openssl1.1
  - 819c965 Support initializing OpenSSL 1.1
- 4910912 Update orchestrate runner file.copy doc example (#37817)
  - ISSUE #37383: (*edwardsdanielj*) Orchestration arguments (kwarg) not being interpreted / How I learned to stop worrying about documentation and love experimenting | refs: #37817
  - PR #37817: (*rallytime*) Update orchestrate runner file.copy doc example
- PR #37816: (*rallytime*) Back-port #32157 to 2016.3 @ 2016-11-21T20:22:27Z
  - ISSUE #37653: (*gravyboat*) Salt.cron docs don't wrap @hourly and @daily correctly in quotes for the examples | refs: #37816
  - ISSUE #31953: (*sjorge*) Documentation for salt.states.cron is incorrect | refs: #32157
  - PR #32157: (*cachedout*) Add quotes to cron doc | refs: #37816
  - c5d3d8b Merge pull request #37816 from rallytime/bp-32157
  - d9c2971 Add quotes to cron doc
- PR #37812: (*rallytime*) Back-port #37790 to 2016.3 @ 2016-11-21T18:46:40Z

- PR #37790: (*sofixa*) Update cloud/proxmox.rst with more options and LXC | refs: #37812
- 97e6b6a Merge pull request #37812 from rallytime/bp-37790
- ca3b6e7 Update proxmox.rst with more options and LXC
- PR #37811: (*rallytime*) Back-port #37789 to 2016.3 @ 2016-11-21T18:46:21Z
  - ISSUE #37751: (*freach*) Documentation salt.states.dockerng.running: ``privileged" property undocumented | refs: #37789
  - PR #37789: (*fedusia*) issue: 37751 | refs: #37811
  - 27703c5 Merge pull request #37811 from rallytime/bp-37789
  - ba3fef4 fix comment
  - a021f76 issue: 37751 Add documentation for option privileged
- PR #37810: (*rallytime*) Back-port #37775 to 2016.3 @ 2016-11-21T18:45:53Z
  - PR #37775: (*calve*) Document *python* argument in *salt.states.virtualenv\_mod* | refs: #37810
  - adac9d7 Merge pull request #37810 from rallytime/bp-37775
  - 2bed914 Document *python* argument in *salt.states.virtualenv\_mod*
- 7de7844 Add nodegroup check to ckminions (#37763)
  - ISSUE #37742: (*blaketmiller*) Cannot match on nodegroup when checking minions | refs: #37763
  - PR #37763: (*cachedout*) Add nodegroup check to ckminions
- d674369 Fix ip/port issue with salt-call (#37766)
  - ISSUE #37725: (*secumod*) salt-call incorrectly parses master hostname:port from minion config | refs: #37766
  - PR #37766: (*cachedout*) Fix ip/port issue with salt-call
- c62ff6b Add thorium path to syspaths (#37767)
  - ISSUE #33709: (*msummers42*) Any/All Salt-SSH invocations in 2016.3.0 Fails with AttributeError: `module' object has no attribute `BASE\_THORIUM\_ROOTS\_DIR' | refs: #37767
  - PR #37767: (*cachedout*) Add thorium path to syspaths
- PR #37760: (*hu-dabao*) Fix couchbase returner and add couple of more features @ 2016-11-18T00:28:23Z
  - bff949f Merge pull request #37760 from hu-dabao/fix\_cb\_returner
  - de372f2 1. returner no need to check whether the jid exists for external job cache setup 2. add full\_ret to return doc so that the document will be informative 3. make ttl as a config attribute because salt-minion does not have keep\_jobs attribute 4. add password into config attribute 5. update the documents accordingly
- PR #37738: (*terminalmage*) Allow pillar.get to retrieve fresh pillar data when saltenv passed @ 2016-11-17T23:13:04Z
  - ISSUE #36629: (*yhekma*) The pillar run module does not honor saltenv | refs: #37738
  - 1f976ac Merge pull request #37738 from terminalmage/issue36629
  - da46678 Allow pillar.get to retrieve fresh pillar data when saltenv passed
- 7aee7fc Switch default filter tag for ONE resources from user only to all resources (#37745)
  - PR #37745: (*cro*) Switch default filter tag for ONE resources from user only to all resources

- 6ba8d4e check for SERVICE\_DIR in \_\_virtual\_\_ in salt.modules.daemontools (#37748)
  - ISSUE #37498: (*githubcdr*) service.restart salt-minion fails on Ubuntu 14.04.5 LTS | refs: #37748 #38587
  - PR #37748: (*silenius*) check for SERVICE\_DIR in \_\_virtual\_\_ in salt.modules.daemontools
- PR #37735: (*Ch3LL*) change size and image of joyent profile @ 2016-11-16T21:07:52Z
  - ISSUE #37734: (*Ch3LL*) Joyent Cloud Size Issue | refs: #37735
  - fa78831 Merge pull request #37735 from Ch3LL/fix\_joyent\_profile
  - 9ef41dc change size and image of joyent profile
- PR #37731: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-16T17:13:02Z
  - PR #37718: (*terminalmage*) Fix incorrectly-formatted RST
  - 98e25c6 Merge pull request #37731 from rallytime/merge-2016.3
  - ec13897 Merge branch `2015.8' into `2016.3'
    - \* f417dbb Merge pull request #37718 from terminalmage/docs
    - 23b8b2a Fix incorrectly-formatted RST
- 3be9ab4 Warn on AES test for systems with > 1 core (#37724)
  - PR #37724: (*cachedout*) Warn on AES test for systems with > 1 core
- PR #37721: (*terminalmage*) Fix for pillar setting `environment' key in \_\_gen\_opts() @ 2016-11-16T16:04:53Z
  - 35655d5 Merge pull request #37721 from terminalmage/zd909
  - acdd551 Update git\_pillar docs to reflect info from bugfix
  - 433737d Fix for pillar setting `environment' key in \_\_gen\_opts()
- PR #37719: (*terminalmage*) Fix incorrectly-formatted RST (2016.3 branch) @ 2016-11-16T08:20:53Z
  - 99cda7c Merge pull request #37719 from terminalmage/docs-2016.3
  - f163b4c Fix incorrectly-formatted RST
- PR #37694: (*cachedout*) Catch differences in git URLs in npm state @ 2016-11-16T01:56:18Z
  - 8dea695 Merge pull request #37694 from cachedout/npm\_git
  - 0e3bc23 Catch differences in git URLs in npm state
- PR #37705: (*rallytime*) Don't overwrite the ``key" variable passed in to \_listeners\_present func @ 2016-11-15T21:26:37Z
  - ISSUE #37665: (*kluoto*) boto\_elb state fails as key is overwritten by the code | refs: #37705
  - 329448c Merge pull request #37705 from rallytime/fix-37665
  - 3b7e9c5 Don't overwrite the ``key" variable passed in to \_listeners\_present func
- PR #37707: (*Ch3LL*) add timeout increase on azure tests @ 2016-11-15T21:24:25Z
  - PR #37239: (*Ch3LL*) Fix cloud tests timeout | refs: #37707
  - ac9a316 Merge pull request #37707 from Ch3LL/fix\_timeout\_azure
  - 363122c add timeout increase on azure tests
- PR #37704: (*twangboy*) Fix test disabled 2016.3 [DO NOT MERGE FORWARD] @ 2016-11-15T16:48:52Z
  - 1ece265 Merge pull request #37704 from twangboy/fix\_test\_disabled\_2016.3

- a0429cf Use nfsd instead of apsd for test\_disabled
- **PR #37690:** (*twangboy*) Update pyzmq to 15.3.0 for 2016.3 [DO NOT MERGE FORWARD] @ 2016-11-15T03:10:36Z
  - 44f05ac Merge pull request #37690 from twangboy/update\_pyzmq\_2016.3
  - cf55342 Update pyzmq to version 15.3.0
- **PR #37680:** (*rallytime*) Back-port #32965 to 2016.3 @ 2016-11-15T02:56:46Z
  - **PR #32965:** (*kevinquinnyo*) Fix 'present' option when used without 'key\_type' | refs: #37680
  - a743d8b Merge pull request #37680 from rallytime/bp-32965
  - 1865b13 Fix 'present' option when used without 'key\_type'
- **PR #37681:** (*rallytime*) Back-port #35965 to 2016.3 @ 2016-11-14T21:19:22Z
  - **ISSUE #35964:** (*edgan*) salt-ssh doesn't set the return code to non-zero on highstate rendering error | refs: #35965
  - **PR #35965:** (*edgan*) Set the return code to 1 on salt-ssh highstate errors | refs: #37681
  - 1c2d6ff Merge pull request #37681 from rallytime/bp-35965
  - 700f3fa Set the return code to 1 on salt-ssh highstate errors
- **PR #37668:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-14T15:43:25Z
  - **PR #37641:** (*cro*) Add docs for rotate\_aes\_key
  - 1b456b5 Merge pull request #37668 from rallytime/merge-2016.3
  - ef684c6 Merge branch '2015.8' into '2016.3'
  - a01b665 Add docs for rotate\_aes\_key (#37641)
- **PR #37625:** (*cachedout*) Return with proper retcodes in batch mode @ 2016-11-12T20:29:09Z
  - **ISSUE #37492:** (*JensRantil*) Failing salt -b 1 minion state.highstate has wrong exit code | refs: #37625
  - 305e51d Merge pull request #37625 from cachedout/issue\_37492
  - b603152 Return with proper retcodes in batch mode
- **PR #37639:** (*rallytime*) Back-port #37607 to 2016.3 @ 2016-11-11T20:29:20Z
  - **ISSUE #34547:** (*sebw*) salt-cloud deployment fails when deploy: True | refs: #37607
  - **PR #37607:** (*techhat*) Try the connection again, in case it's been reset | refs: #37639
  - **PR #35673:** (*cro*) Proxies don't handle reusing the SmartConnect instances very well. D... | refs: #37607
  - **PR #34059:** (*alexbleotu*) Vmware common gh | refs: #37607
  - 7510cd4 Merge pull request #37639 from rallytime/bp-37607
  - 9914c93 Pylint: Remove kwargs that are not in the 2016.3 branch
  - d941e93 Disable pylint warning
  - 940ee49 Lint fix
  - 69893f0 Try the connection again, in case it's been reset
- **PR #37638:** (*rallytime*) Back-port #37349 to 2016.3 @ 2016-11-11T20:29:01Z
  - **ISSUE #37118:** (*gtmanfred*) group in file.find module unable to be a list | refs: #37349 #37349
  - **PR #37349:** (*haeac*) Pull request for Bug #37118 | refs: #37638

- 24ca960 Merge pull request #37638 from rallytime/bp-37349
- ba2105b Fix for Bug #37118, the wrong parameter was being used to convert the group name to group id.
- PR #37644: (*Ch3LL*) digital ocean list\_keypairs: increase limit for ssh keys parsed @ 2016-11-11T20:28:46Z
  - ISSUE #37643: (*Ch3LL*) digital ocean list\_keypairs limits to 20 keys | refs: #37644
  - e1e8b81 Merge pull request #37644 from Ch3LL/fix\_37643
  - c02961a list\_keypairs: increase limit for ssh keys parsed
- PR #37640: (*rallytime*) Add known issue #37541 to 2016.3.4 release notes @ 2016-11-11T20:28:12Z
  - ISSUE #37541: (*yhekma*) salt-minion does not clean up temp files for templates | refs: #37540 #37640
  - a97c2ad Merge pull request #37640 from rallytime/update-release-notes
  - 6d6de12 Grammatical fix
  - 24d7f20 Add known issue #37541 to 2016.3.4 release notes
- PR #37642: (*cro*) Forward-port change from 2015.8 adding release note for rotate\_aes\_key @ 2016-11-11T20:27:07Z
  - fab3eaa Merge pull request #37642 from cro/rotate\_aes\_doc
  - 1ca5b95 Forward-port change from 2015.8 adding release note for rotate\_aes\_key
- PR #37629: (*TronPaul*) fix \_\_opts\_\_ and provider being None in salt.utils.aws:get\_location @ 2016-11-11T09:49:47Z
  - ISSUE #37628: (*TronPaul*) [git 2016.3] Refreshing of an s3 file server results in an exception | refs: #37629
  - 4c07b35 Merge pull request #37629 from TronPaul/fix-s3fs-opts
  - a452cde fix \_\_opts\_\_ and provider being None issue
- PR #37481: (*thatch45*) Raet internal client reference fix @ 2016-11-11T04:39:41Z
  - 200d9fc Merge pull request #37481 from thatch45/raet\_client
  - 50d9111 Attempted fix, needs user verification
- PR #37611: (*jeanpralo*) Fix cmd batch raw @ 2016-11-11T02:53:58Z
  - b14faf1 Merge pull request #37611 from jeanpralo/fix-cmd-batch-raw
  - 4f16840 add integration test for salt.client.LocalClient.cmd\_batch
  - ead47e4 update ret dict to avoid hanging
  - 0a2f153 fix dict key for raw support to avoid exception
- PR #37614: (*gtmanfred*) remove redundant code @ 2016-11-11T02:49:13Z
  - 35c8333 Merge pull request #37614 from gtmanfred/2016.3
  - 71c2df8 remove redundant code
- PR #37627: (*cachedout*) Exempt pip.iteritems from test\_valid\_docs test @ 2016-11-11T02:48:37Z

- 71032f8 Documentation improvements and corrections (#37604)
  - ISSUE #37592: (*craigafinch*) State git.latest does not work with SSH | refs: #37604
  - ISSUE #37551: (*viict*) git.latest ``Not a valid commit name" | refs: #37571 #37604
  - PR #37604: (*terminalmage*) Documentation improvements and corrections
- a7e09f9 Use existing VM's VDD size if not specified in the cloud profile (#37579)

- PR #37579: (*pass-by-value*) Use existing VM's VDD size if not specified in the cloud profile
- PR #37540: (*yhekma*) Added prefix to tempfile for template @ 2016-11-10T00:37:18Z
  - ISSUE #37541: (*yhekma*) salt-minion does not clean up temp files for templates | refs: #37540 #37640
  - fdd13b4 Merge pull request #37540 from yhekma/2016.3
  - 93a59f8 Added prefix to tempfile for template
- 5e80acc Update for m2crypto changes removing lhash (#37578)
  - ISSUE #37084: (*AaronM-Cloudtek*) x509.certificate\_managed does not work with m2crypto >=0.25 | refs: #37578
  - PR #37578: (*clinta*) Update for m2crypto changes removing lhash
- 928462d fix example of function argument limiting (#37584)
  - PR #37584: (*clinta*) Fix eauth example for limiting args
- 2810b85 Add a test to ensure we don't check for fast-forward before fetching (#37571)
  - ISSUE #37551: (*viict*) git.latest ``Not a valid commit name" | refs: #37571 #37604
  - PR #37571: (*terminalmage*) Add a test to ensure we don't check for fast-forward before fetching
- PR #37553: (*rallytime*) Back-port #37521 to 2016.3 @ 2016-11-08T23:11:07Z
  - ISSUE #33645: (*ketzacoatl*) saltutil.sync\_all does not sync custom pillar modules to masterless minions | refs: #33833
  - ISSUE #25297: (*Akilesh1597*) perform `refresh\_pillar` as a part of `sync\_all` | refs: #37521 #25361
  - PR #37521: (*genuss*) refresh\_pillar() should be called always with refresh=True during saltutil.sync\_all | refs: #37553
  - PR #33833: (*terminalmage*) Support syncing pillar modules to masterless minions | refs: #37521
  - PR #25361: (*tedski*) perform *refresh\_pillar* as part of *sync\_all* when *refresh=True* | refs: #37521
  - b01c247 Merge pull request #37553 from rallytime/bp-37521
  - 30f92b0 refresh\_pillar() should be called always
- PR #37565: (*rallytime*) Back-port #37549 to 2016.3 @ 2016-11-08T23:10:25Z
  - PR #37549: (*Mrten*) sqlite is not found in 2015.8 | refs: #37565
  - 694df30 Merge pull request #37565 from rallytime/bp-37549
  - c92a90b Update sqlite3.py
  - fb76557 sqlite is not found in 2015.8
- 2fc0b22 Fix regression in service.dead state (#37562)
  - ISSUE #37511: (*jdolic*) service.dead now only operates if the service file exists | refs: #37562
  - PR #37562: (*terminalmage*) Fix regression in service.dead state
- ac754db Skip config type checking for sdb values (#37560)
  - ISSUE #37554: (*sjmh*) salt-api doesn't dynamically re-read nodegroups configuration | refs: #37560
  - PR #37560: (*whiteinge*) Skip config type checking for sdb values
- 453319b Don't pass the vpc id to boto.vpc.create\_internet\_gateway func (#37556)
  - PR #37556: (*rallytime*) Don't pass the vpc id to boto.vpc.create\_internet\_gateway func

- 89b9417 Documentation rendering fixes (#37543)
  - PR #37543: (*multani*) Documentation rendering fixes
- PR #37457: (*rallytime*) Fixup file.line docs to be more clear and consistent @ 2016-11-08T00:29:20Z
  - ISSUE #31081: (*JensRantil*) salt.modules.file.line documentation unclarities | refs: #37457
  - 96b8b9a Merge pull request #37457 from rallytime/fix-31081
  - 25821bb Clarify which modes use ``before``, ``after``, and ``indent`` options
  - 8b2d2b9 Clarify file.line state docs as well
  - b261589 Move note about using mode=insert with location options to mode section
  - db0b0ce Fixup file.line docs to be more clear and consistent
- PR #37526: (*twangboy*) Remove loop from dsc.apply\_config @ 2016-11-08T00:23:11Z
  - ISSUE #35799: (*davegiles*) dsc.apply\_config hangs (no error) on empty directory on target | refs: #37526
  - 7de790f Merge pull request #37526 from twangboy/fix\_35799
  - fc42609 Remove unnecessary format
  - c934a2b Remove the loop from apply\_config
- PR #37534: (*rallytime*) Back-port fix needed from #37515 @ 2016-11-08T00:14:46Z
  - PR #37515: (*rallytime*) [carbon] Merge forward from 2016.3 to carbon | refs: #37534 #37534
  - 94811df Merge pull request #37534 from rallytime/bp-merge-foward-fix
  - d1b2af1 Add missing source\_hash\_name args to a couple funcs
- PR #37533: (*whiteinge*) Return a 504 response instead of 500 for Salt timeouts @ 2016-11-08T00:14:15Z
  - 17adbb0 Merge pull request #37533 from whiteinge/salt-api-504-timeouts
  - 63226ae Return a 504 response instead of 500 for Salt timeouts
- PR #37529: (*loregordon*) Backport: PR 36736 to 2016.3 @ 2016-11-08T00:04:10Z
  - ISSUE #36679: (*loregordon*) Command `Import-Module ServerManager` failed with return code: 1 | refs: #36736
  - PR #36736: (*m03*) Fix issue 36679 win\_servermanager error | refs: #37529
  - a9f03ee Merge pull request #37529 from lorengordon/bp-36736
  - 21c2664 Fix issue 36679 win\_servermanager failure
- PR #37519: (*rallytime*) Update returner \_\_virtual\_\_() return messages for loader @ 2016-11-07T23:06:23Z
  - ISSUE #37444: (*Tanoti*) Returning False from \_\_virtual\_\_ in a returner does not return expected error | refs: #37502 #37519
  - PR #37502: (*cachedout*) Log proper message on returners that cannot be loaded | refs: #37519
  - 19475aa Merge pull request #37519 from rallytime/returner-load-errors
  - fb261a3 Update returner \_\_virtual\_\_() return messages for loader
- PR #37527: (*rallytime*) Add syndic\_id=None kwarg to save\_minions funcs in returners @ 2016-11-07T23:04:03Z
  - ISSUE #35016: (*pingangit*) TypeError: save\_minions() got an unexpected keyword argument `syndic\_id` | refs: #37527
  - fefdfab Merge pull request #37527 from rallytime/fix-35016

- 2944b24 Add `syndic_id=None` kwarg to `save_minions` funcs in returners
- b77b6ba fix Lithium to 2015.5.0 (#37530)
  - PR #37530: (*gtmanfred*) fix Lithium to 2015.5.0
- PR #37514: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-07T16:51:06Z
  - PR #37482: (*rallytime*) [2015.8] Doc version updated to 2016.3.4
  - 7431648 Merge pull request #37514 from rallytime/merge-2016.3
  - 41166ae Merge branch `2015.8' into `2016.3'
  - c505a05 [2015.8] Doc version updated to 2016.3.4 (#37482)
- PR #37503: (*cachedout*) Catch loader error on returners without `save_load` @ 2016-11-07T09:33:57Z
  - ISSUE #36713: (*Tanoti*) ExtraData: `unpack(b)` received extra data after upgrading to 2016.3.3 | refs: #37503
  - 2d924d0 Merge pull request #37503 from cachedout/issue\_36713
  - 5f7f971 Catch loader error on returners without `save_load`
- PR #37499: (*cachedout*) Clarify docs on salt-key events @ 2016-11-07T09:33:20Z
  - ISSUE #37448: (*alisson276*) In `salt/key' events there are acts that never happen | refs: #37499
  - d95bf59 Merge pull request #37499 from cachedout/key\_docs\_clarify
  - 2758e74 Clarify docs on salt-key events
- PR #37500: (*cachedout*) Remove unused flag @ 2016-11-07T09:33:04Z
  - 1dd1408 Merge pull request #37500 from cachedout/remove\_include\_errors
  - 6c705b1 Remove unused flag
- PR #37502: (*cachedout*) Log proper message on returners that cannot be loaded | refs: #37519 @ 2016-11-07T09:32:45Z
  - ISSUE #37444: (*Tanoti*) Returning `False` from `__virtual__` in a returner does not return expected error | refs: #37502 #37519
  - 4b6f1ab Merge pull request #37502 from cachedout/issue\_37444
  - 4c5ab05 Remove debugging
  - 17d01e4 Log proper message on returners that cannot be loaded
- PR #37494: (*sjorge*) Forgot to update `os_family` map in #37472 @ 2016-11-06T22:18:54Z
  - ISSUE #37389: (*d101nelson*) Some core grains are inaccurate or incomplete for Solaris | refs: #37472
  - PR #37472: (*sjorge*) 2016.3 solaris grains improvements | refs: #37494 #37494
  - 2422daf Merge pull request #37494 from sjorge/2016.3-osfam\_map
  - 96ba545 Forgot to update `os_family` map in #37472
- PR #37496: (*mcalmer*) fix status handling in `sysv` init scripts @ 2016-11-06T22:18:00Z
  - 41bd8e3 Merge pull request #37496 from mcalmer/fix-status-handling-in-sysv-init-scripts
  - 1fb2c4d fix status handling in `sysv` init scripts
- PR #37497: (*terminalmage*) Update 2016.3.5 release notes with `source_hash_name` explanation @ 2016-11-06T22:17:40Z
  - e741a77 Merge pull request #37497 from terminalmage/release\_notes

- c08038d Update 2016.3.5 release notes with source\_hash\_name explanation
- PR #37486: (*twangboy*) Add requirement for PowerShell 3 on Windows @ 2016-11-06T06:01:07Z
  - f4426c2 Merge pull request #37486 from twangboy/fix\_win\_docs
  - 9e0631a Add docs denoting the requirement for at least PowerShell 3
- PR #37493: (*cachedout*) Add sdb support to minion and master configs @ 2016-11-06T06:00:18Z
  - a1f355a Merge pull request #37493 from cachedout/minion\_master\_sdb
  - 9761a46 Add sdb support to minion and master configs
- PR #37452: (*rallytime*) file.line with mode=replace on an empty file should return False, not stacktrace @ 2016-11-06T01:55:11Z
  - ISSUE #31135: (*jeffreyc tang*) file.line mode=replace breaks on empty file. | refs: #37452
  - be93710 Merge pull request #37452 from rallytime/fix-31135
  - c792f76 Bump log level from debug to warning on empty file
  - 5f181cf file.line with mode=replace on an empty file should return False
  - 94a00c6 Write a unit test demonstrating stack trace in #31135
- PR #37469: (*terminalmage*) Rewrite file.extract\_hash to improve its matching ability @ 2016-11-06T01:50:01Z
  - ISSUE #37001: (*phil123456*) URGENT : archive.extracted does not work anymore | refs: #37081
  - ISSUE #29010: (*The-Loeki*) file.managed download failing checksum testing for Ubuntu in initrd w/source\_hash | refs: #37469
  - PR #37081: (*terminalmage*) Fix archive.extracted remote source\_hash verification | refs: #37469 #37469
  - 129b038 Merge pull request #37469 from terminalmage/issue29010
  - a3f38e5 Update file.extract\_hash unit tests
  - b26b528 Add the source\_hash\_name param to file.managed states
  - 52fe72d Rewrite file.extract\_hash
- PR #37472: (*sjorge*) 2016.3 solaris grains improvements | refs: #37494 #37494 @ 2016-11-06T01:46:10Z
  - ISSUE #37389: (*d10nelson*) Some core grains are inaccurate or incomplete for Solaris | refs: #37472
  - 9426b9d Merge pull request #37472 from sjorge/2016.3-solaris-grains
  - 2958f5c detect and properly handle OmniOS
  - 37c3a7f handle Oracle Solaris better
  - 69706d3 parse minorrelease if it has a / in it
  - d1cf4a0 improve regex for parsing /etc/release using files from Solaris 8 SPARC and Solaris 10
  - 88eddef some more cleanup for smartos
  - d3ff39f improve smartos os version grains
- PR #37478: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-04T20:30:08Z
  - ISSUE #37388: (*tyhunt99*) [2016.3.4] Refreshing of an s3 file server results in an exception. | refs: #37428
  - ISSUE #37286: (*terminalmage*) GitFS: mountpoints with trailing slashes cause all file paths in that repo to fail to be matched | refs: #37408

- ISSUE #36849: (*skulikov*) file.managed and archive.extracted don't properly work for tgz remote files | refs: #37418
- PR #37441: (*rallytime*) Back-port #37428 to 2015.8
- PR #37428: (*cachedout*) Fix incorrect reference of `__utils__` in salt.utils | refs: #37441
- PR #37418: (*terminalmage*) Do not use compression in tornado httpclient requests
- PR #37408: (*terminalmage*) Strip slashes from gitfs mountpoints
- 4ba63ab Merge pull request #37478 from rallytime/merge-2016.3
- 3483a44 Merge branch `2015.8' into `2016.3'
  - \* 35888c2 Merge pull request #37408 from terminalmage/issue37286
    - 4e4a057 Strip slashes from gitfs mountpoints
  - \* b6c57c6 Merge pull request #37418 from terminalmage/issue36849
    - 740bc54 Do not use compression in tornado httpclient requests
  - \* 7fba8aa Merge pull request #37441 from rallytime/bp-37428
    - 6fe3ef4 Fix incorrect reference of `__utils__` in salt.utils
- 8aa101a Get release notes started for 2016.3.5 (#37485)
  - PR #37485: (*rallytime*) Get release notes started for 2016.3.5
- dfd9495 [2016.3] Doc version updated to 2016.3.4 (#37483)
  - PR #37483: (*rallytime*) [2016.3] Doc version updated to 2016.3.4
- PR #37121: (*nevins-b*) allow the file.recurse state to support saltenv @ 2016-11-04T05:59:28Z
  - ISSUE #37123: (*nevins-b*) file.recurse state doesn't support pulling from other environments | refs: #37121
  - 580eca7 Merge pull request #37121 from nevins-b/2016.3
  - 99d2c36 making messaging in tests match new return
  - bc4b0e7 adding test for saltenv in file.recurse source url
  - 3315b67 fixing saltenv if not set in url
  - a9683cb allow the file.recurse state to support saltenv (salt://example/dir?saltenv=dev)
- PR #37426: (*jfindlay*) Wait for macOS to change system settings @ 2016-11-04T04:35:52Z
  - PR #37351: (*jfindlay*) modules.mac\_power: give macOS time to change setting | refs: #37426
  - 766b143 Merge pull request #37426 from jfindlay/mac\_sleep
  - 43a8e19 modules.mac\_power: wait for system to make change
  - feabca6 modules.mac\_system: wait for system to make change
  - 0213eb9 utils.mac\_utils: add confirm\_updated
- PR #37438: (*DmitryKuzmenko*) Fix for #37238 salt hang on master restart | refs: #37602 @ 2016-11-04T04:10:51Z
  - ISSUE #37238: (*cmclaughlin*) Restarting master causes minion to hang | refs: #37438 #37602
  - ISSUE #37018: (*tsaridas*) get events from python | refs: #37438 #37602
  - 9eab5c8 Merge pull request #37438 from DSRCorporation/bugs/37238\_salt\_hang\_on\_master\_restart
  - f253d3c Auto reconnect *salt* to master if the connection was lost.

- **PR #37440:** (*rallytime*) Back-port #31207 to 2016.3 @ 2016-11-04T04:09:33Z
  - **PR #31207:** (*thusoy*) Remove error logging of missing boto libraries | refs: #37440
  - 9aa7073 Merge pull request #37440 from rallytime/bp-31207
  - c71ae61 Remove error logging of missing boto libraries
- **PR #37442:** (*twangboy*) Create paths.d directory @ 2016-11-04T04:07:19Z
  - edbfadc Merge pull request #37442 from twangboy/fix\_osx\_postinstall
  - 8091a30 Create paths.d directory
- **PR #37445:** (*twangboy*) Check for Server os before checking [DO NOT MERGE FORWARD] @ 2016-11-04T04:04:49Z
  - afb1b3c Merge pull request #37445 from twangboy/fix\_import\_error\_2016.3
  - c0d5ebd Check for Server os before checking
- **PR #37446:** (*twangboy*) Detect VC++ for Python on Win32 @ 2016-11-04T04:04:02Z
  - 7a9f95a Merge pull request #37446 from twangboy/fix\_build\_32
  - 2de69f4 Detect VC for Python correctly on 32bit Windows
- **PR #37447:** (*rallytime*) Cast ip\_protocol rule as a str() in boto\_secgroup.present @ 2016-11-04T04:03:45Z
  - **ISSUE #36961:** (*nullify005*) boto\_secgroup assumes a string when checking ip\_protocol validity when not tcp|udp|all|-1 | refs: #37447
  - 651e0f7 Merge pull request #37447 from rallytime/fix-36961
  - 6b930ac Cast ip\_protocol rule as a str() in boto\_secgroup.present
- **PR #37455:** (*techhat*) Make api opts respect correct root\_dir @ 2016-11-04T03:25:40Z
  - **ISSUE #36446:** (*whiteinge*) Custom salt-api config problem | refs: #37455
  - **PR #36386:** (*xiaoanyunfei*) fix salt-api's default opts were covered by salt-master #35734 | refs: #37455
  - a51d944 Merge pull request #37455 from techhat/issue36446
  - 7eff90d Make api opts respect correct root\_dir
- **PR #37459:** (*twangboy*) Fix error message when ConvertTo-Json not supported [DO NOT MERGE FORWARD] @ 2016-11-04T03:22:31Z
  - 3591bf0 Merge pull request #37459 from twangboy/fix\_dsc\_json\_msg\_2016.3
  - 949b709 Use cmd.run\_all instead of cmd.shell
- **PR #37430:** (*meaksh*) Including resolution parameters in the Zypper debug-solver call during a dry-run dist-upgrade (2016.3) @ 2016-11-03T14:35:46Z
  - **ISSUE #2016:** (*seanchannel*) status.custom failing on any arguments
  - **PR #37353:** (*meaksh*) Including resolution parameters in the Zypper debug-solver call during a dry-run dist-upgrade | refs: #37430
  - 80a99c4 Merge pull request #37430 from meaksh/zypper-dist-upgrade-debug-solver-fix-2016.3
  - ffc596f Including resolver params for Zypper debug-solver
- 67cc7a7 Fix incorrect reference of \_\_utils\_\_ in salt.utils (#37428)
  - **ISSUE #37388:** (*tyhunt99*) [2016.3.4] Refreshing of an s3 file server results in an exception. | refs: #37428
  - **PR #37428:** (*cachedout*) Fix incorrect reference of \_\_utils\_\_ in salt.utils | refs: #37441

- **PR #37419:** (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-02T21:40:04Z
  - **ISSUE #33187:** (*usbportnoy*) Deploy to jboss TypeError at boss7.py:469 | refs: #33190
  - **PR #37392:** (*rallytime*) Back-port #33190 to 2015.8
  - **PR #33190:** (*usbportnoy*) Fixes Type error in jboss state module when concatenating comments | refs: #37392
  - 7864f9b Merge pull request #37419 from rallytime/merge-2016.3
  - bce47c9 Merge branch `2015.8' into `2016.3'
    - \* 7b1d3b5 Merge pull request #37392 from rallytime/bp-33190
    - \* 4063bae catch None cases for comments in jboss7 state module
- d749567 Fix regression in output for Ctrl-c'ed CLI jobs (#37416)
  - **PR #37416:** (*terminalmage*) Fix regression in output for Ctrl-c'ed CLI jobs
- e9b4620 Add unit tests for cloning from snapshot (#37414)
  - **PR #37414:** (*pass-by-value*) Add unit tests for cloning from snapshot
  - **PR #37350:** (*pass-by-value*) Add handling for full and linked clone | refs: #37414
- **PR #37404:** (*cachedout*) Revert ``Bootstrap delay option for salt-cloud" @ 2016-11-02T09:48:53Z
  - **PR #37401:** (*cachedout*) Bootstrap delay option for salt-cloud | refs: #37404
  - ecd794a Merge pull request #37404 from saltstack/revert-37401-bootstrap\_delay
  - e864de8 Revert ``Bootstrap delay option for salt-cloud"
- **PR #37401:** (*cachedout*) Bootstrap delay option for salt-cloud | refs: #37404 @ 2016-11-02T09:02:13Z
  - 2eb44fb Merge pull request #37401 from cachedout/bootstrap\_delay
  - 6e42b0e Bootstrap delay option for salt-cloud
- **PR #37350:** (*pass-by-value*) Add handling for full and linked clone | refs: #37414 @ 2016-11-02T08:02:29Z
  - 9446e48 Merge pull request #37350 from pass-by-value/full\_and\_linked\_clone\_v1
  - d8b1c9c Add handling for full and linked clone and commit disk mode additions
- **PR #37386:** (*rallytime*) Fix win\_useradd.chgroups return when cmd.run\_all retcode != 0 @ 2016-11-02T06:34:12Z
  - **ISSUE #34841:** (*Ch3LL*) Wrong return when using *user.chgroups* on windows | refs: #37386
  - c7f4d7f Merge pull request #37386 from rallytime/fix-34841
  - c70492a Fix win\_useradd.chgroups return when cmd.run\_all retcode != 0
- **PR #37390:** (*rallytime*) Don't insert \_\_pub\* keys into dnsmasq config file with set\_config function @ 2016-11-02T06:31:53Z
  - **ISSUE #34263:** (*vernonddcole*) Use of dnsmasq.set\_config injects unintentional text into the configuration file. | refs: #37390
  - 34b6c64 Merge pull request #37390 from rallytime/fix-34263
  - e082ff5 Fix failing test now that we're raising a CommandExecutionError
  - c6a3476 Filter out the \_\_pub keys passed via \*\*kwargs for dnsmasq.set\_config
  - fd380c7 Add test case to reproduce dnsmasq.set\_config failure in #34263

- **PR #37391:** (*rallytime*) Back-port #35287 to 2016.3 @ 2016-11-02T06:18:26Z
  - **ISSUE #35163:** (*SolarisYan*) salt file.mkdir | refs: #35287 #35189
  - **PR #35287:** (*dere*) 2016.3 | refs: #37391
  - **PR #35189:** (*dere*) return value for file.mkdir instead of None | refs: #35287
  - 798b2ac Merge pull request #37391 from rallytime/bp-35287
  - 0e1e8ea Simplify return value to ``True``.
  - 13022c5 return value for mkdir instead of None
- **PR #37279:** (*gtmanfred*) initialize super class of NamespacedDictWrapper @ 2016-11-01T15:12:49Z
  - **ISSUE #37264:** (*junster1*) Parsing \_\_grains\_\_ with json.dumps in a module is returning an empty dict in 2016.3.3 | refs: #37279
  - 1a4833b Merge pull request #37279 from gtmanfred/2016.3
  - 597f346 initialize super class of NamespacedDictWrapper
- **PR #37351:** (*jfindlay*) modules.mac\_power: give macOS time to change setting | refs: #37426 @ 2016-10-31T19:15:40Z
  - 3511759 Merge pull request #37351 from jfindlay/mac\_set
  - 0c58056 modules.mac\_power: give macOS time to change setting
- **PR #37340:** (*cachedout*) SIGILL -> SIGKILL in process test @ 2016-10-31T08:50:10Z
  - 25c987e Merge pull request #37340 from cachedout/ill\_kill\_3
  - a6b7417 SIGILL -> SIGKILL in process test
- **PR #37306:** (*DmitryKuzmenko*) Don't use os.wait() on subprocesses managed by *multiprocessing*. @ 2016-10-31T06:55:30Z
  - **ISSUE #35480:** (*jelenak*) 200 processes of salt-master (2016.3.2) | refs: #37306
  - 7f16548 Merge pull request #37306 from DSRCorporation/bugs/35480\_master\_shutdown\_no\_process\_error
  - b6937eb Don't use os.wait() on subprocesses managed by *multiprocessing*.
- **PR #37314:** (*rallytime*) Document the existence of placementgroup option in ec2 driver @ 2016-10-31T06:42:33Z
  - **ISSUE #34998:** (*exowaucka*) placementgroup parameter for salt-cloud is undocumented | refs: #37314
  - bf8ba97 Merge pull request #37314 from rallytime/fix-34998
  - 39459ed Document the existence of placementgroup option in ec2 driver
- **PR #37219:** (*alex-zel*) Fix freeipa ldap groups @ 2016-10-28T04:33:37Z
  - **ISSUE #36148:** (*alex-zel*) Eauth error with openLDAP groups | refs: #37219
  - e0baf4b Merge pull request #37219 from alex-zel/fix-freeipa-ldap-groups
  - b5b2e7e Remove trailing whitespaces
  - 32f906b Add support for FreeIPA

## 20.2.12 Salt 2016.3.6 Release Notes

Version 2016.3.6 is a bugfix release for 2016.3.0.

## Changes for v2016.3.5..v2016.3.6

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2017-03-22T20:18:54Z

Statistics:

- Total Merges: 118
- Total Issue references: 53
- Total PR references: 168

Changes:

- **PR #39855:** (*Foxlik*) Use regular expression instead of split when replacing authorized\_keys @ 2017-03-22T18:28:32Z
  - **ISSUE #39854:** (*Foxlik*) quoted space in authorized\_keys confuses ssh.py | refs: #39855
  - c59ae9a Merge pull request #39855 from Foxlik/use\_regex\_to\_compare\_authorized\_keys
  - d46845a Add newline at end of file
  - d4a3c8a Use regular expression instead of split when replacing authorized\_keys
- **PR #40221:** (*rallytime*) Back-port #39179 to 2016.3 @ 2017-03-22T17:40:34Z
  - **PR #39179:** (*mcalmer*) fix error parsing | refs: #40221
  - fd10430 Merge pull request #40221 from rallytime/bp-39179
  - 07dc2de fix error parsing
- **PR #40206:** (*cro*) Leave sign\_pub\_messages off by default. @ 2017-03-22T16:43:03Z
  - **ISSUE #40203:** (*frogunder*) 2016.3.6. Minion don't connect to older master. | refs: #40206
  - a27a2cc Merge pull request #40206 from cro/sign\_pub\_take2
  - 01048de leave sign\_pub\_messages off on minion by default.
  - a82b005 Leave sign\_pub\_messages off by default.
- **PR #40193:** (*rallytime*) Back-port #40117 to 2016.3 @ 2017-03-22T16:42:21Z
  - **PR #40117:** (*narendraingale2*) Fix force remove | refs: #40193
  - d1abb4c Merge pull request #40193 from rallytime/bp-40117
  - cf18579 More optimization.
  - 5a08266 Removed debug statemnt
  - f557f7c Added fix for issue 39393
  - bb62278 Reverting changes.
  - a9107cd Added if condition for broken link.
- **PR #40196:** (*twangboy*) Update dependencies for PyOpenSSL @ 2017-03-22T16:40:46Z
  - 0f1ff4d Merge pull request #40196 from twangboy/win\_fix\_deps
  - 6761527 Update dependencies for PyOpenSSL
- **PR #40184:** (*terminalmage*) Link to minion start reactor example from FAQ. @ 2017-03-21T17:33:09Z
  - b050151 Merge pull request #40184 from terminalmage/link-reactor-example

- a42be82 Link to minion start reactor example from FAQ.
- PR #40182: (*terminalmage*) Add support for ``stopped" state to dockerng's mod\_watch @ 2017-03-21T15:40:29Z
  - d4e6c58 Merge pull request #40182 from terminalmage/dockerng-mod\_watch-stopped
  - 4629a26 Add support for ``stopped" state to dockerng's mod\_watch
- PR #40171: (*Ch3LL*) additional PRs/issues for 2016.3.6 release notes @ 2017-03-20T22:14:17Z
  - a0b4082 Merge pull request #40171 from Ch3LL/2016.3.6\_release
  - 9c6d8d8 additional PRs/issues for 2016.3.6 release notes
- PR #40120: (*sergeizv*) gce: Exclude GCENodeDriver objects from \_expand\_node result @ 2017-03-20T21:44:42Z
  - 33ba782 Merge pull request #40120 from sergeizv/gce-expand-node-fix
  - 9d0fbe7 gce: Exclude GCENodeDriver objects from \_expand\_node result
- PR #40122: (*meaksh*) Adding ``pkg.install downloadonly=True" support to yum/dnf execution module @ 2017-03-20T21:44:15Z
  - 4884397 Merge pull request #40122 from meaksh/2016.3-yum-downloadonly-support
  - 067f3f7 Adding downloadonly support to yum/dnf module
- PR #40159: (*cro*) Turn on sign\_pub\_messages by default. @ 2017-03-20T21:00:49Z
  - 60e1d4e Merge pull request #40159 from cro/sign\_pub
  - e663b76 Fix small syntax error
  - 0a0f46f Turn on sign\_pub\_messages by default. Make sure messages with no `sig' are dropped with error when sign\_pub\_messages is True.
- PR #40123: (*twangboy*) Adds support for inet\_pton in Windows to network util @ 2017-03-20T16:25:47Z
  - 28e4fc1 Merge pull request #40123 from twangboy/win\_fix\_network
  - 06dfd55 Adds support for inet\_pton in Windows to network util
- PR #40141: (*bobrik*) Use the first address if cannot connect to any @ 2017-03-20T15:06:57Z
  - ISSUE #39995: (*frogunder*) Head of Develop - Multimaster error | refs: #40141
  - ISSUE #39118: (*bobrik*) Minion ipv6 option is not documented | refs: #39289
  - PR #39289: (*bobrik*) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141
  - 35ddb79 Merge pull request #40141 from bobrik/fallback-resolve
  - af1545d Use the first address if cannot connect to any
- PR #40059: (*terminalmage*) Fix traceback when virtualenv.managed is invoked with nonexistant user @ 2017-03-16T20:46:43Z
  - 116201f Merge pull request #40059 from terminalmage/fix-virtualenv-traceback
  - e3cfd29 Fix traceback when virtualenv.managed is invoked with nonexistant user
- PR #40090: (*rallytime*) Back-port #40056 to 2016.3 @ 2017-03-16T19:42:58Z
  - PR #40056: (*thatch45*) update mention bot blacklist | refs: #40090
  - a01b52b Merge pull request #40090 from rallytime/bp-40056
  - ae012db update mention bot blacklist
- PR #40057: (*cachedout*) More mentionbot blacklists @ 2017-03-16T18:10:11Z

- d1570bb Merge pull request #40057 from cachedout/ollie\_blacklist
- 0ac2e83 Merge branch `2016.3' into ollie\_blacklist
- PR #40070: (*Ch3LL*) update 2016.3.6 release notes with additional PR's @ 2017-03-16T15:43:22Z
  - d36bdb1 Merge pull request #40070 from Ch3LL/2016.3.6\_release
  - a1f8b49 update 2016.3.6 release notes with additional PR's
- PR #40018: (*meaksh*) Allows overriding `timeout' and `gather\_job\_timeout' to `manage.up' runner call @ 2017-03-15T19:43:01Z
  - 8dcffc7 Merge pull request #40018 from meaksh/2016.3-handling-timeouts-for-manage.up-runner
  - 9f5c3b7 Allows to set custom timeouts for `manage.up' and `manage.status'
  - 2102d9c Allows to set `timeout' and `gather\_job\_timeout' via kwargs
- PR #40038: (*velom*) correctly parse ``pkg\_name===version" from pip freeze @ 2017-03-15T19:30:03Z
  - 22fc529 Merge pull request #40038 from velom/fix-pip-freeze-parsing
  - 3fae91d correctly parse ``pkg\_name===version" from pip freeze
- PR #40053: (*gtmanfred*) Update rh\_ip.py @ 2017-03-15T18:57:32Z
  - ISSUE #40036: (*oogali*) UnboundLocalError: local variable `ifcfg' referenced before assignment | refs: #40053
  - 3584f93 Merge pull request #40053 from saltstack/rh\_ip\_patch
  - 219947a Update rh\_ip.py
- PR #40041: (*terminalmage*) Fix transposed lines in salt.utils.process @ 2017-03-15T17:58:24Z
  - ISSUE #40011: (*tsaridas*) salt-minion does not shutdown properly 2016.11.3 rh6 | refs: #40041
  - 837432d Merge pull request #40041 from terminalmage/issue40011
  - 5b5d1b3 Fix transposed lines in salt.utils.process
- PR #40021: (*Ch3LL*) 2016.3.6 release notes with change log @ 2017-03-14T21:06:18Z
  - ee7f3b1 Merge pull request #40021 from Ch3LL/2016.3.6\_release
  - f3e7e4f Add 2016.3.6 Release Notes
- PR #40016: (*terminalmage*) Attempt to fix failing grains tests in 2016.3 @ 2017-03-14T18:34:32Z
  - 26895b7 Merge pull request #40016 from terminalmage/fix-grains-test
  - 0ec81a4 Fixup a syntax error
  - 5d84b40 Attempt to fix failing grains tests in 2016.3
- PR #39980: (*vutny*) [2016.3] Allow to use *bg* kwarg for *cmd.run* state function @ 2017-03-14T17:16:14Z
  - 0c61d06 Merge pull request #39980 from vutny/cmd-run-state-bg
  - a81dc9d [2016.3] Allow to use *bg* kwarg for *cmd.run* state function
- PR #39994: (*rallytime*) Add a versionadded tag for dockerng ulimits addition @ 2017-03-13T20:58:02Z
  - ISSUE #39942: (*Foxlik*) Web Documentation not in sync with release 2016.11.3 | refs: #39994
  - b042484 Merge pull request #39994 from rallytime/ulimits-dockerng-version
  - 37bd800 Add a versionadded tag for dockerng ulimits addition
- PR #39988: (*terminalmage*) Add comment explaining change from #39973 @ 2017-03-13T18:37:29Z

- PR #39973: (*terminalmage*) Don't use docker.Client instance from context if missing attributes
- e125c94 Merge pull request #39988 from terminalmage/dockerng-timeout
- bd2519e Add comment explaining change from #39973
- PR #39973: (*terminalmage*) Don't use docker.Client instance from context if missing attributes @ 2017-03-11T14:57:50Z
  - cd0336e Merge pull request #39973 from terminalmage/dockerng-timeout
  - 869416e Don't use docker.Client instance from context if missing attributes
- PR #39962: (*cachedout*) Disable mention bot delay on 2016.3 @ 2017-03-10T20:24:08Z
  - 282c607 Merge pull request #39962 from cachedout/disable\_mentionbot\_delay\_3
  - 7a638f2 Disable mention bot delay on 2016.3
    - \* 5592c68 More mentionbot blacklists
- PR #39937: (*cachedout*) Fix --non-gpg-checks in zypper module @ 2017-03-10T18:02:51Z
  - 1e0c88a Merge pull request #39937 from cachedout/gpg\_zypper
  - 13ed0d1 Fix --non-gpg-checks in zypper module
- PR #39929: (*terminalmage*) Scrap event-based approach for refreshing grains (2016.3 branch) @ 2017-03-09T22:03:16Z
  - 4526fc6 Merge pull request #39929 from terminalmage/pr-39770-2016.3
  - cf0100d Scrap event-based approach for refreshing grains
- PR #39919: (*The-Loeki*) CIDR matching supports IPv6, update docs @ 2017-03-09T16:03:00Z
  - ISSUE #22080: (*The-Loeki*) CIDR matching for IPv6 / improve IPv6 support in utils.network | refs: #39919
  - 111110c Merge pull request #39919 from The-Loeki/patch-1
  - 170cbad CIDR matching supports IPv6, update docs
- PR #39899: (*techhat*) Update cleanup function for azure @ 2017-03-08T23:28:33Z
  - caf10e9 Merge pull request #39899 from techhat/cleanupdisks
  - baf4579 Update cleanup function for azure
- PR #39871: (*terminalmage*) Squelch warning for pygit2 import @ 2017-03-07T20:40:18Z
  - fcf95f3 Merge pull request #39871 from terminalmage/squelch-import-warning
  - 2b2ec69 Squelch warning for pygit2 import
- PR #39794: (*cachedout*) Clean up errors which might be thrown when the monitor socket shuts down @ 2017-03-04T16:12:37Z
  - f223fa8 Merge pull request #39794 from cachedout/clean\_monitor\_socket\_shutdown
  - 2e683e7 Clean up errors which might be thrown when the monitor socket shuts down
- PR #39819: (*terminalmage*) Improve the Top File matching docs @ 2017-03-04T16:06:40Z
  - 4002dc1 Merge pull request #39819 from terminalmage/top-file-matching-docs
  - 7178e77 Improve the Top File matching docs
- PR #39820: (*ni3mm4nd*) Add missing apostrophe in Beacons topic documentation @ 2017-03-04T16:05:29Z
  - c08aaeb Merge pull request #39820 from ni3mm4nd/beacons\_topic\_doc\_typo

- 804b120 Add missing apostrophe
- PR #39826: (*cachedout*) Add group func to yubikey auth @ 2017-03-04T16:02:14Z
  - cbd2a4e Merge pull request #39826 from cachedout/yubikey\_fix
  - 6125eff Add group func to yubikey auth
- PR #39624: (*drawsmcgraw*) Address issue 39622 @ 2017-03-03T15:59:04Z
  - ISSUE #39622: (*drawsmcgraw*) boto\_vpc.create\_subnet does not properly assign tags | refs: #39624
  - f575ef4 Merge pull request #39624 from drawsmcgraw/39622
  - 13da50b Fix indention lint errors
  - 5450263 Address issue 39622
- PR #39796: (*cachedout*) Stop the process manager when it no longer has processes to manage @ 2017-03-02T23:03:13Z
  - ISSUE #39119: (*frogunder*) Head of 2016.3 - Salt-Master uses 90 seconds to restart | refs: #39796
  - 1f3619c Merge pull request #39796 from cachedout/master\_shutdown
  - e31d46c Stop the process manager when it no longer has processes to manage
- PR #39791: (*gtmanfred*) load runners if role is master @ 2017-03-02T19:43:41Z
  - ISSUE #39333: (*jagguli*) Not Available error - Scheduling custom runner functions | refs: #39791
  - ISSUE #38514: (*githubcdr*) Unable to schedule runners | refs: #39791
  - 53341cf Merge pull request #39791 from gtmanfred/2016.3
  - 3ab4f84 load runners if role is master
- PR #39784: (*sergeizv*) Fix 39782 @ 2017-03-02T16:08:51Z
  - ISSUE #39782: (*sergeizv*) salt-cloud show\_instance action fails on EC2 instances | refs: #39784
  - ISSUE #33162: (*jfindlay*) Key error with salt.utils.cloud.cache\_node and EC2 | refs: #33164 #39784
  - PR #33164: (*jfindlay*) cloud.clouds.ec2: cache each named node | refs: #39784 #39784
  - c234c25 Merge pull request #39784 from sergeizv/fix-39782
  - b71c3fe Revert ``cloud.clouds.ec2: cache each named node (#33164)''
- PR #39766: (*rallytime*) Restore ipv6 connectivity and ``master: <ip>:<port>" support @ 2017-03-02T02:55:55Z
  - ISSUE #39336: (*GevatterGaul*) salt-minion fails with IPv6 | refs: #39766
  - ISSUE #39118: (*bobrik*) Minion ipv6 option is not documented | refs: #39289
  - PR #39289: (*bobrik*) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141
  - PR #25021: (*GideonRed*) Introduce ip:port minion config | refs: #39766
  - 4ee59be Merge pull request #39766 from rallytime/fix-ipv6-connection
  - 65b2396 Restore ipv6 connectivity and ``master: <ip>:<port>" support
- PR #39761: (*cachedout*) Properly display error in jboss7 state @ 2017-03-01T18:43:23Z
  - ISSUE #33187: (*usbportnoy*) Deploy to jboss TypeError at boss7.py:469 | refs: #39170 #39761
  - a24da31 Merge pull request #39761 from cachedout/issue\_33187
  - c2df29e Properly display error in jboss7 state

- **PR #39728:** (*rallytime*) [2016.3] Bump latest release version to 2016.11.3 @ 2017-02-28T18:07:44Z
  - 0888bc3 Merge pull request #39728 from rallytime/update-release-ver-2016.3
  - c9bc8af [2016.3] Bump latest release version to 2016.11.3
- **PR #39619:** (*terminalmage*) Add a function to simply refresh the grains @ 2017-02-28T00:20:27Z
  - b52dbee Merge pull request #39619 from terminalmage/zd1207
  - c7dfb49 Fix mocking for grains refresh
  - 7e0ced3 Properly hand proxy minions
  - 692c456 Add a function to simply refresh the grains
- **PR #39487:** (*bobrik*) Document default permission modes for file module @ 2017-02-24T23:49:00Z
  - **ISSUE #39482:** (*bobrik*) file.managed and file mode don't mention default mode | refs: #39487
  - 3f8b5e6 Merge pull request #39487 from bobrik/mode-docs
  - 41ef69b Document default permission modes for file module
- **PR #39641:** (*smarsching*) Return runner return code in a way compatible with check\_state\_result @ 2017-02-24T23:07:11Z
  - **ISSUE #39169:** (*blueyed*) Using batch-mode with *salt.state* in orchestration runner considers all minions to have failed | refs: #39641 #39641
  - f7389bf Merge pull request #39641 from smarsching/issue-39169-2016.3
  - 88c2d9a Fix return data structure for runner (issue #39169).
- **PR #39633:** (*terminalmage*) Fix misspelled argument in salt.modules.systemd.disable() @ 2017-02-24T18:21:36Z
  - fc970b6 Merge pull request #39633 from terminalmage/fix-systemd-typo
  - ca54541 Add missing unit test for disable func
  - 17109e1 Fix misspelled argument in salt.modules.systemd.disable()
- **PR #39613:** (*terminalmage*) Fix inaccurate documentation @ 2017-02-24T06:07:35Z
  - 53e78d6 Merge pull request #39613 from terminalmage/fix-docs
  - 9342eda Fix inaccurate documentation
- **PR #39600:** (*vutny*) state.file: drop non-relevant examples for *source\_hash* parameter @ 2017-02-23T16:55:27Z
  - 4e2b852 Merge pull request #39600 from vutny/state-file-docs
  - 9b0427c state.file: drop non-relevant examples for *source\_hash* parameter
- **PR #39584:** (*cachedout*) A note in the docs about mentionbot @ 2017-02-23T15:12:13Z
  - ed83420 Merge pull request #39584 from cachedout/mentionbot\_docs
  - 652044b A note in the docs about mentionbot
- **PR #39583:** (*cachedout*) Add empty blacklist to mention bot @ 2017-02-23T02:22:57Z
  - d3e50b4 Merge pull request #39583 from cachedout/mentionbot\_blacklist
  - 62491c9 Add empty blacklist to mention bot
- **PR #39579:** (*rallytime*) [2016.3] Pylint: Remove unused import @ 2017-02-22T23:46:33Z
  - 8352e6b Merge pull request #39579 from rallytime/fix-lint
  - 65889e1 [2016.3] Pylint: Remove unused import

- **PR #39578:** (*cachedout*) Add mention-bot configuration @ 2017-02-22T23:39:24Z
  - 43dba32 Merge pull request #39578 from cachedout/2016.3
  - 344499e Add mention-bot configuration
- **PR #39542:** (*twangboy*) Gate ssh\_known\_hosts state against Windows @ 2017-02-22T20:16:41Z
  - 8f7a0f9 Merge pull request #39542 from twangboy/gate\_ssh\_known\_hosts
  - c90a52e Remove expensive check
  - 6d645ca Add \_\_virtual\_\_ function
- **PR #39289:** (*bobrik*) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141 @ 2017-02-22T19:05:32Z
  - **ISSUE #39118:** (*bobrik*) Minion ipv6 option is not documented | refs: #39289
  - c109658 Merge pull request #39289 from bobrik/autodetect-ipv6
  - 2761a1b Move new kwargs to the end of argument list
  - 0df6b92 Narrow down connection exception to socket.error
  - e8a2cc0 Do no try to connect to salt master in syndic config test
  - af95786 Properly log address that failed to resolve or pass connection check
  - 9a34fbe Actually connect to master instead of checking route availability
  - c494839 Avoid bare exceptions in dns\_check
  - 29f3766 Rewrite dns\_check to try to connect to address
  - 55965ce Autodetect IPv6 connectivity from minion to master
- **PR #39569:** (*s0undt3ch*) Don't use our own six dictionary fixes in this branch @ 2017-02-22T18:59:49Z
  - 3fb928b Merge pull request #39569 from s0undt3ch/2016.3
  - 49da135 Don't use our own six dictionary fixes in this branch
- **PR #39508:** (*dincamihai*) Openscap @ 2017-02-22T18:36:36Z
  - 91e3319 Merge pull request #39508 from dincamihai/openscap
  - 9fedb84 Always return oscap's stderr
  - 0ecde2c Include oscap returncode in response
- **PR #39562:** (*terminalmage*) Add ulimits to dockerng state/exec module @ 2017-02-22T16:31:49Z
  - **ISSUE #30802:** (*kjelle*) Missing ulimits on docker.running / dockerng.running | refs: #39562
  - fbe2194 Merge pull request #39562 from terminalmage/issue30802
  - c503740 Add ulimits to dockerng state/exec module
  - da42040 Try the docker-py 2.0 client name first
- 01d4a84 dockerng.get\_client\_args: Fix path for endpoint config for some versions of docker-py (#39544)
  - **PR #39544:** (*terminalmage*) dockerng.get\_client\_args: Fix path for endpoint config for some versions of docker-py
- **PR #39498:** (*terminalmage*) Resubmit PR #39483 against 2016.3 branch @ 2017-02-20T19:35:33Z
  - dff35b5 Merge pull request #39498 from terminalmage/pr-39483
  - 20b097a dockerng: compare sets instead of lists of security\_opt

- **PR #39497:** (*terminalmage*) Two dockerng compatibility fixes @ 2017-02-19T17:43:36Z
  - 6418e72 Merge pull request #39497 from terminalmage/docker-compat-fixes
  - cbd0270 docker: make docker-exec the default execution driver
  - a6a17d5 Handle docker-py 2.0's new host\_config path
- **PR #39423:** (*dincamihai*) Openscap module @ 2017-02-17T18:31:04Z
  - 9c4292f Merge pull request #39423 from dincamihai/openscap
  - 9d13422 OpenSCAP module
- **PR #39464:** (*gtmanfred*) skip false values from preferred\_ip @ 2017-02-16T22:48:32Z
  - **ISSUE #39444:** (*clem-compilatio*) salt-cloud - IPv6 and IPv4 private\_ips - preferred\_ip sends False to is\_public\_ip | refs: #39464
  - 7dd2502 Merge pull request #39464 from gtmanfred/2016.3
  - f829d6f skip false values from preferred\_ip
- **PR #39460:** (*cachedout*) Fix mocks in win\_disim tests @ 2017-02-16T19:27:48Z
  - db359ff Merge pull request #39460 from cachedout/win\_dism\_test\_fix
  - e652a45 Fix mocks in win\_disim tests
- **PR #39426:** (*morganwillcock*) win\_dism: Return failure when package path does not exist @ 2017-02-16T00:09:22Z
  - 9dbfba9 Merge pull request #39426 from morganwillcock/dism
  - a7d5118 Return failure when package path does not exist
- **PR #39431:** (*UtahDave*) Fix grains.setval performance @ 2017-02-15T23:56:30Z
  - 5616270 Merge pull request #39431 from UtahDave/fix\_grains.setval\_performance
  - 391bbec add docs
  - 709c197 allow sync\_grains to be disabled on grains.setval
- **PR #39405:** (*rallytime*) Update :depends: docs for boto states and modules @ 2017-02-15T17:32:08Z
  - **ISSUE #39304:** (*Auha*) boto\_s3\_bucket documentation dependency clarification | refs: #39405
  - 239e16e Merge pull request #39405 from rallytime/fix-39304
  - bd1fe03 Update :depends: docs for boto states and modules
- **PR #39411:** (*rallytime*) Update external\_cache docs with other configuration options @ 2017-02-15T17:30:40Z
  - **ISSUE #38762:** (*oz123*) Configuration information for custom returners | refs: #39411
  - 415102f Merge pull request #39411 from rallytime/fix-38762
  - e13febe Update external\_cache docs with other configuration options
- 7e1803b Update docs on upstream EPEL7 pygit2/libgit2 issues (#39421)
  - **PR #39421:** (*terminalmage*) Update docs on upstream EPEL7 pygit2/libgit2 issues
- 4ff13ac salt.filesserver.roots: Fix regression in symlink\_list (#39409)
  - **PR #39409:** (*terminalmage*) salt.filesserver.roots: Fix regression in symlink\_list
  - **PR #39337:** (*terminalmage*) Don't re-walk the roots filesserver in symlink\_list() | refs: #39409
- **PR #39362:** (*dincamihai*) Add cp.push test @ 2017-02-14T18:42:11Z

- 8b8ab8e Merge pull request #39362 from dincamihai/cp-push-test-2016.3
  - 91383c5 Add cp.push test
- PR #39380: (*joe-niland*) Quote numeric user names so pwd.getpwnam handles them properly @ 2017-02-14T18:33:33Z
  - 4b726f9 Merge pull request #39380 from joe-niland/quote-numeric-username
  - c2edfdd Quote numeric user names so pwd.getpwnam handles them properly
- PR #39400: (*meaksh*) Prevents `OSError` exception in case certain job cache path doesn't exist @ 2017-02-14T18:27:04Z
  - 1116d32 Merge pull request #39400 from meaksh/2016.3-fix-local-cache-issue
  - e7e559e Prevents `OSError` exception in case path doesn't exist
- PR #39300: (*terminalmage*) Replace more usage of str.format in the loader @ 2017-02-13T19:01:19Z
  - PR #39227: (*terminalmage*) Loader optimization | refs: #39300
  - 6c854da Merge pull request #39300 from terminalmage/loader-optimization
  - d3e5d15 Replace more usage of str.format in the loader
- PR #39337: (*terminalmage*) Don't re-walk the roots fileservers in symlink\_list() | refs: #39409 @ 2017-02-13T18:41:17Z
  - 5286b5f Merge pull request #39337 from terminalmage/issue34428
  - a7d2135 Don't re-walk the roots fileservers in symlink\_list()
- PR #39339: (*cro*) Add link to external pillar documentation for clarification. @ 2017-02-13T18:40:13Z
  - ce781de Merge pull request #39339 from cro/pillar\_filetree\_doc
  - 410810c Clarification on external pillar usage.
- fa30143 Document the upstream RedHat bug with their pygit2 package (#39316)
  - PR #39316: (*terminalmage*) Document the upstream RedHat bug with their pygit2 package
- PR #39313: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2017-02-10T16:23:23Z
  - PR #39296: (*sergeizv*) Whitespace fix in docs Makefile
  - PR #39295: (*sergeizv*) Fix typo
  - PR #39294: (*sergeizv*) Fix link in proxyminion guide
  - PR #39293: (*sergeizv*) Grammar fix
  - 9de559f Merge pull request #39313 from rallytime/merge-2016.3
  - 0b8dddf Merge branch `2015.8' into `2016.3'
  - fc551bc Merge pull request #39293 from sergeizv/grammar-fix
    - \* 70f2b58 Rewrap paragraph
    - \* e6ab517 Grammar fix
  - 8a1b456 Merge pull request #39295 from sergeizv/typo-fix
    - \* 5d9f36d Fix typo
  - cfaafec Merge pull request #39296 from sergeizv/whitespace-fix
    - \* 1d4c1dc Whitespace fix in docs Makefile

- 0b4dcf4 Merge pull request #39294 from sergeizv/fix-link
  - \* 04bde6e Fix link in proxyminion guide
- dd3ca0e Fix #38595 - Unexpected error log from redis retuner in master's log (#39299)
  - ISSUE #38595: (yue9944882) Redis ext job cache occurred error | refs: #38610 #38610
  - PR #39299: (rallytime) Back-port #38610 to 2016.3
  - PR #38610: (yue9944882) Fix #38595 - Unexpected error log from redis retuner in master's log | refs: #39299
- PR #39297: (cro) Add doc to recommend pgjsonb for master job caches @ 2017-02-09T22:49:59Z
  - f16027d Merge pull request #39297 from cro/pg\_returner\_docs
  - 28bac64 Typo
  - 19fedcd Add doc to recommend pgjsonb for master job caches
- PR #39286: (terminalmage) Allow minion/CLI saltenv/pillarenv to override master when compiling pillar @ 2017-02-09T21:22:46Z
  - 77e50ed Merge pull request #39286 from terminalmage/fix-pillarenv-precedence
  - 3cb9833 Allow minion/CLI saltenv/pillarenv to override master when compiling pillar
- PR #39221: (lvg01) Fix bug 39220 @ 2017-02-09T18:12:29Z
  - ISSUE #39220: (lvg01) state file.line skips leading spaces in content with mode:ensure and indent:False | refs: #39221 #39221 #39221 #39221
  - 5244041 Merge pull request #39221 from lvg01/fix-bug-39220
  - e8a41d6 Removes to early content stripping (stripping is allready done when needed with ident:true), fixes #39220
  - a4b169e Fixed wrong logic, fixes #39220
- 5a27207 Add warning for Dulwich removal (#39280)
  - ISSUE #36913: (terminalmage) Support custom refsspecs in GitFS | refs: #39210
  - PR #39280: (terminalmage) Add warning for Dulwich removal
  - PR #39210: (terminalmage) salt.utils.gitfs: remove dulwich support, make refsspecs configurable | refs: #39280
- 1b9217d Update jsonschema tests to reflect change in jsonschema 2.6.0 (#39260)
  - PR #39260: (terminalmage) Update jsonschema tests to reflect change in jsonschema 2.6.0
- c1d16cc Better handling of enabled/disabled arguments in pkgrepo.managed (#39251)
  - ISSUE #33536: (murzick) pkgrepo.managed does not disable a yum repo with ``disabled: True" | refs: #35055
  - PR #39251: (terminalmage) Better handling of enabled/disabled arguments in pkgrepo.managed
  - PR #35055: (galet) #33536 pkgrepo.managed does not disable a yum repo with ``disabled: True" | refs: #39251
- PR #39227: (terminalmage) Loader optimization | refs: #39300 @ 2017-02-08T19:38:21Z
  - 8e88f71 Merge pull request #39227 from terminalmage/loader-optimization
  - c750662 Loader optimization

- PR #39228: (*gtmanfred*) default to utf8 encoding if not specified @ 2017-02-08T19:36:57Z
  - ISSUE #38856: (*fhaynes*) salt-cloud throws an exception when ec2 does not return encoding | refs: #39228
  - bc89b29 Merge pull request #39228 from gtmanfred/2016.3
  - afee047 default to utf8 encoding if not specified
- PR #39231: (*terminalmage*) Add clarification for jenkins execution module @ 2017-02-08T19:34:45Z
  - d9b0671 Merge pull request #39231 from terminalmage/clarify-jenkins-depends
  - ad1b125 Add clarification for jenkins execution module
- PR #39232: (*terminalmage*) Avoid recursion in s3/svn ext\_pillars @ 2017-02-08T19:33:28Z
  - ddcff89 Merge pull request #39232 from terminalmage/issue21342
  - c88896c Avoid recursion in s3/svn ext\_pillars
- ef4e437 Fix the win\_ip\_test failures (#39230)
  - ISSUE #38697: (*fboismenu*) On Windows, ip.get\_all\_interfaces returns at most 2 DNS/WINS Servers | refs: #38793
  - PR #39230: (*rallytime*) Fix the win\_ip\_test failures
  - PR #38793: (*fboismenu*) Fix for #38697 | refs: #39197 #39230
- PR #39199: (*rallytime*) Back-port #39170 to 2016.3 @ 2017-02-07T16:19:32Z
  - ISSUE #33187: (*usbportnoy*) Deploy to jboss TypeError at boss7.py:469 | refs: #39170 #39761
  - PR #39170: (*grep4linux*) Added missing source\_hash\_name argument in get\_managed function | refs: #39199
  - df5f934 Merge pull request #39199 from rallytime/bp-39170
  - c129905 Added missing source\_hash\_name argument in get\_managed function Additional fix to #33187 Customer was still seeing errors, this should now work. Tested with 2015.8.13 and 2016.11.2
- PR #39206: (*cachedout*) Ignore empty dicts in highstate outputter @ 2017-02-07T16:11:36Z
  - ISSUE #37174: (*mikeadamz*) The State execution failed to record the order in which all states were executed spam while running pkg.upgrade from orchestration runner | refs: #39206
  - 2621c11 Merge pull request #39206 from cachedout/issue\_issue\_37174
  - be31e05 Ignore empty dicts in highstate outputter
- PR #39209: (*terminalmage*) Sort the return list from the fileserver.envs runner @ 2017-02-07T16:07:08Z
  - dd44045 Merge pull request #39209 from terminalmage/sorted-envs
  - e6dda4a Sort the return list from the fileserver.envs runner
- 7bed687 [2016.3] Pylint fix (#39202)
  - PR #39202: (*rallytime*) [2016.3] Pylint fix
- PR #39197: (*cachedout*) Pr 38793 @ 2017-02-06T19:23:12Z
  - ISSUE #38697: (*fboismenu*) On Windows, ip.get\_all\_interfaces returns at most 2 DNS/WINS Servers | refs: #38793
  - PR #38793: (*fboismenu*) Fix for #38697 | refs: #39197 #39230
  - ab76054 Merge pull request #39197 from cachedout/pr-38793
  - f3d35fb Lint fixes

- 624f25b Fix for #38697
- PR #39166: (*Ch3LL*) fix boto ec2 module create\_image doc @ 2017-02-06T18:27:17Z
  - fa45cbc Merge pull request #39166 from Ch3LL/fix\_boto\_ec2\_docs
  - 90af696 fix boto ec2 module create\_image doc
- PR #39173: (*rallytime*) Restore ``Salt Community" doc section @ 2017-02-06T18:19:11Z
  - PR #30770: (*jacobhammons*) Doc restructuring, organization, and cleanup | refs: #39173
  - PR #10792: (*cachedout*) Documentation overhaul | refs: #39173
  - a40cb46 Merge pull request #39173 from rallytime/restore-community-docs
  - 5aedd4 Restore ``Salt Community" doc section
- 9de08af Apply fix from #38705 to 2016.3 branch (#39077)
  - ISSUE #38704: (*nasenbaer13*) Archive extracted fails when another state run is queued | refs: #38705
  - PR #39077: (*terminalmage*) Apply fix from #38705 to 2016.3 branch
  - PR #38705: (*nasenbaer13*) Fix for #38704 archive extracted and dockerio states
- da3053e update vmware getting started doc (#39146)
  - PR #39146: (*gtmanfred*) update vmware getting started doc
- e78ca0f Fixing a weird edge case when using salt syndics and targetting via pillar. Without this fix the master of masters ends up in an infinite loop since the data returned from the minions is differently structured than if a sync was not in use. (#39145)
  - PR #39145: (*garethgreenaway*) [2016.3] Fix when targeting via pillar with Salt syndic
- PR #38804: (*alexbleotu*) Second attempt to fix prepending of root\_dir to paths @ 2017-02-02T16:10:37Z
  - ISSUE #2016: (*seanchannel*) status.custom failing on any arguments
  - ISSUE #3: (*thatch45*) libvirt module
  - ISSUE #1: (*thatch45*) Enable regex on the salt cli
  - cd8077a Merge pull request #38804 from alexbleotu/root\_dir\_`fix-2016`\_.3-gh
  - b3bdd3b Add missing whiteline
  - c7715ac Merge pull request #3 from cro/ab\_rootdirfix
    - \* e8cbafa When running testsuite, salt.syspaths.ROOT\_DIR is often empty.
  - b12dd44 Merge pull request #1 from cro/ab\_rootdirfix
    - \* bffc537 Remove extra if statements (rstrip will check for the presence anyway).
  - 97521b3 Second attempt to fix prepending of root\_dir to paths
- 6ffeda3 Clarify ipv6 option for minion and interface for master, closes #39118 (#39131)
  - ISSUE #39118: (*bobrik*) Minion ipv6 option is not documented | refs: #39289
  - PR #39131: (*bobrik*) Clarify ipv6 option for minion and interface for master, closes #39118
- 646b9ea Don't abort pillar.get with merge=True if default is None (#39116)
  - PR #39116: (*terminalmage*) Don't abort pillar.get with merge=True if default is None
- PR #39091: (*terminalmage*) Run test\_valid\_docs in batches @ 2017-02-01T19:09:05Z
  - cc9b69b Merge pull request #39091 from terminalmage/update-test-valid-docs

- d76f038 add debug logging for batch vars
- b4afea2 Don't fail test if data is empty
- b3a5d54 Account for trimmed value in `salt -d` output
- 909916c Run test\_valid\_docs in batches
- bcee3d1 Move fileclient tests to tests/integration/filesserver/fileclient\_test.py (#39081)
  - PR #39081: (*terminalmage*) Move fileclient tests to tests/integration/filesserver/fileclient\_test.py
- 122422b Bump openstack deprecation notice to Oxygen (#39067)
  - PR #39067: (*rallytime*) Bump openstack deprecation notice to Oxygen

  - ISSUE #37938: (*johje349*) Memory leak in Reactor | refs: #38951
  - ISSUE #33890: (*hvnstweeting*) salt memleak when running state.sls | refs: #38951
  - da96221 Merge pull request #38951 from DSRCorporation/bugs/37938\_fix\_depends\_decorator\_memleak
  - 0b18f34 Keep the only one record per module-function in depends decorator.
- PR #38982: (*rallytime*) Set response when using ``GET" method in s3 utils @ 2017-01-27T17:04:48Z
  - ISSUE #34780: (*joehoyle*) S3fs broken in 2016.3.1 | refs: #38982
  - 85165ed Merge pull request #38982 from rallytime/fix-34780
  - 1583c55 Set response when using ``GET" method in s3 utils
- PR #38989: (*anlutro*) Documentation: fix SLS in environment variable examples @ 2017-01-27T17:00:08Z
  - cfdbc99 Merge pull request #38989 from alprs/docfix-state\_pt3\_envirom
  - 52a9ad1 fix SLS in environment variable examples
- PR #39000: (*rallytime*) Skip the test\_badload test until Jenkins move is complete @ 2017-01-27T16:58:21Z
  - 55e4d25 Merge pull request #39000 from rallytime/skip-badload-test
  - 4b3ff0f Skip the test\_badload test until Jenkins move is complete
- PR #38995: (*terminalmage*) Fix pillar.item docstring @ 2017-01-27T16:58:00Z
  - fe054eb Merge pull request #38995 from terminalmage/fix-pillar.item-docstring
  - 06d094d Fix pillar.item docstring
- PR #38950: (*mbom2004*) Fixed Logstash Engine in file logstash.py @ 2017-01-26T19:10:07Z
  - ISSUE #34551: (*mbom2004*) salt.engines.logstash not loading | refs: #38950
  - b66b6f6 Merge pull request #38950 from mbom2004/2016.3
  - c09f39d Remove unused json import
  - 249efa3 Fixed Logstash Engine in file logstash.py
- a6c6e47 Handle changing ``is\_default" value in moto package for boto test mock (#38973)
  - PR #38973: (*rallytime*) Handle changing ``is\_default" value in moto package for boto test mock
- PR #38952: (*terminalmage*) Make the ext\_pillars available to pillar.ext tunable @ 2017-01-26T19:01:56Z
  - b965b5d Merge pull request #38952 from terminalmage/zd1168
  - 6b014e5 Rename on\_demand\_pillar to on\_demand\_ext\_pillar
  - d216f90 Document new on\_demand\_pillar option and add to config template
  - 426b20f Add documentation for on-demand pillar to pillar.ext docstring
  - 7b10274 Make on-demand ext\_pillars tunable
  - d54723c Add on\_demand\_pillar config option
- PR #38948: (*rallytime*) Bump the template context deprecation version to Oxygen @ 2017-01-25T19:45:59Z
  - ISSUE #35777: (*rallytime*) Properly deprecate template context data in Oxygen | refs: #38948

- 2c4ad85 Merge pull request #38948 from rallytime/bump-template-context-deprecation
- 749e003 Bump the template context deprecation version to Oxygen
- PR #38946: (*rallytime*) Back-port #37632 to 2016.3 @ 2017-01-25T19:40:40Z
  - PR #37632: (*twangboy*) Fix versions report for Windows Server platforms | refs: #38946
  - e4514ca Merge pull request #38946 from rallytime/bp-37632
  - ee37cda Fix some lint
  - c08071e Fix versions report for server OSs
- PR #38913: (*Adaephon-GH*) Ignore plist files without Label key @ 2017-01-25T19:07:27Z
  - 953a203 Merge pull request #38913 from Adaephon-GH/patch-1
  - e2f4a16 Removing trailing whitespace
  - 616292c Ignore plist files without Label key
- PR #38917: (*twangboy*) Update Jinja2 to 2.9.4 @ 2017-01-25T19:05:38Z
  - 826dce1 Merge pull request #38917 from twangboy/update\_jinja\_mac
  - 62e608b Update Jinja2 to 2.9.4
- PR #38925: (*terminalmage*) Fix two wheel issues in netapi @ 2017-01-25T18:28:52Z
  - ISSUE #38540: (*amendlik*) API wheel client throws exception and success=true | refs: #38925
  - ISSUE #38537: (*amendlik*) API client wheel\_async always returns status 500 | refs: #38925
  - b27733c Merge pull request #38925 from terminalmage/issue38540
  - 76392fc Fix traceback when a netapi module uses wheel\_async
  - bd4474f Fix `success` value for wheel commands
- PR #38926: (*gtmanfred*) add note about pysss for pam eauth @ 2017-01-25T18:12:20Z
  - 618596f Merge pull request #38926 from gtmanfred/2016.3
  - 9cae953 add note about pysss for pam eauth
- PR #38847: (*terminalmage*) Catch MinionError in file.source\_list @ 2017-01-24T16:03:10Z
  - ISSUE #38825: (*IshMalik*) file.managed multiple sources for redundancy failure | refs: #38847
  - 405d86a Merge pull request #38847 from terminalmage/issue38825
  - 11a4780 Use log.exception() instead
  - e40fac5 Catch MinionError in file.source\_list
- PR #38875: (*terminalmage*) Reactor: fix traceback when salt:// path is nonexistant @ 2017-01-24T15:23:39Z
  - ISSUE #36121: (*Ashald*) TemplateNotFound/Unable to cache file | refs: #38875
  - b5df104 Merge pull request #38875 from terminalmage/issue36121
  - fbc4d2a reactor: ensure glob\_ref is a string
  - 2e443d7 cp.cache\_file: add note re: return for nonexistant salt:// path
- PR #38890: (*cro*) Backport #38887 to 2016.3: Enable resetting a VM via salt-cloud & VMware driver @ 2017-01-24T15:15:35Z
  - ISSUE #37413: (*Snarfingcode666*) Salt-cloud vmware missing reboot command | refs: #38890

- e9ebec4 Merge pull request #38890 from cro/vmware\_reset\_vm\_20163
- 0146562 Call correct function for resetting a VM
- PR #38883: (*techhat*) Don't require text\_out path to exist @ 2017-01-23T18:20:42Z
  - PR #38867: (*mchugh19*) Touch deploy.sh before use | refs: #38883
  - PR #32026: (*techhat*) Don't require the decode\_out file to already exist | refs: #38883
  - c3fbfcd Merge pull request #38883 from techhat/dontrequire
  - 67bc4d6 Don't require text\_out path to exist
- PR #38851: (*terminalmage*) Support docker-py 2.0 in dockerng @ 2017-01-23T16:48:12Z
  - 6430a45 Merge pull request #38851 from terminalmage/docker-py-2.0
  - 3c061b2 Support docker-py 2.0 in dockerng
- PR #38844: (*cachedout*) Fix memory leak in HTTP client @ 2017-01-20T20:59:14Z
  - ac8008d Merge pull request #38844 from cachedout/http\_memory\_leak
  - c46bf85 Fix memory leak in HTTP client
- PR #38823: (*gtmanfred*) pass pillar to compound matcher in match module @ 2017-01-20T19:19:09Z
  - ISSUE #38798: (*ripta*) *match.compound* fails to match when pillar data is used | refs: #38823
  - dfe6dfe Merge pull request #38823 from gtmanfred/2016.3
  - f0a71e8 pass pillar to compound matcher in match module

### 20.2.13 Salt 2016.3.7 Release Notes

Version 2016.3.7 is a bugfix release for *2016.3.0*.

### 20.2.14 Salt 2015.8.0 Release Notes - Codename Beryllium

#### 2015.8.0 Detailed Change List

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>)

Generated at: 2015-09-09T18:15:43Z

This list includes all pull requests merged into the 2015.8 branch between the forking of the branch from develop and the release of 2015.8.0.

Statistics:

- Total Merges: 682
- Total Issue references: 342
- Total PR references: 866

Pull Requests:

- #26993: (*whiteinge*) Backport #26975
- #26970: (*cachedout*) Revert ``better path query parsing in fileserver``
- #26980: (*terminalmage*) Use human-readable cachedirs for gitfs-backed winrepo

- #26969: (*TheBigBear*) URL of salt windows downloads has changed
- #26968: (*TheBigBear*) URL of salt windows downloads has changed
- #26958: (*s0undt3ch*) Bradthurber bootstrap command line help doc update
- #26949: (*rallytime*) Back-port #25148 to 2015.8
- #26914: (*cro*) Add salt-proxy script and manpage to setup.py so they will get installed.
- #26909: (*terminalmage*) Don't try to git clone from /tmp on Windows
- #26910: (*s0undt3ch*) Sometimes the event system is just too fast
- #26905: (*s0undt3ch*) Exit the loop if run\_once is true
- #26897: (*msteed*) spm file hash part deux
- #26900: (*s0undt3ch*) If no tag is passed, don't actually subscribe to anything.
- #26880: (*s0undt3ch*) Restore backwards compatibility to *salt.utils.event*
- #26896: (*msteed*) spm remove: use pkgfiles to calculate file hashes
- #26891: (*jtand*) Fixed an unboundlocalerror
- #26892: (*cachedout*) Make the testing ioloop the current one
- #26886: (*jtand*) Gets the azure version correctly on python-azure 1.0.0
- #26870: (*rallytime*) Back-port #26834 to 2015.8
- #26865: (*dmurphy18*) Fix apt preferences for apts, repos for pbuilder building for Debian
- #26873: (*terminalmage*) Properly handle getting local config values in older git versions
- #26869: (*rallytime*) Fix provider --> driver change for salt-cloud lxc
- #26858: (*terminalmage*) Fix a couple version checks for git state and execution module
- #26853: (*UtahDave*) Fix salt-cloud on windows
- #26852: (*basepi*) [2015.8] Only reference msgpack if it imported successfully
- #26835: (*terminalmage*) Backport #26572 to 2015.8
- #26836: (*jacobhammons*) Added rst source for salt-proxy man page, added build and copy lines ...
- #26818: (*terminalmage*) Support empty repositories in git.latest
- #26819: (*rallytime*) Make sure we're calling `_validate_name` in the correct place in 2015.8 Linode driver
- #26841: (*l2ol33rt*) Fix reference before assignment in sqs engine
- #26822: (*terminalmage*) Add some missing imports for masterless winrepo
- #26831: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26826: (*techhat*) Pass a package name to `unregister_file()`
- #26757: (*cachedout*) Fix various filehandle leaks
- #26816: (*gtmanfred*) rev defaults to HEAD
- #26801: (*jacobhammons*) Added doc for dockerng minion configuration options
- #26808: (*anlutro*) Fix git init argument formatting
- #26807: (*terminalmage*) Move `salt.utils.itersplit()` to `salt.utils.itertools.split()`
- #26796: (*jacobhammons*) Add doc for `__states__`

- #26764: (*sjorge*) salt.utils.is\_proxy() is no longer always true on SunOS/Illumos/SmartOS
- #26772: (*sjorge*) pull in smartos `virt` module from develop
- #26726: (*terminalmage*) Redact HTTPS Basic Auth in states/funcks which deal with git remotes
- #26769: (*terminalmage*) Use --track to set tracking branch on older git versions
- #26765: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26761: (*sjorge*) fix SPM paths on smartos/illumos esky
- #26751: (*terminalmage*) Fixes for masterless winrepo
- #26745: (*rallytime*) Make sure pyrax configs are in place before checking for deps
- #26746: (*rallytime*) Make sure nova configs are set before checking for dependencies
- #26750: (*basepi*) [2015.8] Add \_\_utils\_\_ to state modules
- #26752: (*cro*) Fix typo in some diagram labels
- #26747: (*basepi*) [2015.8] Add \_\_states\_\_ to state modules, for cross-calling states
- #26744: (*basepi*) [2015.8] Fix issue from #26717
- #26737: (*dmurphy18*) Fix to allow for package naming other than just salt
- #26742: (*rallytime*) Only warn about vsphere deprecation if vsphere is configured
- #26733: (*sjorge*) Refactor of smartos\_vmadm module
- #26735: (*s0undt3ch*) Add .hg and .cvs to spm\_build\_exclude
- #26720: (*UtahDave*) Updates for winrepo in 2015.8 to support jinja, while maintaining backwards compat
- #26719: (*jodv*) Backport 26532 to 2015.8
- #26721: (*rallytime*) Linode Driver Cleanup
- #26707: (*techhat*) Add top\_level\_dir to FORMULAs
- #26723: (*s0undt3ch*) Handle SPM paths in the setup script
- #26717: (*basepi*) [2015.8] Revert loader changes from #26645
- #26712: (*techhat*) Move SPM paths around
- #26680: (*TheBigBear*) add more python libs info in `--versions-report`
- #26716: (*terminalmage*) Allow git identity to be a list
- #26691: (*garthgreenaway*) Fixes to ipset module for 2015.8
- #26701: (*kev009*) Ignore the first element of kern.disks split, which is the sysctl name (new disks grain)
- #26678: (*terminalmage*) Restructure git.latest rewrite to work better when following HEAD
- #26679: (*rallytime*) Back-port #26661 to 2015.8
- #26684: (*techhat*) Add reactor formulas to spm
- #26682: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26671: (*rallytime*) Warn users if cloud driver dependencies are missing.
- #26674: (*rallytime*) Back-port #26583 to 2015.8
- #26670: (*techhat*) Set up SPM to install -conf packages
- #26657: (*jfindlay*) top file compilation fixes

- #26659: (*TheBigBear*) minor doc edits - spelling
- #26654: (*jfindlay*) merge [`#26650`\\_](#)
- #26567: (*jtand*) Added git version check to git module
- #26649: (*twangboy*) Fixed Lint for real in win\_repo.py
- #26608: (*jacobhammons*) 2015.8.0 release notes and doc/conf.py updates
- #26646: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26645: (*rallytime*) Back-port #26390 to 2015.8
- #26642: (*twangboy*) Added function to render winrepo Jinja
- #26625: (*twangboy*) Correctly detect packages with no version, docs
- #26575: (*msted*) Update spm for integration into raas
- #26635: (*cro*) Don't report windows as a proxy.
- #26622: (*rallytime*) [2015.8] Also add -Z to script args for cloud tests
- #26619: (*rallytime*) Apply cloud test fixes from 2015.5 to 2015.8
- #26603: (*terminalmage*) Fixes for git.latest, git module integration tests, etc.
- #26577: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26534: (*cachedout*) Bump required Tornado version to 4.2.1
- #26566: (*cachedout*) Don't stacktrace trying to publish without a master
- #26541: (*terminalmage*) Make winrepo execution module use the same code as the runner
- #26530: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26570: (*cachedout*) Fix haproxy docs to be valid
- #26562: (*cachedout*) Fix suprious error message with systemd-detect
- #26557: (*jfindlay*) add docs to #26550
- #26544: (*nmadhok*) Do not raise KeyError when calling avail\_images if VM/template is in disconnected state
- #26501: (*terminalmage*) Update git\_pillar docs, add git.list\_worktrees function
- #26521: (*terminalmage*) Work around upstream git bug when cloning repo as root
- #26518: (*krak3n*) Fix for [`#25492`\\_](#)
- #26514: (*evverx*) Unmask a runtime masked services too
- #26529: (*mnalt*) bugfix: fix service.enable for missing rc.conf
- #26516: (*techhat*) Move more path operations into SPM loader
- #26533: (*cachedout*) Fix too aggressive even init check
- #26522: (*cro*) Do not load package provider if its not a proxy
- #26531: (*cachedout*) Fix failing event tests and modify event init
- #26433: (*cro*) Add support for default proxy config options, change default location of proxy config and log to /etc/salt/proxy and /var/log/proxy
- #26504: (*nmadhok*) [Backport] Adding ability to specify the virtual hardware version when creating VM
- #26517: (*cachedout*) Better fix for opensuse tornado httpclient

- #26479: (*rallytime*) Don't allow VMs with duplicate names to be created in EC2/AWS
- #26488: (*cachedout*) Don't pass unsupported kwarg to tornado
- #26451: (*terminalmage*) Use `rpm -qa` instead of repoquery to list installed packages
- #26491: (*jacobhammons*) doc site css fix for tiny fonts that appeared in code or pre tags in ...
- #26442: (*rallytime*) Hide API Key from debug logs for Linode Driver
- #26441: (*rallytime*) Refactor a few linode functions to be useful with salt-cloud command
- #26485: (*s0undt3ch*) One more missed typo
- #26495: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26492: (*cachedout*) Fix schedule test error on py26
- #26489: (*cachedout*) Fixing more tarfile tests on py2.6
- #26475: (*cachedout*) Better object checking on asyncreq cleanup
- #26477: (*cachedout*) Fix integration.modules.git.GitModuleTest.test\_archive on py26
- #26469: (*jtand*) --annotate and --message aren't valid options in older versions of git.
- #26439: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26464: (*rallytime*) Back-port #26456 to 2015.8
- #26463: (*rallytime*) Back-port #26455 to 2015.8
- #26449: (*s0undt3ch*) The CLI options are not meant to include underscores.
- #26270: (*sjorge*) salt.modules.network now supports SmartOS and SunOS < Solaris 11
- #26436: (*TheBigBear*) minor edits
- #26410: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26427: (*anlutro*) git.latest with no rev: fix concatenation error (NoneType and str)
- #26307: (*cachedout*) Fix bug in top file ordering
- #26428: (*cro*) Update docs to reflect new pillar structure
- #26429: (*cachedout*) Add release note regarding tcp transport on freebsd
- #26418: (*driskell*) Fix forward-merged caching from 2015.5 into 2015.8 to be compatible with the new match\_func
- #26252: (*DmitryKuzmenko*) Issues/24048 http client 2015.8
- #26413: (*evverx*) Fix service.{start,restart,reload,force-reload} for masked services
- #26393: (*dmurphy18*) Added option parameters to make\_repo to allow for configuration settings
- #26422: (*TheBigBear*) no dots in SLS filename \_\_AND\_\_ any directories (incl git repos)
- #26323: (*0xf10e*) Fix Credentials used in *glance* Exec Module
- #26341: (*terminalmage*) Rewrite git state and execution modules
- #26419: (*terminalmage*) Only use pygit2.errors if it exists
- #26423: (*eliasp*) doc - Correct function name for peer configuration
- #26401: (*cachedout*) Adapt proxy minion to tornado (w/lint)
- #26400: (*rallytime*) Back-port #26318 to 2015.8

- #26397: (*s0undt3ch*) A single *isinstance()* check for all types is enough
- #26385: (*gtmanfred*) don't require volume endpoint in nova driver
- #26287: (*techhat*) Break out SPM components into loaders
- #26384: (*TheBigBear*) Fix shell quoting for *cmd.run*
- #26391: (*rallytime*) Back-port #26367 to 2015.8
- #26383: (*rallytime*) Allow the creation of a VM without a profile
- #26375: (*s0undt3ch*) [2015.8] Schema DictItem required attribute fixes
- #26363: (*garethgreenaway*) Fixes to mount state 2015.8
- #26347: (*0xf10e*) Load *`pkgng'* as *`pkg'* on FreeBSD 9 when *providers:pkg == `pkgng'*
- #26361: (*TronPaul*) sign security token
- #26346: (*TronPaul*) Fix s3 using IAM credentials
- #26331: (*mnalt*) fix bug in *sysrc* to allow for empty rc variables
- #26334: (*rallytime*) Call *salt.utils.cloud.bootstrap* in GCE Driver provisioning
- #26308: (*dmurphy18*) Support for environment overrides building packages
- #26279: (*TheScriptSage*) Merge changes for pull #26083`\_ and pull #25632`\_ into 2015.8
- #26224: (*cachedout*) Cleanup of a few cases to move to *salt.utils.fopen*
- #26260: (*nmadhok*) Correct spelling of integration in docs
- #26226: (*rallytime*) Fix [`#25463`\\_](#)
- #26248: (*nmadhok*) Initial commit of unit tests for vmware cloud driver
- #26228: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26244: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.8 branch
- #26235: (*sjorge*) *salt.utils.is\_smartos\_zone*, inverse of *is\_smartos\_globalzone*
- #26221: (*sjorge*) SmartOS grain fixes
- #26218: (*terminalmage*) Add warning about *file.recurse* unicode errors with vim swap files.
- #26214: (*rallytime*) Back-port #24878 to 2015.8
- #26211: (*techhat*) Move SPM to its own directory
- #26197: (*TronPaul*) Fix GitFS when whitelisting base
- #26200: (*anlutro*) Make it possible to run salt-cloud as current user
- #26201: (*kev009*) Avoid VBOX storage emulation bugs in FreeBSD disks grain
- #26188: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26194: (*basepi*) Allow virtual grains to be generated even if *virt-what* is not available
- #26176: (*rallytime*) Back-port #26165 to 2015.8
- #26169: (*terminalmage*) Fix attribute error in *gitfs'* *find\_file* functions
- #26170: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it.
- #26143: (*nmadhok*) VMware cloud driver fixes [forward port from 2015.5 into 2015.8]
- #26173: (*jacobhammons*) Updates to cloud docs for the provider > driver change

- #26125: (*evverx*) Use `timedatectl set-timezone` to `tzsetting` if available
- #26145: (*sjorge*) `smartos_imgadm` cleanup
- #26148: (*terminalmage*) Refactor `winrepo` support
- #26128: (*sjorge*) `imgadm.avail` should return multiple results
- #26109: (*jfindlay*) fix quote indent
- #26089: (*anlutro*) User state/module: fix coercing of `None` into string ``None'' in GECOS
- #26081: (*cachedout*) Move invocation routine up
- #26086: (*rallytime*) Back-port #26019 to 2015.8
- #26087: (*rallytime*) Back-port #26059 to 2015.8
- #26052: (*jtand*) `Rh_ip` fix
- #26078: (*cachedout*) Fix missing key in error return
- #26074: (*basepi*) [2015.8] Re-apply #25358 in 2015.8
- #26069: (*jfindlay*) fix `win_firewall.delete_rule`
- #26066: (*s0undt3ch*) [2015.8] Update to latest bootstrap stable release v2015.06.08
- #26049: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26026: (*anlutro*) Fix `httpasswd` result false positive in test mode
- #26037: (*rallytime*) Back-port #25489 to 2015.8
- #26004: (*techhat*) Allow updating a single SPM repo at a time
- #26012: (*cachedout*) Merge `kwargs` into `opts` for `tcp` client
- #26007: (*anlutro*) `file.managed`: wrap `os.remove` in `if isfile`, don't remove on success
- #26009: (*terminalmage*) Add `winrepo` and `dockerng` information to 2015.8.0 release notes
- #26006: (*basepi*) Revert #25727 in favor of #25645
- #26001: (*cachedout*) Fix failing tests
- #25978: (*anlutro*) Correct service state changes in test mode
- #25982: (*sjorge*) `salt.modules.smartos_*` limit to global zone only
- #25989: (*rallytime*) Back-port #25832 to 2015.8
- #25988: (*cachedout*) Move #25642 to 2015.8
- #25999: (*s0undt3ch*) Include subschema defaults
- #25997: (*s0undt3ch*) Allow getting a defaults dictionary from schema defaults
- #25979: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25902: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25956: (*anlutro*) Fix user argument to cron functions
- #25946: (*sjorge*) Fix for `salt.utils.decorators` under `esky`
- #25957: (*anlutro*) Remove temporary file after `file.managed` with `checkcmd`
- #25874: (*rallytime*) Back-port #25668 to 2015.8
- #25929: (*sjorge*) `salt.module.pkgin's` `__virtual__()` should not return `None` if `pkg_info` is not present

- #25952: (*garethgreenaway*) Log when event.fire and event.fire\_master fail 2015.8
- #25944: (*sjorge*) Smartos libcrypto nonesky fix
- #25906: (*dmurphy18*) Cherry-pick of pkgbuild changes from develop branch
- #25925: (*sjorge*) Create default log location in smartos esky buildscript
- #25928: (*cachedout*) Fix stacktrace for non-existent states
- #25922: (*jacksonjtj*) Correct max\_wait -> max\_auth\_wait in MultiMinion
- #25907: (*rallytime*) Back-port #25892 to 2015.8
- #25910: (*terminalmage*) Pass osarch to check\_32()
- #25849: (*basepi*) Repress template error for GPG renderer (can't seek an OrderedDict)
- #25868: (*rallytime*) Back-port #25404 to 2015.8
- #25896: (*cachedout*) Lint
- #25876: (*jacksonjtj*) Fixes for 2015.8
- #25867: (*rallytime*) Back-port #25370 to 2015.8
- #25845: (*jacobhammons*) updated versionadded
- #25836: (*jacksonjtj*) Keep track of SyncWrapper's IOloop usage
- #25859: (*0xf10e*) warn\_until(Carbon,...) instead of Boron
- #25505: (*0xf10e*) Glance state module for 2015.8 ``Beryllium''
- #25843: (*jtand*) Fixed a lint error in parsers.py
- #25835: (*techhat*) spm update\_repo doesn't always require arguments
- #25837: (*jacobhammons*) regenerated man pages
- #25830: (*sjorge*) Loading of libcrypto on smartos esky fixed
- #25808: (*jfindlay*) add highstate opts to config/\_\_init\_\_.py, update docs
- #25820: (*sjorge*) Prerequisite to fix the smartos libcrypto loading
- #25781: (*anlutro*) Fix iptables.build\_rule
- #25764: (*gtmanfred*) allow use of cloudnetworks in ssh\_interface
- #25736: (*jfindlay*) insert explicit formatter number
- #25742: (*rallytime*) Back-port #25731 to 2015.8
- #25741: (*rallytime*) Back-port #25727 to 2015.8
- #25712: (*cachedout*) Fix outputter for state.apply
- #25698: (*rallytime*) Back-port #25659 to 2015.8
- #25690: (*anlutro*) Fix highstate duration alignment (again)
- #25684: (*davidjb*) Fix doc around Include/Exclude for states
- #25549: (*techhat*) Switch Scaleway to salt.utils.cloud.bootstrap()
- #25667: (*jfindlay*) add 2015.8.0rc2 autogenerated changelog
- #25653: (*anlutro*) Properly align highstate duration sum
- #25663: (*rallytime*) Back-port #25638 to 2015.8

- #25639: (*terminalmage*) Don't do pre-flight check on git\_pillar if it is not configured
- #25587: (*cachedout*) Fix prereq in salt.state
- #25628: (*anlutro*) Highstate output: show duration in seconds instead of milliseconds when appropriate
- #25631: (*basepi*) Remove trailing whitespace
- #25627: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25626: (*basepi*) Fix the highstate outputter if `duration` is not present
- #25601: (*terminalmage*) Fix error message when local bin pkg path is not absolute
- #25595: (*terminalmage*) Bring git\_pillar up to feature parity with gitfs
- #25619: (*cachedout*) Lint stateconf changes
- #25578: (*davidjb*) Allow parent relative includes in state files
- #25610: (*s0undt3ch*) [2015.8] Update the bootstrap script to latest release v2015.07.22
- #25599: (*jfindlay*) fix transport settings in #25596
- #25596: (*jfindlay*) Tcp test
- #25591: (*garethgreenaway*) Return data for scheduled jobs in 2015.8 default to True.
- #25588: (*basepi*) Fix some of the retcode work from #23105
- #25583: (*jtand*) Fixed lint error where pprint wasn't imported.
- #25572: (*rallytime*) Back-port #25570 to 2015.8
- #25575: (*rallytime*) Make Sure Scaleway driver works with deprecation paths
- #25564: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25566: (*techhat*) Fix download process for SPM repo updates
- #25553: (*techhat*) Switch SoftLayer to salt.utils.cloud.bootstrap()
- #25552: (*techhat*) Update pricing for SoftlayerHW
- #25547: (*techhat*) Switch Parallels to salt.utils.cloud.bootstrap()
- #25548: (*techhat*) Switch Proxmox to salt.utils.cloud.bootstrap()
- #25543: (*techhat*) Switch GCE to salt.utils.cloud.bootstrap()
- #25546: (*techhat*) Switch CloudStack to salt.utils.cloud.bootstrap()
- #25558: (*cachedout*) Lint config\_test
- #25515: (*s0undt3ch*) salt.utils.schema fixes
- #25514: (*garethgreenaway*) fixes to schedule.add documentation in 2015.8
- #25508: (*s0undt3ch*) [2015.8] Update bootstrap script to latest stable release, v2015.07.17
- #25501: (*basepi*) Add optional job end time to the local\_cache returner
- #25491: (*s0undt3ch*) Let's call it for what it is!
- #25462: (*rallytime*) Wrap is\_profile\_configured calls in try/except block
- #25439: (*rallytime*) Reduce digital\_ocean API call frequency
- #25451: (*s0undt3ch*) Salt-SSH Scan roster bugfixes (And Py3 support)
- #25449: (*ruzarowski*) Exclude dotfiles and directories from minion key lists (Fixes `#25448`\_)

- #25421: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25412: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25415: (*bechtoldt*) [docs] declare YAML as code block
- #25407: (*rallytime*) Back-port #23236 to 2015.8
- #25409: (*rallytime*) Back-port #24422 to 2015.8
- #25394: (*rallytime*) Back-port #25355 to 2015.8
- #25393: (*rallytime*) Back-port #25289 to 2015.8
- #25387: (*cachedout*) Lint #25319
- #25319: (*ruzarowski*) [cloud:EC2] Move SourceDest logic to `_update_enis` and add alias for `delete_interface_on_terminate`
- #25310: (*anlutro*) Add an `is list` test to the jinja environment
- #25264: (*ruzarowski*) Fix `AttributeError` in `fileservers update_opts`
- #25372: (*rallytime*) Don't stacktrace when provisioning instances with `softlayer*` drivers
- #25315: (*ruzarowski*) [cloud:EC2] Move handling of `AssociatePublicIpAddress` to `associate_eip/allocate_new_eip` logic depending on value type
- #25312: (*ruzarowski*) [cloud:EC2] Introduce `eni Name` property to set name tag value after its creation
- #25311: (*ruzarowski*) [cloud:EC2] Add ability to attach an existing `eni`
- #25280: (*rallytime*) Remove deprecation warnings for Beryllium
- #25329: (*twangboy*) Fixed some documentation errors
- #25300: (*s0undt3ch*) Fix ordering issue & Added requirements support
- #25283: (*jfindlay*) ensure `ret` is always defined
- #25252: (*jfindlay*) make `args` optional with default values in `win_firewall.delete_rule`
- #25257: (*notpeter*) Document `SourceDestCheck` added in #25242.
- #25298: (*twangboy*) Continue if profile not found
- #25296: (*twangboy*) Fixed `file.comment` for windows
- #25254: (*rallytime*) Change `versionadded/changed` references from Beryllium to 2015.8.0
- #25285: (*thusoy*) Remove error logging of missing `victorops` keys
- #25266: (*ruzarowski*) `cloud: EC2 eni property SourceDestCheck` is a `AttributeBooleanValue`
- #25216: (*jfindlay*) replace shell code with native python code
- #25278: (*rallytime*) Don't require size for all cloud drivers when checking profile configs
- #25271: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25263: (*techhat*) Allow non-standard HTTP requests on tornado
- #25253: (*s0undt3ch*) Remove the deprecation warning. The driver has been renamed.
- #25248: (*techhat*) Do not resize while iterating
- #25244: (*rallytime*) Remove parted deprecations and fix failing tests
- #25242: (*ruzarowski*) Make `SourceDestCheck` flag available to network interface definition
- #25226: (*nmadhok*) Backporting fix for issue `'#25223'` on 2015.8 branch

- #25234: (*krak3n*) Fix: Bug in boto\_asg state argument passing to boto\_asg module
- #25222: (*rallytime*) Back-port #25219 to 2015.8
- #25188: (*rallytime*) Use linode status descriptions instead of ints when logging status to CLI
- #25203: (*s0undt3ch*) Added DictConfig with tests & More tests
- #25189: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25184: (*rallytime*) Back-port #25126 to 2015.8
- #25172: (*s0undt3ch*) Comment out imports while the YAML and RST rendering is not in-place.
- #25158: (*s0undt3ch*) Comment out not implemented code
- #25145: (*s0undt3ch*) Implement *oneOf*, *anyOf*, *allOf* and *not* with unit tests
- #25140: (*s0undt3ch*) Make the detection code work under Python 3.4
- #25131: (*s0undt3ch*) Array support in salt.utils.config
- #25130: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

### New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. See the following links for instructions:

- [Red Hat / CentOS 5, 6, 7](#)
- [Debian 8](#)
- [Windows](#)
- [FreeBSD](#)

### Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See [fire\\_event](#).

### ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

### SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See [spm](#).

---

**Note:** The `spm` executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

---

## Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See [The Top File](#).

## Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

---

**Note:** Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time ([issue 26051](#))
  - TCP transport stacktrace on windows minion: Future exception was never retrieved ([issue 25718](#))
  - [freebsd] TCP transport not working in 2015.8.0rc3 ([issue 26364](#))
- 

## Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see [Proxy Minion Enhancements](#).

## Engines

Salt engines are long-running, external processes that leverage Salt. See [Salt Engines](#).

## Core Changes

- Add system version info to `versions_report`, which appears in both `salt --versions-report` and `salt '*' test.versions_report`. Also added is an alias `test.versions` to `test.versions_report`. ([issue 21906](#))
- Add colored console logging support. This is activated by using `%(colorlevel)s`, `%(colorname)s`, `%(colorprocess)s`, `%(colormsg)s` in `log_fmt_console` in the config file for any of `salt-master`, `salt-minion`, and `salt-cloud`.

## Git Pillar

The git external pillar has been rewritten to bring it up to feature parity with `gitfs`. Support for `pygit2` has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the git ext\_pillar configuration, further details can be found in the [pillar.git\\_pillar](#) docs.

## Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer\_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode's native API instead of depending on `apache-libcloud` or `linode-python`.

## Salt Cloud Changes

- Changed the default behavior of `rename_on_destroy` to be set to `True` in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the `terminated` state.
- When querying for VMs in `digital_ocean.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.Ocean.

## State and Execution Module Improvements

- New and improved Docker state and execution modules (`state` and `execution module`).

## Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

### Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other `force` arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

### **git.config\_unset** state added

This state allows for configuration values (or entire keys) to be unset. See [here](#) for more information and example SLS.

### **git.config** State Renamed to **git.config\_set**

To reduce confusion after the addition of *git.config\_unset*, the `git.config` state has been renamed to *git.config\_set*. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See [here](#) for more information and example SLS.

### **Initial Support for Git Worktrees in Execution Module**

Several functions have been added to the execution module to manage `worktrees` (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

### **New Functions in Git Execution Module**

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

### **Changes to Functions in Git Execution Module**

#### **git.add**

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

### **git.archive**

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.
- Trailing slash no longer implied in `prefix` argument, must be included if this argument is passed.

### **git.checkout**

- The `rev` argument is now optional when using `-b` or `-B` in `opts`, allowing for a branch to be created (or reset) using `HEAD` as the starting point.

### **git.clone**

- The `name` argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the `cwd`, instead of at that location.
- The `repository` argument has been deprecated and renamed to `url`.

### **git.config\_get**

- The `setting_name` argument has been deprecated and renamed to `key`.
- The `global` argument has been added, to query the global git configuration
- The `all` argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
- The `cwd` argument is now optional if `global` is set to `True`

### **git.config\_set**

- The value(s) of the key being set are now returned
- The `setting_name` argument has been deprecated and renamed to `key`.
- The `setting_value` argument has been deprecated and renamed to `value`.
- The `is_global` argument has been deprecated and renamed to `global`.
- The `multivar` argument has been added to specify a list of values to set for the specified key. The `value` argument is not compatible with `multivar`.
- The `add` argument has been added to add a value to a key (this essentially just adds an `--add` to the `git config` command that is run to set the value).

### **git.fetch**

- The `force` argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including `--force` in the `opts` argument, this argument is just for convenience and to match the usage of other functions with `force` arguments.
- The `refspecs` argument has been added to allow for one or more refspecs to be provided which override the one(s) specified by the `remote.remote_name.fetch` git configuration option.

### **git.ls\_remote**

- The `repository` argument has been deprecated and renamed to `remote`.
- The `branch` argument has been deprecated and renamed to `ref`.
- The `opts` argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

### **git.merge**

- The `branch` argument has been deprecated and renamed to `rev`.

### **git.status**

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

### **git.submodule**

- Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument `timeout` in `jboss7.status`.
- Deprecate `enabled` argument in `pkgrepo.managed` in favor of `disabled`.
- Archive module changes: In the `archive.tar` and `archive.cmd_unzip` module functions, remove the arbitrary prefixing of the options string with `-`. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme. Also, `tar` will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the non- `-` format, when really they are using the with- `-` format.
- Added `__states__` to state modules, for cross-calling states. This enables using existing states when writing custom states. See *cross calling states*.

## Windows Improvements

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name. See *Silent Installer Options*.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (`win_wua`).
- Turned on multi-processing by default for windows in minion configuration.

## Windows Software Repo Changes

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the *Windows Software Repository* documentation for more information.

## Changes to legacy Windows repository

If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the *Windows Software Repository* documentation for more information.

## Win System Module

The unit of the `timeout` parameter in the `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` functions has been changed from seconds to minutes in order to be consistent with the linux timeout setting. (issue 24411) Optionally, the unit can be reverted to seconds by specifying `in_seconds=True`.

## Other Improvements

- Sanitize sensitive fields in `http.query`
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added `rest_timeout` config option and `timeout` argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for `http.request`
- Support `pillarenv` selection as it's done for `saltenv`
- salt was updated to use `python-crypto` version 2.6.1, which removes the dependency on `python-m2crypto`.

## Deprecations

- The `digital_ocean.py` Salt Cloud driver was removed in favor of the `digital_ocean_v2.py` driver as DigitalOcean has removed support for APIv1. The `digital_ocean_v2.py` was renamed to `digital_ocean.py` and supports DigitalOcean's APIv2.
- The `vsphere.py` Salt Cloud driver has been deprecated in favor of the `vmware.py` driver.
- The `openstack.py` Salt Cloud driver has been deprecated in favor of the `nova.py` driver.
- The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the Nitrogen release of Salt. Example provider file:

```
my-ec2-cloud-config:
  id: 'HJGRYCILJLKJYG'
  key: 'kdjgfsqm;woormgl/aseregjksjdhasdfgn'
  private_key: /etc/salt/my_test_key.pem
  keyname: my_test_key
  securitygroup: default
  driver: ec2
```

- The use of `lock` has been deprecated and from `salt.utils.fopen`. `salt.utils.flopen` should be used instead.
- The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.
- The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.
- Support for output in `mine.get` was removed. `--out` should be used instead.
- The use of `delim` was removed from the following functions in the `match` execution module: `pillar_pcre`, `pillar`, `grain_pcre`,

## Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <[asteiger@suse.com](mailto:asteiger@suse.com)> for bringing this to our attention.

## Major Bug Fixes

- Fixed minion failover to next master on DNS errors ([issue 21082](#))
- Fixed memory consumption in SaltEvents ([issue 25557](#))
- Don't lookup outside system path in `which()` util ([issue 24085](#))
- Fixed broken jobs rest api call ([issue 23408](#))
- Fixed stale grains data using in modules ([issue 24073](#))
- Added `ssh_identities_only` config flag for ssh-agent configured environments ([issue 24096](#))
- Fixed ``object has no attribute" errors for Raet transport ([issue 21640](#))
- Flush event returners before master exit ([issue 22814](#))
- Fix `CommandExecutionError` in grains generation with `lspci` missing ([issue 23342](#))

- Fix salt-ssh against CentOS 7 when python-zmq not installed ([issue 23503](#))
- Fix salt-ssh issues related to out-of-date six module ([issue 20949](#))
- Fix salt-ssh thin generation after previous run was interrupted ([issue 24376](#))
- Use proper line endings on Windows with `file.managed` w/contents ([issue 25675](#))
- Fixed broken comment/uncomment functions in `file.py` ([issue 24620](#))
- Fixed problem with unicode when changing computer description ([issue 12255](#))
- Fixed problem with chocolatey module not loading ([issue 25717](#))
- Fixed problem adding users to groups with spaces in the name ([issue 25144](#))
- Fixed problem adding full name to user account ([issue 25206](#))
- Fixed gem module stack trace ([issue 21041](#))
- Fixed problem with `file.managed` when `test=True` ([issue 20441](#))
- Fixed problem with powershell hanging while waiting for user input ([issue 13943](#))
- Fixed problem where the salt-minion service would not consistently start ([issue 25272](#))
- Fixed problem where `pkg.refresh_db` would return True even when `winrepo.p` was not found ([issue 18919](#))
- Could someone please provide end to end example for Proxy Minion with REST ([issue 25500](#))
- Proxy minions stopped working between 2014.7 and 2015.5 ([issue 25053](#))
- Proxy minion documentation includes outdated code sample ([issue 24018](#))
- Proxy Minion documentation missing grains example ([issue 18273](#))
- Improve process management in proxy minion ([issue 12024](#))
- Proxy minion never comes up with message 'I am XXX and I am not supposed to start any proxies!' ([issue 25908](#))
- Fixed an issue that caused an exception when using Salt mine from pillar. ([issue 11509](#))

### 20.2.15 Salt 2015.8.1 Release Notes

Version 2015.8.1 is a bugfix release for *2015.8.0*.

#### Security Fixes

CVE-2015-6941 - `win_useradd` module and `salt-cloud` display passwords in debug log

Updated the `win_useradd` module return data to no longer include the password of the newly created user. The password is now replaced with the string `XXX-REDACTED-XXX`. Updated the Salt Cloud debug output to no longer display `win_password` and `sudo_password` authentication credentials. Also updated the Linode driver to no longer display authentication credentials in debug logs. These credentials are now replaced with `REDACTED` in the debug output.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with `REDACTED` in the debug output. Thanks to Andreas Stieger <[asteiger@suse.com](mailto:asteiger@suse.com)> for bringing this to our attention.

## Major Bug Fixes

- Add support for `spm.d/*` configuration of SPM (issue 27010)
- Fix proxy grains breakage for non-proxy minions (issue 27039)
- Fix global key management for git state
- Fix passing `http` auth to `util.http` from `state.file` (issue 21917)
- Fix `multiprocessing: True` in windows (on by default)
- Add `pkg.info` to `pkg` modules
- Fix name of `serial` grain (this was accidentally renamed in 2015.8.0)
- Merge config values from `master.d/minion.d` conf files (rather than flat update)
- Clean grains cache on grains sync (issue 19853)
- Remove streamed response for fileclient to avoid HTTP redirection problems (issue 27093)
- Fixed incorrect warning about `osrelease` grain (issue 27065)
- Fix authentication via Salt-API with tokens (issue 27270)
- Fix winrepo downloads from https locations (issue 27081)
- Fix potential error with salt-call as non-root user (issue 26889)
- Fix global minion provider overrides (issue 27209)
- Fix backward compatibility issues for `pecl` modules
- Fix Windows uninstaller to only remove `./bin`, `salt*`, `nssm.exe`, `uninst.exe` (issue 27383)
- Fix misc issues with mongo returner.
- Add `sudo` option to cloud config files (issue 27398)
- Fix regression in RunnerClient argument handling (issue 25107)
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
- Increased performance on boto asg/elb states due to `__states__` integration
- Windows minion no longer requires powershell to restart (issue 26629)
- Fix `x509` module to support recent versions of OpenSSL (issue 27326)
- Some issues with proxy minions were corrected.

### Known Issues:

- Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

## Changes for v2015.8.0..v2015.8.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

*Generated at: 2015-10-01T04:45:02Z*

Total Merges: 200

Changes:

- PR #27584: (*jacobhammons*) added changes list to 2015.8.1 release notes
- PR #27575: (*rallytime*) Don't report existing instances as running only if they're actually terminated in EC2
- PR #27573: (*basepi*) [2015.8] Use the custom yaml serializer for minion\_opts for salt-ssh
- PR #27514: (*clinta*) Recent Versions of OpenSSL don't allow importing incomplete PEMs
- PR #27564: (*jacobhammons*) Man pages
- PR #27522: (*twangboy*) Removed dependency on powershell to restart salt-minion
- PR #27550: (*rallytime*) [2015.8] Clean up salt-cloud logging and make it more useful
- PR #27517: (*jacobhammons*) Updated install docs
- PR #27526: (*eliasp*) Add missing newlines before param listing to fix doc rendering
- PR #27525: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27513: (*terminalmage*) Fix integration tests for worktree addition in git >= 2.6
- PR #27510: (*rallytime*) Merge #27475 with test fixes
- PR #27451: (*ticosax*) [dockerng] Enforce usage of host\_config and require docker-py>=1.4.0
- PR #27461: (*cachedout*) Only clean context if it exists
- PR #27473: (*terminalmage*) salt.utils.gitfs: Don't use close\_fds=True on Windows
- PR #27496: (*blueyed*) Fix version reporting of gitpython
- PR #27502: (*ticosax*) Add test to check we don't call inspect\_image on absent images.
- PR #27497: (*blueyed*) dockerng: fix image\_present for forced, non-existent image
- PR #27411: (*terminalmage*) Fix invocation of git.config\_get and git.config\_set
- PR #27477: (*terminalmage*) Don't append role to hash\_cachedir
- PR #27474: (*whiteinge*) Add fake pymongo version attribute for the docs
- PR #27466: (*blueyed*) Fix version reporting of python-gnupg and mysql-python
- PR #27465: (*ticosax*) Fix usage of dockerng ``cmd" was #27459
- PR #27417: (*whiteinge*) Backport #25243 into 2015.8
- PR #27423: (*dmurphy18*) Changes to support configurable repository for Debian / Ubuntu
- PR #27428: (*rallytime*) Back-port #27398 to 2015.8
- PR #27429: (*rallytime*) Back-port #27344 to 2015.8
- PR #27450: (*ticosax*) [dockerng] Fix typo in docstring
- PR #27430: (*jackson tj*) Fix bug introduced in eee0291ff8b65ff1e22f4dc2447a74aa28a3ce7f
- PR #27418: (*terminalmage*) Don't always remove dest path in salt.utils.files.rename()
- PR #27383: (*twangboy*) Uninstaller only removes specific files and dirs
- PR #27416: (*rallytime*) Back-port #27399 to 2015.8
- PR #27394: (*jackson tj*) Remove streamed response for fileclient to avoid HTTP redirection problems
- PR #27415: (*ryan-lane*) Backwards compat fixes for pecl module
- PR #27407: (*meggiebot*) Adding stretch label definition
- PR #27388: (*basepi*) [2015.8] Fix global provider overrides

- PR #27386: (*rallytime*) Document tty: True usage in salt-ssh roster file
- PR #27380: (*jtand*) Skipping Async tests
- PR #27382: (*terminalmage*) Revert ``fixes #27217 clear\_old\_remotes clears wrong directory (gitfs)``
- PR #27361: (*cro*) Correct some issues with proxy minions
- PR #27364: (*ruzarowski*) SaltCloud[EC2] Fix missing credentials in modify\_eni\_properties api call
- PR #27349: (*jfindlay*) add freebsd install docs to release notes
- PR #27343: (*cachedout*) Close io loop before deleting attribute
- PR #27337: (*rallytime*) [2015.8] Fixup salt-cloud logging
- PR #27332: (*terminalmage*) Adjust dockerng/dockerio docstrings
- PR #27353: (*cachedout*) Fix case where var not set in config
- PR #27350: (*rallytime*) Allow IP-forwarding in GCE driver
- PR #27305: (*cachedout*) Re-init logging system on Windows when using multiprocessing
- PR #27331: (*terminalmage*) dockerng: Allow both cmd and command to be used to specify command
- PR #27327: (*isbm*) Fix a typo in the RPM output
- PR #27312: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27303: (*jacobhammons*) Updated module doc index using <https://github.com/saltstack/salt/pull...>
- PR #27301: (*twangboy*) Pass ca\_bundle for windows (fixes SSL Error)
- PR #27300: (*rallytime*) Back-port #27287 to 2015.8
- PR #27288: (*rallytime*) Filter on `name`, not `id`, when listing images
- PR #27283: (*jtand*) \_\_grains\_\_[`osrelease`] returns a string
- PR #27276: (*rallytime*) Back-port #27218 to 2015.8
- PR #27275: (*rallytime*) Back-port #27213 to 2015.8
- PR #27274: (*rallytime*) Back-port #27272 to 2015.8
- PR #27271: (*isbm*) Bugfix: crash on token authentication via API
- PR #27251: (*rallytime*) Add support for post\_uri in SoftLayer cloud drivers
- PR #27260: (*bechtoldt*) add missing module doc references
- PR #27254: (*jfindlay*) 2015.2,2015.8,Beryllium -> 2015.8.0
- PR #27245: (*rallytime*) If two ssh keynames are found in DigitalOcean, abort and warn the user.
- PR #27241: (*jfindlay*) osrelease is only an integer for fedora
- PR #27234: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27240: (*isbm*) Backport of the fix of `pkg.info\*` for Beryllium
- PR #27223: (*pprkut*) Support firewalld per interface zone config on rh7 systems
- PR #27238: (*bechtoldt*) salt.modules.disk.percent() throws KeyError when partition doesn't exist
- PR #27232: (*basepi*) [2015.8] Add stub release notes for 2015.8.1
- PR #27199: (*rallytime*) Avoid RuntimeError (dictionary changed size during iteration) with keys()
- PR #27206: (*rallytime*) Don't repeat GCE setup instructions, and make the use of .json files clearer

- PR #27210: (*rallytime*) Refactor some digital ocean functions
- PR #27197: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27195: (*jacobhammons*) Fixed sphinx / latex build warnings and errors
- PR #27182: (*bernieke*) fix restart\_on\_error
- PR #27163: (*terminalmage*) Workaround upstream tornado bug affecting redirects
- PR #27177: (*rallytime*) Remove note - incorrect info
- PR #27173: (*rallytime*) Add the ability to specify multiple disks on the SoftLayer driver
- PR #27164: (*rallytime*) Make sure changes from #26824 to digital\_ocean\_v2.py driver make it to digital\_ocean.py in 2015.8
- PR #27143: (*cachedout*) Clean grains cache on grains sync
- PR #27150: (*cachedout*) Merge config values from master.d/minion.d conf files
- PR #27137: (*jfindlay*) revert serial grain regression
- PR #27144: (*rallytime*) Don't stacktrace on softlayer\_hw.show\_all\_prices if a code isn't supplied
- PR #27139: (*jacobhammons*) Updated key instruction on rhel7
- PR #27134: (*isbm*) Backport to 2015.8: ``pkg.info``
- PR #27119: (*l2ol33rt*) Boto dynamodb module should be using layer 2 abstractions
- PR #27092: (*perfinion*) salt/master: chdir to root not homedir
- PR #27131: (*jacobhammons*) Install docs
- PR #27124: (*jfindlay*) Backport #27123
- PR #27111: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27122: (*terminalmage*) Fix broken link to git-config(1) docs
- PR #27115: (*jacobhammons*) Release docs
- PR #27110: (*rallytime*) Make sure -Q output is consistent across salt-cloud drivers
- PR #27050: (*twangboy*) Turned multiprocessing on
- PR #27086: (*techhat*) Document development of SPM loader modules
- PR #26941: (*msted*) Make elasticsearch work as master job cache
- PR #27080: (*bechtoldt*) [Proposal] Add Github SPM label for issues
- PR #27064: (*twangboy*) Fixed user docs
- PR #27072: (*rallytime*) Back-port #26840 to 2015.8
- PR #27060: (*cro*) Fix grains breakage when hosts are not Linux, Windows, or SunOS
- PR #27051: (*rallytime*) Back-port #26953 to 2015.8
- PR #26864: (*terminalmage*) Only do git\_pillar preflight checks on new-style git\_pillar configs
- PR #26967: (*TheBigBear*) new URL for windows salt downloads
- PR #26921: (*terminalmage*) Get rid of error in legacy git pillar when using branch mapping notation
- PR #26923: (*rallytime*) Code clean up of cloud drivers and files
- PR #27010: (*rallytime*) Back-port #26988 to 2015.8

- [PR #26985](#): (*rallytime*) Fix versionadded tag

## 20.2.16 Salt 2015.8.10 Release Notes

Version 2015.8.10 is a bugfix release for *2015.8.0*.

### Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

---

### Mint Linux: Important Post-Upgrade Instructions

As a result of some upstream changes, the `os` grain on Mint Linux is now being detected as `LinuxMint` ([issue 33295](#)). Run the following command **after you upgrade to 2015.8.10** to reset the `os` grain to `Mint` and the `os_family` grain to `Debian`:

```
salt -G 'os:LinuxMint' grains.setvals '{"os': 'Mint', 'os_family': 'Debian'}"
```

---

### Changes for v2015.8.9..v2015.8.10

Salt 2015.8.10 includes fixes for the following known issues in 2015.8.9:

- [issue 33376](#): pip state broken in 2015.8.9 with pip <6.0
- [PR 33386](#): Fix traceback in logging for config validation

Since 2015.8.10 includes only two fixes, the 2015.8.9 changes list is included below for convenience:

*Generated at: 2016-05-17T17:09:39Z*

Total Merges: 145

Changes:

- [PR #33293](#): (*twangboy*) Fix minion start retry on Windows (2015.8)
- [22c4331](#) linux\_acl: Allow ` ` as a separation character in ACL permissions. Fixes [#31270](#) ([#33172](#)) ([#33305](#))
- [7a181f2](#) Handle more ipv6 error as an exception [#33299](#) ([#33300](#))
- [eb47a15](#) Ignore retcode when checking service's status ([#33294](#))
- [PR #33274](#): (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- [4f3596a](#) Add comment for test=true w/o changes ret and add changes dict example ([#33254](#))
- [2a30c48](#) Update Git Policy docs to match Contribution guide ([#33252](#))
- [056c273](#) Fix [#33238](#) ([#33239](#))
- [1cd34ab](#) Properly report on invalid gitfs/git\_pillar/winrepo repos ([#33245](#))
- [PR #33253](#): (*rallytime*) Update the release process docs
- [8c2c5b1](#) update 2015.8.9 release notes ([#33251](#))
- [8ee8ee3](#) Handle ipv6 error as an exception ([#33246](#))

- 855bed3 Check rendered YAML for invalid keys (#33213)
- 6fb25a8 Make note of files that begin with `\_' in master.d or minion.d dirs (#33224)
- a6dc0d2 Gate jnpr imports in salt.proxy.junos.py (#33150)
- 64a89c4 Add docs for the http state (#33222)
- 0a32163 Don't stacktrace when using --out=highstate at CLI during staterun. (#33215)
- 04d714d propagate opts to salt.util.http call (#33219)
- c8236c0 update 2015.8.9 release notes (#33237)
- PR #33217: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 730bec1 [2015.8] Merge forward from 2015.5 to 2015.8 (#33207)
- 379b151 Add a fetch when compiling git\_pillar for masterless minions (#33204)
- b3805d8 cloud.clouds.ec2: cache each named node (#33164)
- 86db5df Properly handle failed git commands when redirect\_stderr=True (#33203)
- 8a0950d Don't force use of global ssh\_config when git identity file is specified (#33152)
- ce07133 update 2015.8.9 release notes (#33198)
- PR #33188: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- e9108e0 add 2015.8.9 release notes (#33161)
- 2d9919e [2015.8] Update to latest bootstrap script v2016.05.10 (#33156)
- 033bef2 Hash fileclients by opts (#33142)
- f520fa3 Back-port #31769 to 2015.8 (#33139)
- PR #33144: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33140: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- ad607ef If cache\_jobs: True is set, populate the local job cache when running salt-call (#33100)
- 64689a6 Fix broken parsing of usermgmt.conf on OpenBSD (#33135)
- 06a382e Add a check that the cmdline of the found proc matches (#33129)
- 10018e9 salt.utils.gitfs: fix formatting for warning messages (#33064)
- d45b599 Fix 33058 (#33099)
- PR #33106: (*abednarik*) Moved \_finger\_fail method to parent class.
- 20c7e10 clarify docs that map is designed to be run once. is not stateful (#33102)
- 558561d cloud.query needs to define mapper.opts (#33098)
- PR #33096: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 22a327b salt-cloud: fix ipv6-only virtual machines (#32865)
- e788f7e modules.npm: do not log npm --version at info level (#33084)
- PR #33081: (*jfindlay*) ssh docs: install py-2.6 for RHEL 5
- PR #33088: (*isbm*) Bugfix: Restore boolean values from the repo configuration
- 2c6326f fix tests for file.blockplace to remove newline (#33082)
- PR #32892: (*isbm*) Resolve Zypper locks on asynchronous calls

- 3e0bf23 Add fun\_args to scheduled return data (part of #24237) (#33039)
- 264c0d4 Don't append a newline when creating new content with blockreplace (#33049)
- 54b783a Pass all data to batch.run() call when using --failhard (#33048)
- 2dbfa55 Display command output when command fails with batch + failhard options (#33050)
- add9199 Allow security\_groups kwarg for boto\_elb.present to be string or list (#33053)
- 111701c [2015.8] Merge forward from 2015.5 to 2015.8 (#33054)
- 1066063 File and User test fixes for 2015.8 on Fedora23 (#33056)
- f97b5d5 Back-port #33030 to 2015.8 (#33040)
- e90a501 Update the docs for saltutil.find\_job to be more clear/accurate (#33017)
- d3d77ce Add saltenv to the cmd.script state function (#33031)
- 3434f44 Fix syndic regression (#33021)
- 4bb3ca5 Compare uid and gid instead of name and group (#32674)
- 9ca5b02 Allow batch mode to use verbose option, as well as show\_jid. (#32996)
