salt-cloud -f set_storage_container my-azure name=mycontainer \
    x_ms_meta_name_values='{"my_name": "my_value"}'
```

name: Name of existing container.

meta_name_values: A dict containing name, value for metadata. Example: {'category':'test'}

lease_id: If specified, set_storage_container_metadata only succeeds if the container's lease is active and matches this ID.

`salt.cloud.clouds.msazure.`**`show_affinity_group`**`(`*kwargs=None, conn=None, call=None*`)`

New in version 2015.8.0.

Show an affinity group associated with the account

CLI Example:

```
salt-cloud -f show_affinity_group my-azure service=myservice \
    deployment=mydeployment name=SSH
```

`salt.cloud.clouds.msazure.`**`show_blob_properties`**(*kwargs=None, storage_conn=None, call=None*)

New in version 2015.8.0.

Returns all user-defined metadata, standard HTTP properties, and system properties for the blob.

CLI Example:

```
salt-cloud -f show_blob_properties my-azure container=mycontainer blob=myblob
```

container: Name of existing container.

blob: Name of existing blob.

lease_id: Required if the blob has an active lease.

`salt.cloud.clouds.msazure.`**`show_blob_service_properties`**(*kwargs=None, storage_conn=None, call=None*)

New in version 2015.8.0.

Show a blob's service properties

CLI Example:

```
salt-cloud -f show_blob_service_properties my-azure
```

`salt.cloud.clouds.msazure.`**`show_deployment`**(*kwargs=None, conn=None, call=None*)

New in version 2015.8.0.

Return information about a deployment

CLI Example:

```
salt-cloud -f show_deployment my-azure name=my_deployment
```

`salt.cloud.clouds.msazure.`**`show_disk`**(*kwargs=None, conn=None, call=None*)

New in version 2015.8.0.

Return information about a disk

CLI Example:

```
salt-cloud -f show_disk my-azure name=my_disk
```

`salt.cloud.clouds.msazure.`**`show_input_endpoint`**(*kwargs=None, conn=None, call=None*)

New in version 2015.8.0.

Show an input endpoint associated with the deployment

CLI Example:

```
salt-cloud -f show_input_endpoint my-azure service=myservice \
    deployment=mydeployment name=SSH
```

`salt.cloud.clouds.msazure.`**`show_instance`**(*name*, *call=None*)

Show the details from the provider concerning an instance

`salt.cloud.clouds.msazure.`**`show_management_certificate`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

Return information about a management_certificate

CLI Example:

```
salt-cloud -f get_management_certificate my-azure name=my_management_certificate \
    thumbalgorithm=sha1 thumbprint=0123456789ABCDEF
```

`salt.cloud.clouds.msazure.`**`show_service`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

List hosted service properties

CLI Example:

```
salt-cloud -f show_service my-azure name=my_service
```

`salt.cloud.clouds.msazure.`**`show_service_certificate`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

Return information about a service certificate

CLI Example:

```
salt-cloud -f show_service_certificate my-azure name=my_service_certificate \
    thumbalgorithm=sha1 thumbprint=0123456789ABCDEF
```

`salt.cloud.clouds.msazure.`**`show_storage`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

List storage service properties

CLI Example:

```
salt-cloud -f show_storage my-azure name=my_storage
```

`salt.cloud.clouds.msazure.`**`show_storage_container`**(*kwargs=None*, *storage_conn=None*, *call=None*)

New in version 2015.8.0.

Show a container associated with the storage account

CLI Example:

```
salt-cloud -f show_storage_container my-azure name=myservice
```

name: Name of container to show.

`salt.cloud.clouds.msazure.`**`show_storage_container_acl`**(*kwargs=None*, *storage_conn=None*, *call=None*)

New in version 2015.8.0.

Show a storage container's acl

CLI Example:

```
salt-cloud -f show_storage_container_acl my-azure name=myservice
```

name: Name of existing container.

lease_id: If specified, show_storage_container_acl only succeeds if the container's lease is active and matches this ID.

`salt.cloud.clouds.msazure.`**`show_storage_container_metadata`**(*kwargs=None*, *storage_conn=None*, *call=None*)

New in version 2015.8.0.

Show a storage container's metadata

CLI Example:

```
salt-cloud -f show_storage_container_metadata my-azure name=myservice
```

name: Name of container to show.

lease_id: If specified, show_storage_container_metadata only succeeds if the container's lease is active and matches this ID.

`salt.cloud.clouds.msazure.`**`show_storage_keys`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

Show storage account keys

CLI Example:

```
salt-cloud -f show_storage_keys my-azure name=my_storage
```

`salt.cloud.clouds.msazure.`**`update_affinity_group`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

Update an affinity group's properties

CLI Example:

```
salt-cloud -f update_affinity_group my-azure name=my_group label=my_group
```

`salt.cloud.clouds.msazure.`**`update_disk`**(*kwargs=None*, *conn=None*, *call=None*)

New in version 2015.8.0.

Update a disk's properties

CLI Example:

```
salt-cloud -f update_disk my-azure name=my_disk label=my_disk
salt-cloud -f update_disk my-azure name=my_disk new_name=another_disk
```

`salt.cloud.clouds.msazure.`**`update_input_endpoint`**(*kwargs=None*, *conn=None*, *call=None*, *activity='update'*)

New in version 2015.8.0.

Update an input endpoint associated with the deployment. Please note that there may be a delay before the changes show up.

CLI Example:

```
salt-cloud -f update_input_endpoint my-azure service=myservice \
    deployment=mydeployment role=myrole name=HTTP local_port=80 \
    port=80 protocol=tcp enable_direct_server_return=False \
    timeout_for_tcp_idle_connection=4
```

`salt.cloud.clouds.msazure.`**`update_storage`**`(`*kwargs=None, conn=None, call=None*`)`

New in version 2015.8.0.

Update a storage account's properties

CLI Example:

```
salt-cloud -f update_storage my-azure name=my_storage label=my_storage
```

21.4.13 salt.cloud.clouds.oneandone

1&1 Cloud Server Module

The 1&1 SaltStack cloud module allows a 1&1 server to be automatically deployed and bootstrapped with Salt. It also has functions to create block storages and ssh keys.

depends 1and1 >= 1.2.0

The module requires the 1&1 api_token to be provided. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/oneandone.conf`:

```
my-oneandone-config:
  driver: oneandone
  # The 1&1 api token
  api_token: <your-token>
  # SSH private key filename
  ssh_private_key: /path/to/private_key
  # SSH public key filename
  ssh_public_key: /path/to/public_key
```

```
my-oneandone-profile:
  provider: my-oneandone-config
  # Either provide fixed_instance_size_id or vcore, cores_per_processor, ram, and
↪hdds.
  # Size of the ID desired for the server
  fixed_instance_size: S
  # Total amount of processors
  vcore: 2
  # Number of cores per processor
  cores_per_processor: 2
  # RAM memory size in GB
  ram: 4
  # Hard disks
  hdds:
  -
    is_main: true
    size: 20
  -
```

(continues on next page)

(continued from previous page)

```
    is_main: false
    size: 20
  # ID of the appliance image that will be installed on server
  appliance_id: <ID>
  # ID of the datacenter where the server will be created
  datacenter_id: <ID>
  # Description of the server
  description: My server description
  # Password of the server. Password must contain more than 8 characters
  # using uppercase letters, numbers and other special symbols.
  password: P4$$w0rD
  # Power on server after creation - default True
  power_on: true
  # Firewall policy ID. If it is not provided, the server will assign
  # the best firewall policy, creating a new one if necessary.
  # If the parameter is sent with a 0 value, the server will be created with all
↪ports blocked.
  firewall_policy_id: <ID>
  # IP address ID
  ip_id: <ID>
  # Load balancer ID
  load_balancer_id: <ID>
  # Monitoring policy ID
  monitoring_policy_id: <ID>
```

Set `deploy` to False if Salt should not be installed on the node.

```
my-oneandone-profile:
  deploy: False
```

Create an SSH key

```
sudo salt-cloud -f create_ssh_key my-oneandone-config name='SaltTest' description=
↪'SaltTestDescription'
```

Create a block storage

```
sudo salt-cloud -f create_block_storage my-oneandone-config name='SaltTest2'
description='SaltTestDescription' size=50 datacenter_id=
↪'5091F6D8CBFEF9C26ACE957C652D5D49'
```

`salt.cloud.clouds.oneandone.`**`avail_images`**(*conn=None, call=None*)
Return a list of the server appliances that are on the provider

`salt.cloud.clouds.oneandone.`**`avail_locations`**(*conn=None, call=None*)
List available locations/datacenters for 1&1

`salt.cloud.clouds.oneandone.`**`avail_sizes`**(*call=None*)
Return a dict of all available VM sizes on the cloud provider with relevant data.

`salt.cloud.clouds.oneandone.`**`create`**(*vm_*)
Create a single VM from a data dict

`salt.cloud.clouds.oneandone.`**`create_block_storage`**(*kwargs=None, call=None*)
Create a block storage

`salt.cloud.clouds.oneandone.`**`create_ssh_key`**(*kwargs=None, call=None*)
Create an ssh key

`salt.cloud.clouds.oneandone.`**`destroy`**`(`*name*, *call=None*`)`

destroy a server by name

Parameters

- **`name`** – name given to the server
- **`call`** – call value in this case is 'action'

Returns array of booleans , true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.oneandone.`**`get_configured_provider`**`()`

Return the first configured instance.

`salt.cloud.clouds.oneandone.`**`get_conn`**`()`

Return a conn object for the passed VM data

`salt.cloud.clouds.oneandone.`**`get_dependencies`**`()`

Warn if dependencies are not met.

`salt.cloud.clouds.oneandone.`**`get_image`**`(`*vm_*`)`

Return the image object to use

`salt.cloud.clouds.oneandone.`**`get_key_filename`**`(`*vm_*`)`

Check SSH private key file and return absolute path if exists.

`salt.cloud.clouds.oneandone.`**`get_node`**`(`*conn*, *name*`)`

Return a node for the named VM

`salt.cloud.clouds.oneandone.`**`get_size`**`(`*vm_*`)`

Return the VM's size object

`salt.cloud.clouds.oneandone.`**`get_wait_timeout`**`(`*vm_*`)`

Return the wait_for_timeout for resource provisioning.

`salt.cloud.clouds.oneandone.`**`list_nodes`**`(`*conn=None*, *call=None*`)`

Return a list of VMs that are on the provider

`salt.cloud.clouds.oneandone.`**`list_nodes_full`**`(`*conn=None*, *call=None*`)`

Return a list of the VMs that are on the provider, with all fields

`salt.cloud.clouds.oneandone.`**`list_nodes_select`**`(`*conn=None*, *call=None*`)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.oneandone.`**`load_public_key`**`(`*vm_*`)`

Load the public key file if exists.

`salt.cloud.clouds.oneandone.`**`reboot`**`(`*name*, *call=None*`)`

reboot a server by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.oneandone.`**`script`**`(`*vm_*`)`

Return the script deployment object

`salt.cloud.clouds.oneandone.`**`show_instance`**`(`*name*, *call=None*`)`

Show the details from the provider concerning an instance `salt.cloud.clouds.oneandone.`**`start`**`(`*name*, *call=None*`)`

start a server by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a start vm_name
```

`salt.cloud.clouds.oneandone.`**`stop`**`(`*name*, *call=None*`)`

stop a server by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a stop vm_name
```

21.4.14 salt.cloud.clouds.opennebula

OpenNebula Cloud Module

The OpenNebula cloud module is used to control access to an OpenNebula cloud.

New in version 2014.7.0.

depends lxml

depends OpenNebula installation running version `4.14` or later.

Use of this module requires the `xml_rpc`, `user`, and `password` parameters to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/opennebula.conf`:

```
my-opennebula-config:
  xml_rpc: http://localhost:2633/RPC2
  user: oneadmin
  password: JHGhgsayu32jsa
  driver: opennebula
```

This driver supports accessing new VM instances via DNS entry instead of IP address. To enable this feature, in the provider or profile file add *fqdn_base* with a value matching the base of your fully-qualified domain name. Example:

```
my-opennebula-config:
  [...]
  fqdn_base: <my.basedomain.com>
  [...]
```

The driver will prepend the hostname to the fqdn_base and do a DNS lookup to find the IP of the new VM.

```
salt-cloud -f image_allocate opennebula datastore_name=default \
    data='NAME="My New Image" DESCRIPTION="Description of the image." \
    PATH=/home/one_user/images/image_name.img'
salt-cloud -f secgroup_allocate opennebula \
    data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \
    RANGE = 1000:2000]"
```

`salt.cloud.clouds.opennebula.`**`avail_images`**`(`*call=None*`)`

Return available OpenNebula images.

CLI Example:

```
salt-cloud --list-images opennebula
salt-cloud --function avail_images opennebula
salt-cloud -f avail_images opennebula
```

`salt.cloud.clouds.opennebula.`**`avail_locations`**(*call=None*)

Return available OpenNebula locations.

CLI Example:

```
salt-cloud --list-locations opennebula
salt-cloud --function avail_locations opennebula
salt-cloud -f avail_locations opennebula
```

`salt.cloud.clouds.opennebula.`**`avail_sizes`**(*call=None*)

Because sizes are built into templates with OpenNebula, there will be no sizes to return here.

`salt.cloud.clouds.opennebula.`**`create`**(*vm_*)

Create a single VM from a data dict.

vm_ The dictionary use to create a VM.

Optional vm_ dict options for overwriting template:

region_id Optional - OpenNebula Zone ID

memory Optional - In MB

cpu Optional - Percent of host CPU to allocate

vcpu

Optional - Amount of vCPUs to allocate

CLI Example:

```
 salt-cloud -p my-opennebula-profile vm_name

salt-cloud -p my-opennebula-profile vm_name memory=16384 cpu=2.5 vcpu=16
```

`salt.cloud.clouds.opennebula.`**`destroy`**(*name, call=None*)

Destroy a node. Will check termination protection and warn if enabled.

name The name of the vm to be destroyed.

CLI Example:

```
salt-cloud --destroy vm_name
salt-cloud -d vm_name
salt-cloud --action destroy vm_name
salt-cloud -a destroy vm_name
```

`salt.cloud.clouds.opennebula.`**`get_cluster_id`**(*kwargs=None, call=None*)

Returns a cluster's ID from the given cluster name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_cluster_id opennebula name=my-cluster-name
```

`salt.cloud.clouds.opennebula.`**`get_configured_provider`**`()`

Return the first configured instance.

`salt.cloud.clouds.opennebula.`**`get_datastore_id`**`(`*kwargs=None*, *call=None*`)`

Returns a data store's ID from the given data store name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_datastore_id opennebula name=my-datastore-name
```

`salt.cloud.clouds.opennebula.`**`get_dependencies`**`()`

Warn if dependencies aren't met.

`salt.cloud.clouds.opennebula.`**`get_host_id`**`(`*kwargs=None*, *call=None*`)`

Returns a host's ID from the given host name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_host_id opennebula name=my-host-name
```

`salt.cloud.clouds.opennebula.`**`get_image`**`(`*vm_*`)`

Return the image object to use.

vm_ The VM dictionary for which to obtain an image.

`salt.cloud.clouds.opennebula.`**`get_image_id`**`(`*kwargs=None*, *call=None*`)`

Returns an image's ID from the given image name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_image_id opennebula name=my-image-name
```

`salt.cloud.clouds.opennebula.`**`get_location`**`(`*vm_*`)`

Return the VM's location.

vm_ The VM dictionary for which to obtain a location.

`salt.cloud.clouds.opennebula.`**`get_one_version`**`(`*kwargs=None*, *call=None*`)`

Returns the OpenNebula version.

New in version 2016.3.5.

CLI Example:

```
salt-cloud -f get_one_version one_provider_name
```

`salt.cloud.clouds.opennebula.`**`get_secgroup_id`**`(`*kwargs=None*, *call=None*`)`

Returns a security group's ID from the given security group name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_secgroup_id opennebula name=my-secgroup-name
```

`salt.cloud.clouds.opennebula.`**`get_template`**`(`*vm_*`)`

Return the template id for a VM.

New in version 2016.11.0.

vm_ The VM dictionary for which to obtain a template.

`salt.cloud.clouds.opennebula.`**`get_template_id`**`(`*kwargs=None, call=None*`)`

Returns a template's ID from the given template name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_template_id opennebula name=my-template-name
```

`salt.cloud.clouds.opennebula.`**`get_template_image`**`(`*kwargs=None, call=None*`)`

Returns a template's image from the given template name.

New in version 2018.3.0.

```
salt-cloud -f get_template_image opennebula name=my-template-name
```

`salt.cloud.clouds.opennebula.`**`get_vm_id`**`(`*kwargs=None, call=None*`)`

Returns a virtual machine's ID from the given virtual machine's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vm_id opennebula name=my-vm
```

`salt.cloud.clouds.opennebula.`**`get_vn_id`**`(`*kwargs=None, call=None*`)`

Returns a virtual network's ID from the given virtual network's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vn_id opennebula name=my-vn-name
```

`salt.cloud.clouds.opennebula.`**`image_allocate`**`(`*call=None, kwargs=None*`)`

Allocates a new image in OpenNebula.

New in version 2016.3.0.

path The path to a file containing the template of the image to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data The data containing the template of the image to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

datastore_id The ID of the data-store to be used for the new image. Can be used instead of `datastore_name`.

datastore_name The name of the data-store to be used for the new image. Can be used instead of `datastore_id`.

CLI Example:

```
salt-cloud -f image_allocate opennebula path=/path/to/image_file.txt datastore_
↪id=1
salt-cloud -f image_allocate opennebula datastore_name=default \
    data='NAME="Ubuntu 14.04" PATH="/home/one_user/images/ubuntu_desktop.img" \
    DESCRIPTION="Ubuntu 14.04 for development."'
```

`salt.cloud.clouds.opennebula.`**`image_clone`**`(`*call=None*, *kwargs=None*`)`

Clones an existing image.

New in version 2016.3.0.

name The name of the new image.

image_id The ID of the image to be cloned. Can be used instead of `image_name`.

image_name The name of the image to be cloned. Can be used instead of `image_id`.

CLI Example:

```
salt-cloud -f image_clone opennebula name=my-new-image image_id=10
salt-cloud -f image_clone opennebula name=my-new-image image_name=my-image-to-
↪clone
```

`salt.cloud.clouds.opennebula.`**`image_delete`**`(`*call=None*, *kwargs=None*`)`

Deletes the given image from OpenNebula. Either a name or an image_id must be supplied.

New in version 2016.3.0.

name The name of the image to delete. Can be used instead of `image_id`.

image_id The ID of the image to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f image_delete opennebula name=my-image
salt-cloud --function image_delete opennebula image_id=100
```

`salt.cloud.clouds.opennebula.`**`image_info`**`(`*call=None*, *kwargs=None*`)`

Retrieves information for a given image. Either a name or an image_id must be supplied.

New in version 2016.3.0.

name The name of the image for which to gather information. Can be used instead of `image_id`.

image_id The ID of the image for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f image_info opennebula name=my-image
salt-cloud --function image_info opennebula image_id=5
```

`salt.cloud.clouds.opennebula.`**`image_persistent`**`(`*call=None*, *kwargs=None*`)`

Sets the Image as persistent or not persistent.

New in version 2016.3.0.

name The name of the image to set. Can be used instead of `image_id`.

image_id The ID of the image to set. Can be used instead of `name`.

persist A boolean value to set the image as persistent or not. Set to true for persistent, false for non-persistent.

CLI Example:

```
salt-cloud -f image_persistent opennebula name=my-image persist=True
salt-cloud --function image_persistent opennebula image_id=5 persist=False
```

`salt.cloud.clouds.opennebula.`**`image_snapshot_delete`**`(`*call=None*, *kwargs=None*`)`

Deletes a snapshot from the image.

New in version 2016.3.0.

image_id The ID of the image from which to delete the snapshot. Can be used instead of `image_name`.

image_name The name of the image from which to delete the snapshot. Can be used instead of `image_id`.

snapshot_id The ID of the snapshot to delete.

CLI Example:

```
salt-cloud -f image_snapshot_delete vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_delete vm_name=my-vm snapshot_id=111
```

`salt.cloud.clouds.opennebula.`**`image_snapshot_flatten`**(*call=None*, *kwargs=None*)

Flattens the snapshot of an image and discards others.

New in version 2016.3.0.

image_id The ID of the image. Can be used instead of `image_name`.

image_name The name of the image. Can be used instead of `image_id`.

snapshot_id The ID of the snapshot to flatten.

CLI Example:

```
salt-cloud -f image_snapshot_flatten vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_flatten vm_name=my-vm snapshot_id=45
```

`salt.cloud.clouds.opennebula.`**`image_snapshot_revert`**(*call=None*, *kwargs=None*)

Reverts an image state to a previous snapshot.

New in version 2016.3.0.

image_id The ID of the image to revert. Can be used instead of `image_name`.

image_name The name of the image to revert. Can be used instead of `image_id`.

snapshot_id The ID of the snapshot to which the image will be reverted.

CLI Example:

```
salt-cloud -f image_snapshot_revert vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_revert vm_name=my-vm snapshot_id=120
```

`salt.cloud.clouds.opennebula.`**`image_update`**(*call=None*, *kwargs=None*)

Replaces the image template contents.

New in version 2016.3.0.

image_id The ID of the image to update. Can be used instead of `image_name`.

image_name The name of the image to update. Can be used instead of `image_id`.

path The path to a file containing the template of the image. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template of the image. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

update_type There are two ways to update an image: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud -f image_update opennebula image_id=0 file=/path/to/image_update_file.
↪txt update_type=replace
salt-cloud -f image_update opennebula image_name="Ubuntu 14.04" update_type=merge
↪\
    data='NAME="Ubuntu Dev" PATH="/home/one_user/images/ubuntu_desktop.img" \
    DESCRIPTION = "Ubuntu 14.04 for development."'
```

salt.cloud.clouds.opennebula.**list_clusters**(*call=None*)

Returns a list of clusters in OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_clusters opennebula
```

salt.cloud.clouds.opennebula.**list_datastores**(*call=None*)

Returns a list of data stores on OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_datastores opennebula
```

salt.cloud.clouds.opennebula.**list_hosts**(*call=None*)

Returns a list of hosts on OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_hosts opennebula
```

salt.cloud.clouds.opennebula.**list_nodes**(*call=None*)

Return a list of VMs on OpenNebula.

CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud --function list_nodes opennebula
salt-cloud -f list_nodes opennebula
```

salt.cloud.clouds.opennebula.**list_nodes_full**(*call=None*)

Return a list of the VMs on OpenNebula.

CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud --function list_nodes_full opennebula
salt-cloud -f list_nodes_full opennebula
```

salt.cloud.clouds.opennebula.**list_nodes_select**(*call=None*)

Return a list of the VMs that are on the provider, with select fields.

salt.cloud.clouds.opennebula.**list_security_groups**(*call=None*)

Lists all security groups available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_security_groups opennebula
```

`salt.cloud.clouds.opennebula.`**`list_templates`**(*call=None*)

Lists all templates available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_templates opennebula
```

`salt.cloud.clouds.opennebula.`**`list_vns`**(*call=None*)

Lists all virtual networks available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_vns opennebula
```

`salt.cloud.clouds.opennebula.`**`reboot`**(*name*, *call=None*)

Reboot a VM.

New in version 2016.3.0.

name The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot my-vm
```

`salt.cloud.clouds.opennebula.`**`secgroup_allocate`**(*call=None*, *kwargs=None*)

Allocates a new security group in OpenNebula.

New in version 2016.3.0.

path The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f secgroup_allocate opennebula path=/path/to/secgroup_file.txt
salt-cloud -f secgroup_allocate opennebula \
    data="NAME = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \
    RANGE = 1000:2000]"
```

`salt.cloud.clouds.opennebula.`**`secgroup_clone`**(*call=None*, *kwargs=None*)

Clones an existing security group.

New in version 2016.3.0.

name The name of the new template.

secgroup_id The ID of the security group to be cloned. Can be used instead of `secgroup_name`.

secgroup_name The name of the security group to be cloned. Can be used instead of `secgroup_id`.

CLI Example:

```
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_id=0
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_name=my-
↪secgroup
```

`salt.cloud.clouds.opennebula.`**`secgroup_delete`**`(`*call=None, kwargs=None*`)`

Deletes the given security group from OpenNebula. Either a name or a secgroup_id must be supplied.

New in version 2016.3.0.

name The name of the security group to delete. Can be used instead of `secgroup_id`.

secgroup_id The ID of the security group to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f secgroup_delete opennebula name=my-secgroup
salt-cloud --function secgroup_delete opennebula secgroup_id=100
```

`salt.cloud.clouds.opennebula.`**`secgroup_info`**`(`*call=None, kwargs=None*`)`

Retrieves information for the given security group. Either a name or a secgroup_id must be supplied.

New in version 2016.3.0.

name The name of the security group for which to gather information. Can be used instead of `secgroup_id`.

secgroup_id The ID of the security group for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f secgroup_info opennebula name=my-secgroup
salt-cloud --function secgroup_info opennebula secgroup_id=5
```

`salt.cloud.clouds.opennebula.`**`secgroup_update`**`(`*call=None, kwargs=None*`)`

Replaces the security group template contents.

New in version 2016.3.0.

secgroup_id The ID of the security group to update. Can be used instead of `secgroup_name`.

secgroup_name The name of the security group to update. Can be used instead of `secgroup_id`.

path The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

update_type There are two ways to update a security group: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud --function secgroup_update opennebula secgroup_id=100 \
    path=/path/to/secgroup_update_file.txt \
    update_type=replace
salt-cloud -f secgroup_update opennebula secgroup_name=my-secgroup update_
↪type=merge \
    data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, RANGE =⊠
↪1000:2000]"
```

`salt.cloud.clouds.opennebula.`**`show_instance`**`(`*name, call=None*`)`

Show the details from OpenNebula concerning a named VM.

name The name of the VM for which to display details.

call Type of call to use with this function such as `function`.

CLI Example:

```
salt-cloud --action show_instance vm_name
salt-cloud -a show_instance vm_name
```

`salt.cloud.clouds.opennebula.`**`start`**(*name*, *call=None*)

Start a VM.

New in version 2016.3.0.

name The name of the VM to start.

CLI Example:

```
salt-cloud -a start my-vm
```

`salt.cloud.clouds.opennebula.`**`stop`**(*name*, *call=None*)

Stop a VM.

New in version 2016.3.0.

name The name of the VM to stop.

CLI Example:

```
salt-cloud -a stop my-vm
```

`salt.cloud.clouds.opennebula.`**`template_allocate`**(*call=None*, *kwargs=None*)

Allocates a new template in OpenNebula.

New in version 2016.3.0.

path The path to a file containing the elements of the template to be allocated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the elements of the template to be allocated. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f template_allocate opennebula path=/path/to/template_file.txt
salt-cloud -f template_allocate opennebula \
    data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0",TYPE=
↪"vnc"] \
    MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME="oneadmin"] \
    OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_SELECT="YES
↪" \
    VCPU="1"'
```

`salt.cloud.clouds.opennebula.`**`template_clone`**(*call=None*, *kwargs=None*)

Clones an existing virtual machine template.

New in version 2016.3.0.

name The name of the new template.

template_id The ID of the template to be cloned. Can be used instead of `template_name`.

template_name The name of the template to be cloned. Can be used instead of `template_id`.

clone_images Optional, defaults to False. Indicates if the images attached to the template should be cloned as well.

CLI Example:

```
salt-cloud -f template_clone opennebula name=my-new-template template_id=0
salt-cloud -f template_clone opennebula name=my-new-template template_name=my-
↪template
```

`salt.cloud.clouds.opennebula.`**`template_delete`**(*call=None*, *kwargs=None*)

Deletes the given template from OpenNebula. Either a name or a template_id must be supplied.

New in version 2016.3.0.

name The name of the template to delete. Can be used instead of `template_id`.

template_id The ID of the template to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f template_delete opennebula name=my-template
salt-cloud --function template_delete opennebula template_id=5
```

`salt.cloud.clouds.opennebula.`**`template_instantiate`**(*call=None*, *kwargs=None*)

Instantiates a new virtual machine from a template.

New in version 2016.3.0.

Note: `template_instantiate` creates a VM on OpenNebula from a template, but it does not install Salt on the new VM. Use the `create` function for that functionality: `salt-cloud -p opennebula-profile vm-name`.

vm_name Name for the new VM instance.

template_id The ID of the template from which the VM will be created. Can be used instead of `template_name`.

template_name The name of the template from which the VM will be created. Can be used instead of `template_id`.

CLI Example:

```
salt-cloud -f template_instantiate opennebula vm_name=my-new-vm template_id=0
```

`salt.cloud.clouds.opennebula.`**`template_update`**(*call=None*, *kwargs=None*)

Replaces the template contents.

New in version 2016.3.0.

template_id The ID of the template to update. Can be used instead of `template_name`.

template_name The name of the template to update. Can be used instead of `template_id`.

path The path to a file containing the elements of the template to be updated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the elements of the template to be updated. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

update_type There are two ways to update a template: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud --function template_update opennebula template_id=1 update_
↪type=replace \
    path=/path/to/template_update_file.txt
salt-cloud -f template_update opennebula template_name=my-template update_
↪type=merge \
    data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0",TYPE=
↪"vnc"] \
    MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME="oneadmin"] \
    OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_SELECT="YES
↪" \
    VCPU="1"'
```

`salt.cloud.clouds.opennebula.`**`vm_action`**(*name*, *kwargs=None*, *call=None*)

Submits an action to be performed on a given virtual machine.

New in version 2016.3.0.

name The name of the VM to action.

action

The action to be performed on the VM. Available options include:

- boot
- delete
- delete-recreate
- hold
- poweroff
- poweroff-hard
- reboot
- reboot-hard
- release
- resched
- resume
- shutdown
- shutdown-hard
- stop
- suspend
- undeploy
- undeploy-hard
- unresched

CLI Example:

```
salt-cloud -a vm_action my-vm action='release'
```

`salt.cloud.clouds.opennebula.`**`vm_allocate`**(*call=None*, *kwargs=None*)

Allocates a new virtual machine in OpenNebula.

New in version 2016.3.0.

path The path to a file defining the template of the VM to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template definitions of the VM to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

hold If this parameter is set to `True`, the VM will be created in the `HOLD` state. If not set, the VM is created in the `PENDING` state. Default is `False`.

CLI Example:

```
salt-cloud -f vm_allocate path=/path/to/vm_template.txt
salt-cloud --function vm_allocate path=/path/to/vm_template.txt hold=True
```

`salt.cloud.clouds.opennebula.`**`vm_attach`**(*name*, *kwargs=None*, *call=None*)

Attaches a new disk to the given virtual machine.

New in version 2016.3.0.

name The name of the VM for which to attach the new disk.

path The path to a file containing a single disk vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the data needed to attach a single disk vector attribute. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -a vm_attach my-vm path=/path/to/disk_file.txt
salt-cloud -a vm_attach my-vm data="DISK=[DISK_ID=1]"
```

`salt.cloud.clouds.opennebula.`**`vm_attach_nic`**(*name*, *kwargs=None*, *call=None*)

Attaches a new network interface to the given virtual machine.

New in version 2016.3.0.

name The name of the VM for which to attach the new network interface.

path The path to a file containing a single NIC vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the single NIC vector attribute to attach to the VM. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -a vm_attach_nic my-vm path=/path/to/nic_file.txt
salt-cloud -a vm_attach_nic my-vm data="NIC=[NETWORK_ID=1]"
```

`salt.cloud.clouds.opennebula.`**`vm_deploy`**(*name*, *kwargs=None*, *call=None*)

Initiates the instance of the given VM on the target host.

New in version 2016.3.0.

name The name of the VM to deploy.

host_id The ID of the target host where the VM will be deployed. Can be used instead of `host_name`.

host_name The name of the target host where the VM will be deployed. Can be used instead of `host_id`.

capacity_maintained True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

datastore_id The ID of the target system data-store where the VM will be deployed. Optional and can be used instead of `datastore_name`. If neither `datastore_id` nor `datastore_name` are set, OpenNebula will choose the data-store.

datastore_name The name of the target system data-store where the VM will be deployed. Optional, and can be used instead of `datastore_id`. If neither `datastore_id` nor `datastore_name` are set, OpenNebula will choose the data-store.

CLI Example:

```
salt-cloud -a vm_deploy my-vm host_id=0
salt-cloud -a vm_deploy my-vm host_id=1 capacity_maintained=False
salt-cloud -a vm_deploy my-vm host_name=host01 datastore_id=1
salt-cloud -a vm_deploy my-vm host_name=host01 datastore_name=default
```

`salt.cloud.clouds.opennebula.`**`vm_detach`**(*name*, *kwargs=None*, *call=None*)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

name The name of the VM from which to detach the disk.

disk_id The ID of the disk to detach.

CLI Example:

```
salt-cloud -a vm_detach my-vm disk_id=1
```

`salt.cloud.clouds.opennebula.`**`vm_detach_nic`**(*name*, *kwargs=None*, *call=None*)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

name The name of the VM from which to detach the network interface.

nic_id The ID of the nic to detach.

CLI Example:

```
salt-cloud -a vm_detach_nic my-vm nic_id=1
```

`salt.cloud.clouds.opennebula.`**`vm_disk_save`**(*name*, *kwargs=None*, *call=None*)

Sets the disk to be saved in the given image.

New in version 2016.3.0.

name The name of the VM containing the disk to save.

disk_id The ID of the disk to save.

image_name The name of the new image where the disk will be saved.

image_type The type for the new image. If not set, then the default `ONED` Configuration will be used. Other valid types include: OS, CDROM, DATABLOCK, KERNEL, RAMDISK, and CONTEXT.

snapshot_id The ID of the snapshot to export. If not set, the current image state will be used.

CLI Example:

```
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image image_
↪type=CONTEXT snapshot_id=10
```

(continues on next page)

(continued from previous page)

`salt.cloud.clouds.opennebula.`**`vm_disk_snapshot_create`**(*name, kwargs=None, call=None*)

Takes a new snapshot of the disk image.

New in version 2016.3.0.

name The name of the VM of which to take the snapshot.

disk_id The ID of the disk to save.

description The description for the snapshot.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_create my-vm disk_id=0 description="My Snapshot Description"
```

`salt.cloud.clouds.opennebula.`**`vm_disk_snapshot_delete`**(*name, kwargs=None, call=None*)

Deletes a disk snapshot based on the given VM and the disk_id.

New in version 2016.3.0.

name The name of the VM containing the snapshot to delete.

disk_id The ID of the disk to save.

snapshot_id The ID of the snapshot to be deleted.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_delete my-vm disk_id=0 snapshot_id=6
```

`salt.cloud.clouds.opennebula.`**`vm_disk_snapshot_revert`**(*name, kwargs=None, call=None*)

Reverts a disk state to a previously taken snapshot.

New in version 2016.3.0.

name The name of the VM containing the snapshot.

disk_id The ID of the disk to revert its state.

snapshot_id The ID of the snapshot to which the snapshot should be reverted.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_revert my-vm disk_id=0 snapshot_id=6
```

`salt.cloud.clouds.opennebula.`**`vm_info`**(*name, call=None*)

Retrieves information for a given virtual machine. A VM name must be supplied.

New in version 2016.3.0.

name The name of the VM for which to gather information.

CLI Example:

```
salt-cloud -a vm_info my-vm
```

`salt.cloud.clouds.opennebula.`**`vm_migrate`**(*name*, *kwargs=None*, *call=None*)

Migrates the specified virtual machine to the specified target host.

New in version 2016.3.0.

name The name of the VM to migrate.

host_id The ID of the host to which the VM will be migrated. Can be used instead of `host_name`.

host_name The name of the host to which the VM will be migrated. Can be used instead of `host_id`.

live_migration If set to `True`, a live-migration will be performed. Default is `False`.

capacity_maintained True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

datastore_id The target system data-store ID where the VM will be migrated. Can be used instead of `datastore_name`.

datastore_name The name of the data-store target system where the VM will be migrated. Can be used instead of `datastore_id`.

CLI Example:

```
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1 live_migration=True
salt-cloud -a vm_migrate my-vm host_name=host01 datastore_name=default
```

`salt.cloud.clouds.opennebula.`**`vm_monitoring`**(*name*, *call=None*)

Returns the monitoring records for a given virtual machine. A VM name must be supplied.

The monitoring information returned is a list of VM elements. Each VM element contains the complete dictionary of the VM with the updated information returned by the poll action.

New in version 2016.3.0.

name The name of the VM for which to gather monitoring records.

CLI Example:

```
salt-cloud -a vm_monitoring my-vm
```

`salt.cloud.clouds.opennebula.`**`vm_resize`**(*name*, *kwargs=None*, *call=None*)

Changes the capacity of the virtual machine.

New in version 2016.3.0.

name The name of the VM to resize.

path The path to a file containing new capacity elements CPU, VCPU, MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the new capacity elements CPU, VCPU, and MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Can be used instead of `path`.

capacity_maintained True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

CLI Example:

```
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt capacity_
↪maintained=False
salt-cloud -a vm_resize my-vm data="CPU=1 VCPU=1 MEMORY=1024"
```

`salt.cloud.clouds.opennebula.`**`vm_snapshot_create`**(*vm_name*, *kwargs=None*, *call=None*)

Creates a new virtual machine snapshot from the provided VM.

New in version 2016.3.0.

vm_name The name of the VM from which to create the snapshot.

snapshot_name The name of the snapshot to be created.

CLI Example:

```
salt-cloud -a vm_snapshot_create my-vm snapshot_name=my-new-snapshot
```

`salt.cloud.clouds.opennebula.`**`vm_snapshot_delete`**(*vm_name*, *kwargs=None*, *call=None*)

Deletes a virtual machine snapshot from the provided VM.

New in version 2016.3.0.

vm_name The name of the VM from which to delete the snapshot.

snapshot_id The ID of the snapshot to be deleted.

CLI Example:

```
salt-cloud -a vm_snapshot_delete my-vm snapshot_id=8
```

`salt.cloud.clouds.opennebula.`**`vm_snapshot_revert`**(*vm_name*, *kwargs=None*, *call=None*)

Reverts a virtual machine to a snapshot

New in version 2016.3.0.

vm_name The name of the VM to revert.

snapshot_id The snapshot ID.

CLI Example:

```
salt-cloud -a vm_snapshot_revert my-vm snapshot_id=42
```

`salt.cloud.clouds.opennebula.`**`vm_update`**(*name*, *kwargs=None*, *call=None*)

Replaces the user template contents.

New in version 2016.3.0.

name The name of the VM to update.

path The path to a file containing new user template contents. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the new user template contents. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

update_type There are two ways to update a VM: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud -a vm_update my-vm path=/path/to/user_template_file.txt update_type=
↪'replace'
```

`salt.cloud.clouds.opennebula.`**`vn_add_ar`**`(`*call=None*, *kwargs=None*`)`

Adds address ranges to a given virtual network.

New in version 2016.3.0.

vn_id The ID of the virtual network to add the address range. Can be used instead of `vn_name`.

vn_name The name of the virtual network to add the address range. Can be used instead of `vn_id`.

path The path to a file containing the template of the address range to add. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template of the address range to add. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_add_ar opennebula vn_id=3 path=/path/to/address_range.txt
salt-cloud -f vn_add_ar opennebula vn_name=my-vn \
    data="AR=[TYPE=IP4, IP=192.168.0.5, SIZE=10]"
```

`salt.cloud.clouds.opennebula.`**`vn_allocate`**`(`*call=None*, *kwargs=None*`)`

Allocates a new virtual network in OpenNebula.

New in version 2016.3.0.

path The path to a file containing the template of the virtual network to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template of the virtual network to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

cluster_id The ID of the cluster for which to add the new virtual network. Can be used instead of `cluster_name`. If neither `cluster_id` nor `cluster_name` are provided, the virtual network won't be added to any cluster.

cluster_name The name of the cluster for which to add the new virtual network. Can be used instead of `cluster_id`. If neither `cluster_name` nor `cluster_id` are provided, the virtual network won't be added to any cluster.

CLI Example:

```
salt-cloud -f vn_allocate opennebula path=/path/to/vn_file.txt
```

`salt.cloud.clouds.opennebula.`**`vn_delete`**`(`*call=None*, *kwargs=None*`)`

Deletes the given virtual network from OpenNebula. Either a name or a vn_id must be supplied.

New in version 2016.3.0.

name The name of the virtual network to delete. Can be used instead of `vn_id`.

vn_id The ID of the virtual network to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f vn_delete opennebula name=my-virtual-network
salt-cloud --function vn_delete opennebula vn_id=3
```

`salt.cloud.clouds.opennebula.`**`vn_free_ar`**`(`*call=None*, *kwargs=None*`)`

Frees a reserved address range from a virtual network.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to free an address range. Can be used instead of `vn_name`.

vn_name The name of the virtual network from which to free an address range. Can be used instead of `vn_id`.

ar_id The ID of the address range to free.

CLI Example:

```
salt-cloud -f vn_free_ar opennebula vn_id=3 ar_id=1
salt-cloud -f vn_free_ar opennebula vn_name=my-vn ar_id=1
```

`salt.cloud.clouds.opennebula.`**`vn_hold`**(*call=None*, *kwargs=None*)

Holds a virtual network lease as used.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to hold the lease. Can be used instead of `vn_name`.

vn_name The name of the virtual network from which to hold the lease. Can be used instead of `vn_id`.

path The path to a file defining the template of the lease to hold. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template of the lease to hold. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_hold opennebula vn_id=3 path=/path/to/vn_hold_file.txt
salt-cloud -f vn_hold opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```

`salt.cloud.clouds.opennebula.`**`vn_info`**(*call=None*, *kwargs=None*)

Retrieves information for the virtual network.

New in version 2016.3.0.

name The name of the virtual network for which to gather information. Can be used instead of `vn_id`.

vn_id The ID of the virtual network for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f vn_info opennebula vn_id=3
salt-cloud --function vn_info opennebula name=public
```

`salt.cloud.clouds.opennebula.`**`vn_release`**(*call=None*, *kwargs=None*)

Releases a virtual network lease that was previously on hold.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to release the lease. Can be used instead of `vn_name`.

vn_name The name of the virtual network from which to release the lease. Can be used instead of `vn_id`.

path The path to a file defining the template of the lease to release. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template defining the lease to release. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_release opennebula vn_id=3 path=/path/to/vn_release_file.txt
salt-cloud =f vn_release opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```

`salt.cloud.clouds.opennebula.`**`vn_reserve`**(*call=None*, *kwargs=None*)

Reserve network addresses.

New in version 2016.3.0.

vn_id The ID of the virtual network from which to reserve addresses. Can be used instead of vn_name.

vn_name The name of the virtual network from which to reserve addresses. Can be used instead of vn_id.

path The path to a file defining the template of the address reservation. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data Contains the template defining the address reservation. Syntax can be the usual attribute=value or XML. Data provided must be wrapped in double quotes. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_reserve opennebula vn_id=3 path=/path/to/vn_reserve_file.txt
salt-cloud -f vn_reserve opennebula vn_name=my-vn data="SIZE=10 AR_ID=8 NETWORK_
↪ID=1"
```

21.4.15 salt.cloud.clouds.openstack

Openstack Cloud Driver

depends shade>=1.19.0

OpenStack is an open source project that is in use by a number a cloud providers, each of which have their own ways of using it.

This OpenStack driver uses a the shade python module which is managed by the OpenStack Infra team. This module is written to handle all the different versions of different OpenStack tools for salt, so most commands are just passed over to the module to handle everything.

Provider

There are two ways to configure providers for this driver. The first one is to just let shade handle everything, and configure using os-client-config and setting up */etc/openstack/clouds.yml*.

```
clouds:
  democloud:
    region_name: RegionOne
    auth:
      username: 'demo'
      password: secret
      project_name: 'demo'
      auth_url: 'http://openstack/identity'
```

And then this can be referenced in the salt provider based on the *democloud* name.

```
myopenstack:
  driver: openstack
  cloud: democloud
  region_name: RegionOne
```

This allows for just using one configuration for salt-cloud and for any other openstack tools which are all using */etc/openstack/clouds.yml*

The other method allows for specifying everything in the provider config, instead of using the extra configuration file. This will allow for passing salt-cloud configs only through pillars for minions without having to write a clouds.yml file on each minion.abs

```
myopenstack:
  driver: openstack
  region_name: RegionOne
  auth:
    username: 'demo'
    password: secret
    project_name: 'demo'
    user_domain_name: default,
    project_domain_name: default,
    auth_url: 'http://openstack/identity'
```

Or if you need to use a profile to setup some extra stuff, it can be passed as a *profile* to use any of the vendor config options.

```
myrackspace:
  driver: openstack
  profile: rackspace
  auth:
    username: rackusername
    api_key: myapikey
  region_name: ORD
  auth_type: rackspace_apikey
```

And this will pull in the profile for rackspace and setup all the correct options for the auth_url and different api versions for services.

Profile

Most of the options for building servers are just passed on to the create_server function from shade.

The salt specific ones are:

- ssh_key_file: The path to the ssh key that should be used to login to the machine to bootstrap it
- ssh_key_file: The name of the keypair in openstack
- userdata_template: The renderer to use if the userdata is a file that is templated. Default: False
- ssh_interface: The interface to use to login for bootstrapping: public_ips, private_ips, floating_ips, fixed_ips

```
centos:
  provider: myopenstack
  image: CentOS 7
  size: ds1G
  ssh_key_name: mykey
  ssh_key_file: /root/.ssh/id_rsa
```

This is the minimum setup required.

If metadata is set to make sure that the host has finished setting up the *wait_for_metadata* can be set.

```
centos:
  provider: myopenstack
  image: CentOS 7
```

(continues on next page)

(continued from previous page)

```
size: ds1G
ssh_key_name: mykey
ssh_key_file: /root/.ssh/id_rsa
meta:
  build_config: rack_user_only
wait_for_metadata:
  rax_service_level_automation: Complete
  rackconnect_automation_status: DEPLOYED
```

Anything else from the create_server docs can be passed through here.

- **image**: **Image dict, name or ID to boot with. image is required** unless boot_volume is given.
- **flavor**: Flavor dict, name or ID to boot onto.
- **auto_ip**: **Whether to take actions to find a routable IP for** the server. (defaults to True)
- **ips**: List of IPs to attach to the server (defaults to None)
- **ip_pool**: **Name of the network or floating IP pool to get an** address from. (defaults to None)
- **root_volume**: **Name or ID of a volume to boot from** (defaults to None - deprecated, use boot_volume)
- **boot_volume**: **Name or ID of a volume to boot from** (defaults to None)
- **terminate_volume**: **If booting from a volume, whether it should** be deleted when the server is destroyed. (defaults to False)
- **volumes**: (optional) A list of volumes to attach to the server
- **meta**: **(optional) A dict of arbitrary key/value metadata to** store for this server. Both keys and values must be <=255 characters.
- **files**: **(optional, deprecated) A dict of files to overwrite** on the server upon boot. Keys are file names (i.e. `/etc/passwd`) and values are the file contents (either as a string or as a file-like object). A maximum of five entries is allowed, and each file must be 10k or less.
- **reservation_id**: a UUID for the set of servers being requested.
- **min_count**: **(optional extension) The minimum number of** servers to launch.
- **max_count**: **(optional extension) The maximum number of** servers to launch.
- **security_groups**: A list of security group names
- **userdata**: **user data to pass to be exposed by the metadata** server this can be a file type object as well or a string.
- **key_name**: **(optional extension) name of previously created** keypair to inject into the instance.
- **availability_zone**: **Name of the availability zone for instance** placement.
- **block_device_mapping**: **(optional) A dict of block** device mappings for this server.
- **block_device_mapping_v2**: **(optional) A dict of block** device mappings for this server.
- **nics**: **(optional extension) an ordered list of nics to be** added to this server, with information about connected networks, fixed IPs, port etc.
- **scheduler_hints**: **(optional extension) arbitrary key-value pairs** specified by the client to help boot an instance
- **config_drive**: **(optional extension) value for config drive** either boolean, or volume-id

- **disk_config: (optional extension) control how the disk is** partitioned when the server is created. possible values are 'AUTO' or 'MANUAL'.
- **admin_pass: (optional extension) add a user supplied admin** password.
- **timeout: (optional) Seconds to wait, defaults to 60**. See the `wait` parameter.
- **reuse_ips: (optional) Whether to attempt to reuse pre-existing** floating ips should a floating IP be needed (defaults to True)
- **network: (optional) Network dict or name or ID to attach the** server to. Mutually exclusive with the nics parameter. Can also be be a list of network names or IDs or network dicts.
- **boot_from_volume: Whether to boot from volume. 'boot_volume'** implies True, but boot_from_volume=True with no boot_volume is valid and will create a volume from the image and use that.
- **volume_size: When booting an image from volume, how big should** the created volume be? Defaults to 50.
- **nat_destination: Which network should a created floating IP** be attached to, if it's not possible to infer from the cloud's configuration. (Optional, defaults to None)
- **group: ServerGroup dict, name or id to boot the server in**. If a group is provided in both scheduler_hints and in the group param, the group param will win. (Optional, defaults to None)

Note: If there is anything added, that is not in this list, it can be added to an *extras* dictionary for the profile, and that will be to the create_server function.

`salt.cloud.clouds.openstack.`**`avail_images`**`(`*conn=None, call=None*`)`

List available images for OpenStack

CLI Example

```
salt-cloud -f avail_images myopenstack
salt-cloud --list-images myopenstack
```

`salt.cloud.clouds.openstack.`**`avail_sizes`**`(`*conn=None, call=None*`)`

List available sizes for OpenStack

CLI Example

```
salt-cloud -f avail_sizes myopenstack
salt-cloud --list-sizes myopenstack
```

`salt.cloud.clouds.openstack.`**`call`**`(`*conn=None, call=None, kwargs=None*`)`

Call function from shade.

func

function to call from shade.openstackcloud library

CLI Example

```
salt-cloud -f call myopenstack func=list_images
t sujksalt-cloud -f call myopenstack func=create_network name=mysubnet
```

`salt.cloud.clouds.openstack.`**`create`**`(`*vm_*`)`

Create a single VM from a data dict

`salt.cloud.clouds.openstack.`**`destroy`**`(`*name, conn=None, call=None*`)`

Delete a single VM

`salt.cloud.clouds.openstack.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.openstack.`**`get_conn`**`()`
Return a conn object for the passed VM data

`salt.cloud.clouds.openstack.`**`get_dependencies`**`()`
Warn if dependencies aren't met.

`salt.cloud.clouds.openstack.`**`list_networks`**`(`*conn=None*, *call=None*`)`
List networks for OpenStack

CLI Example

```
salt-cloud -f list_networks myopenstack
```

`salt.cloud.clouds.openstack.`**`list_nodes`**`(`*conn=None*, *call=None*`)`
Return a list of VMs

CLI Example

```
salt-cloud -f list_nodes myopenstack
```

`salt.cloud.clouds.openstack.`**`list_nodes_full`**`(`*conn=None*, *call=None*`)`
Return a list of VMs with all the information about them

CLI Example

```
salt-cloud -f list_nodes_full myopenstack
```

`salt.cloud.clouds.openstack.`**`list_nodes_min`**`(`*conn=None*, *call=None*`)`
Return a list of VMs with minimal information

CLI Example

```
salt-cloud -f list_nodes_min myopenstack
```

`salt.cloud.clouds.openstack.`**`list_nodes_select`**`(`*conn=None*, *call=None*`)`
Return a list of VMs with the fields from *query.selection*

CLI Example

```
salt-cloud -f list_nodes_full myopenstack
```

`salt.cloud.clouds.openstack.`**`list_subnets`**`(`*conn=None*, *call=None*, *kwargs=None*`)`
List subnets in a virtual network

network network to list subnets of

```
salt-cloud -f list_subnets myopenstack network=salt-net
```

`salt.cloud.clouds.openstack.`**`preferred_ip`**`(`*vm_*, *ips*`)`
Return the preferred Internet protocol. Either 'ipv4' (default) or 'ipv6'.

`salt.cloud.clouds.openstack.`**`request_instance`**`(`*vm_*, *conn=None*, *call=None*`)`
Request an instance to be built

`salt.cloud.clouds.openstack.`**`show_instance`**`(`*name*, *conn=None*, *call=None*`)`
Get VM on this OpenStack account

name

name of the instance

CLI Example

```
salt-cloud -a show_instance myserver
```

`salt.cloud.clouds.openstack.`**`ssh_interface`**(*vm_*)
Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

21.4.16 salt.cloud.clouds.parallels

Parallels Cloud Module

The Parallels cloud module is used to control access to cloud providers using the Parallels VPS system.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/parallels.conf`:

```
my-parallels-config:
  # Parallels account information
  user: myuser
  password: mypassword
  url: https://api.cloud.xmission.com:4465/paci/v1.0/
  driver: parallels
```

`salt.cloud.clouds.parallels.`**`avail_images`**(*call=None*)
Return a list of the images that are on the provider

`salt.cloud.clouds.parallels.`**`create`**(*vm_*)
Create a single VM from a data dict

`salt.cloud.clouds.parallels.`**`create_node`**(*vm_*)
Build and submit the XML to create a node

`salt.cloud.clouds.parallels.`**`destroy`**(*name, call=None*)
Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.parallels.`**`get_configured_provider`**()
Return the first configured instance.

`salt.cloud.clouds.parallels.`**`get_image`**(*vm_*)
Return the image object to use

`salt.cloud.clouds.parallels.`**`list_nodes`**(*call=None*)
Return a list of the VMs that are on the provider

`salt.cloud.clouds.parallels.`**`list_nodes_full`**(*call=None*)
Return a list of the VMs that are on the provider

`salt.cloud.clouds.parallels.`**`list_nodes_select`**(*call=None*)
Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.parallels.`**`query`**(*action=None, command=None, args=None, method='GET', data=None*)
Make a web call to a Parallels provider

`salt.cloud.clouds.parallels.`**`script`**`(`*vm_*`)`
Return the script deployment object

`salt.cloud.clouds.parallels.`**`show_image`**`(`*kwargs, call=None*`)`
Show the details from Parallels concerning an image

`salt.cloud.clouds.parallels.`**`show_instance`**`(`*name, call=None*`)`
Show the details from Parallels concerning an instance

`salt.cloud.clouds.parallels.`**`start`**`(`*name, call=None*`)`
Start a node.

CLI Example:

```
salt-cloud -a start mymachine
```

`salt.cloud.clouds.parallels.`**`stop`**`(`*name, call=None*`)`
Stop a node.

CLI Example:

```
salt-cloud -a stop mymachine
```

`salt.cloud.clouds.parallels.`**`wait_until`**`(`*name, state, timeout=300*`)`
Wait until a specific state has been reached on a node

21.4.17 salt.cloud.clouds.profitbricks

ProfitBricks Cloud Module

The ProfitBricks SaltStack cloud module allows a ProfitBricks server to be automatically deployed and bootstraped with Salt.

depends profitbrick >= 3.1.0

The module requires ProfitBricks credentials to be supplied along with an existing virtual datacenter UUID where the server resources will reside. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs. ...

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/profitbricks.conf`:

```
my-profitbricks-config:
  driver: profitbricks
  # The ProfitBricks login username
  username: user@example.com
  # The ProfitBricks login password
  password: secretpassword
  # The ProfitBricks virtual datacenter UUID
  datacenter_id: <UUID>
  # SSH private key filename
  ssh_private_key: /path/to/private.key
  # SSH public key filename
  ssh_public_key: /path/to/public.key
```

```
my-profitbricks-profile:
  provider: my-profitbricks-config
  # Name of a predefined server size.
```

(continues on next page)

(continued from previous page)

```
  size: Micro Instance
  # Assign CPU family to server.
  cpu_family: INTEL_XEON
  # Number of CPU cores to allocate to node (overrides server size).
  cores: 4
  # Amount of RAM in multiples of 256 MB (overrides server size).
  ram: 4096
  # The server availability zone.
  availability_zone: ZONE_1
  # Name or UUID of the HDD image to use.
  image: <UUID>
  # Image alias could be provided instead of image.
  # Example 'ubuntu:latest'
  #image_alias: <IMAGE_ALIAS>
  # Size of the node disk in GB (overrides server size).
  disk_size: 40
  # Type of disk (HDD or SSD).
  disk_type: SSD
  # Storage availability zone to use.
  disk_availability_zone: ZONE_2
  # Assign the server to the specified public LAN.
  public_lan: <ID>
  # Assign firewall rules to the network interface.
  public_firewall_rules:
    SSH:
      protocol: TCP
      port_range_start: 22
      port_range_end: 22
  # Assign the server to the specified private LAN.
  private_lan: <ID>
  # Enable NAT on the private NIC.
  nat: true
  # Assign additional volumes to the server.
  volumes:
    data-volume:
      disk_size: 500
      disk_availability_zone: ZONE_3
    log-volume:
      disk_size: 50
      disk_type: SSD
```

To use a private IP for connecting and bootstrapping node:

```
my-profitbricks-profile:
  ssh_interface: private_lan
```

Set `deploy` to False if Salt should not be installed on the node.

```
my-profitbricks-profile:
  deploy: False
```

`salt.cloud.clouds.profitbricks.`**`avail_images`**(*call=None*)

Return a list of the images that are on the provider

`salt.cloud.clouds.profitbricks.`**`avail_locations`**(*call=None*)

Return a dict of all available VM locations on the cloud provider with relevant data

`salt.cloud.clouds.profitbricks.`**`avail_sizes`**(*call=None*)

Return a dict of all available VM sizes on the cloud provider with relevant data. Latest version can be found at:

`salt.cloud.clouds.profitbricks.`**`create`**`(`*vm_*`)`
Create a single VM from a data dict

`salt.cloud.clouds.profitbricks.`**`create_datacenter`**`(`*call=None, kwargs=None*`)`
Creates a virtual datacenter based on supplied parameters.

CLI Example:

```
salt-cloud -f create_datacenter profitbricks name=mydatacenter
location=us/las description="my description"
```

`salt.cloud.clouds.profitbricks.`**`create_loadbalancer`**`(`*call=None, kwargs=None*`)`
Creates a loadbalancer within the datacenter from the provider config.

CLI Example:

```
salt-cloud -f create_loadbalancer profitbricks name=mylb
```

`salt.cloud.clouds.profitbricks.`**`destroy`**`(`*name, call=None*`)`
destroy a machine by name

Parameters

- **`name`** – name given to the machine
- **`call`** – call value in this case is 'action'

Returns array of booleans , true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.profitbricks.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.profitbricks.`**`get_conn`**`()`
Return a conn object for the passed VM data

`salt.cloud.clouds.profitbricks.`**`get_datacenter`**`(`*conn*`)`
Return the datacenter from the config provider datacenter ID

`salt.cloud.clouds.profitbricks.`**`get_datacenter_id`**`()`
Return datacenter ID from provider configuration

`salt.cloud.clouds.profitbricks.`**`get_dependencies`**`()`
Warn if dependencies are not met.

`salt.cloud.clouds.profitbricks.`**`get_disk_type`**`(`*vm_*`)`
Return the type of disk to use. Either 'HDD' (default) or 'SSD'.

`salt.cloud.clouds.profitbricks.`**`get_image`**`(`*vm_*`)`
Return the image object to use

`salt.cloud.clouds.profitbricks.`**`get_key_filename`**`(`*vm_*`)`
Check SSH private key file and return absolute path if exists.

`salt.cloud.clouds.profitbricks.`**`get_node`**`(`*conn, name*`)`
Return a node for the named VM

`salt.cloud.clouds.profitbricks.`**`get_public_keys`**`(`*vm_*`)`

Retrieve list of SSH public keys.

`salt.cloud.clouds.profitbricks.`**`get_size`**`(`*vm_*`)`

Return the VM's size object

`salt.cloud.clouds.profitbricks.`**`get_wait_timeout`**`(`*vm_*`)`

Return the wait_for_timeout for resource provisioning.

`salt.cloud.clouds.profitbricks.`**`list_datacenters`**`(`*conn=None, call=None*`)`

List all the data centers

CLI Example:

```
salt-cloud -f list_datacenters my-profitbricks-config
```

`salt.cloud.clouds.profitbricks.`**`list_images`**`(`*call=None, kwargs=None*`)`

List all the images with alias by location

CLI Example:

```
salt-cloud -f list_images my-profitbricks-config location=us/las
```

`salt.cloud.clouds.profitbricks.`**`list_loadbalancers`**`(`*call=None*`)`

Return a list of the loadbalancers that are on the provider

`salt.cloud.clouds.profitbricks.`**`list_nodes`**`(`*conn=None, call=None*`)`

Return a list of VMs that are on the provider

`salt.cloud.clouds.profitbricks.`**`list_nodes_full`**`(`*conn=None, call=None*`)`

Return a list of the VMs that are on the provider, with all fields

`salt.cloud.clouds.profitbricks.`**`reboot`**`(`*name, call=None*`)`

reboot a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.profitbricks.`**`reserve_ipblock`**`(`*call=None, kwargs=None*`)`

Reserve the IP Block

`salt.cloud.clouds.profitbricks.`**`set_public_lan`**`(`*lan_id*`)`

Enables public Internet access for the specified public_lan. If no public LAN is available, then a new public LAN is created.

`salt.cloud.clouds.profitbricks.`**`show_instance`**`(`*name, call=None*`)`

Show the details from the provider concerning an instance

`salt.cloud.clouds.profitbricks.`**`signal_event`**`(`*vm_, event, description*`)`

`salt.cloud.clouds.profitbricks.`**`ssh_interface`**`(`*vm_*`)`

Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

`salt.cloud.clouds.profitbricks.`**`start`**`(`*name, call=None*`)`

start a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a start vm_name
```

`salt.cloud.clouds.profitbricks.`**`stop`**(*name*, *call=None*)

stop a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a stop vm_name
```

`salt.cloud.clouds.profitbricks.`**`version_compatible`**(*version*)

Checks profitbricks version

21.4.18 salt.cloud.clouds.proxmox

Proxmox Cloud Module

New in version 2014.7.0.

The Proxmox cloud module is used to control access to cloud providers using the Proxmox system (KVM / OpenVZ / LXC).

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/proxmox.conf`:

```
my-proxmox-config:
  # Proxmox account information
  user: myuser@pam or myuser@pve
  password: mypassword
  url: hypervisor.domain.tld
  driver: proxmox
  verify_ssl: True
```

maintainer Frank Klaassen <frank@cloudright.nl>

depends requests >= 2.2.1

depends IPy >= 0.81

`salt.cloud.clouds.proxmox.`**`avail_images`**(*call=None*, *location='local'*)

Return a list of the images that are on the provider

CLI Example:

```
salt-cloud --list-images my-proxmox-config
```

`salt.cloud.clouds.proxmox.`**`avail_locations`**(*call=None*)

Return a list of the hypervisors (nodes) which this Proxmox PVE machine manages

CLI Example:

```
salt-cloud --list-locations my-proxmox-config
```

`salt.cloud.clouds.proxmox.`**`create`**(*vm_*)

Create a single VM from a data dict

CLI Example:

```
salt-cloud -p proxmox-ubuntu vmhostname
```

salt.cloud.clouds.proxmox.**create_node**(*vm_*, *newid*)
Build and submit the requestdata to create a new node

salt.cloud.clouds.proxmox.**destroy**(*name*, *call=None*)
Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

salt.cloud.clouds.proxmox.**get_configured_provider**()
Return the first configured instance.

salt.cloud.clouds.proxmox.**get_dependencies**()
Warn if dependencies aren't met.

salt.cloud.clouds.proxmox.**get_resources_nodes**(*call=None*, *resFilter=None*)
Retrieve all hypervisors (nodes) available on this environment CLI Example:

```
salt-cloud -f get_resources_nodes my-proxmox-config
```

salt.cloud.clouds.proxmox.**get_resources_vms**(*call=None*, *resFilter=None*, *includeConfig=True*)
Retrieve all VMs available on this environment

CLI Example:

```
salt-cloud -f get_resources_vms my-proxmox-config
```

salt.cloud.clouds.proxmox.**get_vm_status**(*vmid=None*, *name=None*)
Get the status for a VM, either via the ID or the hostname

salt.cloud.clouds.proxmox.**get_vmconfig**(*vmid*, *node=None*, *node_type='openvz'*)
Get VM configuration

salt.cloud.clouds.proxmox.**list_nodes**(*call=None*)
Return a list of the VMs that are managed by the provider

CLI Example:

```
salt-cloud -Q my-proxmox-config
```

salt.cloud.clouds.proxmox.**list_nodes_full**(*call=None*)
Return a list of the VMs that are on the provider

CLI Example:

```
salt-cloud -F my-proxmox-config
```

salt.cloud.clouds.proxmox.**list_nodes_select**(*call=None*)
Return a list of the VMs that are on the provider, with select fields

CLI Example:

```
salt-cloud -S my-proxmox-config
```

salt.cloud.clouds.proxmox.**query**(*conn_type*, *option*, *post_data=None*)
Execute the HTTP request to the API

`salt.cloud.clouds.proxmox.`**`script`**(*vm_*)
Return the script deployment object

`salt.cloud.clouds.proxmox.`**`set_vm_status`**(*status*, *name=None*, *vmid=None*)
Convenience function for setting VM status

`salt.cloud.clouds.proxmox.`**`show_instance`**(*name*, *call=None*)
Show the details from Proxmox concerning an instance

`salt.cloud.clouds.proxmox.`**`shutdown`**(*name=None*, *vmid=None*, *call=None*)
Shutdown a node via ACPI.

CLI Example:

```
salt-cloud -a shutdown mymachine
```

`salt.cloud.clouds.proxmox.`**`start`**(*name*, *vmid=None*, *call=None*)
Start a node.

CLI Example:

```
salt-cloud -a start mymachine
```

`salt.cloud.clouds.proxmox.`**`stop`**(*name*, *vmid=None*, *call=None*)
Stop a node ("pulling the plug").

CLI Example:

```
salt-cloud -a stop mymachine
```

`salt.cloud.clouds.proxmox.`**`wait_for_created`**(*upid*, *timeout=300*)
Wait until a the vm has been created successfully

`salt.cloud.clouds.proxmox.`**`wait_for_state`**(*vmid*, *state*, *timeout=300*)
Wait until a specific state has been reached on a node

21.4.19 salt.cloud.clouds.pyrax

Pyrax Cloud Module

PLEASE NOTE: This module is currently in early development, and considered to be experimental and unstable. It is not recommended for production use. Unless you are actively developing code in this module, you should use the OpenStack module instead.

`salt.cloud.clouds.pyrax.`**`get_configured_provider`**()
Return the first configured instance.

`salt.cloud.clouds.pyrax.`**`get_conn`**(*conn_type*)
Return a conn object for the passed VM data

`salt.cloud.clouds.pyrax.`**`get_dependencies`**()
Warn if dependencies aren't met.

`salt.cloud.clouds.pyrax.`**`queues_create`**(*call*, *kwargs*)

`salt.cloud.clouds.pyrax.`**`queues_delete`**(*call*, *kwargs*)

`salt.cloud.clouds.pyrax.`**`queues_exists`**(*call*, *kwargs*)

`salt.cloud.clouds.pyrax.`**`queues_show`**(*call*, *kwargs*)

21.4.20 salt.cloud.clouds.qingcloud

QingCloud Cloud Module

New in version 2015.8.0.

The QingCloud cloud module is used to control access to the QingCloud. http://www.qingcloud.com/

Use of this module requires the `access_key_id`, `secret_access_key`, `zone` and `key_filename` parameter to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/qingcloud.conf`:

```
my-qingcloud:
  driver: qingcloud
  access_key_id: AKIDMRTGYONNLTFFRBQJ
  secret_access_key: clYwH21U5UOmcov4aNV2V2XocaHCG3JZGcxEczFu
  zone: pek2
  key_filename: /path/to/your.pem
```

depends requests

`salt.cloud.clouds.qingcloud.`**`avail_images`**(*kwargs=None*, *call=None*)
Return a list of the images that are on the provider.

CLI Examples:

```
salt-cloud --list-images my-qingcloud
salt-cloud -f avail_images my-qingcloud zone=gd1
```

`salt.cloud.clouds.qingcloud.`**`avail_locations`**(*call=None*)
Return a dict of all available locations on the provider with relevant data.

CLI Examples:

```
salt-cloud --list-locations my-qingcloud
```

`salt.cloud.clouds.qingcloud.`**`avail_sizes`**(*kwargs=None*, *call=None*)
Return a list of the instance sizes that are on the provider.

CLI Examples:

```
salt-cloud --list-sizes my-qingcloud
salt-cloud -f avail_sizes my-qingcloud zone=pek2
```

`salt.cloud.clouds.qingcloud.`**`create`**(*vm_*)
Create a single instance from a data dict.

CLI Examples:

```
salt-cloud -p qingcloud-ubuntu-c1m1 hostname1
salt-cloud -m /path/to/mymap.sls -P
```

`salt.cloud.clouds.qingcloud.`**`destroy`**(*instance_id*, *call=None*)
Destroy an instance.

CLI Example:

```
salt-cloud -a destroy i-2f733r5n
salt-cloud -d i-2f733r5n
```

`salt.cloud.clouds.qingcloud.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.qingcloud.`**`get_dependencies`**`()`
Warn if dependencies aren't met.

`salt.cloud.clouds.qingcloud.`**`list_nodes`**`(`*call=None*`)`
Return a list of the instances that are on the provider.

CLI Examples:

```
salt-cloud -Q my-qingcloud
```

`salt.cloud.clouds.qingcloud.`**`list_nodes_full`**`(`*call=None*`)`
Return a list of the instances that are on the provider.

CLI Examples:

```
salt-cloud -F my-qingcloud
```

`salt.cloud.clouds.qingcloud.`**`list_nodes_min`**`(`*call=None*`)`
Return a list of the instances that are on the provider. Only a list of instances names, and their state, is returned.

CLI Examples:

```
salt-cloud -f list_nodes_min my-qingcloud
```

`salt.cloud.clouds.qingcloud.`**`list_nodes_select`**`(`*call=None*`)`
Return a list of the instances that are on the provider, with selected fields.

CLI Examples:

```
salt-cloud -S my-qingcloud
```

`salt.cloud.clouds.qingcloud.`**`query`**`(`*params=None*`)`
Make a web call to QingCloud IaaS API.

`salt.cloud.clouds.qingcloud.`**`reboot`**`(`*instance_id, call=None*`)`
Reboot an instance.

CLI Examples:

```
salt-cloud -a reboot i-2f733r5n
```

`salt.cloud.clouds.qingcloud.`**`script`**`(`*vm_*`)`
Return the script deployment object.

`salt.cloud.clouds.qingcloud.`**`show_image`**`(`*kwargs, call=None*`)`
Show the details from QingCloud concerning an image.

CLI Examples:

```
salt-cloud -f show_image my-qingcloud image=trustysrvx64c
salt-cloud -f show_image my-qingcloud image=trustysrvx64c,coreos4
salt-cloud -f show_image my-qingcloud image=trustysrvx64c zone=ap1
```

`salt.cloud.clouds.qingcloud.`**`show_instance`**`(`*instance_id, call=None, kwargs=None*`)`
Show the details from QingCloud concerning an instance.

CLI Examples:

```
salt-cloud -a show_instance i-2f733r5n
```

`salt.cloud.clouds.qingcloud.`**`start`**`(`*instance_id, call=None*`)`
Start an instance.

CLI Examples:

```
salt-cloud -a start i-2f733r5n
```

`salt.cloud.clouds.qingcloud.`**`stop`**`(`*instance_id, force=False, call=None*`)`
Stop an instance.

CLI Examples:

```
salt-cloud -a stop i-2f733r5n
salt-cloud -a stop i-2f733r5n force=True
```

21.4.21 salt.cloud.clouds.saltify

Saltify Module

The Saltify module is designed to install Salt on a remote machine, virtual or bare metal, using SSH. This module is useful for provisioning machines which are already installed, but not Salted.

Changed in version 2018.3.0: The wake_on_lan capability, and actions destroy, reboot, and query functions were added.

Use of this module requires some configuration in cloud profile and provider files as described in the *Gettting Started with Saltify* documentation.

`salt.cloud.clouds.saltify.`**`avail_images`**`(`*call=None*`)`
This function returns a list of images available for this cloud provider.

```
salt-cloud --list-images saltify
```

returns a list of available profiles.

..versionadded:: 2018.3.0

`salt.cloud.clouds.saltify.`**`avail_locations`**`(`*call=None*`)`
This function returns a list of locations available.

```
salt-cloud --list-locations my-cloud-provider
```

[saltify will always return an empty dictionary]

`salt.cloud.clouds.saltify.`**`avail_sizes`**`(`*call=None*`)`
This function returns a list of sizes available for this cloud provider.

```
salt-cloud --list-sizes saltify
```

[saltify always returns an empty dictionary] `salt.cloud.clouds.saltify.`**`create`**`(`*vm_*`)`

if configuration parameter `deploy` is `True`,

> Provision a single machine, adding its keys to the salt master

else,

> Test ssh connections to the machine

Configuration parameters:

- deploy: (see above)
- provider: name of entry in `salt/cloud.providers.d/???` file
- ssh_host: IP address or DNS name of the new machine
- ssh_username: name used to log in to the new machine
- ssh_password: password to log in (unless key_filename is used)
- key_filename: (optional) SSH private key for passwordless login
- ssh_port: (default=22) TCP port for SSH connection
- wake_on_lan_mac: (optional) hardware (MAC) address for wake on lan
- wol_sender_node: (optional) salt minion to send wake on lan command
- wol_boot_wait: (default=30) seconds to delay while client boots
- force_minion_config: (optional) replace the minion configuration files on the new machine

See also *Miscellaneous Salt Cloud Options* and *Getting Started with Saltify*

CLI Example:

```
salt-cloud -p mymachine my_new_id
```

`salt.cloud.clouds.saltify.`**`destroy`**`(`*name*, *call=None*`)`

Destroy a node.

New in version 2018.3.0.

Disconnect a minion from the master, and remove its keys.

Optionally, (if `remove_config_on_destroy` is `True`), disables salt-minion from running on the minion, and erases the Salt configuration files from it.

Optionally, (if `shutdown_on_destroy` is `True`), orders the minion to halt.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.saltify.`**`get_configured_provider`**`()`

Return the first configured instance.

`salt.cloud.clouds.saltify.`**`list_nodes`**`(`*call=None*`)`

List the nodes which have salt-cloud:driver:saltify grains.

```
salt-cloud -Q
```

returns a list of dictionaries of defined standard fields.

..versionadded:: 2018.3.0

`salt.cloud.clouds.saltify.`**`list_nodes_full`**(*call=None*)
Lists complete information for all nodes.

```
salt-cloud -F
```

returns a list of dictionaries.

for 'saltify' minions, returns dict of grains (enhanced).

..versionadded:: 2018.3.0

`salt.cloud.clouds.saltify.`**`list_nodes_select`**(*call=None*)
Return a list of the minions that have salt-cloud grains, with select fields.

`salt.cloud.clouds.saltify.`**`reboot`**(*name*, *call=None*)
Reboot a saltify minion.

..versionadded:: 2018.3.0

name The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.saltify.`**`show_instance`**(*name*, *call=None*)
List the a single node, return dict of grains.

21.4.22 salt.cloud.clouds.scaleway

Scaleway Cloud Module

New in version 2015.8.0.

The Scaleway cloud module is used to interact with your Scaleway BareMetal Servers.

Use of this module only requires the `api_key` parameter to be set. Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/scaleway.conf`:

```
scaleway-config:
  # Scaleway organization and token
  access_key: 0e604a2c-aea6-4081-acb2-e1d1258ef95c
  token: be8fd96b-04eb-4d39-b6ba-a9edbcf17f12
  driver: scaleway
```

`salt.cloud.clouds.scaleway.`**`avail_images`**(*call=None*)
Return a list of the images that are on the provider.

`salt.cloud.clouds.scaleway.`**`create`**(*server_*)
Create a single BareMetal server from a data dict.

`salt.cloud.clouds.scaleway.`**`create_node`**(*args*)
Create a node.

`salt.cloud.clouds.scaleway.`**`destroy`**(*name*, *call=None*)
Destroy a node. Will check termination protection and warn if enabled.

CLI Example: .. code-block:: bash

> salt-cloud –destroy mymachine

`salt.cloud.clouds.scaleway.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.scaleway.`**`get_image`**`(`*server_*`)`
Return the image object to use.

`salt.cloud.clouds.scaleway.`**`list_nodes`**`(`*call=None*`)`
Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.`**`list_nodes_full`**`(`*call=None*`)`
Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.`**`list_nodes_select`**`(`*call=None*`)`
Return a list of the BareMetal servers that are on the provider, with select fields.

`salt.cloud.clouds.scaleway.`**`query`**`(`*method='servers', server_id=None, command=None, args=None, http_method='get'*`)`
Make a call to the Scaleway API.

`salt.cloud.clouds.scaleway.`**`script`**`(`*server_*`)`
Return the script deployment object.

`salt.cloud.clouds.scaleway.`**`show_instance`**`(`*name, call=None*`)`
Show the details from a Scaleway BareMetal server.

21.4.23 salt.cloud.clouds.softlayer

SoftLayer Cloud Module

The SoftLayer cloud module is used to control access to the SoftLayer VPS system.

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

`/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/softlayer.conf`:

```
my-softlayer-config:
  # SoftLayer account api key
  user: MYLOGIN
  apikey: JVkbSJDGHSDKUKSDJfhsdklfjgsjdkflhjlsdfffhgdgjkenrtuinv
  driver: softlayer
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

depends softlayer

`salt.cloud.clouds.softlayer.`**`avail_images`**`(`*call=None*`)`
Return a dict of all available VM images on the cloud provider.

`salt.cloud.clouds.softlayer.`**`avail_locations`**`(`*call=None*`)`
List all available locations

`salt.cloud.clouds.softlayer.`**`avail_sizes`**`(`*call=None*`)`
Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.

`salt.cloud.clouds.softlayer.`**`create`**`(`*vm_*`)`
Create a single VM from a data dict

`salt.cloud.clouds.softlayer.`**`destroy`**`(`*name, call=None*`)`
Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.softlayer.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.softlayer.`**`get_conn`**`(`*service='SoftLayer_Virtual_Guest'*`)`
Return a conn object for the passed VM data

`salt.cloud.clouds.softlayer.`**`get_dependencies`**`()`
Warn if dependencies aren't met.

`salt.cloud.clouds.softlayer.`**`get_location`**`(`*vm_=None*`)`

Return the location to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.softlayer.`**`list_custom_images`**`(`*call=None*`)`
Return a dict of all custom VM images on the cloud provider.

`salt.cloud.clouds.softlayer.`**`list_nodes`**`(`*call=None*`)`
Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer.`**`list_nodes_full`**`(`*mask='mask[id]', call=None*`)`
Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer.`**`list_nodes_select`**`(`*call=None*`)`
Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.softlayer.`**`list_vlans`**`(`*call=None*`)`
List all VLANs associated with the account

`salt.cloud.clouds.softlayer.`**`script`**`(`*vm_*`)`
Return the script deployment object

`salt.cloud.clouds.softlayer.`**`show_instance`**`(`*name, call=None*`)`
Show the details from SoftLayer concerning a guest

21.4.24 salt.cloud.clouds.softlayer_hw

SoftLayer HW Cloud Module

The SoftLayer HW cloud module is used to control access to the SoftLayer hardware cloud system

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

`/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/softlayer.conf`:

```
my-softlayer-config:
  # SoftLayer account api key
  user: MYLOGIN
  apikey: JVkbSJDGHSDKUKSDJfhsdklfjgsjdkflhjlsdfffhgdgjkenrtuinv
  driver: softlayer_hw
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

depends softlayer

`salt.cloud.clouds.softlayer_hw.`**`avail_images`**`(`*call=None*`)`
Return a dict of all available VM images on the cloud provider.

`salt.cloud.clouds.softlayer_hw.`**`avail_locations`**`(`*call=None*`)`
List all available locations

`salt.cloud.clouds.softlayer_hw.`**`avail_sizes`**`(`*call=None*`)`
Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.

`salt.cloud.clouds.softlayer_hw.`**`create`**`(`*vm_*`)`
Create a single VM from a data dict

`salt.cloud.clouds.softlayer_hw.`**`destroy`**`(`*name*, *call=None*`)`
Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.softlayer_hw.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.softlayer_hw.`**`get_conn`**`(`*service='SoftLayer_Hardware'*`)`
Return a conn object for the passed VM data

`salt.cloud.clouds.softlayer_hw.`**`get_dependencies`**`()`
Warn if dependencies aren't met.

`salt.cloud.clouds.softlayer_hw.`**`get_location`**`(`*vm_=None*`)`

Return the location to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.softlayer_hw.`**`list_nodes`**`(`*call=None*`)`
Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer_hw.`**`list_nodes_full`**`(`*mask='mask[id, hostname, primaryIpAddress, primaryBackendIpAddress, processorPhysicalCoreAmount, memoryCount]', call=None*`)`
Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer_hw.`**`list_nodes_select`**`(`*call=None*`)`
Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.softlayer_hw.`**`list_vlans`**`(`*call=None*`)`
List all VLANs associated with the account

`salt.cloud.clouds.softlayer_hw.`**`script`**`(`*vm_*`)`
Return the script deployment object

`salt.cloud.clouds.softlayer_hw.`**`show_all_categories`**`(`*call=None*`)`
Return a dict of all available categories on the cloud provider.

New in version 2016.3.0.

`salt.cloud.clouds.softlayer_hw.`**`show_all_prices`**`(`*call=None, kwargs=None*`)`
Return a dict of all prices on the cloud provider.

`salt.cloud.clouds.softlayer_hw.`**`show_instance`**`(`*name, call=None*`)`
Show the details from SoftLayer concerning a guest

`salt.cloud.clouds.softlayer_hw.`**`show_pricing`**`(`*kwargs=None, call=None*`)`
Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

CLI Examples:

```
salt-cloud -f show_pricing my-softlayerhw-config profile=my-profile
```

If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:

```
salt-cloud -f update_pricing <provider>
```

New in version 2015.8.0.

21.4.25 salt.cloud.clouds.tencentcloud

Tencent Cloud Cloud Module

New in version 3000.

The Tencent Cloud Cloud Module is used to control access to the Tencent Cloud instance. https://intl.cloud.tencent.com/

To use this module, set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/*.conf`:

```
my-tencentcloud-config:
  driver: tencentcloud
  # Tencent Cloud Secret Id
  id: AKIDA64pOio9BMemkApzevX0HS169S4b750A
  # Tencent Cloud Secret Key
  key: 8r2xmPn0C5FDvRAlmcJimiTZKVRsk260
  # Tencent Cloud Region
  location: ap-guangzhou
```

depends tencentcloud-sdk-python

`salt.cloud.clouds.tencentcloud.`**`avail_images`**`(`*call=None*`)`
Return Tencent Cloud available image

CLI Example:

```
salt-cloud --list-images my-tencentcloud-config
salt-cloud -f avail_images my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`avail_locations`**`(`*call=None*`)`
Return Tencent Cloud available region

CLI Example:

```
salt-cloud --list-locations my-tencentcloud-config
salt-cloud -f avail_locations my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`avail_sizes`**`(`*call=None*`)`

Return Tencent Cloud available instance type

CLI Example:

```
salt-cloud --list-sizes my-tencentcloud-config
salt-cloud -f avail_sizes my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`create`**`(`*vm_*`)`

Create a single Tencent Cloud instance from a data dict.

Tencent Cloud profiles require a `provider`, `availability_zone`, `image` and `size`. Set up profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/*.conf`:

```
tencentcloud-guangzhou-s1sm1:
    provider: my-tencentcloud-config
    availability_zone: ap-guangzhou-3
    image: img-31tjrtph
    size: S1.SMALL1
    allocate_public_ip: True
    internet_max_bandwidth_out: 1
    password: '153e41ec96140152'
    securitygroups:
        - sg-5e90804b
```

CLI Examples:

```
salt-cloud -p tencentcloud-guangzhou-s1 myinstance
```

`salt.cloud.clouds.tencentcloud.`**`destroy`**`(`*name, call=None*`)`

Destroy a Tencent Cloud instance

CLI Example:

```
salt-cloud -a destroy myinstance
salt-cloud -d myinstance
```

`salt.cloud.clouds.tencentcloud.`**`get_configured_provider`**`()`

Return the first configured instance.

`salt.cloud.clouds.tencentcloud.`**`get_dependencies`**`()`

Warn if dependencies aren't met.

`salt.cloud.clouds.tencentcloud.`**`get_provider_client`**`(`*name=None*`)`

Return a new provider client

`salt.cloud.clouds.tencentcloud.`**`list_availability_zones`**`(`*call=None*`)`

Return all Tencent Cloud availability zones in current region

CLI Example:

```
salt-cloud -f list_availability_zones my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`list_custom_images`**`(`*call=None*`)`

Return all Tencent Cloud images in current region

CLI Example:

```
salt-cloud -f list_custom_images my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`list_nodes`**(*call=None*)
Return a list of instances that are on the provider

CLI Examples:

```
salt-cloud -Q
```

`salt.cloud.clouds.tencentcloud.`**`list_nodes_full`**(*call=None*)
Return a list of instances that are on the provider, with full details

CLI Examples:

```
salt-cloud -F
```

`salt.cloud.clouds.tencentcloud.`**`list_nodes_min`**(*call=None*)
Return a list of instances that are on the provider, Only names, and their state, is returned.

CLI Examples:

```
salt-cloud -f list_nodes_min my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`list_nodes_select`**(*call=None*)
Return a list of instances that are on the provider, with select fields

CLI Examples:

```
salt-cloud -S
```

`salt.cloud.clouds.tencentcloud.`**`list_securitygroups`**(*call=None*)
Return all Tencent Cloud security groups in current region

CLI Example:

```
salt-cloud -f list_securitygroups my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.`**`reboot`**(*name*, *call=None*)
Reboot a Tencent Cloud instance

CLI Examples:

```
salt-cloud -a reboot myinstance
```

`salt.cloud.clouds.tencentcloud.`**`script`**(*vm_*)
Return the script deployment object

`salt.cloud.clouds.tencentcloud.`**`show_disk`**(*name*, *call=None*)
Show the disk details of Tencent Cloud instance

CLI Examples:

```
salt-cloud -a show_disk myinstance
```

`salt.cloud.clouds.tencentcloud.`**`show_image`**(*kwargs*, *call=None*)
Show the details of Tencent Cloud image

CLI Examples:

```
salt-cloud -f show_image tencentcloud image=img-31tjrtph
```

`salt.cloud.clouds.tencentcloud.`**`show_instance`**`(`*name*, *call=None*`)`

Show the details of Tencent Cloud instance

CLI Examples:

```
salt-cloud -a show_instance myinstance
```

`salt.cloud.clouds.tencentcloud.`**`start`**`(`*name*, *call=None*`)`

Start a Tencent Cloud instance Notice: the instance state must be stopped

CLI Examples:

```
salt-cloud -a start myinstance
```

`salt.cloud.clouds.tencentcloud.`**`stop`**`(`*name*, *force=False*, *call=None*`)`

Stop a Tencent Cloud running instance Note: use *force=True* to make force stop

CLI Examples:

```
salt-cloud -a stop myinstance
salt-cloud -a stop myinstance force=True
```

21.4.26 salt.cloud.clouds.vagrant

Vagrant Cloud Driver

The Vagrant cloud is designed to ”vagrant up” a virtual machine as a Salt minion.

Use of this module requires some configuration in cloud profile and provider files as described in the *Getting Started with Vagrant* documentation.

New in version 2018.3.0.

`salt.cloud.clouds.vagrant.`**`avail_images`**`(`*call=None*`)`

This function returns a list of images available for this cloud provider. vagrant will return a list of profiles. salt-cloud –list-images my-cloud-provider

`salt.cloud.clouds.vagrant.`**`avail_locations`**`(`*call=None*`)`

This function returns a list of locations available.

CLI Example:

```
salt-cloud --list-locations my-cloud-provider

# \[ vagrant will always returns an empty dictionary \]
```

`salt.cloud.clouds.vagrant.`**`avail_sizes`**`(`*call=None*`)`

This function returns a list of sizes available for this cloud provider.

CLI Example:

```
salt-cloud --list-sizes my-cloud-provider

# \[ vagrant always returns an empty dictionary \]
```

`salt.cloud.clouds.vagrant.`**`create`**`(`*vm_*`)`

Provision a single machine

CLI Example:

```
salt-cloud -p my_profile new_node_1
```

`salt.cloud.clouds.vagrant.`**`destroy`**`(`*name*, *call=None*`)`
Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.vagrant.`**`get_configured_provider`**`()`
Return the first configured instance.

`salt.cloud.clouds.vagrant.`**`list_nodes`**`(`*call=None*`)`
List the nodes which have salt-cloud:driver:vagrant grains.

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.vagrant.`**`list_nodes_full`**`(`*call=None*`)`
List the nodes, ask all 'vagrant' minions, return dict of grains (enhanced).

CLI Example:

```
salt-call -F
```

`salt.cloud.clouds.vagrant.`**`list_nodes_select`**`(`*call=None*`)`
Return a list of the minions that have salt-cloud grains, with select fields.

`salt.cloud.clouds.vagrant.`**`reboot`**`(`*name*, *call=None*`)`
Reboot a vagrant minion.

name The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.vagrant.`**`show_instance`**`(`*name*, *call=None*`)`
List the a single node, return dict of grains.

21.4.27 salt.cloud.clouds.virtualbox

A salt cloud provider that lets you use virtualbox on your machine and act as a cloud.

depends vboxapi

For now this will only clone existing VMs. It's best to create a template from which we will clone.

Followed https://docs.saltstack.com/en/latest/topics/cloud/cloud.html#non-libcloud-based-modules to create this.

Dicts provided by salt:

__opts__ [contains the options used to run Salt Cloud,] as well as a set of configuration and environment variables

`salt.cloud.clouds.virtualbox.`**`create`**`(`*vm_info*`)`
Creates a virtual machine from the given VM information

This is what is used to request a virtual machine to be created by the cloud provider, wait for it to become available, and then (optionally) log in and install Salt on it.

Events fired:

This function fires the event `salt/cloud/vm_name/creating`, with the payload containing the names of the VM, profile, and provider.

@param vm_info

```
{
    name: <str>
    profile: <dict>
    driver: <provider>:<profile>
    clonefrom: <vm_name>
    clonemode: <mode> (default: state, choices: state, child, all)
}
```

@type vm_info dict @return dict of resulting vm. !!!Passwords can and should be included!!!

`salt.cloud.clouds.virtualbox.`**`destroy`**`(`*name*, *call=None*`)`

This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is *salt/cloud/<vm name>/destroying*. Once the virtual machine has been destroyed, another event is fired. The tag for that event is *salt/cloud/<vm name>/destroyed*.

Dependencies: list_nodes

@param name: @type name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

`salt.cloud.clouds.virtualbox.`**`list_nodes`**`(`*kwargs=None*, *call=None*`)`

This function returns a list of nodes available on this cloud provider, using the following fields:

id (str) image (str) size (str) state (str) private_ips (list) public_ips (list)

No other fields should be returned in this function, and all of these fields should be returned, even if empty. The private_ips and public_ips fields should always be of a list type, even if empty, and the other fields should always be of a str type. This function is normally called with the -Q option:

```
salt-cloud -Q
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

`salt.cloud.clouds.virtualbox.`**`list_nodes_full`**`(`*kwargs=None*, *call=None*`)`

All information available about all nodes should be returned in this function. The fields in the list_nodes() function should also be returned, even if they would not normally be provided by the cloud provider.

This is because some functions both within Salt and 3rd party will break if an expected field is not present. This function is normally called with the -F option:

```
salt-cloud -F
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

`salt.cloud.clouds.virtualbox.`**`list_nodes_select`**`(`*call=None*`)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.virtualbox.`**`map_clonemode`**`(`*vm_info*`)`

Convert the virtualbox config file values for clone_mode into the integers the API requires

`salt.cloud.clouds.virtualbox.`**`show_image`**`(`*kwargs*, *call=None*`)`

Show the details of an image

`salt.cloud.clouds.virtualbox.`**`start`**(*name*, *call=None*)

Start a machine. @param name: Machine to start @type name: str @param call: Must be "action" @type call: str

`salt.cloud.clouds.virtualbox.`**`stop`**(*name*, *call=None*)

Stop a running machine. @param name: Machine to stop @type name: str @param call: Must be "action" @type call: str

21.4.28 salt.cloud.clouds.vmware

VMware Cloud Module

New in version 2015.5.4.

The VMware cloud module allows you to manage VMware ESX, ESXi, and vCenter.

See *Getting started with VMware* to get started.

codeauthor Nitin Madhok <nmadhok@clemson.edu>

Dependencies

- pyVmomi Python Module

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original VMware cloud driver was developed against.

Note: Ensure python pyVmomi module is installed by running following one-liner check. The output should be 0.

```
python -c "import pyVmomi" ; echo $?
```

Configuration

To use this module, set up the vCenter or ESX/ESXi URL, username and password in the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`:

```
my-vmware-config:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: '10.20.30.40'

vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'
  protocol: 'https'
  port: 443

vcenter02:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter02.domain.com'
  protocol: 'http'
  port: 80

esx01:
  driver: vmware
  user: 'admin'
  password: 'verybadpass'
  url: 'esx01.domain.com'
```

Note: Optionally, `protocol` and `port` can be specified if the vCenter server is not using the defaults. Default is `protocol: https` and `port: 443`.

Note: Changed in version 2015.8.0.

The `provider` parameter in cloud provider configuration was renamed to `driver`. This change was made to avoid confusion with the `provider` parameter that is used in cloud profile configuration. Cloud provider configuration now uses `driver` to refer to the salt-cloud driver that provides the underlying functionality to connect to a cloud provider, while cloud profile configuration continues to use `provider` to refer to the cloud provider configuration that you define.

To test the connection for `my-vmware-config` specified in the cloud configuration, run *`test_vcenter_connection()`*

`salt.cloud.clouds.vmware.`**`add_host`**(*kwargs=None*, *call=None*)

Add a host system to the specified cluster or datacenter in this VMware environment

Note: To use this function, you need to specify `esxi_host_user` and `esxi_host_password` under your provider configuration set up at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`:

```
vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
```

(continues on next page)

(continued from previous page)

```
  url: 'vcenter01.domain.com'

  # Required when adding a host system
  esxi_host_user: 'root'
  esxi_host_password: 'myhostpassword'
  # Optional fields that can be specified when adding a host system
  esxi_host_ssl_thumbprint:
↪'12:A3:45:B6:CD:7E:F8:90:A1:BC:23:45:D6:78:9E:FA:01:2B:34:CD'
```

The SSL thumbprint of the host system can be optionally specified by setting `esxi_host_ssl_thumbprint` under your provider configuration. To get the SSL thumbprint of the host system, execute the following command from a remote server:

```
echo -n | openssl s_client -connect <YOUR-HOSTSYSTEM-DNS/IP>:443 2>/dev/null |
↪openssl x509 -noout -fingerprint -sha1
```

CLI Example:

```
salt-cloud -f add_host my-vmware-config host="myHostSystemName" cluster=
↪"myClusterName"
salt-cloud -f add_host my-vmware-config host="myHostSystemName" datacenter=
↪"myDatacenterName"
```

salt.cloud.clouds.vmware.**avail_images**(*call=None*)

Return a list of all the templates present in this VMware environment with basic details

CLI Example:

```
salt-cloud --list-images my-vmware-config
```

salt.cloud.clouds.vmware.**avail_locations**(*call=None*)

Return a list of all the available locations/datacenters in this VMware environment

CLI Example:

```
salt-cloud --list-locations my-vmware-config
```

salt.cloud.clouds.vmware.**avail_sizes**(*call=None*)

Return a list of all the available sizes in this VMware environment.

CLI Example:

```
salt-cloud --list-sizes my-vmware-config
```

Note: Since sizes are built into templates, this function will return an empty dictionary.

salt.cloud.clouds.vmware.**build_clonespec**(*config_spec, object_ref, reloc_spec, template*)

Returns the clone spec

salt.cloud.clouds.vmware.**connect_host**(*kwargs=None, call=None*)

Connect the specified host system in this VMware environment

CLI Example:

```
salt-cloud -f connect_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.`**`convert_to_template`**(*name, kwargs=None, call=None*)

Convert the specified virtual machine to template.

CLI Example:

```
salt-cloud -a convert_to_template vmname
```

`salt.cloud.clouds.vmware.`**`create`**(*vm_*)

To create a single VM in the VMware environment.

Sample profile and arguments that can be specified in it can be found *here*.

CLI Example:

```
salt-cloud -p vmware-centos6.5 vmname
```

`salt.cloud.clouds.vmware.`**`create_cluster`**(*kwargs=None, call=None*)

Create a new cluster under the specified datacenter in this VMware environment

CLI Example:

```
salt-cloud -f create_cluster my-vmware-config name="myNewCluster" datacenter=
↪"datacenterName"
```

`salt.cloud.clouds.vmware.`**`create_datacenter`**(*kwargs=None, call=None*)

Create a new data center in this VMware environment

CLI Example:

```
salt-cloud -f create_datacenter my-vmware-config name="MyNewDatacenter"
```

`salt.cloud.clouds.vmware.`**`create_datastore_cluster`**(*kwargs=None, call=None*)

Create a new datastore cluster for the specified datacenter in this VMware environment

CLI Example:

```
salt-cloud -f create_datastore_cluster my-vmware-config name="datastoreClusterName
↪" datacenter="datacenterName"
```

`salt.cloud.clouds.vmware.`**`create_folder`**(*kwargs=None, call=None*)

Create the specified folder path in this VMware environment

Note: To create a Host and Cluster Folder under a Datacenter, specify `path="/yourDatacenterName/host/yourFolderName"`

To create a Network Folder under a Datacenter, specify `path="/yourDatacenterName/network/yourFolderName"`

To create a Storage Folder under a Datacenter, specify `path="/yourDatacenterName/datastore/yourFolderName"`

To create a VM and Template Folder under a Datacenter, specify `path="/yourDatacenterName/vm/yourFolderName"`

CLI Example:

```
salt-cloud -f create_folder my-vmware-config path="/Local/a/b/c"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/vm/MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/host/MyHostFolder
↪"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/network/
↪MyNetworkFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/storage/
↪MyStorageFolder"
```

`salt.cloud.clouds.vmware.`**`create_snapshot`**(*name*, *kwargs=None*, *call=None*)

Create a snapshot of the specified virtual machine in this VMware environment

---

Note: If the VM is powered on, the internal state of the VM (memory dump) is included in the snapshot by default which will also set the power state of the snapshot to "powered on". You can set `memdump=False` to override this. This field is ignored if the virtual machine is powered off or if the VM does not support snapshots with memory dumps. Default is `memdump=True`

Note: If the VM is powered on when the snapshot is taken, VMware Tools can be used to quiesce the file system in the virtual machine by setting `quiesce=True`. This field is ignored if the virtual machine is powered off; if VMware Tools are not available or if `memdump=True`. Default is `quiesce=False`

CLI Example:

```
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot" [description="My
↪snapshot"] [memdump=False] [quiesce=True]
```

`salt.cloud.clouds.vmware.`**`destroy`**(*name*, *call=None*)

To destroy a VM from the VMware environment

CLI Example:

```
salt-cloud -d vmname
salt-cloud --destroy vmname
salt-cloud -a destroy vmname
```

`salt.cloud.clouds.vmware.`**`disconnect_host`**(*kwargs=None*, *call=None*)

Disconnect the specified host system in this VMware environment

CLI Example:

```
salt-cloud -f disconnect_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.`**`enter_maintenance_mode`**(*kwargs=None*, *call=None*)

To put the specified host system in maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f enter_maintenance_mode my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.`**`exit_maintenance_mode`**(*kwargs=None*, *call=None*)

To take the specified host system out of maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f exit_maintenance_mode my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.`**`get_clonespec_for_valid_snapshot`**(*config_spec*, *object_ref*, *reloc_spec*, *template*, *vm_*)

return clonespec only if values are valid

`salt.cloud.clouds.vmware.`**`get_vcenter_version`**(*kwargs=None*, *call=None*)

Show the vCenter Server version with build number.

CLI Example:

```
salt-cloud -f get_vcenter_version my-vmware-config
```

`salt.cloud.clouds.vmware.`**`handle_snapshot`**(*config_spec*, *object_ref*, *reloc_spec*, *template*, *vm_*)

Returns a clone spec for cloning from shapshots :rtype vim.vm.CloneSpec

`salt.cloud.clouds.vmware.`**`list_clusters`**(*kwargs=None*, *call=None*)

List all the clusters for this VMware environment

CLI Example:

```
salt-cloud -f list_clusters my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_clusters_by_datacenter`**(*kwargs=None*, *call=None*)

List clusters for each datacenter; or clusters for a specified datacenter in this VMware environment

To list clusters for each datacenter:

CLI Example:

```
salt-cloud -f list_clusters_by_datacenter my-vmware-config
```

To list clusters for a specified datacenter:

CLI Example:

```
salt-cloud -f list_clusters_by_datacenter my-vmware-config datacenter=
↪"datacenterName"
```

`salt.cloud.clouds.vmware.`**`list_datacenters`**(*kwargs=None*, *call=None*)

List all the data centers for this VMware environment

CLI Example:

```
salt-cloud -f list_datacenters my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_datastore_clusters`**(*kwargs=None*, *call=None*)

List all the datastore clusters for this VMware environment

CLI Example:

```
salt-cloud -f list_datastore_clusters my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_datastores`**(*kwargs=None*, *call=None*)

List all the datastores for this VMware environment

CLI Example:

```
salt-cloud -f list_datastores my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_dvs`**`(`*kwargs=None, call=None*`)`

List all the distributed virtual switches for this VMware environment

CLI Example:

```
salt-cloud -f list_dvs my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_folders`**`(`*kwargs=None, call=None*`)`

List all the folders for this VMware environment

CLI Example:

```
salt-cloud -f list_folders my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_hbas`**`(`*kwargs=None, call=None*`)`

List all HBAs for each host system; or all HBAs for a specified host system; or HBAs of specified type for each host system; or HBAs of specified type for a specified host system in this VMware environment

Note: You can specify type as either `parallel`, `iscsi`, `block` or `fibre`.

To list all HBAs for each host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config
```

To list all HBAs for a specified host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName"
```

To list HBAs of specified type for each host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config type="HBAType"
```

To list HBAs of specified type for a specified host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName" type="HBAtype"
```

`salt.cloud.clouds.vmware.`**`list_hosts`**`(`*kwargs=None, call=None*`)`

List all the hosts for this VMware environment

CLI Example:

```
salt-cloud -f list_hosts my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_hosts_by_cluster`**`(`*kwargs=None, call=None*`)`

List hosts for each cluster; or hosts for a specified cluster in this VMware environment

To list hosts for each cluster:

CLI Example:

```
salt-cloud -f list_hosts_by_cluster my-vmware-config
```

To list hosts for a specified cluster:

CLI Example:

```
salt-cloud -f list_hosts_by_cluster my-vmware-config cluster="clusterName"
```

salt.cloud.clouds.vmware.**list_hosts_by_datacenter**(*kwargs=None*, *call=None*)

List hosts for each datacenter; or hosts for a specified datacenter in this VMware environment

To list hosts for each datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

To list hosts for a specified datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config datacenter="datacenterName
↪"
```

salt.cloud.clouds.vmware.**list_networks**(*kwargs=None*, *call=None*)

List all the standard networks for this VMware environment

CLI Example:

```
salt-cloud -f list_networks my-vmware-config
```

salt.cloud.clouds.vmware.**list_nodes**(*kwargs=None*, *call=None*)

Return a list of all VMs and templates that are on the specified provider, with basic fields

CLI Example:

```
salt-cloud -f list_nodes my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with basic fields:

CLI Example:

```
salt-cloud -Q
```

salt.cloud.clouds.vmware.**list_nodes_full**(*kwargs=None*, *call=None*)

Return a list of all VMs and templates that are on the specified provider, with full details

CLI Example:

```
salt-cloud -f list_nodes_full my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with full details:

CLI Example:

```
salt-cloud -F
```

salt.cloud.clouds.vmware.**list_nodes_min**(*kwargs=None*, *call=None*)

Return a list of all VMs and templates that are on the specified provider, with no details

CLI Example:

```
salt-cloud -f list_nodes_min my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_nodes_select`**(*call=None*)

Return a list of all VMs and templates that are on the specified provider, with fields specified under `query.selection` in `/etc/salt/cloud`

CLI Example:

```
salt-cloud -f list_nodes_select my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with fields specified under `query.selection` in `/etc/salt/cloud`:

CLI Example:

```
salt-cloud -S
```

`salt.cloud.clouds.vmware.`**`list_portgroups`**(*kwargs=None*, *call=None*)

List all the distributed virtual portgroups for this VMware environment

CLI Example:

```
salt-cloud -f list_portgroups my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_resourcepools`**(*kwargs=None*, *call=None*)

List all the resource pools for this VMware environment

CLI Example:

```
salt-cloud -f list_resourcepools my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_snapshots`**(*kwargs=None*, *call=None*)

List snapshots either for all VMs and templates or for a specific VM/template in this VMware environment

To list snapshots for all VMs and templates:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config
```

To list snapshots for a specific VM/template:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config name="vmname"
```

`salt.cloud.clouds.vmware.`**`list_templates`**(*kwargs=None*, *call=None*)

List all the templates present in this VMware environment

CLI Example:

```
salt-cloud -f list_templates my-vmware-config
```

`salt.cloud.clouds.vmware.`**`list_vapps`**(*kwargs=None*, *call=None*)

List all the vApps for this VMware environment

CLI Example:

```
salt-cloud -f list_vapps my-vmware-config
```

`salt.cloud.clouds.vmware.`**`reboot_host`**`(`*kwargs=None, call=None*`)`

Reboot the specified host system in this VMware environment

Note: If the host system is not in maintenance mode, it will not be rebooted. If you want to reboot the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

CLI Example:

```
salt-cloud -f reboot_host my-vmware-config host="myHostSystemName" [force=True]
```

`salt.cloud.clouds.vmware.`**`remove_all_snapshots`**`(`*name, kwargs=None, call=None*`)`

Remove all the snapshots present for the specified virtual machine.

Note: All the snapshots higher up in the hierarchy of the current snapshot tree are consolidated and their virtual disks are merged. To override this behavior and only remove all snapshots, set `merge_snapshots=False`. Default is `merge_snapshots=True`

CLI Example:

```
salt-cloud -a remove_all_snapshots vmname [merge_snapshots=False]
```

`salt.cloud.clouds.vmware.`**`remove_host`**`(`*kwargs=None, call=None*`)`

Remove the specified host system from this VMware environment

CLI Example:

```
salt-cloud -f remove_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.`**`remove_snapshot`**`(`*name, kwargs=None, call=None*`)`

Remove a snapshot of the specified virtual machine in this VMware environment

CLI Example:

```
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot" [remove_children=
↪"True"]
```

`salt.cloud.clouds.vmware.`**`rescan_hba`**`(`*kwargs=None, call=None*`)`

To rescan a specified HBA or all the HBAs on the Host System

CLI Example:

```
salt-cloud -f rescan_hba my-vmware-config host="hostSystemName"
salt-cloud -f rescan_hba my-vmware-config hba="hbaDeviceName" host="hostSystemName
↪"
```

`salt.cloud.clouds.vmware.`**`reset`**`(`*name, soft=False, call=None*`)`

To reset a VM using its name

Note: If `soft=True` then issues a command to the guest operating system asking it to perform a reboot. Otherwise hypervisor will terminate VM and start it again. Default is soft=False

For `soft=True` vmtools should be installed on guest system.

CLI Example:

```
salt-cloud -a reset vmname
salt-cloud -a reset vmname soft=True
```

`salt.cloud.clouds.vmware.`**`revert_to_snapshot`**`(`*name, kwargs=None, call=None*`)`

Revert virtual machine to it's current snapshot. If no snapshot exists, the state of the virtual machine remains unchanged

---

Note: The virtual machine will be powered on if the power state of the snapshot when it was created was set to "Powered On". Set `power_off=True` so that the virtual machine stays powered off regardless of the power state of the snapshot when it was created. Default is `power_off=False`.

If the power state of the snapshot when it was created was "Powered On" and if `power_off=True`, the VM will be put in suspended state after it has been reverted to the snapshot.

CLI Example:

```
salt-cloud -a revert_to_snapshot vmame [power_off=True]
salt-cloud -a revert_to_snapshot vmame snapshot_name="selectedSnapshot" [power_
↪off=True]
```

`salt.cloud.clouds.vmware.`**`show_instance`**`(`*name, call=None*`)`

List all available details of the specified VM

CLI Example:

```
salt-cloud -a show_instance vmname
```

`salt.cloud.clouds.vmware.`**`start`**`(`*name, call=None*`)`

To start/power on a VM using its name

CLI Example:

```
salt-cloud -a start vmname
```

`salt.cloud.clouds.vmware.`**`stop`**`(`*name, soft=False, call=None*`)`

To stop/power off a VM using its name

Note: If `soft=True` then issues a command to the guest operating system asking it to perform a clean shutdown of all services. Default is soft=False

For `soft=True` vmtools should be installed on guest system.

CLI Example:

```
salt-cloud -a stop vmname
salt-cloud -a stop vmname soft=True
```

`salt.cloud.clouds.vmware.`**`suspend`**`(`*name, call=None*`)`

To suspend a VM using its name

CLI Example:

```
salt-cloud -a suspend vmname
```

`salt.cloud.clouds.vmware.`**`terminate`**`(`*name, call=None*`)`

To do an immediate power off of a VM using its name. A `SIGKILL` is issued to the vmx process of the VM

CLI Example:

```
salt-cloud -a terminate vmname
```

`salt.cloud.clouds.vmware.`**`test_vcenter_connection`**(*kwargs=None*, *call=None*)

Test if the connection can be made to the vCenter server using the specified credentials inside `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`

CLI Example:

```
salt-cloud -f test_vcenter_connection my-vmware-config
```

`salt.cloud.clouds.vmware.`**`upgrade_tools`**(*name*, *reboot=False*, *call=None*)

To upgrade VMware Tools on a specified virtual machine.

Note: If the virtual machine is running Windows OS, use `reboot=True` to reboot the virtual machine after VMware tools upgrade. Default is `reboot=False`

CLI Example:

```
salt-cloud -a upgrade_tools vmname
salt-cloud -a upgrade_tools vmname reboot=True
```

`salt.cloud.clouds.vmware.`**`upgrade_tools_all`**(*call=None*)

To upgrade VMware Tools on all virtual machines present in the specified provider

Note: If the virtual machine is running Windows OS, this function will attempt to suppress the automatic reboot caused by a VMware Tools upgrade.

CLI Example:

```
salt-cloud -f upgrade_tools_all my-vmware-config
```

21.4.29 salt.cloud.clouds.vultrpy

Vultr Cloud Module using python-vultr bindings

New in version 2016.3.0.

The Vultr cloud module is used to control access to the Vultr VPS system.

Use of this module only requires the `api_key` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vultr.conf`:

```
my-vultr-config:
  # Vultr account api key
  api_key: <supersecretapi_key>
  driver: vultr
```

Set up the cloud profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/vultr.conf`:

```
nyc-4gb-4cpu-ubuntu-14-04:
  location: 1
  provider: my-vultr-config
  image: 160
  size: 95
  enable_private_network: True
```

This driver also supports Vultr's *startup script* feature. You can list startup scripts in your account with

```
salt-cloud -f list_scripts <name of vultr provider>
```

That list will include the IDs of the scripts in your account. Thus, if you have a script called 'setup-networking' with an ID of 493234 you can specify that startup script in a profile like so:

```
nyc-2gb-1cpu-ubuntu-17-04:
  location: 1
  provider: my-vultr-config
  image: 223
  size: 13
  startup_script_id: 493234
```

`salt.cloud.clouds.vultrpy.`**`avail_images`**`(`*conn=None*`)`
Return available images

`salt.cloud.clouds.vultrpy.`**`avail_locations`**`(`*conn=None*`)`
return available datacenter locations

`salt.cloud.clouds.vultrpy.`**`avail_scripts`**`(`*conn=None*`)`
return available startup scripts

`salt.cloud.clouds.vultrpy.`**`avail_sizes`**`(`*conn=None*`)`
Return available sizes ("plans" in VultrSpeak)

`salt.cloud.clouds.vultrpy.`**`create`**`(`*vm_*`)`
Create a single VM from a data dict

`salt.cloud.clouds.vultrpy.`**`destroy`**`(`*name*`)`
Remove a node from Vultr

`salt.cloud.clouds.vultrpy.`**`get_configured_provider`**`()`
Return the first configured instance

`salt.cloud.clouds.vultrpy.`**`list_nodes`**`(`***kwargs*`)`
Return basic data on nodes

`salt.cloud.clouds.vultrpy.`**`list_nodes_full`**`(`***kwargs*`)`
Return all data on nodes

`salt.cloud.clouds.vultrpy.`**`list_nodes_select`**`(`*conn=None, call=None*`)`
Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.vultrpy.`**`list_scripts`**`(`*conn=None, call=None*`)`
return list of Startup Scripts

`salt.cloud.clouds.vultrpy.`**`show_instance`**`(`*name, call=None*`)`
Show the details from the provider concerning an instance

`salt.cloud.clouds.vultrpy.`**`start`**`(`**args, **kwargs*`)`
Execute a "start" action on a VM

`salt.cloud.clouds.vultrpy.`**`stop`**`(`**args, **kwargs*`)`

Execute a "stop" action on a VM

21.4.30 salt.cloud.clouds.xen

XenServer Cloud Driver

The XenServer driver is designed to work with a Citrix XenServer.

Requires XenServer SDK (can be downloaded from https://www.citrix.com/downloads/xenserver/product-software/)

Place a copy of the XenAPI.py in the Python site-packages folder.

depends XenAPI

Example provider configuration:

```
# /etc/salt/cloud.providers.d/myxen.conf
myxen:
  driver: xen
  url: http://10.0.0.120
  user: root
  password: p@ssw0rd
```

Example profile configuration:

```
# /etc/salt/cloud.profiles.d/myxen.conf
suse:
  provider: myxen
  user: root
  password: p@ssw0rd
  image: opensuseleap42_2-template
  storage_repo: 'Local storage'
  resource_pool: default_pool
  clone: True
  minion:
    master: 10.0.0.18
sles:
  provider: myxen
  user: root
  clone: False
  image: sles12sp2-template
  deploy: False
w2k12:
  provider: myxen
  image: w2k12svr-template
  clone: True
  userdata_file: /srv/salt/win/files/windows-firewall.ps1
  win_installer: /srv/salt/win/files/Salt-Minion-2016.11.3-AMD64-Setup.exe
  win_username: Administrator
  win_password: p@ssw0rd
  use_winrm: False
  ipv4_cidr: 10.0.0.215/24
  ipv4_gw: 10.0.0.1
```

`salt.cloud.clouds.xen.`**`avail_images`**`(`*call=None*`)`

Get a list of images from Xen

If called with the *–list-images* then it returns images with all details.

```
salt-cloud --list-images myxen
```

`salt.cloud.clouds.xen.`**`avail_locations`**`(`*session=None*, *call=None*`)`

Return available Xen locations (not implemented)

```
salt-cloud --list-locations myxen
```

`salt.cloud.clouds.xen.`**`avail_sizes`**`(`*session=None*, *call=None*`)`

Return a list of Xen template definitions

```
salt-cloud --list-sizes myxen
```

`salt.cloud.clouds.xen.`**`create`**`(`*vm_*`)`

Create a VM in Xen

The configuration for this function is read from the profile settings.

```
salt-cloud -p some_profile xenvm01
```

`salt.cloud.clouds.xen.`**`destroy`**`(`*name=None*, *call=None*`)`

Destroy Xen VM or template instance

```
salt-cloud -d xenvm01
```

`salt.cloud.clouds.xen.`**`destroy_template`**`(`*name=None*, *call=None*, *kwargs=None*`)`

Destroy Xen VM or template instance

```
salt-cloud -f destroy_template myxen name=testvm2
```

`salt.cloud.clouds.xen.`**`destroy_vm_vdis`**`(`*name=None*, *session=None*, *call=None*`)`

Get virtual block devices on VM

```
salt-cloud -a destroy_vm_vdis  xenvm01
```

`salt.cloud.clouds.xen.`**`get_configured_provider`**`()`

Return the first configured instance.

`salt.cloud.clouds.xen.`**`get_pv_args`**`(`*name*, *session=None*, *call=None*`)`

Get PV arguments for a VM

```
salt-cloud -a get_pv_args xenvm01
```

`salt.cloud.clouds.xen.`**`get_vm_ip`**`(`*name=None*, *session=None*, *call=None*`)`

Get the IP address of the VM

```
salt-cloud -a get_vm_ip xenvm01
```

Note: Requires xen guest tools to be installed in VM

`salt.cloud.clouds.xen.`**`host_list`**`(`*call=None*`)`

Get a list of Xen Servers

```
salt-cloud -f host_list myxen
```

`salt.cloud.clouds.xen.`**`list_nodes`**`()`

List virtual machines

```
salt-cloud -Q
```

`salt.cloud.clouds.xen.`**`list_nodes_full`**`(`*session=None*`)`

List full virtual machines

```
salt-cloud -F
```

`salt.cloud.clouds.xen.`**`list_nodes_select`**`(`*call=None*`)`

Perform a select query on Xen VM instances

```
salt-cloud -S
```

`salt.cloud.clouds.xen.`**`pause`**`(`*name, call=None, session=None*`)`

Pause a vm

```
salt-cloud -a pause xenvm01
```

`salt.cloud.clouds.xen.`**`pif_list`**`(`*call=None*`)`

Get a list of Resource Pools

```
salt-cloud -f pool_list myxen
```

`salt.cloud.clouds.xen.`**`pool_list`**`(`*call=None*`)`

Get a list of Resource Pools

```
salt-cloud -f pool_list myxen
```

`salt.cloud.clouds.xen.`**`reboot`**`(`*name, call=None, session=None*`)`

Reboot a vm

```
salt-cloud -a reboot xenvm01
```

`salt.cloud.clouds.xen.`**`resume`**`(`*name, call=None, session=None*`)`

Resume a vm from disk

```
salt-cloud -a resume xenvm01
```

`salt.cloud.clouds.xen.`**`set_pv_args`**`(`*name, kwargs=None, session=None, call=None*`)`

Set PV arguments for a VM

```
salt-cloud -a set_pv_args xenvm01 pv_args="utf-8 graphical"
```

`salt.cloud.clouds.xen.`**`set_vm_ip`**`(`*name=None, ipv4_cidr=None, ipv4_gw=None, session=None, call=None*`)`

Set the IP address on a virtual interface (vif)

`salt.cloud.clouds.xen.`**`show_instance`**`(`*name, session=None, call=None*`)`

Show information about a specific VM or template

```
salt-cloud -a show_instance xenvm01
```

Note: memory is memory_dynamic_max

`salt.cloud.clouds.xen.`**`shutdown`**(*name, call=None, session=None*)

Shutdown a vm

```
salt-cloud -a shutdown xenvm01
```

`salt.cloud.clouds.xen.`**`sr_list`**(*call=None*)

Geta list of storage repositories

```
salt-cloud -f sr_list myxen
```

`salt.cloud.clouds.xen.`**`start`**(*name, call=None, session=None*)

Start a vm

```
salt-cloud -a start xenvm01
```

`salt.cloud.clouds.xen.`**`stop`**(*name, call=None, session=None*)

Stop a vm

```
salt-cloud -a stop xenvm01
```

`salt.cloud.clouds.xen.`**`suspend`**(*name, call=None, session=None*)

Suspend a vm to disk

```
salt-cloud -a suspend xenvm01
```

`salt.cloud.clouds.xen.`**`template_list`**(*call=None*)

Return available Xen template information.

This returns the details of each template to show number cores, memory sizes, etc..

```
salt-cloud -f template_list myxen
```

`salt.cloud.clouds.xen.`**`unpause`**(*name, call=None, session=None*)

UnPause a vm

```
salt-cloud -a unpause xenvm01
```

`salt.cloud.clouds.xen.`**`vbd_list`**(*name=None, call=None*)

Get a list of VBDs on a VM

requires: the name of the vm with the vbd definition

```
salt-cloud -a vbd_list xenvm01
```

`salt.cloud.clouds.xen.`**`vdi_list`**(*call=None, kwargs=None*)

Return available Xen VDI images

If this function is called with the `-f` or `--function` then it can return a list with minimal deatil using the `terse=True` keyword argument.

```
salt-cloud -f vdi_list myxen terse=True
```

`salt.cloud.clouds.xen.`**`vif_list`**(*name, call=None, kwargs=None*)

Get a list of virtual network interfaces on a VM

requires: the name of the vm with the vbd definition

```
salt-cloud -a vif_list xenvm01
```

21.5 engine modules

docker_events	Send events from Docker events :Depends: Docker API >= 1.22
fluent	An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.
http_logstash	HTTP Logstash engine
ircbot	IRC Bot engine
junos_syslog	Junos Syslog Engine
logentries	An engine that sends events to the Logentries logging service.
logstash_engine	An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.
napalm_syslog	NAPALM syslog engine
reactor	Setup Reactor
redis_sentinel	An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.
slack	An engine that reads messages from Slack and can act on them
sqs_events	An engine that continuously reads messages from SQS and fires them as events.
stalekey	An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.
test	A simple test engine, not intended for real use but as an example
thorium	Manage the Thorium complex event reaction system
webhook	Send events from webhook api

21.5.1 salt.engines.docker_events module

Send events from Docker events :Depends: Docker API >= 1.22

`salt.engines.docker_events.`**`start`**(*docker_url='unix://var/run/docker.sock', timeout=60, tag='salt/engines/docker_events', filters=None*)

Scan for Docker events and fire events

Example Config

```
engines:
  - docker_events:
      docker_url: unix://var/run/docker.sock
      filters:
        event:
        - start
        - stop
        - die
        - oom
```

The config above sets up engines to listen for events from the Docker daemon and publish them to the Salt event bus.

For filter reference, see https://docs.docker.com/engine/reference/commandline/events/

21.5.2 salt.engines.fluent

An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.

New in version 3000.

Configuration

All arguments are optional

Example configuration of default settings

```
engines:
  - fluent:
      host: localhost
      port: 24224
      app: engine
```

Example fluentd configuration

```
<source>
    @type forward
    port 24224
</source>

<match saltstack.**>
    @type file
    path /var/log/td-agent/saltstack
</match>
```

depends fluent-logger

`salt.engines.fluent.`**`start`**(*host='localhost'*, *port=24224*, *app='engine'*)

Listen to salt events and forward them to fluent

Parameters

- **host** (*str*) – Host running fluentd agent. Default is localhost
- **port** (*int*) – Port of fluentd agent. Default is 24224
- **app** (*str*) – Text sent as fluentd tag. Default is "engine". This text is appended to "saltstack." to form a fluentd tag, ex: "saltstack.engine"

21.5.3 salt.engines.http_logstash

HTTP Logstash engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint via HTTP requests.

Changed in version 2018.3.0.

Note: By default, this engine take everything from the Salt bus and exports into Logstash. For a better selection of the events that you want to publish, you can use the `tags` and `funs` options.

configuration Example configuration

```
engines:
  - http_logstash:
      url: http://blabla.com/salt-stuff
      tags:
          - salt/job/*/new
          - salt/job/*/ret/*
      funs:
          - probes.results
          - bgp.config
```

`salt.engines.http_logstash.`**`start`**(*url*, *funs=None*, *tags=None*)

Listen to salt events and forward them to logstash.

url The Logstash endpoint.

funs: `None` A list of functions to be compared against, looking into the `fun` field from the event data. This option helps to select the events generated by one or more functions. If an event does not have the `fun` field in the data section, it will be published. For a better selection, consider using the `tags` option. By default, this option accepts any event to be submitted to Logstash.

tags: `None` A list of pattern to compare the event tag against. By default, this option accepts any event to be submitted to Logstash.

21.5.4 salt.engines.ircbot

IRC Bot engine

New in version 2017.7.0.

Example Configuration

```
engines:
  - ircbot:
      nick: <nick>
      username: <username>
      password: <password>
      host: chat.freenode.net
      port: 7000
      channels:
        - salt-test
        - '##something'
      use_ssl: True
      use_sasl: True
      disable_query: True
      allow_hosts:
        - salt/engineer/.*
      allow_nicks:
        - gtmanfred
```

Available commands on irc are:

ping return pong

echo <stuff> return <stuff> targeted at the user who sent the commands

event <tag> [<extra>, <data>] fire event on the master or minion event stream with the tag *salt/engines/ircbot/<tag>* and a data object with a list of everything else sent in the message

Example of usage

```
08:33:57 @gtmanfred > !ping
08:33:57   gtmanbot > gtmanfred: pong
08:34:02 @gtmanfred > !echo ping
08:34:02   gtmanbot > ping
08:34:17 @gtmanfred > !event test/tag/ircbot irc is useful
08:34:17   gtmanbot > gtmanfred: TaDa!
```

```
[DEBUG   ] Sending event: tag = salt/engines/ircbot/test/tag/ircbot; data = {'_stamp
↪': '2016-11-28T14:34:16.633623', 'data': ['irc', 'is', 'useful']}
```

class salt.engines.ircbot.**Event**(*source*, *code*, *line*)

code
Alias for field number 1

line
Alias for field number 2

source
Alias for field number 0

class salt.engines.ircbot.**IRCClient**(*nick*, *host*, *port=6667*, *username=None*, *password=None*, *channels=None*, *use_ssl=False*, *use_sasl=False*, *char='!'*, *allow_hosts=False*, *allow_nicks=False*, *disable_query=True*)

join_channel(*channel*)

on_closed()

on_connect()

read_messages()

send_message(*line*)

class salt.engines.ircbot.**PrivEvent**(*source*, *nick*, *user*, *host*, *code*, *channel*, *command*, *line*)

channel
Alias for field number 5

code
Alias for field number 4

command
Alias for field number 6

host
Alias for field number 3

line
Alias for field number 7

nick
Alias for field number 1

source
Alias for field number 0

user
Alias for field number 2

`salt.engines.ircbot.`**`start`**`(`*nick*, *host*, *port=6667*, *username=None*, *password=None*, *channels=None*, *use_ssl=False*, *use_sasl=False*, *char='!'*, *allow_hosts=False*, *allow_nicks=False*, *disable_query=True*`)`

IRC Bot for interacting with salt.

nick Nickname of the connected Bot.

host irc server (example - chat.freenode.net).

port irc port. Default: 6667

password password for authenticating. If not provided, user will not authenticate on the irc server.

channels channels to join.

use_ssl connect to server using ssl. Default: False

use_sasl authenticate using sasl, instead of messaging NickServ. Default: False

> **Note:** This will allow the bot user to be fully authenticated before joining any channels

char command character to look for. Default: !

allow_hosts hostmasks allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

allow_nicks Nicks that are allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

disable_query Disable commands from being sent through private queries. Require they be sent to a channel, so that all communication can be controlled by access to the channel. Default: True

> **Warning:** Unauthenticated Access to event stream
>
> This engine sends events calls to the event stream without authenticating them in salt. Authentication will need to be configured and enforced on the irc server or enforced in the irc channel. The engine only accepts commands from channels, so non authenticated users could be banned or quieted in the channel.
>
> /mode +q $~a # quiet all users who are not authenticated /mode +r # do not allow unauthenticated users into the channel
>
> It would also be possible to add a password to the irc channel, or only allow invited users to join.

21.5.5 salt.engines.junos_syslog module

Junos Syslog Engine

New in version 2017.7.0.

depends pyparsing, twisted

An engine that listens to syslog message from Junos devices, extract event information and generate message on SaltStack bus.

The event topic sent to salt is dynamically generated according to the topic title specified by the user. The incoming event data (from the junos device) consists of the following fields:

1. hostname
2. hostip

3. daemon
4. event
5. severity
6. priority
7. timestamp
8. message
9. pid
10. raw (the raw event data forwarded from the device)

The topic title can consist of any of the combination of above fields, but the topic has to start with `jnpr/syslog`. Here are a couple example combinations:

- jnpr/syslog/hostip/daemon/event
- jnpr/syslog/daemon/severity

The corresponding dynamic topic sent on salt event bus would look something like:

- jnpr/syslog/1.1.1.1/mgd/UI_COMMIT_COMPLETED
- jnpr/syslog/sshd/7

The default topic title is `jnpr/syslog/hostname/event`.

One can choose the type of data they want from the event bus. For example, if one wants only events pertaining to a particular daemon, this can be specified in the configuration file:

```
daemon: mgd
```

One can even have a list of daemons:

```
daemon:
  - mgd
  - sshd
```

Example configuration (to be written in master config file)

```
engines:
  - junos_syslog:
      port: 9999
      topic: jnpr/syslog/hostip/daemon/event
      daemon:
        - mgd
        - sshd
```

For junos_syslog engine to receive events, syslog must be set on the junos device. This can be done via following configuration:

```
set system syslog host <ip-of-the-salt-device> port 516 any any
```

Below is a sample syslog event which is received from the junos device:

```
<30>May 29 05:18:12 bng-ui-vm-9 mspd[1492]: No chassis configuration found
```

The source for parsing the syslog messages is taken from: https://gist.github.com/leandrosilva/3651640#file-xlog-py `salt.engines.junos_syslog.`**`start`**(*port=516*, ***kwargs*)

21.5.6 salt.engines.logentries

An engine that sends events to the Logentries logging service.

maintainer Jimmy Tang (jimmy_tang@rapid7.com)

maturity New

depends ssl, certifi

platform all

To enable this engine the master and/or minion will need the following python libraries

ssl certifi

If you are running a new enough version of python then the ssl library will be present already.

You will also need the following values configured in the minion or master config.

configuration Example configuration

```
engines:
  - logentries:
      endpoint: data.logentries.com
      port: 10000
      token: 057af3e2-1c05-47c5-882a-5cd644655dbf
```

The 'token' can be obtained from the Logentries service.

To test this engine

```
salt '*' test.ping cmd.run uptime
```

class `salt.engines.logentries.`**`PlainTextSocketAppender`**(*verbose=True*, *LE_API='data.logentries.com'*, *LE_PORT=80*, *LE_TLS_PORT=443*)

`close_connection`()

`open_connection`()

`put`(*data*)

`reopen_connection`()

`salt.engines.logentries.`**`SocketAppender`**

alias of *`salt.engines.logentries.TLSSocketAppender`*

class `salt.engines.logentries.`**`TLSSocketAppender`**(*verbose=True*, *LE_API='data.logentries.com'*, *LE_PORT=80*, *LE_TLS_PORT=443*)

`open_connection`()

`salt.engines.logentries.`**`event_bus_context`**(*opts*)

`salt.engines.logentries.`**`start`**(*endpoint='data.logentries.com'*, *port=10000*, *token=None*, *tag='salt/engines/logentries'*)

Listen to salt events and forward them to Logentries

21.5.7 salt.engines.logstash_engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.

configuration Example configuration

```
engines:
  - logstash:
      host: log.my_network.com
      port: 5959
      proto: tcp
```

depends logstash

`salt.engines.logstash_engine.`**`event_bus_context`**`(`*opts*`)`

`salt.engines.logstash_engine.`**`start`**`(`*host*, *port=5959*, *tag='salt/engine/logstash'*, *proto='udp'*`)`
Listen to salt events and forward them to logstash

21.5.8 salt.engines.napalm_syslog

NAPALM syslog engine

New in version 2017.7.0.

An engine that takes syslog messages structured in OpenConfig or IETF format and fires Salt events.

As there can be many messages pushed into the event bus, the user is able to filter based on the object structure.

Requirements

- napalm-logs

This engine transfers objects from the napalm-logs library into the event bus. The top dictionary has the following keys:

- `ip`
- `host`
- `timestamp`
- `os`: the network OS identified
- `model_name`: the OpenConfig or IETF model name
- `error`: the error name (consult the documentation)
- `message_details`: details extracted from the syslog message
- `open_config`: the OpenConfig model

The napalm-logs transfers the messages via widely used transport mechanisms such as: ZeroMQ (default), Kafka, etc.

The user can select the right transport using the `transport` option in the configuration.

configuration Example configuration

```
engines:
  - napalm_syslog:
      transport: zmq
      address: 1.2.3.4
      port: 49018
```

configuration Configuration example, excluding messages from IOS-XR devices:

```
engines:
  - napalm_syslog:
      transport: kafka
      address: 1.2.3.4
      port: 49018
      os_blacklist:
        - iosxr
```

Event example:

```
{
    "_stamp": "2017-05-26T10:03:18.653045",
    "error": "BGP_PREFIX_THRESH_EXCEEDED",
    "host": "vmx01",
    "ip": "192.168.140.252",
    "message_details": {
        "date": "May 25",
        "host": "vmx01",

```
                            }
                        },
                        "neighbor_address": "192.168.140.254",
                        "state": {
                            "peer_as": 65001
                        }
                    }
                }
            }
        }
    },
    "os": "junos",
    "timestamp": "1495741841"
}
```

To consume the events and eventually react and deploy a configuration changes on the device(s) firing the event, one is able to identify the minion ID, using one of the following alternatives, but not limited to:

- `Host grains` to match the event tag
- `Host DNS grain` to match the IP address in the event data
- `Hostname grains` to match the event tag
- *Define static grains*
- *Write a grains module*
- *Targeting minions using pillar data* - The user can configure certain information in the Pillar data and then use it to identify minions

Master configuration example, to match the event and react:

```
reactor:
  - 'napalm/syslog/*/BGP_PREFIX_THRESH_EXCEEDED/*':
    - salt://increase_prefix_limit_on_thresh_exceeded.sls
```

Which matches the events having the error code `BGP_PREFIX_THRESH_EXCEEDED` from any network operating system, from any host and reacts, executing the `increase_prefix_limit_on_thresh_exceeded.sls` reactor, found under one of the `file_roots` paths.

Reactor example:

```
increase_prefix_limit_on_thresh_exceeded:
  local.net.load_template:
    - tgt: "hostname:{{ data['host'] }}"
    - tgt_type: grain
    - kwarg:
        template_name: salt://increase_prefix_limit.jinja
        openconfig_structure: {{ data['open_config'] }}
```

The reactor in the example increases the BGP prefix limit when triggered by an event as above. The minion is matched using the `host` field from the `data` (which is the body of the event), compared to the `hostname grain` field. When the event occurs, the reactor will execute the `net.load_template` function, sending as arguments the template `salt://increase_prefix_limit.jinja` defined by the user in their environment and the complete OpenConfig object under the variable name `openconfig_structure`. Inside the Jinja template, the user can process the object from `openconfig_structure` and define the bussiness logic as required.

`salt.engines.napalm_syslog.`**`start`**(*transport='zmq', address='0.0.0.0', port=49017, auth_address='0.0.0.0', auth_port=49018, disable_security=False, certificate=None, os_whitelist=None, os_blacklist=None, error_whitelist=None, error_blacklist=None, host_whitelist=None, host_blacklist=None*)

Listen to napalm-logs and publish events into the Salt event bus.

transport: **`zmq`** Choose the desired transport.

> **Note**: Currently `zmq` is the only valid option.

address: **`0.0.0.0`** The address of the publisher, as configured on napalm-logs.

port: **`49017`** The port of the publisher, as configured on napalm-logs.

auth_address: **`0.0.0.0`** The address used for authentication when security is not disabled.

auth_port: **`49018`** Port used for authentication.

disable_security: **`False`** Trust unencrypted messages. Strongly discouraged in production.

certificate: **`None`** Absolute path to the SSL certificate.

os_whitelist: **`None`** List of operating systems allowed. By default everything is allowed.

os_blacklist: **`None`** List of operating system to be ignored. Nothing ignored by default.

error_whitelist: **`None`** List of errors allowed.

error_blacklist: **`None`** List of errors ignored.

host_whitelist: **`None`** List of hosts or IPs to be allowed.

host_blacklist: **`None`** List of hosts of IPs to be ignored.

21.5.9 salt.engines.reactor module

Setup Reactor

Example Config in Master or Minion config

```yaml
engines:
  - reactor:
      refresh_interval: 60
      worker_threads: 10
      worker_hwm: 10000

reactor:
  - 'salt/cloud/*/destroyed':
    - /srv/reactor/destroy/*.sls
```

`salt.engines.reactor.`**`start`**(*refresh_interval=None, worker_threads=None, worker_hwm=None*)

21.5.10 salt.engines.redis_sentinel module

An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.

configuration Example configuration

```
engines:
  - redis_sentinel:
      hosts:
        matching: 'board*'
        port: 26379
        interface: eth2
      channels:
        - '+switch-master'
        - '+odown'
        - '-odown'
```

depends redis

class `salt.engines.redis_sentinel.`**`Listener`**(*host=None, port=None, channels=None, tag=None*)

`run`()

`work`(*item*)

`salt.engines.redis_sentinel.`**`start`**(*hosts, channels, tag=None*)

21.5.11 salt.engines.slack module

An engine that reads messages from Slack and can act on them

depends slackclient Python module

Important: This engine requires a bot user. To create a bot user, first go to the **Custom Integrations** page in your Slack Workspace. Copy and paste the following URL, and replace `myworkspace` with the proper value for your workspace:

`https://myworkspace.slack.com/apps/manage/custom-integrations`

Next, click on the `Bots` integration and request installation. Once approved by an admin, you will be able to proceed with adding the bot user. Once the bot user has been added, you can configure it by adding an avatar, setting the display name, etc. You will also at this time have access to your API token, which will be needed to configure this engine.

Finally, add this bot user to a channel by switching to the channel and using `/invite @mybotuser`. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

This engine has two boolean configuration parameters that toggle specific features (both default to `False`):

1. `control` - If set to `True`, then any message which starts with the trigger string (which defaults to `!` and can be overridden by setting the `trigger` option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various `groups` will determine if the Slack user is allowed to run the command. The `targets` and `default_target` options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:

   - `target` - The target expression to use for the command
   - `tgt_type` - The match type, can be one of `glob`, `list`, `pcre`, `grain`, `grain_pcre`, `pillar`, `nodegroup`, `range`, `ipcidr`, or `compound`. The default value is `glob`.

   Here are a few examples:

```
!test.ping target=*
!state.apply foo target=os:CentOS tgt_type=grain
!pkg.version mypkg target=role:database tgt_type=pillar
```

2. `fire_all` - If set to `True`, all messages which are not prefixed with the trigger string will fired as events onto Salt's ref:*event bus <event-system>*. The tag for these veents will be prefixed with the string specified by the `tag` config option (default: `salt/engines/slack`).

The `groups_pillar_name` config option can be used to pull group configuration from the specified pillar key.

Note: In order to use `groups_pillar_name`, the engine must be running as a minion running on the master, so that the `Caller` client can be used to retrieve that minions pillar data, because the master process does not have pillar data.

Configuration Examples

Changed in version 2017.7.0: Access control group support added

This example uses a single group called `default`. In addition, other groups are being loaded from pillar data. The group names do not have any significance, it is the users and commands defined within them that are used to determine whether the Slack user has permission to run the desired command.

```
engines:
  - slack:
      token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: False
      groups_pillar_name: 'slack_engine:groups_pillar'
      groups:
        default:
          users:
            - '*'
          commands:
            - test.ping
            - cmd.run
            - list_jobs
            - list_commands
          aliases:
            list_jobs:
              cmd: jobs.list_jobs
            list_commands:
              cmd: 'pillar.get salt:engines:slack:valid_commands target=saltmaster
↪tgt_type=list'
          default_target:
            target: saltmaster
            tgt_type: glob
          targets:
            test.ping:
              target: '*'
              tgt_type: glob
            cmd.run:
              target: saltmaster
              tgt_type: list
```

This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using `*`, the value must be quoted, or else PyYAML will fail to load the configuration.

```
engines:
  - slack:
      groups_pillar: slack_engine_pillar
      token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: True
      tag: salt/engines/slack
      groups_pillar_name: 'slack_engine:groups_pillar'
      groups:
        default:
          users:
            - '*'
          commands:
            - test.ping
          aliases:
            list_jobs:
              cmd: jobs.list_jobs
            list_commands:
              cmd: 'pillar.get salt:engines:slack:valid_commands target=saltmaster
↪tgt_type=list'
        gods:
          users:
            - garethgreenaway
          commands:
            - '*'
```

class salt.engines.slack.**SlackClient**(*token*)

can_user_run(*user, command, groups*)

Break out the permissions into the following:

Check whether a user is in any group, including whether a group has the '*' membership

Parameters

- **user** (*str*) – The username being checked against
- **command** (*str*) – The command that is being invoked (e.g. test.ping)
- **groups** (*dict*) – the dictionary with groups permissions structure.

Return type tuple

Returns

On a successful permitting match, returns 2-element tuple that contains the name of the group that successfully matched, and a dictionary containing the configuration of the group so it can be referenced.

On failure it returns an empty tuple

commandline_to_list(*cmdline_str, trigger_string*)

cmdline_str is the string of the command line trigger_string is the trigger string, to be removed

control_message_target(*slack_user_name, text, loaded_groups, trigger_string*)

Returns a tuple of (target, cmdline,) for the response

Raises IndexError if a user can't be looked up from all_slack_users

Returns (False, False) if the user doesn't have permission

These are returned together because the commandline and the targeting interact with the group config (specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

fire(*tag*, *msg*)
This replaces a function in main called 'fire'

It fires an event into the salt bus.

format_return_text(*data*, *function*, ***kwargs*)
Print out YAML using the block mode

generate_triggered_messages(*token*, *trigger_string*, *groups*, *groups_pillar_name*)
slack_token = string trigger_string = string input_valid_users = set input_valid_commands = set

When the trigger_string prefixes the message text, yields a dictionary of:

```
{
    'message_data': m_data,
    'cmdline': cmdline_list, # this is a list
    'channel': channel,
    'user': m_data['user'],
    'slack_client': sc
}
```

else yields {'message_data': m_data} and the caller can handle that

When encountering an error (e.g. invalid message), yields {}, the caller can proceed to the next message

When the websocket being read from has given up all its messages, yields {'done': True} to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

get_config_groups(*groups_conf*, *groups_pillar_name*)
get info from groups in config, and from the named pillar

todo: add specification for the minion to use to recover pillar

get_jobs_from_runner(*outstanding_jids*)
Given a list of job_ids, return a dictionary of those job_ids that have completed and their results.

Query the salt event bus via the jobs runner. jobs.list_job will show a job in progress, jobs.lookup_jid will return a job that has completed.

returns a dictionary of job id: result

get_slack_channels(*token*)
Get all channel names from Slack

get_slack_users(*token*)
Get all users from Slack

get_target(*permitted_group*, *cmdline*, *alias_cmdline*)
When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).

It's possible for None or False to be the result of either, which means that it's expected that the caller provide a specific target.

If no configured target is provided, the command line will be parsed for target=foo and tgt_type=bar

Test for this:

```
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
    'default_target': {'target': '*', 'tgt_type': 'glob'},
    'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type': 'list'}},
    'users': {'dmangot', 'jmickle', 'pcn'}}
f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {},'users': {'dmangot', 'jmickle', 'pcn
↪'}}

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
```

Run each of them through `get_configured_target(('foo', f), 'pillar.get')` and confirm a valid target

message_text(*m_data*)
Raises ValueError if a value doesn't work out, and TypeError if this isn't a message type

parse_args_and_kwargs(*cmdline*)
cmdline: list

returns tuple of: args (list), kwargs (dict)

run_command_async(*msg*)

Parameters

- **message_generator** (*generator of dict*) – Generates messages from slack that should be run
- **fire_all** (*bool*) – Whether to also fire messages to the event bus
- **tag** (*str*) – The tag to send to use to send to the event bus
- **interval** (*int*) – time to wait between ending a loop and beginning the next

run_commands_from_slack_async(*message_generator, fire_all, tag, control, interval=1*)
Pull any pending messages from the message_generator, sending each one to either the event bus, the command_async or both, depending on the values of fire_all and command

`salt.engines.slack.`**start**(*token, control=False, trigger='!', groups=None, groups_pillar_name=None, fire_all=False, tag='salt/engines/slack'*)
Listen to slack events and forward them to salt, new version

21.5.12 salt.engines.sqs_events

An engine that continuously reads messages from SQS and fires them as events.

Note that long polling is utilized to avoid excessive CPU usage.

New in version 2015.8.0.

depends boto

Configuration

This engine can be run on the master or on a minion.

Example Config:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
sqs.message_format: json
```

Explicit sqs credentials are accepted but this engine can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not (or for `boto` version < 2.5.1) used you need to specify them either in a pillar or in the config file of the master or minion, as appropriate:

To deserialize the message from json:

```
sqs.message_format: json
```

It's also possible to specify key, keyid and region via a profile:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Additionally you can define cross account sqs:

```
engines:
  - sqs_events:
      queue: prod
      owner_acct_id: 111111111111
```

`salt.engines.sqs_events.`**`start`**`(`*queue*, *profile=None*, *tag='salt/engine/sqs'*, *owner_acct_id=None*`)`

Listen to sqs and fire message on event bus

21.5.13 salt.engines.stalekey module

An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.

Requires that the *`minion_data_cache`* option be enabled.

configuration Example configuration:

```
engines:
  - stalekey:
```

(continues on next page)

(continued from previous page)

```
        interval: 3600
        expire: 86400
```

`salt.engines.stalekey.`**`start`**`(`*interval=3600, expire=604800*`)`

21.5.14 salt.engines.test

A simple test engine, not intended for real use but as an example

`salt.engines.test.`**`event_bus_context`**`(`*opts*`)`

`salt.engines.test.`**`start`**`()`
Listen to events and write them to a log file

21.5.15 salt.engines.thorium module

Manage the Thorium complex event reaction system

`salt.engines.thorium.`**`start`**`(`*grains=False, grain_keys=None, pillar=False, pillar_keys=None*`)`
Execute the Thorium runtime

21.5.16 salt.engines.webhook

Send events from webhook api

`salt.engines.webhook.`**`start`**`(`*address=None, port=5000, ssl_crt=None, ssl_key=None*`)`
Api to listen for webhooks to send to the reactor.

Implement the webhook behavior in an engine. `rest_cherrypy Webhook docs`

Unlike the rest_cherrypy Webhook, this is only an unauthenticated webhook endpoint. If an authenticated webhook endpoint is needed, use the salt-api webhook which runs on the master and authenticates through eauth.

Warning: Unauthenticated endpoint

This engine sends webhook calls to the event stream. If the engine is running on a minion with *file_client: local* the event is sent to the minion event stream. Otherwise it is sent to the master event stream.

Example Config

```
engines:
  - webhook: {}
```

```
engines:
  - webhook:
      port: 8000
      address: 10.128.1.145
      ssl_crt: /etc/pki/tls/certs/localhost.crt
      ssl_key: /etc/pki/tls/certs/localhost.key
```

21.6 executors modules

direct_call	Direct call executor module
docker	Docker executor module
splay	Splay function calls across targeted minions
sudo	Sudo executor module

21.6.1 salt.executors.direct_call module

Direct call executor module

`salt.executors.direct_call.`**`execute`**`(`*opts, data, func, args, kwargs*`)`
Directly calls the given function with arguments

21.6.2 salt.executors.docker module

Docker executor module

Used with the docker proxy minion.

`salt.executors.docker.`**`allow_missing_func`**`(`*function*`)`
Allow all calls to be passed through to docker container.

The docker call will use direct_call, which will return back if the module was unable to be run.

`salt.executors.docker.`**`execute`**`(`*opts, data, func, args, kwargs*`)`
Directly calls the given function with arguments

21.6.3 salt.executors.splay module

Splay function calls across targeted minions

`salt.executors.splay.`**`execute`**`(`*opts, data, func, args, kwargs*`)`
Splay a salt function call execution time across minions over a number of seconds (default: 300)

Note: You *probably* want to use –async here and look up the job results later. If you're dead set on getting the output from the CLI command, then make sure to set the timeout (with the -t flag) to something greater than the splaytime (max splaytime + time to execute job). Otherwise, it's very likely that the cli will time out before the job returns.

CLI Example:

```
# With default splaytime
salt --async --module-executors='[splay, direct_call]' '*' pkg.install cowsay
↪version=3.03-8.el6
```

```
# With specified splaytime (5 minutes) and timeout with 10 second buffer
salt -t 310 --module-executors='[splay, direct_call]' --executor-opts='
↪{splaytime: 300}' '*' pkg.version cowsay
```

21.6.4 salt.executors.sudo module

Sudo executor module

`salt.executors.sudo.`**`execute`**`(`*opts*, *data*, *func*, *args*, *kwargs*`)`

Allow for the calling of execution modules via sudo.

This module is invoked by the minion if the `sudo_user` minion config is present.

Example minion config:

```
sudo_user: saltdev
```

Once this setting is made, any execution module call done by the minion will be run under `sudo -u <sudo_user> salt-call`. For example, with the above minion config,

```
salt sudo_minion cmd.run 'cat /etc/sudoers'
```

is equivalent to

```
sudo -u saltdev salt-call cmd.run 'cat /etc/sudoers'
```

being run on `sudo_minion`.

21.7 fileserver modules

azurefs	The backend for serving files from the Azure blob storage service.
gitfs	Git Fileserver Backend
hgfs	Mercurial Fileserver Backend
minionfs	Fileserver backend which serves files pushed to the Master
roots	The default file server backend
s3fs	Amazon S3 Fileserver Backend
svnfs	Subversion Fileserver Backend

21.7.1 salt.fileserver.azurefs

The backend for serving files from the Azure blob storage service.

New in version 2015.8.0.

To enable, add `azurefs` to the *`fileserver_backend`* option in the Master config file.

```
fileserver_backend:
  - azurefs
```

Starting in Salt 2018.3.0, this fileserver requires the standalone Azure Storage SDK for Python. Theoretically any version >= v0.20.0 should work, but it was developed against the v0.33.0 version.

Each storage container will be mapped to an environment. By default, containers will be mapped to the `base` environment. You can override this behavior with the `saltenv` configuration option. You can have an unlimited number of storage containers, and can have a storage container serve multiple environments, or have multiple storage containers mapped to the same environment. Normal first-found rules apply, and storage containers are searched in the order they are defined.

You must have either an account_key or a sas_token defined for each container, if it is private. If you use a sas_token, it must have READ and LIST permissions.

```
azurefs:
  - account_name: my_storage
    account_key:
↪'fNH9cRp0+qVIVYZ+5rnZAhHc9ycOUcJnHtzpfOr0W0sxrtL2KVLuMe1xDfLwmfed+JJInZaEdWVCPHD4d/
↪oqeA=='
    container_name: my_container
  - account_name: my_storage
    sas_token: 'ss=b&sp=&sv=2015-07-08&sig=cohxXabx8FQdXsSEHyUXMjsSfNH2tZ2OB97Ou44pkRE
↪%3D&srt=co&se=2017-04-18T21%3A38%3A01Z'
    container_name: my_dev_container
    saltenv: dev
  - account_name: my_storage
    container_name: my_public_container
```

Note: Do not include the leading ? for sas_token if generated from the web

21.7.2 salt.fileserver.gitfs

Git Fileserver Backend

With this backend, branches and tags in a remote git repository are exposed to salt as different environments.

To enable, add `gitfs` to the *`fileserver_backend`* option in the Master config file.

```
fileserver_backend:
  - gitfs
```

Note: `git` also works here. Prior to the 2018.3.0 release, *only* `git` would work.

The Git fileserver backend supports both pygit2 and GitPython, to provide the Python interface to git. If both are present, the order of preference for which one will be chosen is the same as the order in which they were listed: pygit2, then GitPython.

An optional master config parameter (*`gitfs_provider`*) can be used to specify which provider should be used, in the event that compatible versions of both pygit2 and GitPython are installed.

More detailed information on how to use GitFS can be found in the *GitFS Walkthrough*.

Note: Minimum requirements

To use pygit2 for GitFS requires a minimum pygit2 version of 0.20.3. pygit2 0.20.3 requires libgit2 0.20.0. pygit2 and libgit2 are developed alongside one another, so it is recommended to keep them both at the same major release to avoid unexpected behavior. For example, pygit2 0.21.x requires libgit2 0.21.x, pygit2 0.22.x will require libgit2 0.22.x, etc.

To use GitPython for GitFS requires a minimum GitPython version of 0.3.0, as well as the git CLI utility. Instructions for installing GitPython can be found *here*.

To clear stale refs the git CLI utility must also be installed.

21.7.3 salt.fileserver.hgfs

Mercurial Fileserver Backend

To enable, add `hgfs` to the *`fileserver_backend`* option in the Master config file.

```
fileserver_backend:
  - hgfs
```

Note: `hg` also works here. Prior to the 2018.3.0 release, *only* `hg` would work.

After enabling this backend, branches, bookmarks, and tags in a remote mercurial repository are exposed to salt as different environments. This feature is managed by the *`fileserver_backend`* option in the salt master config file.

This fileserver has an additional option *`hgfs_branch_method`* that will set the desired branch method. Possible values are: `branches`, `bookmarks`, or `mixed`. If using `branches` or `mixed`, the `default` branch will be mapped to `base`.

Changed in version 2014.1.0: The *`hgfs_base`* master config parameter was added, allowing for a branch other than `default` to be used for the `base` environment, and allowing for a `base` environment to be specified when using an *`hgfs_branch_method`* of `bookmarks`.

depends

- mercurial
- python bindings for mercurial (`python-hglib`)

21.7.4 salt.fileserver.minionfs

Fileserver backend which serves files pushed to the Master

The *`cp.push`* function allows Minions to push files up to the Master. Using this backend, these pushed files are exposed to other Minions via the Salt fileserver.

To enable minionfs, *`file_recv`* needs to be set to `True` in the master config file (otherwise *`cp.push`* will not be allowed to push files to the Master), and `minionfs` must be added to the `fileserver_backends` list.

```
fileserver_backend:
  - minionfs
```

Note: `minion` also works here. Prior to the 2018.3.0 release, *only* `minion` would work.

Other minionfs settings include: *`minionfs_whitelist`*, *`minionfs_blacklist`*, *`minionfs_mountpoint`*, and *`minionfs_env`*.

See also:

MinionFS Backend Walkthrough

21.7.5 salt.fileserver.roots

The default file server backend

This fileserver backend serves files from the Master's local filesystem. If *fileserver_backend* is not defined in the Master config file, then this backend is enabled by default. If it *is* defined then `roots` must be in the *fileserver_backend* list to enable this backend.

```
fileserver_backend:
  - roots
```

Fileserver environments are defined using the *file_roots* configuration option.

21.7.6 salt.fileserver.s3fs

Amazon S3 Fileserver Backend

New in version 0.16.0.

This backend exposes directories in S3 buckets as Salt environments. To enable this backend, add `s3fs` to the *fileserver_backend* option in the Master config file.

```
fileserver_backend:
  - s3fs
```

S3 credentials must also be set in the master config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

Alternatively, if on EC2 these credentials can be automatically loaded from instance metadata.

This fileserver supports two modes of operation for the buckets:

1. **A single bucket per environment**

   ```
   s3.buckets:
     production:
       - bucket1
       - bucket2
     staging:
       - bucket3
       - bucket4
   ```

2. **Multiple environments per bucket**

   ```
   s3.buckets:
     - bucket1
     - bucket2
     - bucket3
     - bucket4
   ```

Note that bucket names must be all lowercase both in the AWS console and in Salt, otherwise you may encounter `SignatureDoesNotMatch` errors.

A multiple-environment bucket must adhere to the following root directory structure:

```
s3://<bucket name>/<environment>/<files>
```

Note: This fileserver back-end requires the use of the MD5 hashing algorithm. MD5 may not be compliant with all security policies.

Note: This fileserver back-end is only compatible with MD5 ETag hashes in the S3 metadata. This means that you must use SSE-S3 or plaintext for bucket encryption, and that you must not use multipart upload when uploading to your bucket. More information here: https://docs.aws.amazon.com/AmazonS3/latest/API/RESTCommonResponseHeaders.html

Objects without an MD5 ETag will be fetched on every fileserver update.

If you deal with objects greater than 8MB, then you should use the following AWS CLI config to avoid mutipart upload:

```
s3 =
  multipart_threshold = 1024MB
```

More info here: https://docs.aws.amazon.com/cli/latest/topic/s3-config.html

---

21.7.7 salt.fileserver.svnfs

Subversion Fileserver Backend

After enabling this backend, branches and tags in a remote subversion repository are exposed to salt as different environments. To enable this backend, add `svnfs` to the *`fileserver_backend`* option in the Master config file.

```
fileserver_backend:
  - svnfs
```

Note: `svn` also works here. Prior to the 2018.3.0 release, *only* `svn` would work.

This backend assumes a standard svn layout with directories for `branches`, `tags`, and `trunk`, at the repository root.

depends

- subversion
- pysvn

Changed in version 2014.7.0: The paths to the trunk, branches, and tags have been made configurable, via the config options *`svnfs_trunk`*, *`svnfs_branches`*, and *`svnfs_tags`*. *`svnfs_mountpoint`* was also added. Finally, support for per-remote configuration parameters was added. See the *`documentation`* for more information.

21.8 grains modules

`cimc`	Generate baseline proxy minion grains for cimc hosts.
`chronos`	Generate chronos proxy minion grains.
`core`	The static grains, these are the core, or built in grains.
`disks`	Detect disks
`esxi`	Generate baseline proxy minion grains for ESXi hosts.
`extra`	
`fx2`	Generate baseline proxy minion grains for Dell FX2 chassis.

Continued on next page

Table 8 – continued from previous page

junos	Grains for junos.
marathon	Generate marathon proxy minion grains.
mdadm	Detect MDADM RAIDs
metadata	Grains from cloud metadata servers at 169.254.169.254
napalm	NAPALM Grains
opts	Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set
panos	Generate baseline proxy minion grains for panos hosts.
philips_hue	Static grains for the Philips HUE lamps
rest_sample	Generate baseline proxy minion grains

21.8.1 salt.grains.cimc

Generate baseline proxy minion grains for cimc hosts.

`salt.grains.cimc.`**`cimc`**`(`*proxy=None*`)`

21.8.2 salt.grains.chronos

Generate chronos proxy minion grains.

New in version 2015.8.2.

`salt.grains.chronos.`**`kernel`**`()`

`salt.grains.chronos.`**`os`**`()`

`salt.grains.chronos.`**`os_data`**`()`

`salt.grains.chronos.`**`os_family`**`()`

21.8.3 salt.grains.core

The static grains, these are the core, or built in grains.

When grains are loaded they are not loaded in the same way that modules are loaded, grain functions are detected and executed, the functions MUST return a dict which will be applied to the main grains dict. This module will always be executed first, so that any grains loaded here in the core module can be overwritten just by returning dict keys with the same value as those returned here

`salt.grains.core.`**`append_domain`**`()`
Return append_domain if set

`salt.grains.core.`**`cwd`**`()`
Current working directory

`salt.grains.core.`**`default_gateway`**`()`
Populates grains which describe whether a server has a default gateway configured or not. Uses *ip -4 route show* and *ip -6 route show* and greps for a *default* at the beginning of any line. Assuming the standard *default via <ip>* format for default gateways, it will also parse out the ip address of the default gateway, and put it in ip4_gw or ip6_gw.

If the *ip* command is unavailable, no grains will be populated.

Currently does not support multiple default gateways. The grains will be set to the first default gateway found.

List of grains:

ip4_gw: True # ip/True/False if default ipv4 gateway ip6_gw: True # ip/True/False if default ipv6 gateway ip_gw: True # True if either of the above is True, False otherwise

`salt.grains.core.`**`dns`**`()`
Parse the resolver configuration file

New in version 2016.3.0.

`salt.grains.core.`**`fqdns`**`()`
Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

`salt.grains.core.`**`get_machine_id`**`()`
Provide the machine-id for machine/virtualization combination

`salt.grains.core.`**`get_master`**`()`
Provides the minion with the name of its master. This is useful in states to target other services running on the master.

`salt.grains.core.`**`get_server_id`**`()`
Provides an integer based on the FQDN of a machine. Useful as server-id in MySQL replication or anywhere else you'll need an ID like this.

`salt.grains.core.`**`hostname`**`()`
Return fqdn, hostname, domainname

Note: On Windows the `domain` grain may refer to the dns entry for the host instead of the Windows domain to which the host is joined. It may also be empty if not a part of any domain. Refer to the `windowsdomain` grain instead

`salt.grains.core.`**`hwaddr_interfaces`**`()`
Provide a dict of the connected interfaces and their hw addresses (Mac Address)

`salt.grains.core.`**`id_`**`()`
Return the id

`salt.grains.core.`**`ip4_interfaces`**`()`
Provide a dict of the connected interfaces and their ip4 addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`ip6_interfaces`**`()`
Provide a dict of the connected interfaces and their ip6 addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`ip_fqdn`**`()`
Return ip address and FQDN grains

`salt.grains.core.`**`ip_interfaces`**`()`
Provide a dict of the connected interfaces and their ip addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`linux_distribution`**`(`*`**kwargs`*`)`

`salt.grains.core.`**`locale_info`**`()`

Provides defaultlanguage defaultencoding

`salt.grains.core.`**`os_data`**`()`
Return grains pertaining to the operating system

`salt.grains.core.`**`path`**`()`
Return the path

`salt.grains.core.`**`pythonexecutable`**`()`
Return the python executable in use

`salt.grains.core.`**`pythonpath`**`()`
Return the Python path

`salt.grains.core.`**`pythonversion`**`()`
Return the Python version

`salt.grains.core.`**`saltpath`**`()`
Return the path of the salt module

`salt.grains.core.`**`saltversion`**`()`
Return the version of salt

`salt.grains.core.`**`saltversioninfo`**`()`
Return the version_info of salt

New in version 0.17.0.

`salt.grains.core.`**`zmqversion`**`()`
Return the zeromq version

21.8.4 salt.grains.disks

Detect disks

`salt.grains.disks.`**`disks`**`()`
Return list of disk devices

21.8.5 salt.grains.esxi

Generate baseline proxy minion grains for ESXi hosts.

New in version 2015.8.4.

`salt.grains.esxi.`**`esxi`**`()`

`salt.grains.esxi.`**`kernel`**`()`

`salt.grains.esxi.`**`os`**`()`

`salt.grains.esxi.`**`os_family`**`()`

21.8.6 salt.grains.extra

`salt.grains.extra.`**`config`**`()`
Return the grains set in the grains file

`salt.grains.extra.`**`shell`**`()`
Return the default shell to use on this system

21.8.7 salt.grains.fx2

Generate baseline proxy minion grains for Dell FX2 chassis. The challenge is that most of Salt isn't bootstrapped yet, so we need to repeat a bunch of things that would normally happen in proxy/fx2.py–just enough to get data from the chassis to include in grains.

`salt.grains.fx2.`**`fx2`**`()`

`salt.grains.fx2.`**`kernel`**`()`

`salt.grains.fx2.`**`location`**`()`

`salt.grains.fx2.`**`os_data`**`()`

`salt.grains.fx2.`**`os_family`**`()`

21.8.8 salt.grains.junos

Grains for junos. NOTE this is a little complicated–junos can only be accessed via salt-proxy-minion.Thus, some grains make sense to get them from the minion (PYTHONPATH), but others don't (ip_interfaces)

`salt.grains.junos.`**`defaults`**`()`

`salt.grains.junos.`**`facts`**`(`*proxy=None*`)`

`salt.grains.junos.`**`os_family`**`()`

21.8.9 salt.grains.marathon

Generate marathon proxy minion grains.

New in version 2015.8.2.

`salt.grains.marathon.`**`kernel`**`()`

`salt.grains.marathon.`**`marathon`**`()`

`salt.grains.marathon.`**`os`**`()`

`salt.grains.marathon.`**`os_data`**`()`

`salt.grains.marathon.`**`os_family`**`()`

21.8.10 salt.grains.mdadm

Detect MDADM RAIDs

`salt.grains.mdadm.`**`mdadm`**`()`
Return list of mdadm devices

21.8.11 salt.grains.metadata

Grains from cloud metadata servers at 169.254.169.254

New in version 2017.7.0.

depends requests

To enable these grains that pull from the http://169.254.169.254/latest metadata server set *metadata_server_grains: True*.

```
metadata_server_grains: True
```

`salt.grains.metadata.`**`metadata`**`()`

21.8.12 salt.grains.napalm

NAPALM Grains

codeauthor Mircea Ulinic <ping@mirceaulinic.net>

maturity new

depends napalm

platform unix

Dependencies

- `NAPALM proxy module`

New in version 2016.11.0.

`salt.grains.napalm.`**`getos`**`(`*proxy=None*`)`

Returns the Operating System name running on the network device.

Example: junos, iosxr, eos, ios etc.

CLI Example - select all network devices running JunOS:

```
salt -G 'os:junos' test.ping
```

`salt.grains.napalm.`**`host`**`(`*proxy=None*`)`

This grain is set by the NAPALM grain module only when running in a proxy minion. When Salt is installed directly on the network device, thus running a regular minion, the `host` grain provides the physical hostname of the network device, as it would be on an ordinary minion server. When running in a proxy minion, `host` points to the value configured in the pillar: *`NAPALM proxy module`*.

Note: The diference between `host` and `hostname` is that `host` provides the physical location - either domain name or IP address, while `hostname` provides the hostname as configured on the device. They are not necessarily the same.

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host
```

Output:

```
device1:
    ip-172-31-13-136.us-east-2.compute.internal
device2:
```

(continues on next page)

(continued from previous page)

```
    ip-172-31-11-193.us-east-2.compute.internal
device3:
    ip-172-31-2-181.us-east-2.compute.internal
```

`salt.grains.napalm.`**`host_dns`**(*proxy=None*)

Return the DNS information of the host. This grain is a dictionary having two keys:

- A
- AAAA

Note: This grain is disabled by default, as the proxy startup may be slower when the lookup fails. The user can enable it using the `napalm_host_dns_grain` option (in the pillar or proxy configuration file):

```
napalm_host_dns_grain: true
```

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host_dns
```

Output:

```
device1:
    A:
        - 172.31.9.153
    AAAA:
        - fd52:188c:c068::1
device2:
    A:
        - 172.31.46.249
    AAAA:
        - fdca:3b17:31ab::17
device3:
    A:
        - 172.31.8.167
    AAAA:
        - fd0f:9fd6:5fab::1
```

`salt.grains.napalm.`**`hostname`**(*proxy=None*)

Return the hostname as configured on the network device.

CLI Example:

```
salt 'device*' grains.get hostname
```

Output:

```
device1:
    edge01.yyz01
device2:
    edge01.bjm01
device3:
    edge01.flw01
```

`salt.grains.napalm.`**`interfaces`**`(`*proxy=None*`)`

Returns the complete interfaces list of the network device.

Example: ['lc-0/0/0', 'pfe-0/0/0', 'xe-1/3/0', 'lo0', 'irb', 'demux0', 'fxp0']

CLI Example - select all devices that have a certain interface, e.g.: xe-1/1/1:

```
salt -G 'interfaces:xe-1/1/1' test.ping
```

Output:

```
edge01.yyz01:
    True
edge01.maa01:
    True
edge01.syd01:
    True
edge01.del01:
    True
edge01.dus01:
    True
edge01.kix01:
    True
```

`salt.grains.napalm.`**`model`**`(`*proxy=None*`)`

Returns the network device chassis model.

Example: MX480, ASR-9904-AC etc.

CLI Example - select all Juniper MX480 routers and execute traceroute to 8.8.8.8:

```
salt -G 'model:MX480' net.traceroute 8.8.8.8
```

`salt.grains.napalm.`**`optional_args`**`(`*proxy=None*`)`

Return the connection optional args.

Note: Sensible data will not be returned.

New in version 2017.7.0.

CLI Example - select all devices connecting via port 1234:

```
salt -G 'optional_args:port:1234' test.ping
```

Output:

```
device1:
    True
device2:
    True
```

`salt.grains.napalm.`**`serial`**`(`*proxy=None*`)`

Returns the chassis serial number.

Example: FOX1234W00F

CLI Example - select all devices whose serial number begins with *FOX* and display the serial number value:

```
salt -G 'serial:FOX*' grains.get serial
```

Output:

```
edge01.icn01:
    FOXW00F001
edge01.del01:
    FOXW00F002
edge01.yyz01:
    FOXW00F003
edge01.mrs01:
    FOXW00F004
```

`salt.grains.napalm.`**`uptime`**(*proxy=None*)

Returns the uptime in seconds.

CLI Example - select all devices started/restarted within the last hour:

```
salt -G 'uptime<3600' test.ping
```

`salt.grains.napalm.`**`username`**(*proxy=None*)

Return the username.

New in version 2017.7.0.

CLI Example - select all devices using *foobar* as username for connection:

```
salt -G 'username:foobar' test.ping
```

Output:

`salt.grains.napalm.`**`vendor`**(*proxy=None*)

Returns the network device vendor.

Example: juniper, cisco, arista etc.

CLI Example - select all devices produced by Cisco and shutdown:

```
salt -G 'vendor:cisco' net.cli "shut"
```

`salt.grains.napalm.`**`version`**(*proxy=None*)

Returns the OS version.

Example: 13.3R6.5, 6.0.2 etc.

CLI Example - select all network devices running JunOS 13.3R6.5 and return the model:

```
salt -G 'os:junos and version:13.3R6.5' grains.get model
```

Output:

```
edge01.bjm01:
    MX2000
edge01.sjc01:
    MX960
edge01.mrs01:
    MX480
edge01.muc01:
    MX240
```

21.8.13 salt.grains.opts

Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set

`salt.grains.opts.`**`opts`**`()`

Return the minion configuration settings

21.8.14 salt.grains.panos

Generate baseline proxy minion grains for panos hosts.

`salt.grains.panos.`**`panos`**`(`*proxy=None*`)`

21.8.15 salt.grains.philips_hue

Static grains for the Philips HUE lamps

New in version 2015.8.3.

`salt.grains.philips_hue.`**`kernel`**`()`

`salt.grains.philips_hue.`**`os`**`()`

`salt.grains.philips_hue.`**`os_family`**`()`

`salt.grains.philips_hue.`**`product`**`()`

`salt.grains.philips_hue.`**`vendor`**`()`

21.8.16 salt.grains.rest_sample

Generate baseline proxy minion grains

`salt.grains.rest_sample.`**`kernel`**`()`

`salt.grains.rest_sample.`**`location`**`()`

`salt.grains.rest_sample.`**`os`**`()`

`salt.grains.rest_sample.`**`os_data`**`()`

`salt.grains.rest_sample.`**`os_family`**`()`

`salt.grains.rest_sample.`**`proxy_functions`**`(`*proxy*`)`

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so *proxy* might be None.

21.9 execution modules

Virtual modules

21.9.1 salt.modules.group

`group` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
groupadd	Linux, NetBSD, and OpenBSD systems using `groupadd(8)`, `groupdel(8)`, and `groupmod(8)`
pw_group	FreeBSD-based OSes using `pw(8)`
solaris_group	Solaris-based OSes using `groupadd(1M)`, `groupdel(1M)`, and `groupmod(1M)`
win_groupadd	Windows

21.9.2 salt.modules.kernelpkg

`kernelpkg` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
kernelpkg_linux_apt	Debian/Ubuntu-based distros which use `apt-get` for package management
kernelpkg_linux_yum	RedHat-based distros and derivatives using `yum` or `dnf`

21.9.3 salt.modules.pkg

`pkg` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
aixpkg	AIX OS using `installp` and `rpm`
aptpkg	Debian/Ubuntu-based distros which use `apt-get(8)` for package management
mac_brew_pkg	Mac OS software management using Homebrew
ebuildpkg	Gentoo-based systems (utilizes the `portage` python module as well as `emerge(1)`)
freebsdpkg	FreeBSD-based OSes using `pkg_add(1)`
openbsdpkg	OpenBSD-based OSes using `pkg_add(1)`
pacmanpkg	Arch Linux-based distros using `pacman(8)`
pkgin	NetBSD-based OSes using `pkgin(1)`
pkgng	FreeBSD-based OSes using `pkg(8)`
pkgutil	Solaris-based OSes using OpenCSW's `pkgutil(1)`
solarispkg	Solaris-based OSes using `pkgadd(1M)`
solarisipspkg	Solaris-based OSes using IPS `pkg(1)`
win_pkg	Salt's *Windows Package Manager*
yumpkg	RedHat-based distros and derivatives using `yum(8)` or `dnf(8)`
zypperpkg	SUSE-based distros using `zypper(8)`

21.9.4 salt.modules.service

`service` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
debian_service	Debian Wheezy and earlier
freebsdservice	FreeBSD-based OSes using `service(8)`
gentoo_service	Gentoo Linux using `sysvinit` and `rc-update(8)`
mac_service	Mac OS hosts using `launchctl(1)`
netbsdservice	NetBSD-based OSes
openbsdservice	OpenBSD-based OSes
rh_service	RedHat-based distros and derivatives using `service(8)` and `chkconfig(8)`. Supports both pure sysvinit and mixed sysvinit/upstart systems.
service	Fallback which simply wraps sysvinit scripts
smf_service	Solaris-based OSes which use SMF
systemd_service	Linux distros which use systemd
upstart_service	Ubuntu-based distros using upstart
win_service	Windows

21.9.5 salt.modules.shadow

`shadow` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
shadow	Linux
bsd_shadow	FreeBSD, OpenBSD, NetBSD
solaris_shadow	Solaris-based OSes
win_shadow	Windows

21.9.6 salt.modules.user

`user` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
useradd	Linux, NetBSD, and OpenBSD systems using `useradd(8)`, `userdel(8)`, and `usermod(8)`
pw_user	FreeBSD-based OSes using `pw(8)`
solaris_user	Solaris-based OSes using `useradd(1M)`, `userdel(1M)`, and `usermod(1M)`
mac_user	MacOS
win_useradd	Windows

---

acme	ACME / Let's Encrypt module
aix_group	Manage groups on Solaris
aixpkg	Package support for AIX
aliases	Manage the information in the aliases file
alternatives	Support for Alternatives system
ansiblegate	Ansible Support
apache	Support for Apache

Continued on next page

Table 9 – continued from previous page

apcups	Module for apcupsd
apf	Support for Advanced Policy Firewall (APF)
apkpkg	Support for apk
aptpkg	Support for APT (Advanced Packaging Tool)
archive	A module to wrap (non-Windows) archive calls
arista_pyeapi	Arista pyeapi
artifactory	Module for fetching artifacts from Artifactory
at	Wrapper module for at(1)
at_solaris	Wrapper for at(1) on Solaris-like systems
augeas_cfg	Manages configuration files via augeas
aws_sqs	Support for the Amazon Simple Queue Service.
azurearm_compute	Azure (ARM) Compute Execution Module
azurearm_network	Azure (ARM) Network Execution Module
azurearm_resource	Azure (ARM) Resource Execution Module
bamboohr	Support for BambooHR
bcache	Module for managing BCache sets
beacons	Module for managing the Salt beacons on a minion
bigip	An execution module which can manipulate an f5 bigip via iControl REST
bluez_bluetooth	Support for Bluetooth (using BlueZ in Linux).
boto3_elasticache	Execution module for Amazon Elasticache using boto3
boto3_elasticsearch	Connection module for Amazon Elasticsearch Service
boto3_route53	Execution module for Amazon Route53 written against Boto 3
boto_apigateway	Connection module for Amazon APIGateway
boto_asg	Connection module for Amazon Autoscale Groups
boto_cfn	Connection module for Amazon Cloud Formation
boto_cloudfront	Connection module for Amazon CloudFront
boto_cloudtrail	Connection module for Amazon CloudTrail
boto_cloudwatch	Connection module for Amazon CloudWatch
boto_cloudwatch_event	Connection module for Amazon CloudWatch Events
boto_cognitoidentity	Connection module for Amazon CognitoIdentity
boto_datapipeline	Connection module for Amazon Data Pipeline
boto_dynamodb	Connection module for Amazon DynamoDB
boto_ec2	Connection module for Amazon EC2
boto_efs	Connection module for Amazon EFS
boto_elasticache	Connection module for Amazon Elasticache
boto_elasticsearch_domain	Connection module for Amazon Elasticsearch Service
boto_elb	Connection module for Amazon ELB
boto_elbv2	Connection module for Amazon ALB
boto_iam	Connection module for Amazon IAM
boto_iot	Connection module for Amazon IoT
boto_kinesis	Connection module for Amazon Kinesis
boto_kms	Connection module for Amazon KMS
boto_lambda	Connection module for Amazon Lambda
boto_rds	Connection module for Amazon RDS
boto_route53	Connection module for Amazon Route53
boto_s3_bucket	Connection module for Amazon S3 Buckets
boto_secgroup	Connection module for Amazon Security Groups
boto_sns	Connection module for Amazon SNS

Continued on next page

Table 9 – continued from previous page

boto_sqs	Connection module for Amazon SQS
boto_vpc	Connection module for Amazon VPC
bower	Manage and query Bower packages
bridge	Module for gathering and managing bridging information
bsd_shadow	Manage the password database on BSD systems
btrfs	Module for managing BTRFS file systems.
cabal	Manage and query Cabal packages
capirca_acl	Capirca ACL
cassandra	Cassandra NoSQL Database Module
cassandra_cql	Cassandra Database Module
celery	Support for scheduling celery tasks.
ceph	Module to provide ceph control with salt.
chassis	Glue execution module to link to the *fx2 proxymodule*.
chef	Execute chef in server or solo mode
chocolatey	A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)
chronos	Module providing a simple management interface to a chronos cluster.
cimc	Module to provide Cisco UCS compatibility to Salt
ciscoconfparse_mod	Execution module for ciscoconfparse
cisconso	Execution module for Cisco Network Services Orchestrator Proxy minions
cloud	Salt-specific interface for calling Salt Cloud directly
cmdmod	A module for shelling out.
composer	Use composer to install PHP dependencies for a directory
config	Return config information
consul	Interact with Consul
container_resource	Common resources for LXC and systemd-nspawn containers
cp	Minion side functions for salt-cp
cpan	Manage Perl modules using CPAN
cron	Work with cron
csf	Support for Config Server Firewall (CSF)
cyg	Manage cygwin packages.
daemontools	daemontools service module.
data	Manage a local persistent data structure that can hold any arbitrary data specific to the minion
datadog_api	An execution module that interacts with the Datadog API
ddns	Support for RFC 2136 dynamic DNS updates.
deb_apache	Support for Apache
deb_postgres	Module to provide Postgres compatibility to salt for debian family specific tools.
debuild_pkgbuild	Debian Package builder system
debconfmod	Support for Debconf
debian_ip	The networking module for Debian-based distros
debian_service	Service support for Debian systems (uses update-rc.d and /sbin/service)

Continued on next page

Table 9 – continued from previous page

defaults	Module to work with salt formula defaults files
devmap	Device-Mapper module
dig	Compendium of generic DNS utilities.
disk	Module for managing disks and blockdevices
djangomod	Manage Django sites
dnsmasq	Module for managing dnsmasq
dnsutil	Compendium of generic DNS utilities.
dockercompose	Module to import docker-compose via saltstack
dockermod	Management of Docker Containers
dpkg_lowpkg	Support for DEB packages
drac	Manage Dell DRAC
dracr	Manage Dell DRAC.
drbd	DRBD administration module
dummyproxy_pkg	Package support for the dummy proxy used by the test suite
dummyproxy_service	Provide the service module for the dummy proxy used in integration tests
ebuildpkg	Support for Portage
eix	Support for Eix
elasticsearch	Elasticsearch - A distributed RESTful search and analytics server
environ	Support for getting and setting the environment variables of the current salt process.
eselect	Support for eselect, Gentoo's configuration and management tool.
esxi	Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.
etcd_mod	Execution module to work with etcd
ethtool	Module for running ethtool command
event	Use the *Salt Event System* to fire events from the master to the minion and vice-versa.
extfs	Module for managing ext2/3/4 file systems
file	Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data
firewalld	Support for firewalld.
freebsd_sysctl	Module for viewing and modifying sysctl parameters
freebsd_update	Support for freebsd-update utility on FreeBSD.
freebsdjail	The jail module for FreeBSD
freebsdkmod	Module to manage FreeBSD kernel modules
freebsdpkg	Remote package support using `pkg_add(1)`
freebsdports	Install software from the FreeBSD `ports(7)` system
freebsdservice	The service module for FreeBSD
gem	Manage ruby gems.
genesis	Module for managing container and VM images
gentoo_service	Top level package command wrapper, used to translate the os detected by grains to the correct service manager
gentoolkitmod	Support for Gentoolkit
git	Support for the Git SCM
github	Module for interacting with the GitHub v3 API.

Continued on next page

Table 9 – continued from previous page

glance	Module for handling openstack glance calls.
glanceng	Glance module for interacting with OpenStack Glance
glusterfs	Manage a glusterfs pool
gnomedesktop	GNOME implementations
google_chat	Module for sending messages to google chat.
gpg	Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers.
grafana4	Module for working with the Grafana v4 API
grains	Return/control aspects of the grains data
groupadd	Manage groups on Linux, OpenBSD and NetBSD
grub_legacy	Support for GRUB Legacy
guestfs	Interact with virtual machine images via libguestfs
hadoop	Support for hadoop
haproxyconn	Support for haproxy
hashutil	A collection of hashing and encoding functions
heat	Module for handling OpenStack Heat calls
hg	Support for the Mercurial SCM
hosts	Manage the information in the hosts file
http	Module for making various web calls.
ifttt	Support for IFTTT
ilo	Manage HP ILO
icinga2	Module to provide icinga2 compatibility to salt.
incron	Work with incron
influxdbmod	InfluxDB - A distributed time series database
influxdb08mod	InfluxDB - A distributed time series database
infoblox	This module have been tested on infoblox API v1.2.1, other versions of the API are likly workable.
ini_manage	Edit ini files
inspectlib	
inspectlib.collector	
inspectlib.dbhandle	
inspectlib.entities	
inspectlib.exceptions	
inspectlib.fsdb	**codeauthor** Bo Maryniuk <bo@suse.de>
inspectlib.kiwiproc	
inspectlib.query	
inspector	Module for full system inspection.
introspect	Functions to perform introspection on a minion, and return data in a format usable by Salt States
iosconfig	Cisco IOS configuration manipulation helpers
ipmi	Support IPMI commands over LAN.
ipset	Support for ipset
iptables	Support for iptables
iwtools	Support for Wireless Tools for Linux
jboss7	Module for managing JBoss AS 7 through the CLI interface.
jboss7_cli	Module for low-level interaction with JbossAS7 through CLI.

Continued on next page

Table 9 – continued from previous page

jenkinsmod	Module for controlling Jenkins
jinja	Module for checking jinja maps and verifying the result of loading JSON/YAML files
jira_mod	JIRA Execution module
junos	Module to interact with Junos devices.
k8s	Salt module to manage Kubernetes cluster
kapacitor	Kapacitor execution module.
kerberos	Manage Kerberos KDC
kernelpkg_linux_apt	Manage Linux kernel packages on APT-based systems
kernelpkg_linux_yum	Manage Linux kernel packages on YUM-based systems
key	Functions to view the minion's public key information
keyboard	Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.
keystone	Module for handling openstack keystone calls.
keystoneng	Keystone module for interacting with OpenStack Keystone
keystore	Module to interact with keystores
kmod	Module to manage Linux kernel modules
kubernetesmod	Module for handling kubernetes calls.
launchctl_service	Module for the management of MacOS systems that use launchd/launchctl
layman	Support for Layman
ldap3	Query and modify an LDAP database (alternative interface)
ldapmod	Salt interface to LDAP commands
libcloud_compute	Apache Libcloud Compute Management
libcloud_dns	Apache Libcloud DNS Management
libcloud_loadbalancer	Apache Libcloud Load Balancer Management
libcloud_storage	Apache Libcloud Storage Management
linux_acl	Support for Linux File Access Control Lists
linux_ip	The networking module for Non-RH/Deb Linux distros
linux_lvm	Support for Linux LVM2
linux_sysctl	Module for viewing and modifying sysctl parameters
localemod	Module for managing locales on POSIX-like systems.
locate	Module for using the locate utilities
logadm	Module for managing Solaris logadm based log rotations.
logmod	On-demand logging
logrotate	Module for managing logrotate.
lvs	Support for LVS (Linux Virtual Server)
lxc	Control Linux Containers via Salt
lxd	Module for managing the LXD daemon and its containers.
mac_assistive	This module allows you to manage assistive access on macOS minions with 10.9+
mac_brew_pkg	Homebrew for macOS
macdefaults	Set defaults on Mac OS
mac_desktop	macOS implementations of various commands in the "desktop" interface
mac_group	Manage groups on Mac OS 10.7+

Continued on next page

Table 9 – continued from previous page

mac_keychain	Install certificates into the keychain on Mac OS
macpackage	Install pkg, dmg and .app applications on macOS minions.
mac_pkgutil	Installer support for macOS.
mac_portspkg	Support for MacPorts under macOS.
mac_power	Module for editing power settings on macOS
mac_service	The service module for macOS
mac_shadow	Manage macOS local directory passwords and policies
mac_softwareupdate	Support for the softwareupdate command on MacOS.
mac_sysctl	Module for viewing and modifying sysctl parameters
mac_system	System module for sleeping, restarting, and shutting down the system on Mac OS X
mac_timezone	Module for editing date/time settings on macOS
mac_user	Manage users on Mac OS 10.7+
mac_xattr	This module allows you to manage extended attributes on files or directories
makeconf	Support for modifying make.conf under Gentoo
mandrill	Mandrill
marathon	Module providing a simple management interface to a marathon cluster.
match	The match module allows for match routines to be run and determine target specs
mattermost	Module for sending messages to Mattermost
mdadm_raid	Salt module to manage RAID arrays with mdadm
mdata	Module for managaging metadata in SmartOS Zones
memcached	Module for Management of Memcached Keys
mine	The function cache system allows for data to be stored on the master so it can be easily read by other minions
minion	Module to provide information about minions
mod_random	Provides access to randomness generators.
modjk	Control Modjk via the Apache Tomcat "Status" worker (http://tomcat.apache.org/connectors-doc/reference/status.html)
mongodb	Module to provide MongoDB functionality to Salt
monit	Monit service module.
moosefs	Module for gathering and managing information about MooseFS
mount	Salt module to manage Unix mounts and the fstab file
mssql	Module to provide MS SQL Server compatibility to salt.
msteams	Module for sending messages to MS Teams
munin	Run munin plugins/checks from salt and format the output as data.
mysql	Module to provide MySQL compatibility to salt.
nacl	This module helps include encrypted passwords in pillars, grains and salt state files.
nagios	Run nagios plugins/checks from salt and get the return as data.
nagios_rpc	Check Host & Service status from Nagios via JSON RPC.
namecheap_domains_dns	Namecheap DNS Management
namecheap_domains	Namecheap Domain Management

Continued on next page

Table 9 – continued from previous page

namecheap_domains_ns	Namecheap Nameserver Management
namecheap_ssl	Namecheap SSL Certificate Management
namecheap_users	Namecheap User Management
napalm_mod	NAPALM helpers
napalm_netacl	NAPALM ACL
napalm_bgp	NAPALM BGP
napalm_formula	NAPALM Formula helpers
napalm_mod	NAPALM helpers
napalm_network	NAPALM Network
napalm_ntp	NAPALM NTP
napalm_probes	NAPALM Probes
napalm_route	NAPALM Route
napalm_snmp	NAPALM SNMP
napalm_users	NAPALM Users
napalm_yang_mod	NAPALM YANG
netaddress	Module for getting information about network addresses.
netbox	NetBox
netbsd_sysctl	Module for viewing and modifying sysctl parameters
netbsdservice	The service module for NetBSD
netmiko_mod	Netmiko Execution Module
netscaler	Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)
network	Module for gathering and managing network information
neutron	Module for handling OpenStack Neutron calls
neutronng	Neutron module for interacting with OpenStack Neutron
nfs3	Module for managing NFS version 3.
nftables	Support for nftables
nginx	Support for nginx
nilrt_ip	The networking module for NI Linux Real-Time distro
nix	Work with Nix packages
nova	Module for handling OpenStack Nova calls
npm	Manage and query NPM packages.
nspawn	Manage nspawn containers
nxos	Execution module for Cisco NX OS Switches Proxy minions
nxos_api	Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API
omapi	This module interacts with an ISC DHCP Server via OMAPI.
openbsd_sysctl	Module for viewing and modifying OpenBSD sysctl parameters
openbsdpkg	Package support for OpenBSD
openbsdrcctl_service	The rcctl service module for OpenBSD
openbsdservice	The service module for OpenBSD
openscap	Module for OpenSCAP Management
openstack_config	Modify, retrieve, or delete values from OpenStack configuration files.
openstack_mng	Module for OpenStack Management

Continued on next page

Table 9 – continued from previous page

openvswitch	Support for Open vSwitch - module with basic Open vSwitch commands.
opkg	Support for Opkg
opsgenie	Module for sending data to OpsGenie
oracle	Oracle DataBase connection module
osquery	Support for OSQuery - https://osquery.io.
out	Output Module
pacmanpkg	A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)
pagerduty	Module for Firing Events via PagerDuty
pagerduty_util	Module for manageing PagerDuty resource
pam	Support for pam
panos	Module to provide Palo Alto compatibility to Salt
parallels	Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`.
parted_partition	Module for managing partitions on POSIX-like systems.
pcs	Configure a Pacemaker/Corosync cluster with PCS
pdbedit	Manage accounts in Samba's passdb using pdbedit
pecl	Manage PHP pecl extensions.
peeringdb	PeeringDB Module
pf	Control the OpenBSD packet filter (PF).
philips_hue	Philips HUE lamps module for proxy.
pillar	Extract the pillar data for this minion
pip	Install Python packages with pip to either the system or a virtualenv
pkg_resource	Resources needed by pkg providers
pkgin	Package support for pkgin based systems, inspired from freebsdpkg module
pkgng	Support for `pkgng`, the new package manager for FreeBSD
pkgutil	Pkgutil support for Solaris
portage_config	Configure `portage(5)`
postfix	Support for Postfix
postgres	Module to provide Postgres compatibility to salt.
poudriere	Support for poudriere
powerpath	powerpath support.
proxy	This module allows you to manage proxy settings
ps	A salt interface to psutil, a system and process library.
publish	Publish a command from a minion to a target
puppet	Execute puppet routines
purefa	Management of Pure Storage FlashArray
purefb	Management of Pure Storage FlashBlade
pushbullet	Module for sending messages to Pushbullet (https://www.pushbullet.com)
pushover_notify	Module for sending messages to Pushover (https://www.pushover.net)
pw_group	Manage groups on FreeBSD
pw_user	Manage users with the pw command
pyenv	Manage python installations with pyenv.

Continued on next page

Table 9 – continued from previous page

qemu_img	Qemu-img Command Wrapper
qemu_nbd	Qemu Command Wrapper
quota	Module for managing quotas on POSIX-like systems.
rabbitmq	Module to provide RabbitMQ compatibility to Salt.
rallydev	Support for RallyDev
random_org	Module for retrieving random information from Random.org
rbac_solaris	Module for Solaris' Role-Based Access Control
rbenv	Manage ruby installations with rbenv.
rdp	Manage RDP Service on Windows servers
redismod	Module to provide redis functionality to Salt
reg	Manage the Windows registry
rest_pkg	Package support for the REST example
rest_sample_utils	Utility functions for the rest_sample
rest_service	Provide the service module for the proxy-minion REST sample
restartcheck	checkrestart functionality for Debian and Red Hat Based systems
ret	Module to integrate with the returner system and retrieve data sent to a salt returner
rh_ip	The networking module for RHEL/Fedora based distros
rh_service	Service support for RHEL-based systems, including support for both upstart and sysvinit
riak	Riak Salt Module
rpm_lowpkg	Support for rpm
rpmbuild_pkgbuild	RPM Package builder system
rsync	Wrapper for rsync
runit	runit service module (http://smarden.org/runit)
rvm	Manage ruby installations and gemsets with RVM, the Ruby Version Manager.
s3	Connection module for Amazon S3
s6	s6 service module
salt_proxy	Salt proxy module
salt_version	Access Salt's elemental release code-names.
saltcheck	A module for testing the logic of states and highstates
saltcloudmod	Control a salt cloud system
saltutil	The Saltutil module is used to manage the state of the salt minion itself.
schedule	Module for managing the Salt schedule on a minion
scp_mod	SCP Module
scsi	SCSI administration module
sdb	Module for Manipulating Data via the Salt DB API
seed	Virtual machine image management tools
selinux	Execute calls on selinux
sensehat	Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
sensors	Read lm-sensors
serverdensity_device	Wrapper around Server Density API
service	If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

Continued on next page

Table 9 – continued from previous page

`servicenow`	Module for execution of ServiceNow CI (configuration items)
`shadow`	Manage the shadow file on Linux systems
`slack_notify`	Module for sending messages to Slack
`slsutil`	Utility functions for use with or in SLS files
`smartos_imgadm`	Module for running imgadm command on SmartOS
`smartos_nictagadm`	Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos
`smartos_virt`	virst compatibility module for managing VMs on SmartOS
`smartos_vmadm`	Module for running vmadm command on SmartOS
`smbios`	Interface to SMBIOS/DMI
`smf_service`	Service support for Solaris 10 and 11, should work with other systems that use SMF also.
`smtp`	Module for Sending Messages via SMTP
`solaris_fmadm`	Module for running fmadm and fmdump on Solaris
`solaris_group`	Manage groups on Solaris
`solaris_shadow`	Manage the password database on Solaris systems
`solaris_system`	Support for reboot, shutdown, etc
`solaris_user`	Manage users with the useradd command
`solarisipspkg`	IPS pkg support for Solaris
`solarispkg`	Package support for Solaris
`solr`	Apache Solr Salt Module
`solrcloud`	Module for solrcloud configuration
`splunk`	Module for interop with the Splunk API
`splunk_search`	Module for interop with the Splunk API
`sqlite3`	Support for SQLite3
`ssh`	Manage client ssh components
`ssh_pkg`	Service support for the REST example
`ssh_service`	Provide the service module for the proxy-minion SSH sample ..
`snapper`	Module to manage filesystem snapshots with snapper
`state`	Control the state system on the minion.
`status`	Module for returning various status data about a minion.
`statuspage`	StatusPage
`supervisord`	Provide the service module for system supervisord or supervisord in a virtualenv
`suse_apache`	Support for Apache
`svn`	Subversion SCM
`swarm`	Docker Swarm Module using Docker's Python SDK
`swift`	Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>
`sysbench`	The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.
`sysfs`	Module for interfacing with SysFS
`syslog_ng`	Module for getting information about syslog-ng

Continued on next page

Table 9 – continued from previous page

sysmod	The sys module provides information about the available functions on the minion
sysrc	sysrc module for FreeBSD
system	Support for reboot, shutdown, etc on POSIX-like systems.
system_profiler	System Profiler Module
systemd_service	Provides the service module for systemd
telegram	Module for sending messages via Telegram.
telemetry	Connection module for Telemetry
temp	Simple module for creating temporary directories and files
test	Module for running arbitrary tests
testinframod	This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions.
test_virtual	Module for running arbitrary tests with a __virtual__ function
textfsm_mod	TextFSM
timezone	Module for managing timezone on POSIX-like systems.
tls	A salt module for SSL/TLS.
tomcat	Support for Tomcat
trafficserver	Apache Traffic Server execution module.
travisci	Commands for working with travisci.
tuned	Interface to Red Hat tuned-adm module
twilio_notify	Module for notifications via Twilio
udev	Manage and query udev info
upstart_service	Module for the management of upstart systems.
uptime	Wrapper around uptime API
useradd	Manage users with the useradd command
uwsgi	uWSGI stats server https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html
vagrant	Work with virtual machines managed by Vagrant.
varnish	Support for Varnish
vault	Functions to interact with Hashicorp Vault.
vbox_guest	VirtualBox Guest Additions installer
vboxmanage	Support for VirtualBox using the VBoxManage command
victorops	Support for VictorOps
virt	Work with virtual machines managed by libvirt
virtualenv_mod	Create virtualenv environments.
vmctl	Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
vsphere	Manage VMware vCenter servers and ESXi hosts.
webutil	Support for htpasswd command.
win_autoruns	Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)
win_certutil	This module allows you to install certificates into the windows certificate manager.
win_dacl	Manage DACLs on Windows
win_disk	Module for gathering disk information on Windows

Continued on next page

Table 9 – continued from previous page

win_dism	Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows.
win_dns_client	Module for configuring DNS Client on Windows systems
win_dsc	Module for working with Windows PowerShell DSC (Desired State Configuration)
win_file	Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories
win_firewall	Module for configuring Windows Firewall using `netsh`
win_groupadd	Manage groups on Windows
win_iis	Microsoft IIS site management via WebAdministration powershell module
win_ip	The networking module for Windows based systems
win_lgpo	Manage Local Policy on Windows
win_license	This module allows you to manage windows licensing via slmgr.vbs
win_network	Module for gathering and managing network information
win_ntp	Management of NTP servers on Windows
win_path	Manage the Windows System PATH
win_pkg	A module to manage software on Windows
win_pki	Microsoft certificate management via the PKI Client PowerShell module.
win_powercfg	This module allows you to control the power settings of a windows minion via powercfg.
win_psget	Module for managing PowerShell through PowerShell-Get (PSGet)
winrepo	Module to manage Windows software repo on a Standalone Minion
win_servermanager	Manage Windows features via the ServerManager powershell module.
win_service	Windows Service module.
win_shadow	Manage the shadow file
win_smtp_server	Module for managing IIS SMTP server configuration on Windows servers.
win_snmp	Module for managing SNMP service settings on Windows servers.
win_status	Module for returning various status data about a minion.
win_system	Module for managing windows systems.
win_task	Windows Task Scheduler Module ..
win_timezone	Module for managing timezone on Windows systems.
win_useradd	Module for managing Windows Users
win_wua	Module for managing Windows Updates using the Windows Update Agent.
win_wusa	Microsoft Update files management via wusa.exe
x509	Manage X509 certificates
xapi_virt	This module (mostly) uses the XenAPI to manage Xen virtual machines.

Continued on next page

Table 9 – continued from previous page

xbpspkg	Package support for XBPS package manager (used by VoidLinux)
xfs	Module for managing XFS file systems.
xml	XML file manager
xmpp	Module for Sending Messages via XMPP (a.k.a.
yumpkg	Support for YUM/DNF
zabbix	Support for Zabbix
zcbuildout	Management of zc.buildout
zenoss	Module for working with the Zenoss API
zfs	Module for running ZFS command
zk_concurrency	Concurrency controls in zookeeper
znc	znc - An advanced IRC bouncer
zoneadm	Module for Solaris 10's zoneadm
zonecfg	Module for Solaris 10's zonecfg
zookeeper	Zookeeper Module
zpool	Module for running ZFS zpool command
zypperpkg	Package support for openSUSE via the zypper package manager

21.9.7 salt.modules.acme module

ACME / Let's Encrypt module

This module currently looks for certbot script in the $PATH as - certbot, - lestsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

Note: Installation & configuration of the Let's Encrypt client can for example be done using https://github.com/saltstack-formulas/letsencrypt-formula

Warning: Be sure to set at least accept-tos = True in cli.ini!

Most parameters will fall back to cli.ini defaults if None is given.

DNS plugins

This module currently supports the CloudFlare certbot DNS plugin. The DNS plugin credentials file needs to be passed in using the `dns_plugin_credentials` argument.

Make sure the appropriate certbot plugin for the wanted DNS provider is installed before using this module.

`salt.modules.acme.`**`cert`**(*name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **name** – Common Name of the certificate (DNS name of certificate)
- **aliases** – subjectAltNames (Additional DNS names on certificate)
- **email** – e-mail address for interaction with ACME provider
- **webroot** – True or a full path to use to use webroot. Otherwise use standalone mode
- **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** – True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** – RSA key bits
- **server** – API endpoint to talk to
- **owner** – owner of the private key file
- **group** – group of the private key file
- **mode** – mode of the private key file
- **certname** – Name of the certificate to save
- **preferred_challenges** – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** – The address the server listens to during tls-sni-01 challenge.
- **http_01_port** – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** – The address the server listens to during http-01 challenge.
- **dns_plugin** – Name of a DNS plugin to use (currently only 'cloudflare' or 'digitalocean')
- **dns_plugin_credentials** – Path to the credentials file if required by the specified DNS plugin
- **dns_plugin_propagate_seconds** – Number of seconds to wait for DNS propogations before asking ACME servers to verify the DNS record. (default 10)

Return type dict

Returns Dictionary with 'result' True/False/None, 'comment' and certificate's expiry date ('not_after')

CLI example:

```
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]" test_
↪cert=True         renew=14 webroot=/opt/gitlab/embedded/service/gitlab-rails/
↪public
```

salt.modules.acme.**certs**()

Return a list of active certificates

CLI example:

```
salt 'vhost.example.com' acme.certs
```

salt.modules.acme.**expires**(*name*)

The expiry date of a certificate in ISO format

Parameters **name** (*str*) – CommonName of certificate

Return type str

Returns Expiry date in ISO format.

CLI example:

```
salt 'gitlab.example.com' acme.expires dev.example.com
```

`salt.modules.acme.`**`has`**`(`*name*`)`

Test if a certificate is in the Let's Encrypt Live directory

Parameters **name** (*str*) – CommonName of certificate

Return type bool

Code example:

```
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

`salt.modules.acme.`**`info`**`(`*name*`)`

Return information about a certificate

Parameters **name** (*str*) – CommonName of certificate

Return type dict

Returns Dictionary with information about the certificate. If neither the `tls` nor the `x509` module can be used to determine the certificate information, the information will be retrieved as one big text block under the key `text` using the openssl cli.

CLI example:

```
salt 'gitlab.example.com' acme.info dev.example.com
```

`salt.modules.acme.`**`needs_renewal`**`(`*name, window=None*`)`

Check if a certificate needs renewal

Parameters

- **name** (*str*) – CommonName of certificate
- **window** (*bool/str/int*) – Window in days to renew earlier or True/force to just return True

Return type bool

Returns Whether or not the certificate needs to be renewed.

Code example:

```
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

`salt.modules.acme.`**`renew_by`**`(`*name, window=None*`)`

Date in ISO format when a certificate should first be renewed

Parameters

- **name** (*str*) – CommonName of certificate

- **window** (*int*) – number of days before expiry when renewal should take place

Return type str

Returns Date of certificate renewal in ISO format.

21.9.8 salt.modules.aix_group module

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.aix_group.`**`add`**`(`*name, gid=None, system=False, root=None*`)`

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.aix_group.`**`adduser`**`(`*name, username, root=None*`)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.aix_group.`**`chgid`**`(`*name, gid*`)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.aix_group.`**`delete`**`(`*name*`)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.aix_group.`**`deluser`**`(`*name, username, root=None*`)`

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.aix_group.`**`getent`**`(`*refresh=False*`)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.aix_group.`**`info`**`(`*name*`)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.aix_group.`**`members`**`(`*name*, *members_list*, *root=None*`)`

Replaces members of the group with a provided list.

CLI Example:

> salt '*' group.members foo 'user1,user2,user3,…'

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,…

21.9.9 salt.modules.aixpkg

Package support for AIX

Important: If you feel that Salt should be using this module to manage filesets or rpm packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.aixpkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

> Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.
>
> If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.
>
> CLI Example:
>
> ```
> salt '*' pkg.latest_version <package name>
> salt '*' pkg.latest_version <package1> <package2> <package3> ...
> ```
>
> NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

`salt.modules.aixpkg.`**`install`**`(`*name=None*, *refresh=False*, *pkgs=None*, *version=None*, *test=False*, ***kwargs*`)`

Install the named fileset(s)/rpm package(s).

name The name of the fileset or rpm package to be installed.

refresh Whether or not to update the yum database before executing.

Multiple Package Installation Options:

pkgs A list of filesets and/or rpm packages to install. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

version Install a specific version of a fileset/rpm package. (Unused at present).

test Verify that command functions correctly:

Returns a dict containing the new fileset(s)/rpm package(s) names and versions:

> **{'<package>': {'old': '<old-version>',** 'new': '<new-version>'}}

CLI Example:

```
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm refresh=True
salt '*' pkg.install /stage/middleware/AIX/VIOS2211_update/tpc_4.1.1.85.bff
salt '*' pkg.install /stage/middleware/AIX/Xlc/usr/sys/inst.images/xlC.rte
salt '*' pkg.install /stage/middleware/AIX/Firefox/ppc-AIX53/Firefox.base
salt '*' pkg.install pkgs='["foo", "bar"]'
```

`salt.modules.aixpkg.`**`latest_version`**`(`**names, **kwargs*`)`

Return the latest version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: Repositories are not presently supported for AIX. This function will always return an empty string for a given fileset/rpm package.

`salt.modules.aixpkg.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

List the filesets/rpm packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.aixpkg.`**`remove`**`(`*name=None, pkgs=None, **kwargs*`)`

Remove specified fileset(s)/rpm package(s).

name The name of the fileset or rpm package to be deleted.

Multiple Package Options:

pkgs A list of filesets and/or rpm packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <fileset/rpm package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove xlC.rte
salt '*' pkg.remove Firefox.base.adt
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.aixpkg.`**`upgrade_available`**`(`*name*`)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.aixpkg.`**`version`**`(`**names, **kwargs*`)`

Common interface for obtaining the version of installed fileset/rpm package.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
```

21.9.10 salt.modules.aliases

Manage the information in the aliases file

`salt.modules.aliases.`**`get_target`**`(`*alias*`)`

Return the target associated with an alias

CLI Example:

```
salt '*' aliases.get_target alias
```

`salt.modules.aliases.`**`has_target`**`(`*alias, target*`)`

Return true if the alias/target is set

CLI Example:

```
salt '*' aliases.has_target alias target
```

`salt.modules.aliases.`**`list_aliases`**`()`

Return the aliases found in the aliases file in this format:

```
{'alias': 'target'}
```

CLI Example:

```
salt '*' aliases.list_aliases
```

`salt.modules.aliases.`**`rm_alias`**`(`*alias*`)`

Remove an entry from the aliases file

CLI Example:

```
salt '*' aliases.rm_alias alias
```

`salt.modules.aliases.`**`set_target`**`(`*alias, target*`)`

Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.

CLI Example:

```
salt '*' aliases.set_target alias target
```

21.9.11 salt.modules.alternatives

Support for Alternatives system

codeauthor Radek Rada <radek.rada@gmail.com>

`salt.modules.alternatives.`**`auto`**`(`*name*`)`

Trigger alternatives to set the path for <name> as specified by priority.

CLI Example:

```
salt '*' alternatives.auto name
```

`salt.modules.alternatives.`**`check_exists`**`(`*name*, *path*`)`

Check if the given path is an alternative for a name.

New in version 2015.8.4.

CLI Example:

```
salt '*' alternatives.check_exists name path
```

`salt.modules.alternatives.`**`check_installed`**`(`*name*, *path*`)`

Check if the current highest-priority match for a given alternatives link is set to the desired path

CLI Example:

```
salt '*' alternatives.check_installed name path
```

`salt.modules.alternatives.`**`display`**`(`*name*`)`

Display alternatives settings for defined command name

CLI Example:

```
salt '*' alternatives.display editor
```

`salt.modules.alternatives.`**`install`**`(`*name*, *link*, *path*, *priority*`)`

Install symbolic links determining default commands

CLI Example:

```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

`salt.modules.alternatives.`**`remove`**`(`*name*, *path*`)`

Remove symbolic links determining the default commands.

CLI Example:

```
salt '*' alternatives.remove name path
```

`salt.modules.alternatives.`**`set_`**`(`*name*, *path*`)`

Manually set the alternative <path> for <name>.

CLI Example:

```
salt '*' alternatives.set name path
```

`salt.modules.alternatives.`**`show_current`**`(`*name*`)`

Display the current highest-priority alternative for a given alternatives link

CLI Example:

```
salt '*' alternatives.show_current editor
```

`salt.modules.alternatives.`**`show_link`**`(`*name*`)`

Display master link for the alternative

New in version 2015.8.13,2016.3.4,2016.11.0.

CLI Example:

```
salt '*' alternatives.show_link editor
```

21.9.12 salt.modules.ansiblegate

Ansible Support

This module can have an optional minion-level configuration in /etc/salt/minion.d/ as follows:

ansible_timeout: 1200

The timeout is how many seconds Salt should wait for any Ansible module to respond.

class `salt.modules.ansiblegate.`**`AnsibleModuleCaller`**(*resolver*)

`DEFAULT_TIMEOUT = 1200`

`OPT_TIMEOUT_KEY = 'ansible_timeout'`

`call`(*module*, **args*, ***kwargs*)

Call an Ansible module by invoking it. :param module: the name of the module. :param args: Arguments to the module :param kwargs: keywords to the module :return:

class `salt.modules.ansiblegate.`**`AnsibleModuleResolver`**(*opts*)

This class is to resolve all available modules in Ansible.

`get_modules_list`(*pattern=None*)

Return module map references. :return:

`install`()

`load_module`(*module*)

Introspect Ansible module.

Parameters **`module`** –

Returns

`resolve`()

`salt.modules.ansiblegate.`**`help`**(*module=None*, **args*)

Display help on Ansible standard module.

Parameters **`module`** –

Returns

`salt.modules.ansiblegate.`**`list`**(*pattern=None*)

Lists available modules. :return:

`salt.modules.ansiblegate.`**`playbooks`**(*playbook*, *rundir=None*, *check=False*, *diff=False*, *extra_vars=None*, *flush_cache=False*, *forks=5*, *inventory=None*, *limit=None*, *list_hosts=False*, *list_tags=False*, *list_tasks=False*, *module_path=None*, *skip_tags=None*, *start_at_task=None*, *syntax_check=False*, *tags=None*, *playbook_kwargs=None*)

Run Ansible Playbooks

Parameters

- **playbook** – Which playbook to run.
- **rundir** – Directory to run *ansible-playbook* in. (Default: None)
- **check** – don't make any changes; instead, try to predict some of the changes that may occur (Default: False)
- **diff** – when changing (small) files and templates, show the differences in those files; works great with –check (default: False)
- **extra_vars** – set additional variables as key=value or YAML/JSON, if filename prepend with @, (default: None)
- **flush_cache** – clear the fact cache for every host in inventory (default: False)
- **forks** – specify number of parallel processes to use (Default: 5)
- **inventory** – specify inventory host path or comma separated host list. (Default: None) (Ansible's default is /etc/ansible/hosts)
- **limit** – further limit selected hosts to an additional pattern (Default: None)
- **list_hosts** – outputs a list of matching hosts; does not execute anything else (Default: False)
- **list_tags** – list all available tags (Default: False)
- **list_tasks** – list all tasks that would be executed (Default: False)
- **module_path** – prepend colon-separated path(s) to module library. (Default: None)
- **skip_tags** – only run plays and tasks whose tags do not match these values (Default: False)
- **start_at_task** – start the playbook at the task matching this name (Default: None)
- **tags** – only run plays and tasks tagged with these values (Default: None)

Param syntax_check: perform a syntax check on the playbook, but do not execute it (Default: False)

Returns Playbook return

CLI Example:

```
salt 'ansiblehost'  ansible.playbook playbook=/srv/playbooks/play.yml
```

21.9.13 salt.modules.apache

Support for Apache

Note: The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into deb_apache.py, but will still load under the `apache` namespace when a Debian-based system is detected.

`salt.modules.apache.`**`config`**`(`*name, config, edit=True*`)`

Create VirtualHost configuration files

name File for the virtual host

config VirtualHost configurations

Note: This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="[{'Listen': '22'}]"
```

salt.modules.apache.**directives**()

Return list of directives together with expected arguments and places where the directive is valid (`apachectl -L`)

CLI Example:

```
salt '*' apache.directives
```

salt.modules.apache.**fullversion**()

Return server version (`apachectl -V`)

CLI Example:

```
salt '*' apache.fullversion
```

salt.modules.apache.**modules**()

Return list of static and shared modules (`apachectl -M`)

CLI Example:

```
salt '*' apache.modules
```

salt.modules.apache.**server_status**(*profile='default'*)

Get Information from the Apache server-status handler

Note: The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See http://httpd.apache.org/docs/2.2/mod/mod_status.html

---

The following configuration needs to exists in pillar/grains. Each entry nested in `apache.server-status` is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:

```
salt '*' apache.server_status
salt '*' apache.server_status other-profile
```

salt.modules.apache.**servermods**()

Return list of modules compiled into the server (`apachectl -l`)

CLI Example:

```
salt '*' apache.servermods
```

`salt.modules.apache.`**`signal`**`(`*signal=None*`)`

Signals httpd to start, restart, or stop.

CLI Example:

```
salt '*' apache.signal restart
```

`salt.modules.apache.`**`useradd`**`(`*pwfile, user, password, opts=''*`)`

Add HTTP user using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created. Valid options that can be passed are:

```
n  Don't update file; display results on stdout.
m  Force MD5 hashing of the password (default).
d  Force CRYPT(3) hashing of the password.
p  Do not hash the password (plaintext).
s  Force SHA1 hashing of the password.
```

CLI Examples:

```
salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.apache.`**`userdel`**`(`*pwfile, user*`)`

Delete HTTP user from the specified `htpasswd` file.

CLI Example:

```
salt '*' apache.userdel /etc/httpd/htpasswd larry
```

`salt.modules.apache.`**`version`**`()`

Return server version (`apachectl -v`)

CLI Example:

```
salt '*' apache.version
```

`salt.modules.apache.`**`vhosts`**`()`

Show the settings as parsed from the config file (currently only shows the virtualhost settings) (`apachectl -S`). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using `-t 10`.

CLI Example:

```
salt -t 10 '*' apache.vhosts
```

21.9.14 salt.modules.apcups

Module for apcupsd

`salt.modules.apcups.`**`status`**`()`

Return apcaccess output

CLI Example:

```
salt '*' apcups.status
```

salt.modules.apcups.**status_battery**()

Return true if running on battery power

CLI Example:

```
salt '*' apcups.status_battery
```

salt.modules.apcups.**status_charge**()

Return battery charge

CLI Example:

```
salt '*' apcups.status_charge
```

salt.modules.apcups.**status_load**()

Return load

CLI Example:

```
salt '*' apcups.status_load
```

21.9.15 salt.modules.apf

Support for Advanced Policy Firewall (APF)

maintainer Mostafa Hussein <mostafa.hussein91@gmail.com>

maturity new

depends python-iptables

platform Linux

salt.modules.apf.**allow**(*ip*, *port=None*)

Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall CLI Example:

```
salt '*' apf.allow 127.0.0.1
```

salt.modules.apf.**deny**(*ip*)

Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall CLI Example:

```
salt '*' apf.deny 1.2.3.4
```

salt.modules.apf.**disable**()

Stop (flush) all firewall rules CLI Example:

```
salt '*' apf.disable
```

salt.modules.apf.**enable**()

Load all firewall rules CLI Example:

```
salt '*' apf.enable
```

salt.modules.apf.**refresh**()

Refresh & resolve dns names in trust rules CLI Example:

```
salt '*' apf.refresh
```

`salt.modules.apf.`**`reload`**`()`
Stop (flush) & reload firewall rules CLI Example:

```
salt '*' apf.reload
```

`salt.modules.apf.`**`remove`**`(`*ip*`)`
Remove host from [glob]*_hosts.rules and immediately remove rule from firewall CLI Example:

```
salt '*' apf.remove 1.2.3.4
```

`salt.modules.apf.`**`running`**`()`
Check apf status CLI Example:

```
salt '*' apf.running
```

21.9.16 salt.modules.apkpkg

Support for apk

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.apkpkg.`**`file_dict`**`(`**packages*`)`
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.apkpkg.`**`file_list`**`(`**packages*`)`
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.apkpkg.`**`install`**`(`*name=None, refresh=False, pkgs=None, sources=None, **kwargs*`)`
Install the passed package, add refresh=True to update the apk database.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

sources A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

install_recommends Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.apkpkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.apkpkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.apkpkg.`**`list_upgrades`**(*refresh=True*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.apkpkg.`**`owner`**(**paths*)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version <salt.modules.apk.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

salt '*' pkg.owns /usr/bin/apachectl salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename

`salt.modules.apkpkg.`**`purge`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`
Alias to remove

`salt.modules.apkpkg.`**`refresh_db`**`()`
Updates the package list

- `True`: Database updated successfully
- `False`: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.apkpkg.`**`remove`**`(`*name=None*, *pkgs=None*, *purge=False*, ***kwargs*`)`
Remove packages using `apk del`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.apkpkg.`**`upgrade`**`(`*name=None*, *pkgs=None*, *refresh=True*`)`
Upgrades all packages via `apk upgrade` or a specific package if name or pkgs is specified. Name is ignored if pkgs is specified

Returns a dict containing the changes.

{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.apkpkg.`**`version`**`(`**names*, ***kwargs*`)`
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.17 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

For repository management, the `python-apt` package must be installed.

`salt.modules.aptpkg.`**`add_repo_key`**(*path=None, text=None, keyserver=None, keyid=None, saltenv='base'*)

New in version 2017.7.0.

Add a repo key using `apt-key add`.

Parameters

- **`path`** (*`str`*) – The path of the key file to import.
- **`text`** (*`str`*) – The key data to import, in string form.
- **`keyserver`** (*`str`*) – The server to download the repo key specified by the keyid.
- **`keyid`** (*`str`*) – The key id of the repo key to add.
- **`saltenv`** (*`str`*) – The environment the key file resides in.

Returns A boolean representing whether the repo key was added.

Return type bool

CLI Examples:

```
salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'

salt '*' pkg.add_repo_key text="'$KEY1'"

salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

`salt.modules.aptpkg.`**`autoremove`**(*list_only=False, purge=False*)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

list_only [False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.

purge [False] Also remove package config data when autoremoving packages.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

`salt.modules.aptpkg.`**`del_repo`**(*repo, **kwargs*)

Delete a repo from the sources.list / sources.list.d

If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.

The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```

`salt.modules.aptpkg.`**`del_repo_key`**(*name=None*, ***kwargs*)

New in version 2015.8.0.

Remove a repo key using `apt-key del`

name Repo from which to remove the key. Unnecessary if `keyid` is passed.

keyid The KeyID of the GPG key to remove

keyid_ppa [False] If set to `True`, the repo's GPG key ID will be looked up from ppa.launchpad.net and removed.

> **Note:** Setting this option to `True` requires that the `name` param also be passed.

CLI Examples:

```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

`salt.modules.aptpkg.`**`expand_repo_def`**(***kwargs*)

Take a repository definition and expand it to the full pkg repository dict that can be used for comparison. This is a helper function to make the Debian/Ubuntu apt sources sane for comparison in the pkgrepo states.

This is designed to be called from pkgrepo states and will have little use being called on the CLI.

`salt.modules.aptpkg.`**`file_dict`**(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

`salt.modules.aptpkg.`**`file_list`**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.aptpkg.`**`get_repo`**(*repo*, ***kwargs*)

Display a repo from the sources.list / sources.list.d

The repo passed in needs to be a complete repo entry.

CLI Examples:

```
salt '*' pkg.get_repo "myrepo definition"
```

`salt.modules.aptpkg.`**`get_repo_keys`**`()`

New in version 2017.7.0.

List known repo key details.

Returns A dictionary containing the repo keys.

Return type dict

CLI Examples:

```
salt '*' pkg.get_repo_keys
```

`salt.modules.aptpkg.`**`get_selections`**`(`*pattern=None, state=None*`)`

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```
{'<host>':
    {'<state>': ['pkg1',
                 ...
                ]
    },
    ...
}
```

CLI Example:

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

`salt.modules.aptpkg.`**`hold`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

New in version 2014.7.0.

Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.`**`info_installed`**`(`**names, **kwargs*`)`

Return the information of the named package(s) installed on the system.

New in version 2015.8.1.

names The names of the packages for which to return information.

failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> failhard=false
```

`salt.modules.aptpkg.install`(*name=None, refresh=False, fromrepo=None, skip_verify=False, debconf=None, pkgs=None, sources=None, reinstall=False, downloadonly=False, ignore_epoch=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package, add refresh=True to update the dpkg database.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

fromrepo Specify a package repository to install from (e.g., `apt-get -t unstable install somepackage`)

skip_verify Skip the GPG verification check (e.g., `--allow-unauthenticated`, or `--force-bad-verify` for install from package file).

debconf Provide the path to a debconf answers file, processed before installation.

version Install a specific version of the package, e.g. 1.2.3~0ubuntu0. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

reinstall [False] Specifying reinstall=True will use `apt-get install --reinstall` rather than simply `apt-get install` for requested packages that are already installed.

If a version is specified with the requested package, then `apt-get install --reinstall` will only be used if the installed version matches the requested version.

New in version 2015.8.0.

ignore_epoch [False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to `True`, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

sources A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

force_yes Passes `--force-yes` to the apt-get command. Don't use this unless you know what you're doing.

New in version 0.17.4.

install_recommends Whether to install the packages marked as recommended. Default is True.

New in version 2015.5.0.

only_upgrade Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

force_conf_new Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.aptpkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.`**`list_downloaded`**(*root=None*, ***kwargs*)

New in version 3000?.

List prefetched packages downloaded by apt in the local disk.

root operate on a different root directory.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.aptpkg.`**`list_pkgs`**`(`*versions_as_list=False, removed=False, purge_desired=False, **kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

removed If `True`, then only packages which have been removed (but not purged) will be returned.

purge_desired If `True`, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed

Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.aptpkg.`**`list_repo_pkgs`**`(`**args, **kwargs*`)`

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *`pkg.installed`* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
    'bash': ['4.3-14ubuntu1.1',
             '4.3-14ubuntu1'],
    'nginx': ['1.10.0-0ubuntu0.16.04.4',
              '1.9.15-0ubuntu1']
}
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

`salt.modules.aptpkg.`**`list_repos`**`()`

Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

`salt.modules.aptpkg.`**`list_upgrades`**`(`*refresh=True, dist_upgrade=True, **kwargs*`)`

List all available package upgrades.

refresh Whether to refresh the package database before listing upgrades. Default: True.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

dist_upgrade Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.aptpkg.`**`mod_repo`**(*repo*, *saltenv='base'*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the `ppa:<project>/repo` format is acceptable. `ppa:` format can only be used to create a new repository.

The following options are available to modify a repo definition:

architectures A comma-separated list of supported architectures, e.g. `amd64` If this option is not set, all architectures (configured in the system) will be used.

comps A comma separated list of components for the repo, e.g. `main`

file A file name to be used

keyserver Keyserver to get gpg key from

keyid Key ID or a list of key IDs to load with the `keyserver` argument

key_url URL to a GPG key to add to the APT GPG keyring

key_text GPG key in string form to add to the APT GPG keyring

New in version 2018.3.0.

consolidate [False] If `True`, will attempt to de-duplicate and consolidate sources

comments Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (#) before it.

New in version 2015.8.9.

refresh [True] Enable or disable (True or False) refreshing of the apt package database. The previous `refresh_db` argument was deprecated in favor of `refresh``. The `refresh_db` argument will still continue to work to ensure backwards compatibility, but please change to using the preferred `refresh`.

Note: Due to the way keys are stored for APT, there is a known issue where the key won't be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

CLI Examples:

```
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

`salt.modules.aptpkg.`**`normalize_name`**(*name*)

Strips the architecture from the specified package name, if necessary.

CLI Example:

```
salt '*' pkg.normalize_name zsh:amd64
```

salt.modules.aptpkg.**owner**(**paths*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

salt.modules.aptpkg.**parse_arch**(*name*)

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh:amd64
```

salt.modules.aptpkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.**refresh_db**(*cache_valid_time=0*, *failhard=False*)

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- `True`: Database updated successfully
- `False`: Problem updating database
- `None`: Database already up-to-date

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

failhard

If False, return results of Err lines as `False` for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.aptpkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages using `apt-get remove`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.`**`set_selections`**(*path=None*, *selection=None*, *clear=False*, *saltenv='base'*)

Change package state in the dpkg database.

The state can be any one of, documented in `dpkg(1)`:

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by `apt-get -u dselect-upgrade`.

Note: Be careful with the `clear` argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:

```
{'<host>':
    {'<package>': {'new': '<new-state>',
                   'old': '<old-state>'}
    },
    ...
}
```

CLI Example:

```
salt '*' pkg.set_selections selection='{"install": ["netcat"]}'
salt '*' pkg.set_selections selection='{"hold": ["openssh-server", "openssh-client
↪"]}'
salt '*' pkg.set_selections salt://path/to/file
salt '*' pkg.set_selections salt://path/to/file clear=True
```

`salt.modules.aptpkg.`**`show`**`(`**names, **kwargs*`)`

New in version 2019.2.0.

Runs an `apt-cache show` on the passed package names, and returns the results in a nested dictionary. The top level of the return data will be the package name, with each package name mapping to a dictionary of version numbers to any additional information returned by `apt-cache show`.

filter An optional comma-separated list (or quoted Python list) of case-insensitive keys on which to filter. This allows one to restrict the information returned for each package to a smaller selection of pertinent items.

refresh [False] If `True`, the apt cache will be refreshed first. By default, no refresh is performed.

CLI Examples:

```
salt myminion pkg.show gawk
salt myminion pkg.show 'nginx-*'
salt myminion pkg.show 'nginx-*' filter=description,provides
```

`salt.modules.aptpkg.`**`unhold`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

New in version 2014.7.0.

Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.`**`upgrade`**`(`*refresh=True, dist_upgrade=False, **kwargs*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Upgrades all packages via `apt-get upgrade` or `apt-get dist-upgrade` if `dist_upgrade` is `True`.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

dist_upgrade Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.

New in version 2014.7.0.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

download_only (or downloadonly) Only download the packages, don't unpack or install them. Use downloadonly to be in line with yum and zypper module.

New in version 2018.3.0.

force_conf_new Always install the new version of any configuration files.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.aptpkg.`**`upgrade_available`**`(`*name*`)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.aptpkg.`**`version`**`(`**names, **kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.`**`version_cmp`**`(`*pkg1, pkg2, ignore_epoch=False*`)`

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'
```

21.9.18 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

`salt.modules.archive.`**`cmd_unzip`**(*zip_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim_output=False*, *password=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.unzip`.

Uses the `unzip` command to unpack zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply `unzip`.

zip_file Path of zip file to be unpacked

dest The destination directory into which the file should be unpacked

excludes [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip '/tmp/{{grains.id}}
↪' excludes=file_1,file_2
```

options Optional when using `zip` archives, ignored when usign other archives files. This is mostly used to overwrite existing files with `o`. This options are only used when `unzip` binary is used.

New in version 2016.3.1.

runas [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

password Password to use with password protected zip files

> **Note:** This is not considered secure. It is recommended to instead use *`archive.unzip`* for password-protected ZIP files. If a password is used here, then the unzip command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_
↪2
```

`salt.modules.archive.`**`cmd_zip`**(*zip_file*, *sources*, *template=None*, *cwd=None*, *runas=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.zip`.

Uses the `zip` command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply `zip`.

zip_file Path of zip file to be created

sources Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/
↪tmp/{{grains.id}}.txt
```

cwd [None] Use this argument along with relative paths in `sources` to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was `/`, and creating a zip file of `/foo/bar/baz.txt` will contain the parent directories `foo` and `bar`. To create a zip file containing just `baz.txt`, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

CLI Example:

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.cmd_zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

`salt.modules.archive.`**`gunzip`**(*gzipfile*, *template=None*, *runas=None*, *options=None*)

Uses the gunzip command to unpack gzip files

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

`salt.modules.archive.`**`gzip`**(*sourcefile*, *template=None*, *runas=None*, *options=None*)

Uses the gzip command to create gzip files

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gzip template=jinja /tmp/{{grains.id}}.txt
```

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt.gz
salt '*' archive.gzip /tmp/sourcefile.txt
salt '*' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'
```

`salt.modules.archive.`**`is_encrypted`**`(`*name*, *clean=False*, *saltenv='base'*, *source_hash=None*`)`

New in version 2016.11.0.

Returns `True` if the zip archive is password-protected, `False` if not. If the specified file is not a ZIP archive, an error will be raised.

name The path / URL of the archive to check.

clean [False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

> **Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

saltenv [base] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

source_hash If `name` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' archive.is_encrypted /path/to/myfile.zip
salt '*' archive.is_encrypted salt://foo.zip
salt '*' archive.is_encrypted salt://foo.zip saltenv=dev
salt '*' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '*' archive.is_encrypted https://domain.tld/myfile.zip source_
↪hash=f1d2d2f924e986ac86fdf7b36c94bcdf32beec15
salt '*' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

`salt.modules.archive.`**`list_`**`(`*name*, *archive_format=None*, *options=None*, *strip_components=None*, *clean=False*, *verbose=False*, *saltenv='base'*, *source_hash=None*`)`

New in version 2016.11.0.

Changed in version 2016.11.2: The rarfile Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the `rar` CLI tool, which do not support listing the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

> **Note:** This function will only provide results for XZ-compressed archives if the xz CLI command is available, as Python does not at this time natively support XZ compression in its tarfile module. Keep in mind however that most Linux distros ship with xz already installed.
>
> To check if a given minion has xz, the following Salt command can be run:
>
> ```
> salt minion_id cmd.which xz
> ```
>
> If `None` is returned, then xz is not present and must be installed. It is widely available and should be packaged as either `xz` or `xz-utils`.

name Path/URL of archive

archive_format Specify the format of the archive (`tar`, `zip`, or `rar`). If this argument is omitted, the archive format will be guessed based on the value of the `name` parameter.

options **For tar archives only**. This function will, by default, try to use the tarfile module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to `tar -tf -` to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by tarfile, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress --
↪stdout'
```

Note: It is not necessary to manually specify options for gzip'ed archives, as gzip compression is natively supported by tarfile.

strip_components This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if `--strip-components` (or `--strip`) were used when extracting tar archives.

New in version 2016.11.2.

clean [False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

Note: If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

verbose [False] If `False`, this function will return a list of files/dirs in the archive. If `True`, it will return a dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

saltenv [base] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

source_hash If `name` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list https://domain.tld/myfile.zip source_
↪hash=f1d2d2f924e986ac86fdf7b36c94bcdf32beec15
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

`salt.modules.archive.`**`rar`**(*rarfile, sources, template=None, cwd=None, runas=None*)

Uses rar for Linux to create rar files

rarfile Path of rar file to be created

sources Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

cwd [None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/sourcefile1,/tmp/{
↪{grains.id}}.txt'
```

CLI Example:

```
salt '*' archive.rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.rar /tmp/rarfile.rar '/tmp/sourcefile*'
```

`salt.modules.archive.`**`tar`**(*options*, *tarfile*, *sources=None*, *dest=None*, *cwd=None*, *template=None*, *runas=None*)

Note: This function has changed for version 0.17.0. In prior versions, the `cwd` and `template` arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, `sources` must be a comma-separated list, and the `cwd` and `template` arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

options Options to pass to the tar command

Changed in version 2015.8.0: The mandatory - prefixing has been removed. An options string beginning with a *–long-option*, would have uncharacteristically needed its first - removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they're using the non-- format, when really they are using the with-- format.

tarfile The filename of the tar archive to pack/unpack

sources Comma delimited list of files to **pack** into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

dest The destination directory into which to **unpack** the tarfile

cwd [None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}} template=jinja
```

CLI Examples:

```
# Create a tarfile
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
# Create a tarfile using globbing (2017.7.0 and later)
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
# Unpack a tarfile
salt '*' archive.tar xf foo.tar dest=/target/directory
```

`salt.modules.archive.`**`unrar`**(*rarfile*, *dest*, *excludes=None*, *template=None*, *runas=None*, *trim_output=False*)

Uses rar for Linux to unpack rar files

rarfile Name of rar file to be unpacked

dest The destination directory into which to **unpack** the rar file

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/↩
↪excludes=file_1,file_2
```

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
```

`salt.modules.archive.`**`unzip`**(*zip_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim_output=False*, *password=None*, *extract_perms=True*)

Uses the `zipfile` Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function *`archive.cmd_unzip`*. For versions 2014.7.x and earlier, see the *`archive.cmd_zip`* documentation.

zip_file Path of zip file to be unpacked

dest The destination directory into which the file should be unpacked

excludes [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

options This options are only used when `unzip` binary is used. In this function is ignored.

New in version 2016.3.1.

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}}/↩
↪excludes=file_1,file_2
```

runas [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```

password Password to use with password protected zip files

Note: The password will be present in the events logged to the minion log file at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

extract_perms [True] The Python zipfile module does not extract file/directory attributes by default. When this argument is set to `True`, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to `False` to disable this behavior.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ password='BadPassword'
```

`salt.modules.archive.`**`zip_`**(*zip_file*, *sources*, *template=None*, *cwd=None*, *runas=None*, *zip64=False*)

Uses the `zipfile` Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function *`archive.cmd_zip`*. For versions 2014.7.x and earlier, see the *`archive.cmd_zip`* documentation.

zip_file Path of zip file to be created

sources Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/tmp/{
↪{grains.id}}.txt
```

cwd [None] Use this argument along with relative paths in `sources` to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was `/`, and creating a zip file of `/foo/bar/baz.txt` will contain the parent directories `foo` and `bar`. To create a zip file containing just `baz.txt`, the following command would be used:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

zip64 [False] Used to enable ZIP64 support, necessary to create archives larger than 4 GByte in size. If true, will create ZIP file with the ZIPp64 extension when the zipfile is larger than 2 GB. ZIP64 extension is disabled by default in the Python native zip support because the default zip and unzip commands on Unix (the InfoZIP utilities) don't support these extensions.

CLI Example:

```
salt '*' archive.zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

21.9.19 salt.modules.arista_pyeapi

Arista pyeapi

New in version 2019.2.0.

Execution module to interface the connection with Arista switches, connecting to the remote network device using the pyeapi library. It is flexible enough to execute the commands both when running under an Arista Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `host`, `username`, `password` etc.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>

maturity new

depends pyeapi

platform unix

Note: To understand how to correctly enable the eAPI on your switch, please check https://eos.arista.com/arista-eapi-101/.

Dependencies

The `pyeapi` Execution module requires the Python Client for eAPI (pyeapi) to be installed: `pip install pyeapi`.

Usage

This module can equally be used via the *`pyeapi`* Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API, and the `pyeapi` library is installed.

When running outside of the *`pyeapi Proxy`* (i.e., from another Proxy Minion type, or regular Minion), the pyeapi connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `pyeapi` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `pyeapi` Proxy Module:

transport: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

host: `localhost` The IP address or DNS host name of the connection device.

username: `admin` The username to pass to the device to authenticate the eAPI connection.

password The password to pass to the device to authenticate the eAPI connection.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

enablepwd The enable mode password if required by the destination node.

Example (when not running in a `pyeapi` Proxy Minion):

```
pyeapi:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `pyeapi` Proxy, e.g.:

```
salt '*' pyeapi.send_commands 'show version' 'show interfaces'
salt '*' pyeapi.config 'ntp server 1.2.3.4'
```

Note: Remember that the above applies only when not running in a `pyeapi` Proxy Minion. If you want to use the *`pyeapi Proxy`*, please follow the documentation notes for a proper setup.

`salt.modules.arista_pyeapi.`**`call`**`(`*method*, **args*, ***kwargs*`)`

Invoke an arbitrary pyeapi method.

method The name of the pyeapi method to invoke.

args A list of arguments to send to the method invoked.

kwargs Key-value dictionary to send to the method invoked.

transport: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

host: `localhost` The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

username: `admin` The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

enablepwd The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

CLI Example:

```
salt '*' pyeapi.call run_commands "['show version']"
```

`salt.modules.arista_pyeapi.`**`config`**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

Configures the node with the specified commands.

This method is used to send configuration commands to the node. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Returns the diff after the configuration commands are loaded.

config_file The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

commands The commands to send to the node in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

template_engine: **`jinja`** The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context Variables to add to the template context.

defaults Default values of the `context` dict.

transport: **`https`** Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

host: **`localhost`** The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

username: **`admin`** The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

enablepwd The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

CLI Example:

```
salt '*' pyeapi.config commands="['ntp server 1.2.3.4', 'ntp server 5.6.7.8']"
salt '*' pyeapi.config config_file=salt://config.txt
salt '*' pyeapi.config config_file=https://bit.ly/2LGLcDy context="{'servers': [
↪'1.2.3.4']}"
```

`salt.modules.arista_pyeapi.`**`get_config`**(*config='running-config'*, *params=None*, *as_string=False*, ***kwargs*)

Retrieves the config from the device.

This method will retrieve the config from the node as either a string or a list object. The config to retrieve can be specified as either the startup-config or the running-config.

config: `running-config` Specifies to return either the nodes `startup-config` or `running-config`. The default value is the `running-config`.

params A string of keywords to append to the command for retrieving the config.

as_string: `False` Flag that determines the response. If `True`, then the configuration is returned as a raw string. If `False`, then the configuration is returned as a list. The default value is `False`.

transport: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

host: `localhost` The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

username: `admin` The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

enablepwd The enable mode password if required by the destination node.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

CLI Example:

```
salt '*' pyeapi.get_config
salt '*' pyeapi.get_config params='section snmp-server'
salt '*' pyeapi.get_config config='startup-config'
```

`salt.modules.arista_pyeapi.`**`get_connection`**(***kwargs*)

Return the connection object to the pyeapi Node.

> **Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

kwargs Key-value dictionary with the authentication details.

USAGE Example:

```
conn = __salt__['pyeapi.get_connection'](host='router1.example.com',
                                          username='example',
                                          password='example')
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

`salt.modules.arista_pyeapi.`**`run_commands`**(**commands*, ***kwargs*)

Sends the commands over the transport to the device.

This function sends the commands to the device using the nodes transport. This is a lower layer function that shouldn't normally need to be used, preferring instead to use `config()` or `enable()`.

transport: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

host: `localhost` The IP address or DNS host name of the connection device.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

username: `admin` The username to pass to the device to authenticate the eAPI connection.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

enablepwd The enable mode password if required by the destination node.

> **Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

CLI Example:

```
salt '*' pyeapi.run_commands 'show version'
salt '*' pyeapi.run_commands 'show version' encoding=text

      version:
          4.18.1F
```

`salt.modules.arista_pyeapi.`**`section`**(*regex*, *config='running-config'*, ***kwargs*)

Return a section of the config.

regex A valid regular expression used to select sections of configuration to return.

config: **`running-config`** The configuration to return. Valid values for config are `running-config` or `startup-config`. The default value is `running-config`.

transport: **`https`** Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

host: **`localhost`** The IP address or DNS host name of the connection device.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

username: **`admin`** The username to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

password The password to pass to the device to authenticate the eAPI connection.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

port The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

enablepwd The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a *`pyeapi`* Proxy Minion.

CLI Example:

```
salt '*'
```

21.9.20 salt.modules.artifactory

Module for fetching artifacts from Artifactory

`exception` `salt.modules.artifactory.`**`ArtifactoryError`**(*value*)

`salt.modules.artifactory.`**`get_latest_release`**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*, *use_literal_group_id=False*)

Gets the latest release of the artifact

artifactory_url URL of artifactory instance

repository Release repository in artifactory to retrieve artifact from, for example: libs-releases

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username Artifactory username. Optional parameter.

password Artifactory password. Optional parameter.

`salt.modules.artifactory.`**`get_latest_snapshot`**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*, *use_literal_group_id=False*)

Gets latest snapshot of the given artifact

artifactory_url URL of artifactory instance

repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username Artifactory username. Optional parameter.

password Artifactory password. Optional parameter.

`salt.modules.artifactory.`**`get_release`**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*, *use_literal_group_id=False*)

Gets the specified release of the artifact

artifactory_url URL of artifactory instance

repository Release repository in artifactory to retrieve artifact from, for example: libs-releases

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

version Version of the artifact

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username Artifactory username. Optional parameter.

password Artifactory password. Optional parameter.

`salt.modules.artifactory.`**`get_snapshot`**(*artifactory_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False*)

Gets snapshot of the desired version of the artifact

artifactory_url URL of artifactory instance

repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

version Version of the artifact

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username Artifactory username. Optional parameter.

password Artifactory password. Optional parameter.

21.9.21 salt.modules.at

Wrapper module for at(1)

Also, a 'tag' feature has been added to more easily tag jobs.

platform linux,openbsd,freebsd

Changed in version 2017.7.0.

`salt.modules.at.`**`at`**(**args, **kwargs*)

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

`salt.modules.at.`**`atc`**(*jobid*)

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

`salt.modules.at.`**`atq`**`(`*tag=None*`)`

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

`salt.modules.at.`**`atrm`**`(`**args*`)`

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

`salt.modules.at.`**`jobcheck`**`(`***kwargs*`)`

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

21.9.22 salt.modules.at_solaris

Wrapper for at(1) on Solaris-like systems

Note: we try to mirror the generic at module where possible

maintainer jorge schrauwen <sjorge@blackdot.be>

maturity new

platform solaris,illumos,smartso

New in version 2017.7.0.

`salt.modules.at_solaris.`**`at`**`(`**args, **kwargs*`)`

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

`salt.modules.at_solaris.`**`atc`**`(`*jobid*`)`

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

`salt.modules.at_solaris.`**`atq`**(*tag=None*)

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

`salt.modules.at_solaris.`**`atrm`**(**args*)

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

`salt.modules.at_solaris.`**`jobcheck`**(***kwargs*)

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

21.9.23 salt.modules.augeas_cfg

Manages configuration files via augeas

This module requires the `augeas` Python module.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.modules.augeas_cfg.`**`execute`**(*context=None, lens=None, commands=(), load_path=None*)

Execute Augeas commands

New in version 2014.7.0.

CLI Example:

```
salt '*' augeas.execute /files/etc/redis/redis.conf \
commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```

context The Augeas context

lens The Augeas lens to use

commands The Augeas commands to execute

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`get`**(*path*, *value=''*, *load_path=None*)

Get a value for a specific augeas path

CLI Example:

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

path The path to get the value of

value The optional value to get

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`ls`**(*path*, *load_path=None*)

List the direct children of a node

CLI Example:

```
salt '*' augeas.ls /files/etc/passwd
```

path The path to list

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`match`**(*path*, *value=''*, *load_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

path The path to match

value The value to match on

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`remove`**(*path*, *load_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.remove \
/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

path The path to remove

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`setvalue`**`(`**args*`)`

Set a value for a specific augeas path

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```

This will set the first entry in /etc/hosts to localhost

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \
                         /files/etc/hosts/01/canonical test
```

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:

```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \
         "spec[user = '%wheel']/user" "%wheel" \
         "spec[user = '%wheel']/host_group/host" 'ALL' \
         "spec[user = '%wheel']/host_group/command[1]" 'ALL' \
         "spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \
         "spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \
         "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/aptitude
```

`salt.modules.augeas_cfg.`**`tree`**`(`*path, load_path=None*`)`

Returns recursively the complete tree of a node

CLI Example:

```
salt '*' augeas.tree /files/etc/
```

path The base of the recursive listing

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

21.9.24 salt.modules.aws_sqs

Support for the Amazon Simple Queue Service.

`salt.modules.aws_sqs.`**`create_queue`**`(`*name*, *region*, *opts=None*, *user=None*`)`

Creates a queue with the correct name.

name Name of the SQS queue to create

region Region to create the SQS queue in

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt '*' aws_sqs.create_queue <sqs queue> <region>

`salt.modules.aws_sqs.`**`delete_message`**`(`*queue*, *region*, *receipthandle*, *opts=None*, *user=None*`)`

Delete one or more messages from a queue in a region

queue The name of the queue to delete messages from

region Region where SQS queues exists

receipthandle The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from receive_message

opts [None] Any additional options to add to the command line

user [None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle='<sqs
↪ReceiptHandle>'
```

New in version 2014.7.0.

`salt.modules.aws_sqs.`**`delete_queue`**`(`*name*, *region*, *opts=None*, *user=None*`)`

Deletes a queue in the region.

name Name of the SQS queue to deletes

region Name of the region to delete the queue from

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt '*' aws_sqs.delete_queue <sqs queue> <region>

`salt.modules.aws_sqs.`**`list_queues`**`(`*region*, *opts=None*, *user=None*`)`

List the queues in the selected region.

region Region to list SQS queues for

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt '*' aws_sqs.list_queues <region>

`salt.modules.aws_sqs.`**`queue_exists`**`(`*name*, *region*, *opts=None*, *user=None*`)`

Returns True or False on whether the queue exists in the region

name Name of the SQS queue to search for

region Name of the region to search for the queue in

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt ’*’ aws_sqs.queue_exists <sqs queue> <region>

`salt.modules.aws_sqs.`**`receive_message`**`(`*queue, region, num=1, opts=None, user=None*`)`

Receive one or more messages from a queue in a region

queue The name of the queue to receive messages from

region Region where SQS queues exists

num [1] The max number of messages to receive

opts [None] Any additional options to add to the command line

user [None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.receive_message <sqs queue> <region>
salt '*' aws_sqs.receive_message <sqs queue> <region> num=10
```

New in version 2014.7.0.

21.9.25 salt.modules.azurearm_compute

Azure (ARM) Compute Execution Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

`salt.modules.azurearm_compute.`**`availability_set_create_or_update`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Create or update an availability set.

Parameters

- **`name`** – The availability set to create.
- **`resource_group`** – The resource group name assigned to the availability set.

CLI Example:

```
salt-call azurearm_compute.availability_set_create_or_update testset testgroup
```

`salt.modules.azurearm_compute.`**`availability_set_delete`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Delete an availability set.

Parameters

- **`name`** – The availability set to delete.
- **`resource_group`** – The resource group name assigned to the availability set.

CLI Example:

```
salt-call azurearm_compute.availability_set_delete testset testgroup
```

`salt.modules.azurearm_compute.`**`availability_set_get`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Get a dictionary representing an availability set's properties.

Parameters

- **`name`** – The availability set to get.
- **`resource_group`** – The resource group name assigned to the availability set.

CLI Example:

```
salt-call azurearm_compute.availability_set_get testset testgroup
```

`salt.modules.azurearm_compute.`**`availability_sets_list`**`(`*resource_group*, ***kwargs*`)`

New in version 2019.2.0.

List all availability sets within a resource group.

Parameters **`resource_group`** – The resource group name to list availability sets within.

CLI Example:

```
salt-call azurearm_compute.availability_sets_list testgroup
```

`salt.modules.azurearm_compute.`**`availability_sets_list_available_sizes`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

List all available virtual machine sizes that can be used to to create a new virtual machine in an existing availability set.

Parameters

- **`name`** – The availability set name to list available virtual machine sizes within.
- **`resource_group`** – The resource group name to list available availability set sizes within.

CLI Example:

```
salt-call azurearm_compute.availability_sets_list_available_sizes testset
↪testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machine_capture`**`(`*name*, *destination_name*, *resource_group*, *prefix='capture-'*, *overwrite=False*, ***kwargs*`)`

New in version 2019.2.0.

Captures the VM by copying virtual hard disks of the VM and outputs a template that can be used to create similar VMs.

Parameters

- **`name`** – The name of the virtual machine.
- **`destination_name`** – The destination container name.
- **`resource_group`** – The resource group name assigned to the virtual machine.

- **prefix** – (Default: 'capture-') The captured virtual hard disk's name prefix.
- **overwrite** – (Default: False) Overwrite the destination disk in case of conflict.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_capture testvm testcontainer testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machine_convert_to_managed_disks`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Converts virtual machine disks from blob-based to managed disks. Virtual machine must be stop-deallocated before invoking this operation.

Parameters

- **name** – The name of the virtual machine to convert.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_convert_to_managed_disks testvm␣
↪testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machine_deallocate`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Power off a virtual machine and deallocate compute resources.

Parameters

- **name** – The name of the virtual machine to deallocate.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_deallocate testvm testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machine_generalize`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Set the state of a virtual machine to 'generalized'.

Parameters

- **name** – The name of the virtual machine.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_generalize testvm testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machine_get`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Retrieves information about the model view or the instance view of a virtual machine.

Parameters

- **name** – The name of the virtual machine.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_get testvm testgroup
```

salt.modules.azurearm_compute.**virtual_machine_power_off**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Power off (stop) a virtual machine.

Parameters

- **name** – The name of the virtual machine to stop.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_power_off testvm testgroup
```

salt.modules.azurearm_compute.**virtual_machine_redeploy**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Redeploy a virtual machine.

Parameters

- **name** – The name of the virtual machine to redeploy.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_redeploy testvm testgroup
```

salt.modules.azurearm_compute.**virtual_machine_restart**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Restart a virtual machine.

Parameters

- **name** – The name of the virtual machine to restart.
- **resource_group** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_restart testvm testgroup
```

salt.modules.azurearm_compute.**virtual_machine_start**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Power on (start) a virtual machine.

Parameters

- **`name`** – The name of the virtual machine to start.
- **`resource_group`** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machine_start testvm testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machines_list`**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all virtual machines within a resource group.

Parameters **`resource_group`** – The resource group name to list virtual machines within.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list testgroup
```

`salt.modules.azurearm_compute.`**`virtual_machines_list_all`**(***kwargs*)

New in version 2019.2.0.

List all virtual machines within a subscription.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list_all
```

`salt.modules.azurearm_compute.`**`virtual_machines_list_available_sizes`**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Lists all available virtual machine sizes to which the specified virtual machine can be resized.

Parameters

- **`name`** – The name of the virtual machine.
- **`resource_group`** – The resource group name assigned to the virtual machine.

CLI Example:

```
salt-call azurearm_compute.virtual_machines_list_available_sizes testvm testgroup
```

21.9.26 salt.modules.azurearm_network

Azure (ARM) Network Execution Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0

- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.

Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

`salt.modules.azurearm_network.`**`check_dns_name_availability`**`(`*name*, *region*, ***kwargs*`)`

New in version 2019.2.0.

Check whether a domain name in the current zone is available for use.

Parameters

- **`name`** – The DNS name to query.
- **`region`** – The region to query for the DNS name in question.

CLI Example:

```
salt-call azurearm_network.check_dns_name_availability testdnsname westus
```

`salt.modules.azurearm_network.`**`check_ip_address_availability`**(*ip_address*, *virtual_network*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Check that a private ip address is available within the specified virtual network.

Parameters

- **ip_address** – The ip_address to query.
- **virtual_network** – The virtual network to query for the IP address in question.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.check_ip_address_availability 10.0.0.4 testnet␣
↪testgroup
```

`salt.modules.azurearm_network.`**`default_security_rule_get`**(*name*, *security_group*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a default security rule within a security group.

Parameters

- **name** – The name of the security rule to query.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.default_security_rule_get DenyAllOutBound testnsg␣
↪testgroup
```

`salt.modules.azurearm_network.`**`default_security_rules_list`**(*security_group*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

List default security rules within a security group.

Parameters

- **security_group** – The network security group to query.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.default_security_rules_list testnsg testgroup
```

`salt.modules.azurearm_network.`**`get_virtual_machine_scale_set_network_interface`**(*name*, *scale_set*, *vm_index*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get information about a specfic network interface within a scale set.

Parameters

- **`name`** – The name of the network interface to query.
- **`scale_set`** – The name of the scale set containing the interface.
- **`vm_index`** – The virtual machine index.
- **`resource_group`** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.get_virtual_machine_scale_set_network_interface test-
↪iface0 testset testvm testgroup
```

`salt.modules.azurearm_network.`**`list_virtual_machine_scale_set_network_interfaces`**(*scale_set*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get information about all network interfaces within a scale set.

Parameters

- **`scale_set`** – The name of the scale set to query.
- **`resource_group`** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces␣
↪testset testgroup
```

`salt.modules.azurearm_network.`**`list_virtual_machine_scale_set_vm_network_interfaces`**(*scale_set*, *vm_index*, *re-source_gro*
***kwargs*)

New in version 2019.2.0.

Get information about all network interfaces in a specific virtual machine within a scale set.

Parameters

- **`scale_set`** – The name of the scale set to query.
- **`vm_index`** – The virtual machine index.
- **`resource_group`** – The resource group name assigned to the scale set.

CLI Example:

```
salt-call azurearm_network.list_virtual_machine_scale_set_vm_network_interfaces␣
↪testset testvm testgroup
```

`salt.modules.azurearm_network.`**`load_balancer_create_or_update`**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Create or update a load balancer within a specified resource group.

Parameters

- **name** – The name of the load balancer to create.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:

```
salt-call azurearm_network.load_balancer_create_or_update testlb testgroup
```

salt.modules.azurearm_network.**load_balancer_delete**(*name*, *resource_group*, ***kwargs*)
New in version 2019.2.0.

Delete a load balancer.

Parameters

- **name** – The name of the load balancer to delete.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:

```
salt-call azurearm_network.load_balancer_delete testlb testgroup
```

salt.modules.azurearm_network.**load_balancer_get**(*name*, *resource_group*, ***kwargs*)
New in version 2019.2.0.

Get details about a specific load balancer.

Parameters

- **name** – The name of the load balancer to query.
- **resource_group** – The resource group name assigned to the load balancer.

CLI Example:

```
salt-call azurearm_network.load_balancer_get testlb testgroup
```

salt.modules.azurearm_network.**load_balancers_list**(*resource_group*, ***kwargs*)
New in version 2019.2.0.

List all load balancers within a resource group.

Parameters **resource_group** – The resource group name to list load balancers within.

CLI Example:

```
salt-call azurearm_network.load_balancers_list testgroup
```

salt.modules.azurearm_network.**load_balancers_list_all**(***kwargs*)
New in version 2019.2.0.

List all load balancers within a subscription.

CLI Example:

```
salt-call azurearm_network.load_balancers_list_all
```

`salt.modules.azurearm_network.`**`network_interface_create_or_update`**`(`*name, ip_configurations, subnet, virtual_network, resource_group, **kwargs*`)`

New in version 2019.2.0.

Create or update a network interface within a specified resource group.

Parameters

- **`name`** – The name of the network interface to create.
- **`ip_configurations`** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **`subnet`** – The name of the subnet assigned to the network interface.
- **`virtual_network`** – The name of the virtual network assigned to the subnet.
- **`resource_group`** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.network_interface_create_or_update test-iface0 [{'name
↪': 'testipconfig1'}]                          testsubnet testnet testgroup
```

`salt.modules.azurearm_network.`**`network_interface_delete`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Delete a network interface.

Parameters

- **`name`** – The name of the network interface to delete.
- **`resource_group`** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_delete test-iface0 testgroup
```

`salt.modules.azurearm_network.`**`network_interface_get`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Get details about a specific network interface.

Parameters

- **`name`** – The name of the network interface to query.
- **`resource_group`** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_get test-iface0 testgroup
```

salt.modules.azurearm_network.**network_interface_get_effective_route_table**(*name, resource_group, **kwargs*)

New in version 2019.2.0.

Get all route tables for a specific network interface.

Parameters

- **name** – The name of the network interface to query.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_get_effective_route_table test-
↪iface0 testgroup
```

salt.modules.azurearm_network.**network_interface_list_effective_network_security_groups**(*nam re- sourc **kw*

New in version 2019.2.0.

Get all network security groups applied to a specific network interface.

Parameters

- **name** – The name of the network interface to query.
- **resource_group** – The resource group name assigned to the network interface.

CLI Example:

```
salt-call azurearm_network.network_interface_list_effective_network_security_
↪groups test-iface0 testgroup
```

salt.modules.azurearm_network.**network_interfaces_list**(*resource_group, **kwargs*)

New in version 2019.2.0.

List all network interfaces within a resource group.

Parameters **resource_group** – The resource group name to list network interfaces within.

CLI Example:

```
salt-call azurearm_network.network_interfaces_list testgroup
```

salt.modules.azurearm_network.**network_interfaces_list_all**(***kwargs*)

New in version 2019.2.0.

List all network interfaces within a subscription.

CLI Example:

```
salt-call azurearm_network.network_interfaces_list_all
```

salt.modules.azurearm_network.**network_security_group_create_or_update**(*name, resource_group, **kwargs*)

New in version 2019.2.0.

Create or update a network security group.

Parameters

- **name** – The name of the network security group to create.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_create_or_update testnsg␣
↪testgroup
```

salt.modules.azurearm_network.**network_security_group_delete**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Delete a network security group within a resource group.

Parameters

- **name** – The name of the network security group to delete.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_delete testnsg testgroup
```

salt.modules.azurearm_network.**network_security_group_get**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a network security group within a resource group.

Parameters

- **name** – The name of the network security group to query.
- **resource_group** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.network_security_group_get testnsg testgroup
```

salt.modules.azurearm_network.**network_security_groups_list**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all network security groups within a resource group.

Parameters **resource_group** – The resource group name to list network security groups within.

CLI Example:

```
salt-call azurearm_network.network_security_groups_list testgroup
```

salt.modules.azurearm_network.**network_security_groups_list_all**(***kwargs*)

New in version 2019.2.0.

List all network security groups within a subscription.

CLI Example:

```
salt-call azurearm_network.network_security_groups_list_all
```

salt.modules.azurearm_network.**public_ip_address_create_or_update**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Create or update a public IP address within a specified resource group.

Parameters

- **name** – The name of the public IP address to create.
- **resource_group** – The resource group name assigned to the public IP address.

CLI Example:

```
salt-call azurearm_network.public_ip_address_create_or_update test-ip-0 testgroup
```

salt.modules.azurearm_network.**public_ip_address_delete**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Delete a public IP address.

Parameters

- **name** – The name of the public IP address to delete.
- **resource_group** – The resource group name assigned to the public IP address.

CLI Example:

```
salt-call azurearm_network.public_ip_address_delete test-pub-ip testgroup
```

salt.modules.azurearm_network.**public_ip_address_get**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a specific public IP address.

Parameters

- **name** – The name of the public IP address to query.
- **resource_group** – The resource group name assigned to the public IP address.

CLI Example:

```
salt-call azurearm_network.public_ip_address_get test-pub-ip testgroup
```

salt.modules.azurearm_network.**public_ip_addresses_list**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all public IP addresses within a resource group.

Parameters **resource_group** – The resource group name to list public IP addresses within.

CLI Example:

```
salt-call azurearm_network.public_ip_addresses_list testgroup
```

`salt.modules.azurearm_network.`**`public_ip_addresses_list_all`**`(`***kwargs*`)`

New in version 2019.2.0.

List all public IP addresses within a subscription.

CLI Example:

```
salt-call azurearm_network.public_ip_addresses_list_all
```

`salt.modules.azurearm_network.`**`route_create_or_update`**`(`*name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, **kwargs*`)`

New in version 2019.2.0.

Create or update a route within a specified route table.

Parameters

- **`name`** – The name of the route to create.
- **`address_prefix`** – The destination CIDR to which the route applies.
- **`next_hop_type`** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **`next_hop_ip_address`** – Optional IP address to which packets should be forwarded. Next hop values are only allowed in routes where the next_hop_type is 'VirtualAppliance'.
- **`route_table`** – The name of the route table containing the route.
- **`resource_group`** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_create_or_update test-rt '10.0.0.0/8' test-rt-
↪table testgroup
```

`salt.modules.azurearm_network.`**`route_delete`**`(`*name, route_table, resource_group, **kwargs*`)`

New in version 2019.2.0.

Delete a route from a route table.

Parameters

- **`name`** – The route to delete.
- **`route_table`** – The route table containing the route.
- **`resource_group`** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_delete test-rt test-rt-table testgroup
```

`salt.modules.azurearm_network.`**`route_filter_create_or_update`**`(`*name, resource_group, **kwargs*`)`

New in version 2019.2.0.

Create or update a route filter within a specified resource group.

Parameters

- **name** – The name of the route filter to create.
- **resource_group** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_create_or_update test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filter_delete`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Delete a route filter.

Parameters

- **name** – The name of the route filter to delete.
- **resource_group** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_delete test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filter_get`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Get details about a specific route filter.

Parameters

- **name** – The name of the route table to query.
- **resource_group** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_get test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filter_rule_create_or_update`**`(`*name*, *access*, *communities*, *route_filter*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Create or update a rule within a specified route filter.

Parameters

- **name** – The name of the rule to create.
- **access** – The access type of the rule. Valid values are 'Allow' and 'Deny'.
- **communities** – A list of BGP communities to filter on.
- **route_filter** – The name of the route filter containing the rule.
- **resource_group** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_create_or_update ␣
↪test-rule allow "['12076:51006']" test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filter_rule_delete`**`(`*name, route_filter, resource_group, **kwargs*`)`

New in version 2019.2.0.

Delete a route filter rule.

Parameters

- **`name`** – The route filter rule to delete.
- **`route_filter`** – The route filter containing the rule.
- **`resource_group`** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_delete test-rule test-filter␣
↪testgroup
```

`salt.modules.azurearm_network.`**`route_filter_rule_get`**`(`*name, route_filter, resource_group, **kwargs*`)`

New in version 2019.2.0.

Get details about a specific route filter rule.

Parameters

- **`name`** – The route filter rule to query.
- **`route_filter`** – The route filter containing the rule.
- **`resource_group`** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rule_get test-rule test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filter_rules_list`**`(`*route_filter, resource_group, **kwargs*`)`

New in version 2019.2.0.

List all routes within a route filter.

Parameters

- **`route_filter`** – The route filter to query.
- **`resource_group`** – The resource group name assigned to the route filter.

CLI Example:

```
salt-call azurearm_network.route_filter_rules_list test-filter testgroup
```

`salt.modules.azurearm_network.`**`route_filters_list`**`(`*resource_group, **kwargs*`)`

New in version 2019.2.0.

List all route filters within a resource group.

Parameters **`resource_group`** – The resource group name to list route filters within.

CLI Example:

```
salt-call azurearm_network.route_filters_list testgroup
```

salt.modules.azurearm_network.**route_filters_list_all**(***kwargs*)

New in version 2019.2.0.

List all route filters within a subscription.

CLI Example:

```
salt-call azurearm_network.route_filters_list_all
```

salt.modules.azurearm_network.**route_get**(*name*, *route_table*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a specific route.

Parameters

- **name** – The route to query.
- **route_table** – The route table containing the route.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_get test-rt test-rt-table testgroup
```

salt.modules.azurearm_network.**route_table_create_or_update**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Create or update a route table within a specified resource group.

Parameters

- **name** – The name of the route table to create.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_create_or_update test-rt-table testgroup
```

salt.modules.azurearm_network.**route_table_delete**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Delete a route table.

Parameters

- **name** – The name of the route table to delete.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_delete test-rt-table testgroup
```

salt.modules.azurearm_network.**route_table_get**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a specific route table.

Parameters

- **name** – The name of the route table to query.

- **resource_group** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.route_table_get test-rt-table testgroup
```

`salt.modules.azurearm_network.`**`route_tables_list`**`(`*resource_group*, ***kwargs*`)`

New in version 2019.2.0.

List all route tables within a resource group.

Parameters **resource_group** – The resource group name to list route tables within.

CLI Example:

```
salt-call azurearm_network.route_tables_list testgroup
```

`salt.modules.azurearm_network.`**`route_tables_list_all`**`(`***kwargs*`)`

New in version 2019.2.0.

List all route tables within a subscription.

CLI Example:

```
salt-call azurearm_network.route_tables_list_all
```

`salt.modules.azurearm_network.`**`routes_list`**`(`*route_table*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

List all routes within a route table.

Parameters

- **route_table** – The route table to query.
- **resource_group** – The resource group name assigned to the route table.

CLI Example:

```
salt-call azurearm_network.routes_list test-rt-table testgroup
```

`salt.modules.azurearm_network.`**`security_rule_create_or_update`**`(`*name*, *access*, *direction*, *priority*, *protocol*, *security_group*, *resource_group*, *source_address_prefix=None*, *destination_address_prefix=None*, *source_port_range=None*, *destination_port_range=None*, *source_address_prefixes=None*, *destination_address_prefixes=None*, *source_port_ranges=None*, *destination_port_ranges=None*, ***kwargs*`)`

New in version 2019.2.0.

Create or update a security rule within a specified network security group.

Parameters

- **`name`** – The name of the security rule to create.
- **`access`** – 'allow' or 'deny'
- **`direction`** – 'inbound' or 'outbound'
- **`priority`** – Integer between 100 and 4096 used for ordering rule application.
- **`protocol`** – 'tcp', 'udp', or '*'
- **`destination_address_prefix`** – The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **`destination_port_range`** – The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **`source_address_prefix`** – The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **`source_port_range`** – The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **`destination_address_prefixes`** – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **`destination_port_ranges`** – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **`source_address_prefixes`** – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **`source_port_ranges`** – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **`security_group`** – The network security group containing the security rule.
- **`resource_group`** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.security_rule_create_or_update testrule1 allow⊠
↪outbound 101 tcp testnsg testgroup                     source_address_prefix='*'⊠
↪destination_address_prefix=internet source_port_range='*'                  ⊠
↪destination_port_range='1-1024'
```

`salt.modules.azurearm_network.`**`security_rule_delete`**(*security_rule*, *security_group*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Delete a security rule within a specified security group.

Parameters

- **`name`** – The name of the security rule to delete.
- **`security_group`** – The network security group containing the security rule.

- **`resource_group`** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.security_rule_delete testrule1 testnsg testgroup
```

`salt.modules.azurearm_network.`**`security_rule_get`**`(`*security_rule, security_group, resource_group, **kwargs*`)`

New in version 2019.2.0.

Get a security rule within a specified network security group.

Parameters

- **`name`** – The name of the security rule to query.
- **`security_group`** – The network security group containing the security rule.
- **`resource_group`** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.security_rule_get testrule1 testnsg testgroup
```

`salt.modules.azurearm_network.`**`security_rules_list`**`(`*security_group, resource_group, **kwargs*`)`

New in version 2019.2.0.

List security rules within a network security group.

Parameters

- **`security_group`** – The network security group to query.
- **`resource_group`** – The resource group name assigned to the network security group.

CLI Example:

```
salt-call azurearm_network.security_rules_list testnsg testgroup
```

`salt.modules.azurearm_network.`**`subnet_create_or_update`**`(`*name, address_prefix, virtual_network, resource_group, **kwargs*`)`

New in version 2019.2.0.

Create or update a subnet.

Parameters

- **`name`** – The name assigned to the subnet being created or updated.
- **`address_prefix`** – A valid CIDR block within the virtual network.
- **`virtual_network`** – The virtual network name containing the subnet.
- **`resource_group`** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnet_create_or_update testsubnet
↪'10.0.0.0/24' testnet testgroup
```

`salt.modules.azurearm_network.`**`subnet_delete`**`(`*name, virtual_network, resource_group, **kwargs*`)`

New in version 2019.2.0.

Delete a subnet.

Parameters

- **`name`** – The name of the subnet to delete.
- **`virtual_network`** – The virtual network name containing the subnet.
- **`resource_group`** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnet_delete testsubnet testnet testgroup
```

`salt.modules.azurearm_network.`**`subnet_get`**`(`*name*, *virtual_network*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Get details about a specific subnet.

Parameters

- **`name`** – The name of the subnet to query.
- **`virtual_network`** – The virtual network name containing the subnet.
- **`resource_group`** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnet_get testsubnet testnet testgroup
```

`salt.modules.azurearm_network.`**`subnets_list`**`(`*virtual_network*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

List all subnets within a virtual network.

Parameters

- **`virtual_network`** – The virtual network name to list subnets within.
- **`resource_group`** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.subnets_list testnet testgroup
```

`salt.modules.azurearm_network.`**`usages_list`**`(`*location*, ***kwargs*`)`

New in version 2019.2.0.

List subscription network usage for a location.

Parameters **`location`** – The Azure location to query for network usage.

CLI Example:

```
salt-call azurearm_network.usages_list westus
```

`salt.modules.azurearm_network.`**`virtual_network_create_or_update`**`(`*name*, *address_prefixes*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Create or update a virtual network.

Parameters

- **name** – The name assigned to the virtual network being created or updated.
- **address_prefixes** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.virtual_network_create_or_update
↪testnet ['10.0.0.0/16'] testgroup
```

salt.modules.azurearm_network.**virtual_network_delete**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Delete a virtual network.

Parameters

- **name** – The name of the virtual network to delete.
- **resource_group** – The resource group name assigned to the virtual network

CLI Example:

```
salt-call azurearm_network.virtual_network_delete testnet testgroup
```

salt.modules.azurearm_network.**virtual_network_get**(*name*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get details about a specific virtual network.

Parameters

- **name** – The name of the virtual network to query.
- **resource_group** – The resource group name assigned to the virtual network.

CLI Example:

```
salt-call azurearm_network.virtual_network_get testnet testgroup
```

salt.modules.azurearm_network.**virtual_networks_list**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all virtual networks within a resource group.

Parameters **resource_group** – The resource group name to list virtual networks within.

CLI Example:

```
salt-call azurearm_network.virtual_networks_list testgroup
```

salt.modules.azurearm_network.**virtual_networks_list_all**(***kwargs*)

New in version 2019.2.0.

List all virtual networks within a subscription.

CLI Example:

```
salt-call azurearm_network.virtual_networks_list_all
```

21.9.27 salt.modules.azurearm_resource

Azure (ARM) Resource Execution Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as keyword arguments to every function in order to work properly.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: **Used to point the cloud driver to different API endpoints, such as Azure GovCloud.**

Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

`salt.modules.azurearm_resource.`**`deployment_cancel`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Cancel a deployment if in 'Accepted' or 'Running' state.

Parameters

- **`name`** – The name of the deployment to cancel.
- **`resource_group`** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_cancel testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_check_existence`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Check the existence of a deployment.

Parameters

- **`name`** – The name of the deployment to query.
- **`resource_group`** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_check_existence testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_create_or_update`**`(`*name*, *resource_group*, *deploy_mode='incremental'*, *debug_setting='none'*, *deploy_params=None*, *parameters_link=None*, *deploy_template=None*, *template_link=None*, ***kwargs*`)`

New in version 2019.2.0.

Deploys resources to a resource group.

Parameters

- **`name`** – The name of the deployment to create or update.
- **`resource_group`** – The resource group name assigned to the deployment.
- **`deploy_mode`** – The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.
- **`debug_setting`** – The debug setting of the deployment. The permitted values are 'none', 'requestContent', 'responseContent', or 'requestContent,responseContent'. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.

- **deploy_params** – JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.
- **parameters_link** – The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.
- **deploy_template** – JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.
- **template_link** – The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_create_or_update testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_delete`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Delete a deployment.

Parameters

- **name** – The name of the deployment to delete.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_delete testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_export_template`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Exports the template used for the specified deployment.

Parameters

- **name** – The name of the deployment to query.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_export_template testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_get`**`(`*name*, *resource_group*, ***kwargs*`)`

New in version 2019.2.0.

Get details about a specific deployment.

Parameters

- **name** – The name of the deployment to query.
- **resource_group** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_get testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_operation_get`**(*operation*, *deployment*, *resource_group*, ***kwargs*)

New in version 2019.2.0.

Get a deployment operation within a deployment.

Parameters

- **`operation`** – The operation ID of the operation within the deployment.
- **`deployment`** – The name of the deployment containing the operation.
- **`resource_group`** – The resource group name assigned to the deployment.

CLI Example:

```
salt-call azurearm_resource.deployment_operation_get XXXXX testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_operations_list`**(*name*, *resource_group*, *result_limit=10*, ***kwargs*)

New in version 2019.2.0.

List all deployment operations within a deployment.

Parameters

- **`name`** – The name of the deployment to query.
- **`resource_group`** – The resource group name assigned to the deployment.
- **`result_limit`** – (Default: 10) The limit on the list of deployment operations.

CLI Example:

```
salt-call azurearm_resource.deployment_operations_list testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployment_validate`**(*name*, *resource_group*, *deploy_mode=None*, *debug_setting=None*, *deploy_params=None*, *parameters_link=None*, *deploy_template=None*, *template_link=None*, ***kwargs*)

New in version 2019.2.0.

Validates whether the specified template is syntactically correct and will be accepted by Azure Resource Manager.

Parameters

- **`name`** – The name of the deployment to validate.
- **`resource_group`** – The resource group name assigned to the deployment.
- **`deploy_mode`** – The mode that is used to deploy resources. This value can be either 'incremental' or 'complete'. In Incremental mode, resources are deployed without deleting existing resources that are not included in the template. In Complete mode, resources are deployed and existing resources in the resource group that are not included in the template are deleted. Be careful when using Complete mode as you may unintentionally delete resources.

- **debug_setting** – The debug setting of the deployment. The permitted values are 'none', 'requestContent', 'responseContent', or 'requestContent,responseContent'. By logging information about the request or response, you could potentially expose sensitive data that is retrieved through the deployment operations.
- **deploy_params** – JSON string containing name and value pairs that define the deployment parameters for the template. You use this element when you want to provide the parameter values directly in the request rather than link to an existing parameter file. Use either the parameters_link property or the deploy_params property, but not both.
- **parameters_link** – The URI of a parameters file. You use this element to link to an existing parameters file. Use either the parameters_link property or the deploy_params property, but not both.
- **deploy_template** – JSON string of template content. You use this element when you want to pass the template syntax directly in the request rather than link to an existing template. Use either the template_link property or the deploy_template property, but not both.
- **template_link** – The URI of the template. Use either the template_link property or the deploy_template property, but not both.

CLI Example:

```
salt-call azurearm_resource.deployment_validate testdeploy testgroup
```

`salt.modules.azurearm_resource.`**`deployments_list`**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all deployments within a resource group.

CLI Example:

```
salt-call azurearm_resource.deployments_list testgroup
```

`salt.modules.azurearm_resource.`**`policy_assignment_create`**(*name*, *scope*, *definition_name*, ***kwargs*)

New in version 2019.2.0.

Create a policy assignment.

Parameters

- **name** – The name of the policy assignment to create.
- **scope** – The scope of the policy assignment.
- **definition_name** – The name of the policy definition to assign.

CLI Example:

```
salt-call azurearm_resource.policy_assignment_create testassign        /
↪subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852 testpolicy
```

`salt.modules.azurearm_resource.`**`policy_assignment_delete`**(*name*, *scope*, ***kwargs*)

New in version 2019.2.0.

Delete a policy assignment.

Parameters

- **name** – The name of the policy assignment to delete.
- **scope** – The scope of the policy assignment.

CLI Example:

```
salt-call azurearm_resource.policy_assignment_delete testassign          /
↪subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
```

`salt.modules.azurearm_resource.`**`policy_assignment_get`**(*name*, *scope*, ***kwargs*)

New in version 2019.2.0.

Get details about a specific policy assignment.

Parameters

- **name** – The name of the policy assignment to query.
- **scope** – The scope of the policy assignment.

CLI Example:

```
salt-call azurearm_resource.policy_assignment_get testassign          /
↪subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
```

`salt.modules.azurearm_resource.`**`policy_assignments_list`**(***kwargs*)

New in version 2019.2.0.

List all policy assignments for a subscription.

CLI Example:

```
salt-call azurearm_resource.policy_assignments_list
```

`salt.modules.azurearm_resource.`**`policy_assignments_list_for_resource_group`**(*resource_group*, ***kwargs*)

New in version 2019.2.0.

List all policy assignments for a resource group.

Parameters **resource_group** – The resource group name to list policy assignments within.

CLI Example:

```
salt-call azurearm_resource.policy_assignments_list_for_resource_group testgroup
```

`salt.modules.azurearm_resource.`**`policy_definition_create_or_update`**(*name*, *policy_rule*, ***kwargs*)

New in version 2019.2.0.

Create or update a policy definition.

Parameters

- **name** – The name of the policy definition to create or update.
- **policy_rule** – A dictionary defining the policy rule.

CLI Example:

```
salt-call azurearm_resource.policy_definition_create_or_update testpolicy '{...
↪rule definition..}'
```

`salt.modules.azurearm_resource.`**`policy_definition_delete`**(*name*, ***kwargs*)

New in version 2019.2.0.

Delete a policy definition.

Parameters **name** – The name of the policy definition to delete.

CLI Example:

```
salt-call azurearm_resource.policy_definition_delete testpolicy
```

salt.modules.azurearm_resource.**policy_definition_get**(*name*, ***kwargs*)
New in version 2019.2.0.

Get details about a specific policy definition.

Parameters **name** – The name of the policy definition to query.

CLI Example:

```
salt-call azurearm_resource.policy_definition_get testpolicy
```

salt.modules.azurearm_resource.**policy_definitions_list**(*hide_builtin=False*, ***kwargs*)
New in version 2019.2.0.

List all policy definitions for a subscription.

Parameters **hide_builtin** – Boolean which will filter out BuiltIn policy definitions from the result.

CLI Example:

```
salt-call azurearm_resource.policy_definitions_list
```

salt.modules.azurearm_resource.**resource_group_check_existence**(*name*, ***kwargs*)
New in version 2019.2.0.

Check for the existence of a named resource group in the current subscription.

Parameters **name** – The resource group name to check.

CLI Example:

```
salt-call azurearm_resource.resource_group_check_existence testgroup
```

salt.modules.azurearm_resource.**resource_group_create_or_update**(*name*, *location*, ***kwargs*)
New in version 2019.2.0.

Create or update a resource group in a given location.

Parameters

- **name** – The name of the resource group to create or update.
- **location** – The location of the resource group. This value is not able to be updated once the resource group is created.

CLI Example:

```
salt-call azurearm_resource.resource_group_create_or_update testgroup westus
```

salt.modules.azurearm_resource.**resource_group_delete**(*name*, ***kwargs*)
New in version 2019.2.0.

Delete a resource group from the subscription.

Parameters **name** – The resource group name to delete.

CLI Example:

```
salt-call azurearm_resource.resource_group_delete testgroup
```

`salt.modules.azurearm_resource.`**`resource_group_get`**`(`*name*, ***kwargs*`)`

New in version 2019.2.0.

Get a dictionary representing a resource group's properties.

Parameters **`name`** – The resource group name to get.

CLI Example:

```
salt-call azurearm_resource.resource_group_get testgroup
```

`salt.modules.azurearm_resource.`**`resource_groups_list`**`(`***kwargs*`)`

New in version 2019.2.0.

List all resource groups within a subscription.

CLI Example:

```
salt-call azurearm_resource.resource_groups_list
```

`salt.modules.azurearm_resource.`**`subscription_get`**`(`*subscription_id=None*, ***kwargs*`)`

New in version 2019.2.0.

Get details about a subscription.

Parameters **`subscription_id`** – The ID of the subscription to query.

CLI Example:

```
salt-call azurearm_resource.subscription_get XXXXXXXX
```

`salt.modules.azurearm_resource.`**`subscriptions_list`**`(`***kwargs*`)`

New in version 2019.2.0.

List all subscriptions for a tenant.

CLI Example:

```
salt-call azurearm_resource.subscriptions_list
```

`salt.modules.azurearm_resource.`**`subscriptions_list_locations`**`(`*subscription_id=None*, ***kwargs*`)`

New in version 2019.2.0.

List all locations for a subscription.

Parameters **`subscription_id`** – The ID of the subscription to query.

CLI Example:

```
salt-call azurearm_resource.subscriptions_list_locations XXXXXXXX
```

`salt.modules.azurearm_resource.`**`tenants_list`**`(`***kwargs*`)`

New in version 2019.2.0.

List all tenants for your account.

CLI Example:

```
salt-call azurearm_resource.tenants_list
```

21.9.28 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a `subdomain` and an `apikey` in `/etc/salt/minion`:

```
bamboohr:
  apikey: 012345678901234567890
  subdomain: mycompany
```

`salt.modules.bamboohr.`**`list_employees`**`(`*order_by='id'*`)`

Show all employees for this company.

CLI Example:

salt myminion bamboohr.list_employees

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

salt myminion bamboohr.list_employees order_by=id salt myminion bamboohr.list_employees order_by=displayName salt myminion bamboohr.list_employees order_by=workEmail

`salt.modules.bamboohr.`**`list_meta_fields`**`()`

Show all meta data fields for this company.

CLI Example:

salt myminion bamboohr.list_meta_fields

`salt.modules.bamboohr.`**`list_users`**`(`*order_by='id'*`)`

Show all users for this company.

CLI Example:

salt myminion bamboohr.list_users

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

salt myminion bamboohr.list_users order_by=id salt myminion bamboohr.list_users order_by=email

`salt.modules.bamboohr.`**`show_employee`**`(`*emp_id, fields=None*`)`

Show all employees for this company.

CLI Example:

salt myminion bamboohr.show_employee 1138

By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:

- canUploadPhoto
- department
- displayName
- firstName
- id
- jobTitle
- lastName
- location
- mobilePhone
- nickname
- photoUploaded
- photoUrl
- workEmail
- workPhone
- workPhoneExtension

If needed, a different set of fields may be specified, separated by commas:

CLI Example:

> salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth

A list of available fields can be found at http://www.bamboohr.com/api/documentation/employees.php

`salt.modules.bamboohr.`**`update_employee`**(*emp_id*, *key=None*, *value=None*, *items=None*)

Update one or more items for this employee. Specifying an empty value will clear it for that employee.

CLI Examples:

> salt myminion bamboohr.update_employee 1138 nickname Curly salt myminion bamboohr.update_employee 1138 nickname ” salt myminion bamboohr.update_employee 1138 items=’{”nickname”: ”Curly”} salt myminion bamboohr.update_employee 1138 items=’{”nickname”: ””}

21.9.29 salt.modules.bcache module

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It’s available in Linux mainline kernel since 3.10

https://www.kernel.org/doc/Documentation/bcache.txt

This module needs the bcache userspace tools to function.

`salt.modules.bcache.`**`attach_`**(*dev=None*)

Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI example:

```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

Returns bool or None if nuttin' happened

`salt.modules.bcache.`**`back_make`**(*dev*, *cache_mode='writeback'*, *force=False*, *attach=True*, *bucket_size=None*)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI example:

```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

Parameters

- **`cache_mode`** – writethrough, writeback, writearound or none.
- **`force`** – Overwrite existing bcaches
- **`attach`** – Immediately attach the backing device to the set
- **`bucket_size`** – Size of a bucket (see kernel doc)

`salt.modules.bcache.`**`cache_make`**(*dev*, *reserved=None*, *force=False*, *block_size=None*, *bucket_size=None*, *attach=True*)

Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI example:

```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

Parameters

- **`reserved`** – if dev is a full device, create a partition table with this size empty.

  Note: this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

- **`block_size`** – Block size of the cache; defaults to devices' logical block size
- **`force`** – Overwrite existing BCache sets
- **`attach`** – Attach all existing backend devices immediately

`salt.modules.bcache.`**`config_`**(*dev=None*, ***kwargs*)

Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI example:

```
salt '*' bcache.config
salt '*' bcache.config bcache1
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcache1 cache_mode=writeback writeback_percent=15
```

Returns config or True/False

`salt.modules.bcache.`**`detach`**`(`*dev=None*`)`

Detach a backing device(s) from a cache set If no dev is given, all backing devices will be attached.

Detaching a backing device will flush it's write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI example:

```
salt '*' bcache.detach sdc
salt '*' bcache.detach bcache1
```

`salt.modules.bcache.`**`device`**`(`*dev*, *stats=False*, *config=False*, *internals=False*, *superblock=False*`)`

Check the state of a single bcache device

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

Parameters

- **`stats`** – include statistics
- **`settings`** – include all settings
- **`internals`** – include all internals
- **`superblock`** – include superblock info

`salt.modules.bcache.`**`start`**`()`

Trigger a start of the full bcache system through udev.

CLI example:

```
salt '*' bcache.start
```

`salt.modules.bcache.`**`status`**`(`*stats=False*, *config=False*, *internals=False*, *superblock=False*, *alldevs=False*`)`

Show the full status of the BCache system and optionally all it's involved devices

CLI example:

```
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True
```

Parameters

- **`stats`** – include statistics
- **`config`** – include settings
- **`internals`** – include internals
- **`superblock`** – include superblock

`salt.modules.bcache.`**`stop`**`(`*dev=None*`)`

Stop a bcache device If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

> **Warning:** 'Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly 'disappear' from the device lists

CLI example:

```
salt '*' bcache.stop
```

`salt.modules.bcache.`**`super_`**(*dev*)

Read out BCache SuperBlock

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

`salt.modules.bcache.`**`uuid`**(*dev=None*)

Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI example:

```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

21.9.30 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

`salt.modules.beacons.`**`add`**(*name*, *beacon_data*, ***kwargs*)

Add a beacon on the minion

Parameters

- **`name`** – Name of the beacon to configure
- **`beacon_data`** – Dictionary or list containing configuration for beacon.

Returns Boolean and status message on success or failure of add.

CLI Example:

```
salt '*' beacons.add ps "[{'processes': {'salt-master': 'stopped', 'apache2':
↪'stopped'}}]"
```

`salt.modules.beacons.`**`delete`**(*name*, ***kwargs*)

Delete a beacon item

Parameters **`name`** – Name of the beacon to delete

Returns Boolean and status message on success or failure of delete.

CLI Example:

```
salt '*' beacons.delete ps

salt '*' beacons.delete load
```

salt.modules.beacons.**disable**(***kwargs*)

Disable all beacons jobs on the minion

Returns Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable
```

salt.modules.beacons.**disable_beacon**(*name*, ***kwargs*)

Disable beacon on the minion

Name Name of the beacon to disable.

Returns Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable_beacon ps
```

salt.modules.beacons.**enable**(***kwargs*)

Enable all beacons on the minion

Returns Boolean and status message on success or failure of enable.

Return type bool

CLI Example:

```
salt '*' beacons.enable
```

salt.modules.beacons.**enable_beacon**(*name*, ***kwargs*)

Enable beacon on the minion

Name Name of the beacon to enable.

Returns Boolean and status message on success or failure of enable.

CLI Example:

```
salt '*' beacons.enable_beacon ps
```

salt.modules.beacons.**list_**(*return_yaml=True*, *include_pillar=True*, *include_opts=True*, ***kwargs*)

List the beacons currently configured on the minion

Parameters

- **`return_yaml`** – Whether to return YAML formatted output, default `True`
- **`include_pillar`** – Whether to include beacons that are configured in pillar, default is `True`.
- **`include_opts`** – Whether to include beacons that are configured in opts, default is `True`.

Returns List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list
```

salt.modules.beacons.**list_available**(*return_yaml=True*, ***kwargs*)

List the beacons currently available on the minion

Parameters **`return_yaml`** – Whether to return YAML formatted output, default `True`

Returns List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list_available
```

`salt.modules.beacons.`**`modify`**`(`*name*, *beacon_data*, ***kwargs*`)`

Modify an existing beacon

Parameters

- **`name`** – Name of the beacon to configure
- **`beacon_data`** – Dictionary or list containing updated configuration for beacon.

Returns Boolean and status message on success or failure of modify.

CLI Example:

```
salt '*' beacons.modify ps "[{'salt-master': 'stopped'}, {'apache2': 'stopped'}]"
```

`salt.modules.beacons.`**`reset`**`(`***kwargs*`)`

Resest beacon configuration on the minion

CLI Example:

```
salt '*' beacons.reset
```

`salt.modules.beacons.`**`save`**`(`***kwargs*`)`

Save all beacons on the minion

Returns Boolean and status message on success or failure of save.

CLI Example:

```
salt '*' beacons.save
```

21.9.31 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

maturity develop

platform f5_bigip_11.6

`salt.modules.bigip.`**`add_pool_member`**`(`*hostname*, *username*, *password*, *name*, *member*`)`

A function to connect to a bigip device and add a new member to an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The name of the member to add i.e. 10.1.1.2:80

CLI Example:

```
salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80
```

`salt.modules.bigip.`**`commit_transaction`**(*hostname, username, password, label*)

A function to connect to a bigip device and commit an existing transaction.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

label the label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.commit_transaction bigip admin admin my_transaction
```

`salt.modules.bigip.`**`create_monitor`**(*hostname, username, password, monitor_type, name, **kwargs*)

A function to connect to a bigip device and create a monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor timeout=10
↪interval=5
```

`salt.modules.bigip.`**`create_node`**(*hostname, username, password, name, address, trans_label=None*)

A function to connect to a bigip device and create a node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node

address The address of the node

trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

`salt.modules.bigip.`**`create_pool`**`(`*hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None*`)`

A function to connect to a bigip device and create a pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to create.

members List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

allow_nat [yes | no]

allow_snat [yes | no]

description [string]

gateway_failsafe_device [string]

ignore_persisted_weight [enabled | disabled]

ip_tos_to_client [pass-through | [integer]]

ip_tos_to_server [pass-through | [integer]]

link_qos_to_client [pass-through | [integer]]

link_qos_to_server [pass-through | [integer]]

load_balancing_mode [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

min_active_members [integer]

min_up_members_action [failover | reboot | restart-all]

min_up_members_checking [enabled | disabled]

monitor [name]

profiles [none | profile_name]

queue_depth_limit [integer]

queue_on_connection_limit [enabled | disabled]

queue_time_limit [integer]

reselect_tries [integer]

service_down_action [drop | none | reselect | reset]

slow_ramp_time [integer]

CLI Example:

```
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.
↪1.3:80 monitor=http
```

`salt.modules.bigip.`**`create_profile`**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to create

name The name of the profile to create

kwargs `[ arg=val ] ... [arg=key1:val1,key2:val2] ...`

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists `[i,i,i]`: `param='item1,item2,item3'`

Dictionary `[k:v,k:v,k,v]`: `param='key-1:val-1,key-2:val2,key-3:va-3'`

List of Dictionaries `[k:v,k:v|k:v,k:v|k:v,k:v]`: `param='key-1:val-1, key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'`

JSON: `'j{ ... }j'`: `cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'`

Escaping Delimiters: Use `\,` or `\:` or `\|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

CLI Examples:

```
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http'
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http' \
    enforcement=maxHeaderCount:3200,maxRequests:10
```

`salt.modules.bigip.`**`create_virtual`**`(`*hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None*`)`

A function to connect to a bigip device and create a virtual server.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual to create

destination [[virtual_address_name:port] | [ipv4:port] | [ipv6.port]]

translate_port [enabled | disabled]

vlans [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ...]

CLI Examples:

```
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 26.2.2.5:80 \
    pool=my-http-pool-http profiles=http,tcp

salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 \
    pool=test-http-pool-http profiles=http,websecurity persist=cookie,hash \
    policies=asm_auto_l7_policy__http-virtual \
    rules=_sys_APM_ExchangeSupport_helper,_sys_https_redirect \
    related_rules=_sys_APM_activesync,_sys_APM_ExchangeSupport_helper \
    source_address_translation=snat:my-snat-pool \
    translate_address=enabled translate_port=enabled \
    traffic_classes=my-class,other-class \
    vlans=enabled:external,internal
```

`salt.modules.bigip.`**`delete_monitor`**(*hostname, username, password, monitor_type, name*)

A function to connect to a bigip device and delete an existing monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to delete

name The name of the monitor to delete

CLI Example:

```
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```

`salt.modules.bigip.`**`delete_node`**(*hostname, username, password, name, trans_label=None*)

A function to connect to a bigip device and delete a specific node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node which will be deleted.

trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-node
```

`salt.modules.bigip.`**`delete_pool`**(*hostname, username, password, name*)

A function to connect to a bigip device and delete a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool which will be deleted

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-pool
```

`salt.modules.bigip.`**`delete_pool_member`**(*hostname, username, password, name, member*)

A function to connect to a bigip device and delete a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The name of the pool member to delete

CLI Example:

```
salt '*' bigip.delete_pool_member bigip admin admin my-pool 10.2.2.2:80
```

`salt.modules.bigip.`**`delete_profile`**(*hostname, username, password, profile_type, name*)

A function to connect to a bigip device and delete an existing profile.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to delete

name The name of the profile to delete

CLI Example:

```
salt '*' bigip.delete_profile bigip admin admin http my-http-profile
```

salt.modules.bigip.**delete_transaction**(*hostname*, *username*, *password*, *label*)
A function to connect to a bigip device and delete an existing transaction.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

label The label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.delete_transaction bigip admin admin my_transaction
```

salt.modules.bigip.**delete_virtual**(*hostname*, *username*, *password*, *name*)
A function to connect to a bigip device and delete a specific virtual.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual to delete

CLI Example:

```
salt '*' bigip.delete_virtual bigip admin admin my-virtual
```

salt.modules.bigip.**list_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name=None*)
A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors of the specified type will be listed.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor(s) to list

name The name of the monitor to list

CLI Example:

```
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor
```

salt.modules.bigip.**list_node**(*hostname*, *username*, *password*, *name=None*, *trans_label=None*)
A function to connect to a bigip device and list all nodes or a specific node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to list. If no name is specified than all nodes will be listed.

trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.list_node bigip admin admin my-node
```

`salt.modules.bigip.`**`list_pool`**(*hostname*, *username*, *password*, *name=None*)

A function to connect to a bigip device and list all pools or a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to list. If no name is specified then all pools will be listed.

CLI Example:

```
salt '*' bigip.list_pool bigip admin admin my-pool
```

`salt.modules.bigip.`**`list_profile`**(*hostname*, *username*, *password*, *profile_type*, *name=None*)

A function to connect to a bigip device and list an existing profile. If no name is provided than all profiles of the specified type will be listed.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile(s) to list

name The name of the profile to list

CLI Example:

```
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

`salt.modules.bigip.`**`list_transaction`**(*hostname*, *username*, *password*, *label*)

A function to connect to a bigip device and list an existing transaction.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

label the label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

`salt.modules.bigip.`**`list_virtual`**(*hostname*, *username*, *password*, *name=None*)

A function to connect to a bigip device and list all virtuals or a specific virtual.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual to list. If no name is specified than all virtuals will be listed.

CLI Example:

```
salt '*' bigip.list_virtual bigip admin admin my-virtual
```

`salt.modules.bigip.`**`modify_monitor`**`(`*hostname, username, password, monitor_type, name, **kwargs*`)`

A function to connect to a bigip device and modify an existing monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to modify

name The name of the monitor to modify

kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor  timout=16␣
↪interval=6
```

`salt.modules.bigip.`**`modify_node`**`(`*hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, state=None, trans_label=None*`)`

A function to connect to a bigip device and modify an existing node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to modify

connection_limit [integer]

description [string]

```

`salt.modules.bigip.`**`modify_profile`**(*hostname, username, password, profile_type, name, **kwargs*)

A function to connect to a bigip device and create a profile.

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to create

name The name of the profile to create

kwargs `[ arg=val ] ... [arg=key1:val1,key2:val2] ...`

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists `[i,i,i]`: `param='item1,item2,item3'`

Dictionary `[k:v,k:v,k,v]`: `param='key-1:val-1,key-2:val2,key-3:va-3'`

List of Dictionaries `[k:v,k:v|k:v,k:v|k:v,k:v]`: `param='key-1:val-1, key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'`

JSON: `'j{ ... }j'`: `cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'`

Escaping Delimiters: Use `\,` or `\:` or `\|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

CLI Examples:

```
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http'

salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http' \
    enforcement=maxHeaderCount:3200,maxRequests:10

salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-1⊠
↪retainCertificate=false \
    ciphers='DEFAULT\:!SSLv3'
    cert_key_chain='j{ "default": { "cert": "default.crt", "chain": "default.crt",
↪ "key": "default.key" } }j'
```

`salt.modules.bigip.`**`modify_virtual`**(*hostname, username, password, name, destination=None, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None*)

A function to connect to a bigip device and modify an existing virtual server.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual to modify

destination [[virtual_address_name:port] | [ipv4:port] | [ipv6.port]]

pool [[pool_name] | none]

address_status [yes | no]

auto_lasthop [default | enabled | disabled]

bwc_policy [none] | string]

cmp_enabled [yes | no]

dhcp_relay [yes | no}

connection_limit [integer]

description [string]

state [disabled | enabled]

fallback_persistence [none | [profile name]]

flow_eviction_policy [none | [eviction policy name]]

gtm_score [integer]

ip_forward [yes | no]

ip_protocol [any | protocol]

internal [yes | no]

twelve_forward (12-forward) [yes | no]

last_hop-pool [[pool_name] | none]

mask { [ipv4] | [ipv6] }

mirror { [disabled | enabled | none] }

nat64 [enabled | disabled]

persist [none | profile1,profile2,profile3 …]

profiles [none | default | profile1,profile2,profile3 …]

policies [none | default | policy1,policy2,policy3 …]

rate_class [name]

rate_limit [integer]

rate_limitr_mode [destination | object | object-destination | object-source | object-source-destination | source | source-destination]

rate_limit_dst [integer]

rate_limit_src [integer]

rules [none | [rule_one,rule_two …]]

related_rules [none | [rule_one,rule_two …]]

reject [yes | no]

source { [ipv4[/prefixlen]] | [ipv6[/prefixlen]] }

source_address_translation [none | snat:pool_name | lsn | automap]

source_port [change | preserve | preserve-strict]

state [enabled | disable]

traffic_classes [none | default | class_one,class_two …]

translate_address [enabled | disabled]

translate_port [enabled | disabled]

vlans [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 …]

CLI Example:

```
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_
↪translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,my-other-
↪rule
```

`salt.modules.bigip.`**`replace_pool_members`**(*hostname, username, password, name, members*)

A function to connect to a bigip device and replace members of an existing pool with new members.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

members List of comma delimited pool members to replace existing members with. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:

```
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.
↪2:80,10.2.2.3:80
```

`salt.modules.bigip.`**`start_transaction`**(*hostname, username, password, label*)

A function to connect to a bigip device and start a new transaction.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

label The name / alias for this transaction. The actual transaction id will be stored within a grain called `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

21.9.32 salt.modules.bluez_bluetooth

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18

`salt.modules.bluez_bluetooth.`**`address_`**`()`

Get the many addresses of the Bluetooth adapter

CLI Example:

```
salt '*' bluetooth.address
```

`salt.modules.bluez_bluetooth.`**`block`**`(`*bdaddr*`)`

Block a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.block DE:AD:BE:EF:CA:FE
```

`salt.modules.bluez_bluetooth.`**`discoverable`**`(`*dev*`)`

Enable this bluetooth device to be discoverable.

CLI Example:

```
salt '*' bluetooth.discoverable hci0
```

`salt.modules.bluez_bluetooth.`**`noscan`**`(`*dev*`)`

Turn off scanning modes on this device.

CLI Example:

```
salt '*' bluetooth.noscan hci0
```

`salt.modules.bluez_bluetooth.`**`pair`**`(`*address, key*`)`

Pair the bluetooth adapter with a device

CLI Example:

```
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

`salt.modules.bluez_bluetooth.`**`power`**`(`*dev, mode*`)`

Power a bluetooth device on or off

CLI Examples:

```
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

`salt.modules.bluez_bluetooth.`**`scan`**`()`

Scan for bluetooth devices in the area

CLI Example:

```
salt '*' bluetooth.scan
```

`salt.modules.bluez_bluetooth.`**`start`**`()`

Start the bluetooth service.

CLI Example:

```
salt '*' bluetooth.start
```

salt.modules.bluez_bluetooth.**stop**()

Stop the bluetooth service.

CLI Example:

```
salt '*' bluetooth.stop
```

salt.modules.bluez_bluetooth.**unblock**(*bdaddr*)

Unblock a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.unblock DE:AD:BE:EF:CA:FE
```

salt.modules.bluez_bluetooth.**unpair**(*address*)

Unpair the bluetooth adapter from a device

CLI Example:

```
salt '*' bluetooth.unpair DE:AD:BE:EF:CA:FE
```

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez_bluetooth.**version**()

Return Bluez version from bluetoothd -v

CLI Example:

```
salt '*' bluetoothd.version
```

21.9.33 salt.modules.boto3_elasticache module

Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto3_elasticache.`**`add_tags_to_resource`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function…

Example:

```
salt myminion boto3_elasticache.add_tags_to_resource                 name
↪'=arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'                ⊠
↪Tags="[{'Key': 'TeamOwner', 'Value': 'infrastructure'}]"
```

`salt.modules.boto3_elasticache.`**`authorize_cache_security_group_ingress`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.authorize_cache_security_group_ingress          ⊠
↪                              mycachesecgrp                                     ⊠
↪   EC2SecurityGroupName=someEC2sg                                         ⊠
↪EC2SecurityGroupOwnerId=SOMEOWNERID
```

`salt.modules.boto3_elasticache.`**`cache_cluster_exists`**(*name*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a cache cluster exists.

Example:

```
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```

`salt.modules.boto3_elasticache.`**`cache_security_group_exists`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache security group exists.

Example:

```
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

`salt.modules.boto3_elasticache.`**`cache_subnet_group_exists`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache subnet group exists.

Example:

```
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

`salt.modules.boto3_elasticache.`**`copy_snapshot`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Make a copy of an existing snapshot.

Example:

```
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot                     ⊠
↪                                   TargetSnapshotName=copyOfMySnapshot
```

`salt.modules.boto3_elasticache.`**`create_cache_cluster`**(*name*, *wait=600*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster          ⊠
↪                                                     Engine=redis                ⊠
↪                                               CacheNodeType=cache.t2.micro      ⊠
↪                                                         NumCacheNodes=1         ⊠
↪                                                      SecurityGroupIds='[sg-
↪11223344]'                                                              ⊠
↪CacheSubnetGroupName=myCacheSubnetGroup
```

`salt.modules.boto3_elasticache.`**`create_cache_parameter_group`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group                 ⊠
↪name=myParamGroup                  CacheParameterGroupFamily=redis2.8            ⊠
↪      Description="My Parameter Group"
```

`salt.modules.boto3_elasticache.`**`create_cache_security_group`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache security group.

Example:

```
salt myminion boto3_elasticache.create_cache_security_group mycachesecgrp
↪Description='My Cache Security Group'
```

`salt.modules.boto3_elasticache.`**`create_cache_subnet_group`**(*name, subnets=None, region=None, key=None, keyid=None, profile=None, **args*)

Create an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.create_cache_subnet_group name=my-subnet-group
↪                                             CacheSubnetGroupDescription=
↪"description"                                                 subnets=
↪'[myVPCSubnet1,myVPCSubnet2]'
```

`salt.modules.boto3_elasticache.`**`create_replication_group`**(*name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args*)

Create a replication group. Params are extensive and variable - see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group for in-depth usage documentation.

Example:

```
salt myminion boto3_elasticache.create_replication_group
↪                         name=myelasticache
↪                ReplicationGroupDescription=description
```

`salt.modules.boto3_elasticache.`**`delete_cache_cluster`**(*name, wait=600, region=None, key=None, keyid=None, profile=None, **args*)

Delete a cache cluster.

Example:

```
salt myminion boto3_elasticache.delete myelasticache
```

`salt.modules.boto3_elasticache.`**`delete_cache_parameter_group`**(*name, region=None, key=None, keyid=None, profile=None, **args*)

Delete a cache parameter group.

Example:

```
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```

`salt.modules.boto3_elasticache.`**`delete_cache_security_group`**(*name, region=None, key=None, keyid=None, profile=None, **args*)

Delete a cache security group.

Example:

```
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg
```

`salt.modules.boto3_elasticache.`**`delete_cache_subnet_group`**`(`*name, region=None, key=None, keyid=None, profile=None, **args*`)`

Delete an ElastiCache subnet group.

Example:

```
salt myminion boto3_elasticache.delete_subnet_group my-subnet-group region=us-
↪east-1
```

`salt.modules.boto3_elasticache.`**`delete_replication_group`**`(`*name, wait=600, region=None, key=None, keyid=None, profile=None, **args*`)`

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

```
salt myminion boto3_elasticache.delete_replication_group my-replication-group
```

`salt.modules.boto3_elasticache.`**`describe_cache_clusters`**`(`*name=None, conn=None, region=None, key=None, keyid=None, profile=None, **args*`)`

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache
```

`salt.modules.boto3_elasticache.`**`describe_cache_parameter_groups`**`(`*name=None, conn=None, region=None, key=None, keyid=None, profile=None*`)`

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup
```

`salt.modules.boto3_elasticache.`**`describe_cache_security_groups`**`(`*name=None, conn=None, region=None, key=None, keyid=None, profile=None*`)`

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp
```

`salt.modules.boto3_elasticache.`**`describe_cache_subnet_groups`**(*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1
```

`salt.modules.boto3_elasticache.`**`describe_replication_groups`**(*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

`salt.modules.boto3_elasticache.`**`list_cache_subnet_groups`**(*region=None, key=None, keyid=None, profile=None*)

Return a list of all cache subnet group names

Example:

```
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

`salt.modules.boto3_elasticache.`**`list_tags_for_resource`**(*name, region=None, key=None, keyid=None, profile=None, **args*)

List tags on an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:

```
salt myminion boto3_elasticache.list_tags_for_resource                  name
↪'=arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'
```

`salt.modules.boto3_elasticache.`**`modify_cache_cluster`**(*name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args*)

Update a cache cluster in place.

Notes: {ApplyImmediately: False} is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster ⊠
↪                                                   ⊠
↪NotificationTopicStatus=inactive
```

`salt.modules.boto3_elasticache.`**`modify_cache_subnet_group`**(*name, subnets=None, region=None, key=None, keyid=None, profile=None, **args*)

Modify an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.modify_cache_subnet_group                   ⊠
↪                      name=my-subnet-group                                 ⊠
↪         subnets='[myVPCSubnet3]'
```

`salt.modules.boto3_elasticache.`**`modify_replication_group`**(*name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args*)

Modify a replication group.

Example:

```
salt myminion boto3_elasticache.modify_replication_group                    ⊠
↪                         name=myelasticache                                ⊠
↪              ReplicationGroupDescription=newDescription
```

`salt.modules.boto3_elasticache.`**`remove_tags_from_resource`**(*name, region=None, key=None, keyid=None, profile=None, **args*)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function…

Example:

```
salt myminion boto3_elasticache.remove_tags_from_resource                 name
↪'=arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'            ⊠
↪TagKeys="['TeamOwner']"
```

`salt.modules.boto3_elasticache.`**`replication_group_exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if a replication group exists.

Example:

```
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

salt.modules.boto3_elasticache.**revoke_cache_security_group_ingress**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.revoke_cache_security_group_ingress                  ↩
↪                           mycachesecgrp                                            ↩
↪EC2SecurityGroupName=someEC2sg                                    ↩
↪EC2SecurityGroupOwnerId=SOMEOWNERID
```

21.9.34 salt.modules.boto3_elasticsearch module

Connection module for Amazon Elasticsearch Service

New in version Natrium.

configuration This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

All methods return a dict with: 'result' key containing a boolean indicating success or failure, 'error' key containing the errormessage returned by boto on error, 'response' key containing the data of the response returned by boto on success.

codeauthor Herbert Buurman <herbert.buurman@ogd.nl>

depends boto3

`salt.modules.boto3_elasticsearch.`**`add_tags`**(*domain_name=None, arn=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Attaches tags to an existing Elasticsearch domain. Tags are a set of case-sensitive key value pairs. An Elasticsearch domain may have up to 10 tags.

Parameters

- **domain_name** (*str*) – The name of the Elasticsearch domain you want to add tags to.
- **arn** (*str*) – The ARN of the Elasticsearch domain you want to add tags to. Specifying this overrides `domain_name`.
- **tags** (*dict*) – The dict of tags to add to the Elasticsearch domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.add_tags domain_name=mydomain tags='{"foo": "bar
↪", "baz": "qux"}'
```

`salt.modules.boto3_elasticsearch.`**`cancel_elasticsearch_service_software_update`**(*domain_name, region=None, keyid=None, key=None, profile=None*)

Cancels a scheduled service software update for an Amazon ES domain. You can only perform this operation before the AutomatedUpdateDate and when the UpdateStatus is in the PENDING_UPDATE state.

Parameters **domain_name** (*str*) – The name of the domain that you want to stop the latest service software update on.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the current service software options. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`check_upgrade_eligibility`**(*domain_name, elasticsearch_version, region=None, keyid=None, key=None, profile=None*)

Helper function to determine in one call if an Elasticsearch domain can be upgraded to the specified Elasticsearch version.

This assumes that the Elasticsearch domain is at rest at the moment this function is called. I.e. The domain is not in the process of :

- being created.
- being updated.

- another upgrade running, or a check thereof.
- being deleted.

Behind the scenes, this does 3 things:

- Check if `elasticsearch_version` is among the compatible elasticsearch versions.
- Perform a check if the Elasticsearch domain is eligible for the upgrade.
- Check the result of the check and return the result as a boolean.

Parameters

- **`name`** (*str*) – The Elasticsearch domain name to check.
- **`elasticsearch_version`** (*str*) – The Elasticsearch version to upgrade to.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with boolean result of the check. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.check_upgrade_eligibility mydomain '6.7'
```

`salt.modules.boto3_elasticsearch.`**`create_elasticsearch_domain`**(*domain_name, elasticsearch_version=None, elasticsearch_cluster_config=None, ebs_options=None, access_policies=None, snapshot_options=None, vpc_options=None, cognito_options=None, encryption_at_rest_options=None, node_to_node_encryption_options=None, advanced_options=None, log_publishing_options=None, blocking=False, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a domain.

Parameters

- **`domain_name`** (*str*) – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region.

Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- **elasticsearch_version** (*str*) – String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- **elasticsearch_cluster_config** (*dict*) – Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (str): The instance type for an Elasticsearch cluster.
  - InstanceCount (int): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled. If this is not enabled, the Elasticsearch domain will only be in one availability zone.
  - ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled. Allowed values: 2, 3
  - DedicatedMasterType (str): The instance type for a dedicated master node.
  - DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- **ebs_options** (*dict*) – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **access_policies** (*str or dict*) – Dict or JSON string with the IAM access policy.
- **snapshot_options** (*dict*) – Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc_options** (*dict*) – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- **cognito_options** (*dict*) – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.

  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- **encryption_at_rest_options** (*dict*) – Dict specifying the encryption at rest options. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.
- **node_to_node_encryption_options** (*dict*) – Dict specifying the node to node encryption options. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.
- **advanced_options** (*dict*) – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide /es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.
- **log_publishing_options** (*dict*) – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS

  The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) – Whether or not to wait (block) until the Elasticsearch domain has been created.

Note: Not all instance types allow enabling encryption at rest. See https://docs.aws.amazon.com /elasticsearch-service/latest/developerguide/aes-supported-instance-types.html

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.create_elasticsearch_domain mydomain \
elasticsearch_cluster_config='{ \
  "InstanceType": "t2.micro.elasticsearch", \
  "InstanceCount": 1, \
  "DedicatedMasterEnabled": False, \
  "ZoneAwarenessEnabled": False}' \
ebs_options='{ \
  "EBSEnabled": True, \
  "VolumeType": "gp2", \
  "VolumeSize": 10, \
  "Iops": 0}' \
```

(continues on next page)

(continued from previous page)

```
access_policies='{ \
  "Version": "2012-10-17", \
  "Statement": [ \
    {"Effect": "Allow", \
     "Principal": {"AWS": "*"}, \
     "Action": "es:*", \
     "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
     "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]}' \
snapshot_options='{"AutomatedSnapshotStartHour": 0}' \
advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'
```

`salt.modules.boto3_elasticsearch.`**`delete_elasticsearch_domain`**(*domain_name*, *blocking=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Permanently deletes the specified Elasticsearch domain and all of its data. Once a domain is deleted, it cannot be recovered.

Parameters

- **domain_name** (*str*) – The name of the domain to delete.
- **blocking** (*bool*) – Whether or not to wait (block) until the Elasticsearch domain has been deleted.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`delete_elasticsearch_service_role`**(*region=None*, *keyid=None*, *key=None*, *profile=None*)

Deletes the service-linked role that Elasticsearch Service uses to manage and maintain VPC domains. Role deletion will fail if any existing VPC domains use the role. You must delete any such Elasticsearch domains before deleting the role.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`describe_elasticsearch_domain`**(*domain_name*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Given a domain name gets its status description.

Parameters **domain_name** (*str*) – The name of the domain to get the status of.

Return type dict

Returns Dictionary ith key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`describe_elasticsearch_domain_config`**`(`*domain_name, region=None, keyid=None, key=None, profile=None*`)`

Provides cluster configuration information about the specified Elasticsearch domain, such as the state, creation date, update version, and update date for cluster options.

Parameters **`domain_name`** (*`str`*) – The name of the domain to describe.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the current configuration information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`describe_elasticsearch_domains`**`(`*domain_names, region=None, keyid=None, key=None, profile=None*`)`

Returns domain configuration information about the specified Elasticsearch domains, including the domain ID, domain endpoint, and domain ARN.

Parameters **`domain_names`** (*`list`*) – List of domain names to get information for.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the list of domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_domains '["domain_a",
↪"domain_b"]'
```

`salt.modules.boto3_elasticsearch.`**`describe_elasticsearch_instance_type_limits`**`(`*instance_type, elasticsearch_version, domain_name=None, region=None, keyid=None, key=None, profile=None*`)`

Describe Elasticsearch Limits for a given InstanceType and ElasticsearchVersion. When modifying existing Domain, specify the “ DomainName “ to know what Limits are supported for modifying.

Parameters

- **`instance_type`** (*str*) – The instance type for an Elasticsearch cluster for which Elasticsearch `Limits` are needed.
- **`elasticsearch_version`** (*str*) – Version of Elasticsearch for which `Limits` are needed.
- **`domain_name`** (*str*) – Represents the name of the Domain that we are trying to modify. This should be present only if we are querying for Elasticsearch `Limits` for existing domain.

Return type dict

Returns Dictionary with key ’result’ and as value a boolean denoting success or failure. Upon success, also contains a key ’reponse’ with the limits information. Upon failure, also contains a key ’error’ with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_instance_type_limits \
  instance_type=r3.8xlarge.elasticsearch \
  elasticsearch_version='6.2'
```

`salt.modules.boto3_elasticsearch.`**`describe_reserved_elasticsearch_instance_offerings`**(*reserved_ region=Non keyid=No key=None profile=None*

Lists available reserved Elasticsearch instance offerings.

Parameters **`reserved_elasticsearch_instance_offering_id`** (*str*) – The offering identifier filter value. Use this parameter to show only the available offering that matches the specified reservation identifier.

Return type dict

Returns Dictionary with key ’result’ and as value a boolean denoting success or failure. Upon success, also contains a key ’reponse’ with the list of offerings information. Upon failure, also contains a key ’error’ with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`describe_reserved_elasticsearch_instances`**(*reserved_elasticsearch_ region=None, keyid=None, key=None, profile=None*)

Returns information about reserved Elasticsearch instances for this account.

Parameters **`reserved_elasticsearch_instance_id`** (*str*) – The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of information on reserved instances. Upon failure, also contains a key 'error' with the error message as value.

Note Version 1.9.174 of boto3 has a bug in that reserved_elasticsearch_instance_id is considered a required argument, even though the documentation says otherwise.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`exists`**(*domain_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a domain name, check to see if the given domain exists.

Parameters **`domain_name`** (*`str`*) – The name of the domain to check.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`get_compatible_elasticsearch_versions`**(*domain_name=None*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Returns a list of upgrade compatible Elastisearch versions. You can optionally pass a `domain_name` to get all upgrade compatible Elasticsearch versions for that specific domain.

Parameters **`domain_name`** (*`str`*) – The name of an Elasticsearch domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of compatible versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`get_upgrade_history`**(*domain_name*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Retrieves the complete history of the last 10 upgrades that were performed on the domain.

Parameters **`domain_name`** (*`str`*) – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of upgrade histories. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`get_upgrade_status`**(*domain_name*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Retrieves the latest status of the last upgrade or upgrade eligibility check that was performed on the domain.

Parameters **`domain_name`** (*`str`*) – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with upgrade status information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`list_domain_names`**(*region=None*, *keyid=None*, *key=None*, *profile=None*)

Returns the name of all Elasticsearch domains owned by the current user's account.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of domain names. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`list_elasticsearch_instance_types`**(*elasticsearch_version*, *domain_name=None*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

List all Elasticsearch instance types that are supported for given ElasticsearchVersion.

Parameters

- **`elasticsearch_version`** (*`str`*) – Version of Elasticsearch for which list of supported elasticsearch instance types are needed.
- **`domain_name`** (*`str`*) – DomainName represents the name of the Domain that we are trying to modify. This should be present only if we are querying for list of available Elasticsearch instance types when modifying existing domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of Elasticsearch instance types. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`list_elasticsearch_versions`**(*region=None*, *keyid=None*, *key=None*, *profile=None*)

List all supported Elasticsearch versions.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of Elasticsearch versions. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`list_tags`**(*domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None*)

Returns all tags for the given Elasticsearch domain.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a dict of tags. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`purchase_reserved_elasticsearch_instance_offering`**(*reserved_el reservation_name, instance_cou region=None, keyid=Non key=None, profile=None*)

Allows you to purchase reserved Elasticsearch instances.

Parameters

- **`reserved_elasticsearch_instance_offering_id`** (*`str`*) – The ID of the reserved Elasticsearch instance offering to purchase.
- **`reservation_name`** (*`str`*) – A customer-specified identifier to track this reservation.
- **`instance_count`** (*`int`*) – The number of Elasticsearch instances to reserve.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with purchase information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`remove_tags`**(*tag_keys, domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None*)

Removes the specified set of tags from the specified Elasticsearch domain.

Parameters

- **`tag_keys`** (*`list`*) – List with tag keys you want to remove from the Elasticsearch domain.

- **domain_name** (*str*) – The name of the Elasticsearch domain you want to remove tags from.
- **arn** (*str*) – The ARN of the Elasticsearch domain you want to remove tags from. Specifying this overrides `domain_name`.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.remove_tags '["foo", "bar"]' domain_name=my_
↪domain
```

`salt.modules.boto3_elasticsearch.`**`start_elasticsearch_service_software_update`**(*domain_name, region=None, keyid=None, key=None, profile=None*)

Schedules a service software update for an Amazon ES domain.

Parameters **domain_name** (*str*) – The name of the domain that you want to update to the latest service software.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with service software information. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

`salt.modules.boto3_elasticsearch.`**`update_elasticsearch_domain_config`**(*domain_name, elasticsearch_cluster_config=None, ebs_options=None, vpc_options=None, access_policies=None, snapshot_options=None, cognito_options=None, advanced_options=None, log_publishing_options=None, blocking=False, region=None, key=None, keyid=None, profile=None*)

Modifies the cluster configuration of the specified Elasticsearch domain, for example setting the instance type and the number of instances.

Parameters

- **`domain_name`** (*`str`*) – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **`elasticsearch_cluster_config`** (*`dict`*) – Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (str): The instance type for an Elasticsearch cluster.
  - InstanceCount (int): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled.
  - ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
  - DedicatedMasterType (str): The instance type for a dedicated master node.
  - DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- **`ebs_options`** (*`dict`*) – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **`snapshot_options`** (*`dict`*) – Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **`vpc_options`** (*`dict`*) – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- **`cognito_options`** (*`dict`*) – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.

  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

- **advanced_options** (*dict*) – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide /es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.
- **access_policies** (*str/dict*) – Dict or JSON string with the IAM access policy.
- **log_publishing_options** (*dict*) – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:

  INDEX_SLOW_LOGS, SEARCH_SLOW_LOGS, ES_APPLICATION_LOGS.

  The value assigned to each key is a dict with the following case sensitive keys:

  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) – Whether or not to wait (block) until the Elasticsearch domain has been updated.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.update_elasticsearch_domain_config mydomain \
  elasticsearch_cluster_config='{\
    "InstanceType": "t2.micro.elasticsearch", \
    "InstanceCount": 1, \
    "DedicatedMasterEnabled": false,
    "ZoneAwarenessEnabled": false}' \
  ebs_options='{\
    "EBSEnabled": true, \
    "VolumeType": "gp2", \
    "VolumeSize": 10, \
    "Iops": 0}' \
  access_policies='{"Version": "2012-10-17", "Statement": [{\
    "Effect": "Allow", "Principal": {"AWS": "*"}, "Action": "es:*", \
    "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
    "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]}' \
  snapshot_options='{"AutomatedSnapshotStartHour": 0}' \
  advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'
```

salt.modules.boto3_elasticsearch.**upgrade_elasticsearch_domain**(*domain_name, target_version, perform_check_only=None, blocking=False, region=None, keyid=None, key=None, profile=None*)

Allows you to either upgrade your domain or perform an Upgrade eligibility check to a compatible Elasticsearch version.

Parameters

- **domain_name** (*str*) – The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **target_version** (*str*) – The version of Elasticsearch that you intend to upgrade the domain to.
- **perform_check_only** (*bool*) – This flag, when set to True, indicates that an Upgrade Eligibility Check needs to be performed. This will not actually perform the Upgrade.
- **blocking** (*bool*) – Whether or not to wait (block) until the Elasticsearch domain has been upgraded.

Return type dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

CLI Example:

```
salt myminion boto3_elasticsearch.upgrade_elasticsearch_domain mydomain \
target_version='6.7' \
perform_check_only=True
```

salt.modules.boto3_elasticsearch.**wait_for_upgrade**(*domain_name, region=None, keyid=None, key=None, profile=None*)

Block until an upgrade-in-progress for domain `name` is finished.

Parameters **name** (*str*) – The name of the domain to wait for.

Rtype dict

Returns Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version Natrium.

21.9.35 salt.modules.boto3_route53 module

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Note that Route53 essentially ignores all (valid) settings for 'region', since there is only one Endpoint (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

depends boto3

`salt.modules.boto3_route53.`**`associate_vpc_with_hosted_zone`**`(`*HostedZoneId=None, Name=None, VPCId=None, VPCName=None, VPCRegion=None, Comment=None, region=None, key=None, keyid=None, profile=None*`)`

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can't convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from a another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Note that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you're associating a VPC to a zone in a different account, as outlined above, you unfortunately MUST use the HostedZoneId parameter exclusively.

HostedZoneId The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

Comment Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.associate_vpc_with_hosted_zone                    ☒
↪Name=example.org. VPCName=myVPC                    VPCRegion=us-east-1 Comment=
↪"Whoo-hoo!  I added another VPC."
```

`salt.modules.boto3_route53.`**`aws_encode`**`(`*x*`)`

An implementation of the encoding required to suport AWS's domain name rules defined here:

While AWS's documentation specifies individual ASCII characters which need to be encoded, we instead just try to force the string to one of escaped unicode or idna depending on whether there are non-ASCII characters present.

This means that we support things like ☒☒☒☒.☒☒☒ as a domain name string.

More information about IDNA encoding in python is found here:

`salt.modules.boto3_route53.`**`change_resource_record_sets`**`(`*HostedZoneId=None, Name=None, PrivateZone=None, ChangeBatch=None, region=None, key=None, keyid=None, profile=None*`)`

See the AWS Route53 API docs as well as the Boto3 documentation for all the details…

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trival configurations.

```
{
    "Comment": "string",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
                "Name": "string",
                "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF
↪"|"AAAA",
                "SetIdentifier": "string",
                "Weight": 123,
                "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-
↪central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-
↪southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-
↪south-1",
                "GeoLocation": {
                    "ContinentCode": "string",
                    "CountryCode": "string",
                    "SubdivisionCode": "string"
                },
                "Failover": "PRIMARY"|"SECONDARY",
                "TTL": 123,
```

(continues on next page)

(continued from previous page)

```
                "ResourceRecords": [
                    {
                        "Value": "string"
                    },
                ],
                "AliasTarget": {
                    "HostedZoneId": "string",
                    "DNSName": "string",
                    "EvaluateTargetHealth": True|False
                },
                "HealthCheckId": "string",
                "TrafficPolicyInstanceId": "string"
            }
        },
    ]
}
```

CLI Example:

```
foo='{
       "Name": "my-cname.example.org.",
       "TTL": 600,
       "Type": "CNAME",
       "ResourceRecords": [
         {
           "Value": "my-host.example.org"
         }
       ]
     }'
foo=`echo $foo`  # Remove newlines
salt myminion boto3_route53.change_resource_record_sets DomainName=example.org.
↪                keyid=A1234567890ABCDEF123 key=xblahblahblah
↪ChangeBatch="{'Changes': [{'Action': 'UPSERT', 'ResourceRecordSet': $foo}]}"
```

`salt.modules.boto3_route53.`**`create_hosted_zone`**(*Name, VPCId=None, VPCName=None, VPCRegion=None, CallerReference=None, Comment=”, PrivateZone=False, DelegationSetId=None, region=None, key=None, keyid=None, profile=None*)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if creating a private hosted zone.

DelegationSetId If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you'd need to manually create any delegation sets before utilizing this.

region Region endpoint to connect to.

key AWS key to bind with.

keyid AWS keyid to bind with.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.create_hosted_zone example.org.
```

`salt.modules.boto3_route53.`**`delete_hosted_zone`**(*Id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

`salt.modules.boto3_route53.`**`delete_hosted_zone_by_domain`**(*Name*, *PrivateZone=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.
```

`salt.modules.boto3_route53.`**`disassociate_vpc_from_hosted_zone`**(*HostedZoneId=None*, *Name=None*, *VPCId=None*, *VPCName=None*, *VPCRegion=None*, *Comment=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disassociates an Amazon VPC from a private hosted zone.

You can't disassociate the last VPC from a private hosted zone. You also can't convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works XXX FACTCHECK within a single AWS account - if you're disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

HostedZoneId The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

Comment Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
↪Name=example.org. VPCName=myVPC                          VPCRegion=us-east-1 Comment=
↪"Whoops!  Don't wanna talk to this-here zone no more."
```

`salt.modules.boto3_route53.`**`find_hosted_zone`**(*Id=None, Name=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None*)

Find a hosted zone with the given characteristics.

Id The unique Zone Identifier for the Hosted Zone. Exclusive with Name.

Name The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to match more then one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

PrivateZone Boolean - Set to True if searching for a private hosted zone.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.find_hosted_zone Name=salt.org.
↪profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}
↪'
```

`salt.modules.boto3_route53.`**`get_hosted_zone`**(*Id, region=None, key=None, keyid=None, profile=None*)

Return detailed info about the given zone.

Id The unique Zone Identifier for the Hosted Zone.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zone Z1234567690                  profile='{
↪"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

`salt.modules.boto3_route53.`**`get_hosted_zones_by_domain`**`(`*Name, region=None, key=None, keyid=None, profile=None*`)`

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.

Name The domain name associated with the Hosted Zone(s).

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.
↪profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}
↪'
```

`salt.modules.boto3_route53.`**`get_resource_records`**`(`*HostedZoneId=None, Name=None, StartRecordName=None, StartRecordType=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None*`)`

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

`salt.modules.boto3_route53.`**`list_hosted_zones`**`(`*DelegationSetId=None, region=None, key=None, keyid=None, profile=None*`)`

Return detailed info about all zones in the bound account.

DelegationSetId If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.describe_hosted_zones                profile='{
↪"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

`salt.modules.boto3_route53.`**`update_hosted_zone_comment`**`(`*Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None*`)`

Update the comment on an existing Route 53 hosted zone.

Id The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if changing a private hosted zone.

CLI Example:

```
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org.
↪         Comment="This is an example comment for an example zone"
```

21.9.36 salt.modules.boto_apigateway module

Connection module for Amazon APIGateway

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
apigateway.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-west-2
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_apigateway`) return:

```
apigateway:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

`salt.modules.boto_apigateway.`**`activate_api_deployment`**(*restApiId, stageName, deploymentId, region=None, key=None, keyid=None, profile=None*)

Activates previously deployed deployment for a given stage

CLI Example:

```
salt myminion boto_apigateway.activate_api_deployent restApiId stagename␣
↪deploymentId
```

`salt.modules.boto_apigateway.`**`api_exists`**(*name, description=None, region=None, key=None, keyid=None, profile=None*)

Check to see if the given Rest API Name and optionally description exists.

CLI Example:

```
salt myminion boto_apigateway.exists myapi_name
```

`salt.modules.boto_apigateway.`**`api_model_exists`**(*restApiId, modelName, region=None, key=None, keyid=None, profile=None*)

Check to see if the given modelName exists in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

`salt.modules.boto_apigateway.`**`associate_api_key_stagekeys`**(*apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None*)

associate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.associate_stagekeys_api_key \
        api_key '["restapi id/stage name", ...]'
```

salt.modules.boto_apigateway.**attach_usage_plan_to_apis**(*plan_id, apis, region=None, key=None, keyid=None, profile=None*)

Attaches given usage plan to each of the apis provided in a list of apiId and stage values

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

apiId a string, which is the id of the created API in AWS ApiGateway

stage a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.attach_usage_plan_to_apis plan_id='usage plan id'␣
↪apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

salt.modules.boto_apigateway.**create_api**(*name, description, cloneFrom=None, region=None, key=None, keyid=None, profile=None*)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:

```
salt myminion boto_apigateway.create_api myapi_name api_description
```

salt.modules.boto_apigateway.**create_api_deployment**(*restApiId, stageName, stageDescription=", description=", cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None*)

Creates a new API deployment.

CLI Example:

```
salt myminion boto_apigateway.create_api_deployent restApiId stagename␣
↪stageDescription='' \
description='' cacheClusterEnabled=True|False cacheClusterSize=0.5 variables='{
↪"name": "value"}'
```

salt.modules.boto_apigateway.**create_api_integration**(*restApiId, resourcePath, httpMethod, integrationType, integrationHttpMethod, uri, credentials, requestParameters=None, requestTemplates=None, region=None, key=None, keyid=None, profile=None*)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.

uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARN) ”arn:aws:apigateway:APIGATEWAY_REGION:lambda:path/2015-03-31/functions/LAMBDA_FUNC_ARN/invocations”

credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId resourcePath⊠
↪httpMethod \
                     integrationType integrationHttpMethod uri credentials ['{}' [
↪'{}']]
```

salt.modules.boto_apigateway.**create_api_integration_response**(*restApiId, resourcePath, httpMethod, statusCode, selectionPattern, responseParameters=None, responseTemplates=None, region=None, key=None, keyid=None, profile=None*)

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId⊠
↪resourcePath httpMethod \
                    statusCode selectionPattern ['{}' ['{}']]
```

salt.modules.boto_apigateway.**create_api_key**(*name, description, enabled=True, stageKeys=None, region=None, key=None, keyid=None, profile=None*)

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with ’restApiId’ and ’stageName’ as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name description

salt myminion boto_apigateway.create_api_key name description enabled=False

salt myminion boto_apigateway.create_api_key name description \
     stageKeys='[{"restApiId": "id", "stageName": "stagename"}]'
```

salt.modules.boto_apigateway.**create_api_method**(*restApiId, resourcePath, httpMethod, authorizationType, apiKeyRequired=False, requestParameters=None, requestModels=None, region=None, key=None, keyid=None, profile=None*)

Creates API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method restApiId resourcePath,
↪httpMethod, authorizationType, \
    apiKeyRequired=False, requestParameters='{"name", "value"}', requestModels='{
↪"content-type", "value"}'
```

salt.modules.boto_apigateway.**create_api_method_response**(*restApiId, resourcePath, httpMethod, statusCode, responseParameters=None, responseModels=None, region=None, key=None, keyid=None, profile=None*)

Create API method response for a method on a given resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method_response restApiId resourcePath
↪httpMethod \
       statusCode responseParameters='{"name", "True|False"}' responseModels='{
↪"content-type", "model"}'
```

salt.modules.boto_apigateway.**create_api_model**(*restApiId, modelName, modelDescription, schema, contentType='application/json', region=None, key=None, keyid=None, profile=None*)

Create a new model in a given API with a given schema, currently only contentType supported is 'application/json'

CLI Example:

```
salt myminion boto_apigateway.create_api_model restApiId modelName
↪modelDescription '<schema>' 'content-type'
```

salt.modules.boto_apigateway.**create_api_resources**(*restApiId, path, region=None, key=None, keyid=None, profile=None*)

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.create_api_resources myapi_id resource_path
```

salt.modules.boto_apigateway.**create_api_stage**(*restApiId, stageName, deploymentId, description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None*)

Creates a new API stage for a given restApiId and deploymentId.

CLI Example:

```
salt myminion boto_apigateway.create_api_stage restApiId stagename deploymentId \
    description='' cacheClusterEnabled=True|False cacheClusterSize='0.5'
↪variables='{"name": "value"}'
```

salt.modules.boto_apigateway.**create_usage_plan**(*name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None*)

Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

name Name of the usage plan

throttle A dictionary consisting of the following keys:

- **rateLimit** requests per second at steady rate, float
- **burstLimit** maximum number of requests per second, integer

quota A dictionary consisting of the following keys:

- **limit** number of allowed requests per specified quota period [required if quota parameter is present]
- **offset** number of requests to be subtracted from limit at the beginning of the period [optional]
- **period** quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.create_usage_plan name='usage plan name' throttle='{
↪"rateLimit": 10.0, "burstLimit": 10}'
```

`salt.modules.boto_apigateway.`**`delete_api`**(*name, description=None, region=None, key=None, keyid=None, profile=None*)

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```
salt myminion boto_apigateway.delete_api myapi_name

salt myminion boto_apigateway.delete_api myapi_name description='api description'
```

`salt.modules.boto_apigateway.`**`delete_api_deployment`**(*restApiId, deploymentId, region=None, key=None, keyid=None, profile=None*)

Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

`salt.modules.boto_apigateway.`**`delete_api_integration`**(*restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None*)

Deletes an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration restApiId resourcePath
↪httpMethod
```

salt.modules.boto_apigateway.**delete_api_integration_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration_response restApiId
↪resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.**delete_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a given apiKey

CLI Example:

```
salt myminion boto_apigateway.delete_api_key apikeystring
```

salt.modules.boto_apigateway.**delete_api_method**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.**delete_api_method_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method_response restApiId resourcePath
↪httpMethod statusCode
```

salt.modules.boto_apigateway.**delete_api_model**(*restApiId*, *modelName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a model identified by name in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_model restApiId modelName
```

salt.modules.boto_apigateway.**delete_api_resources**(*restApiId*, *path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource '/', the function will return False. Returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path
```

`salt.modules.boto_apigateway.`**`delete_api_stage`**(*restApiId*, *stageName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.delete_api_stage restApiId stageName
```

`salt.modules.boto_apigateway.`**`delete_usage_plan`**(*plan_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes usage plan identified by plan_id

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'
```

`salt.modules.boto_apigateway.`**`describe_api_deployment`**(*restApiId*, *deploymentId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get API deployment for a given restApiId and deploymentId.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployent restApiId deploymentId
```

`salt.modules.boto_apigateway.`**`describe_api_deployments`**(*restApiId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployments restApiId
```

`salt.modules.boto_apigateway.`**`describe_api_integration`**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration restApiId resourcePath␣
↪httpMethod
```

`salt.modules.boto_apigateway.`**`describe_api_integration_response`**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration_response restApiId␣
↪resourcePath httpMethod statusCode
```

`salt.modules.boto_apigateway.`**`describe_api_key`**`(`*apiKey, region=None, key=None, keyid=None, profile=None*`)`

Gets info about the given api key

CLI Example:

```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

`salt.modules.boto_apigateway.`**`describe_api_keys`**`(`*region=None, key=None, keyid=None, profile=None*`)`

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:

```
salt myminion boto_apigateway.describe_api_keys
```

`salt.modules.boto_apigateway.`**`describe_api_method`**`(`*restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None*`)`

Get API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath␣
↪httpMethod
```

`salt.modules.boto_apigateway.`**`describe_api_method_response`**`(`*restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None*`)`

Get API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath␣
↪httpMethod statusCode
```

`salt.modules.boto_apigateway.`**`describe_api_model`**`(`*restApiId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None*`)`

Get a model by name for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_model restApiId modelName [True]
```

`salt.modules.boto_apigateway.`**`describe_api_models`**`(`*restApiId, region=None, key=None, keyid=None, profile=None*`)`

Get all models for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_models restApiId
```

salt.modules.boto_apigateway.**describe_api_resource**(*restApiId, path, region=None, key=None, keyid=None, profile=None*)

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

salt.modules.boto_apigateway.**describe_api_resource_method**(*restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None*)

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path
↪httpmethod
```

salt.modules.boto_apigateway.**describe_api_resources**(*restApiId, region=None, key=None, keyid=None, profile=None*)

Given rest api id, return all resources for this api.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

salt.modules.boto_apigateway.**describe_api_stage**(*restApiId, stageName, region=None, key=None, keyid=None, profile=None*)

Get API stage for a given apiID and stage name

CLI Example:

```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

salt.modules.boto_apigateway.**describe_api_stages**(*restApiId, deploymentId, region=None, key=None, keyid=None, profile=None*)

Get all API stages for a given apiID and deploymentID

CLI Example:

```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

salt.modules.boto_apigateway.**describe_apis**(*name=None, description=None, region=None, key=None, keyid=None, profile=None*)

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:

```
salt myminion boto_apigateway.describe_apis

salt myminion boto_apigateway.describe_apis name='api name'

salt myminion boto_apigateway.describe_apis name='api name' description='desc str'
```

salt.modules.boto_apigateway.**describe_usage_plans**(*name=None*, *plan_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```

salt.modules.boto_apigateway.**detach_usage_plan_from_apis**(*plan_id*, *apis*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detaches given usage plan from each of the apis provided in a list of apiId and stage value

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

apiId a string, which is the id of the created API in AWS ApiGateway

stage a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.detach_usage_plan_to_apis plan_id='usage plan id'
↪apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

salt.modules.boto_apigateway.**disable_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

disable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

salt.modules.boto_apigateway.**disassociate_api_key_stagekeys**(*apiKey*, *stagekeyslist*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.disassociate_stagekeys_api_key \
        api_key '["restapi id/stage name", ...]'
```

salt.modules.boto_apigateway.**enable_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

enable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

`salt.modules.boto_apigateway.`**`flush_api_stage_cache`**(*restApiId, stageName, region=None, key=None, keyid=None, profile=None*)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

`salt.modules.boto_apigateway.`**`overwrite_api_stage_variables`**(*restApiId, stageName, variables, region=None, key=None, keyid=None, profile=None*)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:

```
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName
↪variables='{"name": "value"}'
```

`salt.modules.boto_apigateway.`**`update_api_key_description`**(*apiKey, description, region=None, key=None, keyid=None, profile=None*)

update the given apiKey with the given description.

CLI Example:

```
salt myminion boto_apigateway.update_api_key_description api_key description
```

`salt.modules.boto_apigateway.`**`update_api_model_schema`**(*restApiId, modelName, schema, region=None, key=None, keyid=None, profile=None*)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

`salt.modules.boto_apigateway.`**`update_usage_plan`**(*plan_id, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None*)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

plan_id Id of the created usage plan

throttle A dictionary consisting of the following keys:

- **rateLimit** requests per second at steady rate, float
- **burstLimit** maximum number of requests per second, integer

quota A dictionary consisting of the following keys:

- **limit** number of allowed requests per specified quota period [required if quota parameter is present]
- **offset** number of requests to be subtracted from limit at the beginning of the period [optional]

period quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' throttle='
↪{"rateLimit": 10.0, "burstLimit": 10}'
```

21.9.37 salt.modules.boto_asg

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

configuration This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

depends boto3

`salt.modules.boto_asg.`**`create`**(*name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, tags=None, termination_policies=None, suspended_processes=None, scaling_policies=None, scheduled_actions=None, region=None, notification_arn=None, notification_types=None, key=None, keyid=None, profile=None*)

Create an autoscale group.

CLI example:

```
salt myminion boto_asg.create myasg mylc '["us-east-1a", "us-east-1e"]' 1 10 load_
↪balancers='["myelb", "myelb2"]' tags='[{"key": "Name", value="myasg",
↪"propagate_at_launch": True}]'
```

`salt.modules.boto_asg.`**`create_launch_configuration`**(*name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, instance_type='m1.small', kernel_id=None, ramdisk_id=None, block_device_mappings=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, volume_type=None, delete_on_termination=True, iops=None, use_block_device_types=False, region=None, key=None, keyid=None, profile=None*)

Create a launch configuration.

CLI example:

```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-0b9c9f62 key_
↪name='mykey' security_groups='["mygroup"]' instance_type='c3.2xlarge'
```

`salt.modules.boto_asg.`**`delete`**(*name, force=False, region=None, key=None, keyid=None, profile=None*)

Delete an autoscale group.

CLI example:

```
salt myminion boto_asg.delete myasg region=us-east-1
```

`salt.modules.boto_asg.`**`delete_launch_configuration`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete a launch configuration.

CLI example:

```
salt myminion boto_asg.delete_launch_configuration mylc
```

`salt.modules.boto_asg.`**`describe_launch_configuration`**(*name, region=None, key=None, keyid=None, profile=None*)

Dump details of a given launch configuration.

CLI example:

```
salt myminion boto_asg.describe_launch_configuration mylc
```

`salt.modules.boto_asg.`**`enter_standby`**(*name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None*)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.enter_standby my_autoscale_group_name '["i-xxxxxx"]'
```

`salt.modules.boto_asg.`**`exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an autoscale group exists.

CLI example:

```
salt myminion boto_asg.exists myasg region=us-east-1
```

`salt.modules.boto_asg.`**`exit_standby`**(*name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None*)

Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.exit_standby my_autoscale_group_name '["i-xxxxxx"]'
```

`salt.modules.boto_asg.`**`get_all_groups`**(*region=None, key=None, keyid=None, profile=None*)

Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

`salt.modules.boto_asg.`**`get_all_launch_configurations`**(*region=None, key=None, keyid=None, profile=None*)

Fetch and return all Launch Configuration with details.

CLI example:

```
salt myminion boto_asg.get_all_launch_configurations
```

`salt.modules.boto_asg.`**`get_cloud_init_mime`**(*cloud_init*)

Get a mime multipart encoded string from a cloud-init dict. Currently supports boothooks, scripts and cloud-config.

CLI Example:

```
salt myminion boto.get_cloud_init_mime <cloud init>
```

`salt.modules.boto_asg.`**`get_config`**(*name, region=None, key=None, keyid=None, profile=None*)

Get the configuration for an autoscale group.

CLI example:

```
salt myminion boto_asg.get_config myasg region=us-east-1
```

`salt.modules.boto_asg.`**`get_instances`**(*name, lifecycle_state='InService', health_status='Healthy', attribute='private_ip_address', attributes=None, region=None, key=None, keyid=None, profile=None*)

return attribute of all instances in the named autoscale group.

CLI example:

```
salt-call boto_asg.get_instances my_autoscale_group_name
```

`salt.modules.boto_asg.`**`get_scaling_policy_arn`**(*as_group*, *scaling_policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:

```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

`salt.modules.boto_asg.`**`launch_configuration_exists`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check for a launch configuration's existence.

CLI example:

```
salt myminion boto_asg.launch_configuration_exists mylc
```

`salt.modules.boto_asg.`**`list_groups`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.list_groups region=us-east-1
```

`salt.modules.boto_asg.`**`list_launch_configurations`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all Launch Configurations.

CLI example:

```
salt myminion boto_asg.list_launch_configurations
```

`salt.modules.boto_asg.`**`update`**(*name*, *launch_config_name*, *availability_zones*, *min_size*, *max_size*, *desired_capacity=None*, *load_balancers=None*, *default_cooldown=None*, *health_check_type=None*, *health_check_period=None*, *placement_group=None*, *vpc_zone_identifier=None*, *tags=None*, *termination_policies=None*, *suspended_processes=None*, *scaling_policies=None*, *scheduled_actions=None*, *notification_arn=None*, *notification_types=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update an autoscale group.

CLI example:

```
salt myminion boto_asg.update myasg mylc '["us-east-1a", "us-east-1e"]' 1 10 load_
↪balancers='["myelb", "myelb2"]' tags='[{"key": "Name", value="myasg",
↪"propagate_at_launch": True}]'
```

21.9.38 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
cfn.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

depends boto

`salt.modules.boto_cfn.`**`create`**(*name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None*)

Create a CFN stack.

CLI Example:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.com/
↪bucket/template.cft'          region=us-east-1
```

`salt.modules.boto_cfn.`**`delete`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete a CFN stack.

CLI Example:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

`salt.modules.boto_cfn.`**`describe`**(*name, region=None, key=None, keyid=None, profile=None*)

Describe a stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

`salt.modules.boto_cfn.`**`exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if a stack exists.

CLI Example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```

`salt.modules.boto_cfn.`**`get_template`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if attributes are set on a CFN stack.

CLI Example:

```
salt myminion boto_cfn.get_template mystack
```

`salt.modules.boto_cfn.`**`update_stack`**`(`*name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=False, timeout_in_minutes=None, capabilities=None, tags=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None*`)`

Update a CFN stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.
↪com/bucket/template.cft'         region=us-east-1
```

`salt.modules.boto_cfn.`**`validate_template`**`(`*template_body=None, template_url=None, region=None, key=None, keyid=None, profile=None*`)`

Validate cloudformation template

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.validate_template mystack-template
```

21.9.39 salt.modules.boto_cloudfront

Connection module for Amazon CloudFront

New in version 2018.3.0.

depends boto3

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/
    iam-roles-for-amazon-ec2.html

http://boto3.readthedocs.io/en/latest/guide/
    configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudfront.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

`salt.modules.boto_cloudfront.`**`create_distribution`**(*name, config, tags=None, region=None, key=None, keyid=None, profile=None*)

Create a CloudFront distribution with the given name, config, and (optionally) tags.

name Name for the CloudFront distribution

config Configuration for the distribution

tags Tags to associate with the distribution

region Region to connect to

key Secret key to use

keyid Access key to use

profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.create_distribution name=mydistribution⊠
↪profile=awsprofile           config='{"Comment":"partial configuration",
↪"Enabled":true}'
```

`salt.modules.boto_cloudfront.`**`export_distributions`**(*region=None, key=None, keyid=None, profile=None*)

Get details of all CloudFront distributions. Produces results that can be used to create an SLS file.

CLI Example:

```
salt-call boto_cloudfront.export_distributions --out=txt |            sed "s/
↪local: //" > cloudfront_distributions.sls
```

`salt.modules.boto_cloudfront.`**`get_distribution`**(*name, region=None, key=None, keyid=None, profile=None*)

Get information about a CloudFront distribution (configuration, tags) with a given name.

name Name of the CloudFront distribution

region Region to connect to

key Secret key to use

keyid Access key to use

profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.get_distribution name=mydistribution⊠
↪profile=awsprofile
```

`salt.modules.boto_cloudfront.`**`update_distribution`**`(`*name, config, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Update the config (and optionally tags) for the CloudFront distribution with the given name.

name Name of the CloudFront distribution

config Configuration for the distribution

tags Tags to associate with the distribution

region Region to connect to

key Secret key to use

keyid Access key to use

profile A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.update_distribution name=mydistribution
↪profile=awsprofile             config='{"Comment":"partial configuration",
↪"Enabled":true}'
```

21.9.40 salt.modules.boto_cloudtrail module

Connection module for Amazon CloudTrail

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudtrail.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

`salt.modules.boto_cloudtrail.`**`add_tags`**`(`*Name, region=None, key=None, keyid=None, profile=None, **kwargs*`)`

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

`salt.modules.boto_cloudtrail.`**`create`**`(`*Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

`salt.modules.boto_cloudtrail.`**`delete`**`(`*Name, region=None, key=None, keyid=None, profile=None*`)`

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

`salt.modules.boto_cloudtrail.`**`describe`**`(`*Name, region=None, key=None, keyid=None, profile=None*`)`

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

`salt.modules.boto_cloudtrail.`**`exists`**`(`*Name, region=None, key=None, keyid=None, profile=None*`)`

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:

```
salt myminion boto_cloudtrail.exists mytrail
```

`salt.modules.boto_cloudtrail.`**`list`**`(`*region=None, key=None, keyid=None, profile=None*`)`

List all trails

Returns list of trails

CLI Example:

```
policies:
  - {...}
  - {...}
```

`salt.modules.boto_cloudtrail.`**`list_tags`**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List tags of a trail

Returns

- {…}
- {…}

Return type tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

`salt.modules.boto_cloudtrail.`**`remove_tags`**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

`salt.modules.boto_cloudtrail.`**`start_logging`**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:

```
salt myminion boto_cloudtrail.start_logging my_trail
```

`salt.modules.boto_cloudtrail.`**`status`**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

`salt.modules.boto_cloudtrail.`**`stop_logging`**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Stop logging for a trail

Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.

CLI Example:

```
salt myminion boto_cloudtrail.stop_logging my_trail
```

`salt.modules.boto_cloudtrail.`**`update`**(*Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.update my_trail my_bucket
```

21.9.41 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_cloudwatch.`**`convert_to_arn`**(*arns, region=None, key=None, keyid=None, profile=None*)

Convert a list of strings into actual arns. Converts convenience names such as 'scaling_policy:...'

CLI Example:

```
salt '*' convert_to_arn 'scaling_policy:'
```

salt.modules.boto_cloudwatch.**create_or_update_alarm**(*connection=None, name=None, metric=None, namespace=None, statistic=None, comparison=None, threshold=None, period=None, evaluation_periods=None, unit=None, description='', dimensions=None, alarm_actions=None, insufficient_data_actions=None, ok_actions=None, region=None, key=None, keyid=None, profile=None*)

Create or update a cloudwatch alarm.

Params are the same as: https://boto.readthedocs.io/en/latest/ref/cloudwatch.html#boto.ec2.cloudwatch.alarm.MetricAlarm.

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. alarm_actions, insufficient_data_actions, and ok_actions must be lists of string. If the passed-in value is a string, it will be split on "," to produce a list. The strings themselves for alarm_actions, insufficient_data_actions, and ok_actions must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

> arn:aws:.... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html scaling_policy:<as_name>:<scaling_policy_name> The named autoscale group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with scaling_policies, and then set up boto_cloudwatch_alarm.present states which have alarm_actions that reference the scaling_policy.

CLI example:

> salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1

salt.modules.boto_cloudwatch.**delete_alarm**(*name, region=None, key=None, keyid=None, profile=None*)

Delete a cloudwatch alarm

CLI example to delete a queue:

```
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.**get_alarm**(*name, region=None, key=None, keyid=None, profile=None*)

Get alarm details. Also can be used to check to see if an alarm exists.

CLI example:

```
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.**get_all_alarms**(*region=None, prefix=None, key=None, keyid=None, profile=None*)

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. **Make a "backup" of all existing alarms** $ salt-call boto_cloudwatch.get_all_alarms –out=txt | sed "s/local: //" > legacy_alarms.sls

2. **Get all alarms with new prefixed names** $ salt-call boto_cloudwatch.get_all_alarms "prefix=**MANAGED BY SALT** " –out=txt | sed "s/local: //" > managed_alarms.sls
3. **Insert the managed alarms into cloudwatch** $ salt-call state.template managed_alarms.sls
4. Manually verify that the new alarms look right
5. Delete the original alarms $ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls $ salt-call state.template remove_legacy_alarms.sls
6. Get all alarms again, verify no changes $ salt-call boto_cloudwatch.get_all_alarms –out=txt | sed "s/local: //" > final_alarms.sls $ diff final_alarms.sls managed_alarms.sls

CLI example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

21.9.42 salt.modules.boto_cloudwatch_event module

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto_cloudwatch_event.`**`create_or_update`**(*Name, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an event rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_cloudwatch_event.create_or_update my_rule
```

`salt.modules.boto_cloudwatch_event.`**`delete`**(*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_cloudwatch_event.delete myrule
```

`salt.modules.boto_cloudwatch_event.`**`describe`**(*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.describe myrule
```

`salt.modules.boto_cloudwatch_event.`**`exists`**(*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI example:

```
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1
```

`salt.modules.boto_cloudwatch_event.`**`list_rules`**(*region=None, key=None, keyid=None, profile=None*)

List, with details, all Cloudwatch Event rules visible in the current scope.

CLI example:

```
salt myminion boto_cloudwatch_event.list_rules region=us-east-1
```

`salt.modules.boto_cloudwatch_event.`**`list_targets`**(*Rule, region=None, key=None, keyid=None, profile=None*)

Given a rule name list the targets of that rule.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.list_targets myrule
```

`salt.modules.boto_cloudwatch_event.`**`put_targets`**(*Rule, Targets, region=None, key=None, keyid=None, profile=None*)

Add the given targets to the given rule

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.put_targets myrule [{'Id': 'target1', 'Arn':
↪'arn:***'}]
```

`salt.modules.boto_cloudwatch_event.`**`remove_targets`**(*Rule, Ids, region=None, key=None, keyid=None, profile=None*)

Given a rule name remove the named targets from the target list

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']
```

21.9.43 salt.modules.boto_cognitoidentity module

Connection module for Amazon CognitoIdentity

New in version 2016.11.0.

configuration This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cognitoidentity.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_identity_pools*) return:

```
identity_pools:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends boto3

`salt.modules.boto_cognitoidentity.`**`create_identity_pool`**(*IdentityPoolName, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None*)

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name
↪                    DeveloperProviderName=custom_developer_provider
```

`salt.modules.boto_cognitoidentity.`**`delete_identity_pools`**(*IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:

```
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.delete_identity_pools '' IdentityPoolId=my_id_
↪pool_id
```

`salt.modules.boto_cognitoidentity.`**`describe_identity_pools`**(*IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name's pool properties

CLI Example:

```
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.describe_identity_pools '' IdentityPoolId=my_
↪id_pool_id
```

salt.modules.boto_cognitoidentity.**get_identity_pool_roles**(*IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None*)

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles '' IdentityPoolId=my_
↪id_pool_id
```

salt.modules.boto_cognitoidentity.**set_identity_pool_roles**(*IdentityPoolId, AuthenticatedRole=None, UnauthenticatedRole=None, region=None, key=None, keyid=None, profile=None*)

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam arn, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_roles  #
↪this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id        
↪   AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role  # this
↪set both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id        
↪   AuthenticatedRole=my_auth_role  # this will set the auth role and clear the
↪unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id        
↪   UnauthenticatedRole=my_unauth_role  # this will set the unauth role and
↪clear the auth role
```

salt.modules.boto_cognitoidentity.**update_identity_pool**(*IdentityPoolId, IdentityPoolName=None, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None*)

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass '{}'

To clear OpenIdConnectProviderARNs pass '[]'

boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_id_pool_
↪name                              DeveloperProviderName=custom_developer_
↪provider
```

21.9.44 salt.modules.boto_datapipeline module

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

depends boto3

salt.modules.boto_datapipeline.**activate_pipeline**(*pipeline_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Start processing pipeline tasks. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.**create_pipeline**(*name*, *unique_id*, *description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new, empty pipeline. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

salt.modules.boto_datapipeline.**delete_pipeline**(*pipeline_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.**describe_pipelines**(*pipeline_ids*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieve metadata about one or more pipelines.

CLI example:

```
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

salt.modules.boto_datapipeline.**get_pipeline_definition**(*pipeline_id*, *version='latest'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the definition of the specified pipeline.

CLI example:

```
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id
```

`salt.modules.boto_datapipeline.`**`list_pipelines`**`(`*region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Get a list of pipeline ids and names for all pipelines.

CLI Example:

```
salt myminion boto_datapipeline.list_pipelines profile=myprofile
```

`salt.modules.boto_datapipeline.`**`pipeline_id_from_name`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Get the pipeline id, if it exists, for the given name.

CLI example:

```
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name
```

`salt.modules.boto_datapipeline.`**`put_pipeline_definition`**`(`*pipeline_id*, *pipeline_objects*, *parameter_objects=None*, *parameter_values=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI example:

```
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_
↪pipeline_objects
```

21.9.45 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_dynamodb.`**`create_global_secondary_index`**(*table_name, global_index, region=None, key=None, keyid=None, profile=None*)

Creates a single global secondary index on a DynamoDB table.

CLI Example: .. code-block:: bash

salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name

`salt.modules.boto_dynamodb.`**`create_table`**(*table_name, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None*)

Creates a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_table table_name /
region=us-east-1 /
hash_key=id /
hash_key_data_type=N /
range_key=created_at /
range_key_data_type=N /
read_capacity_units=1 /
write_capacity_units=1
```

`salt.modules.boto_dynamodb.`**`delete`**(*table_name, region=None, key=None, keyid=None, profile=None*)

Delete a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

`salt.modules.boto_dynamodb.`**`describe`**(*table_name, region=None, key=None, keyid=None, profile=None*)

Describe a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.describe table_name region=us-east-1
```

`salt.modules.boto_dynamodb.`**`exists`**(*table_name, region=None, key=None, keyid=None, profile=None*)

Check to see if a table exists.

CLI Example:

```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

`salt.modules.boto_dynamodb.`**`extract_index`**(*index_data*, *global_index=False*)

Instantiates and returns an AllIndex object given a valid index configuration

CLI Example: salt myminion boto_dynamodb.extract_index index

`salt.modules.boto_dynamodb.`**`update`**(*table_name*, *throughput=None*, *global_indexes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

`salt.modules.boto_dynamodb.`**`update_global_secondary_index`**(*table_name*, *global_indexes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Updates the throughput of the given global secondary indexes.

CLI Example: .. code-block:: bash

salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes

21.9.46 salt.modules.boto_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

configuration This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

`salt.modules.boto_ec2.`**`allocate_eip_address`**(*domain=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Allocate a new Elastic IP address and associate it with your account.

domain (string) Optional param - if set to exactly 'vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

returns (dict) dict of 'interesting' information about the newly allocated EIP, with probably the most interesting keys being 'public_ip'; and 'allocation_id' iff 'domain=vpc' was passed.

CLI Example:

```
salt-call boto_ec2.allocate_eip_address domain=vpc
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`assign_private_ip_addresses`**(*network_interface_name=None, network_interface_id=None, private_ip_addresses=None, secondary_private_ip_address_count=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None*)

Assigns one or more secondary private IP addresses to a network interface.

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with 'secondary_private_ip_address_count')

secondary_private_ip_address_count (int) - The number of secondary IP addresses to assign to the network interface. (exclusive with 'private_ip_addresses')

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni␣
↪private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni␣
↪secondary_private_ip_address_count=2
```

New in version 2017.7.0.

`salt.modules.boto_ec2.`**`associate_eip_address`**(*instance_id=None, instance_name=None, public_ip=None, allocation_id=None, network_interface_id=None, network_interface_name=None, private_ip_address=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None*)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either 'public_ip' or 'allocation_id', depending on whether you're associating a VPC address or a plain EC2 address.

instance_id (string) – ID of the instance to associate with (exclusive with 'instance_name')

instance_name (string) – Name tag of the instance to associate with (exclusive with 'instance_id')

public_ip (string) – Public IP address, for standard EC2 based allocations.

allocation_id (string) – Allocation ID for a VPC-based EIP.

network_interface_id (string) - ID of the network interface to associate the EIP with

network_interface_name (string) - Name of the network interface to associate the EIP with

private_ip_address (string) – The primary or secondary private IP address to associate with the Elastic IP address.

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep␣
↪allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`attach_network_interface`**(*device_index, name=None, network_interface_id=None, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None*)

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-master␣
↪device_index=0
```

`salt.modules.boto_ec2.`**`attach_volume`**(*volume_id, instance_id, device, region=None, key=None, keyid=None, profile=None*)

Attach an EBS volume to an EC2 instance. ..

volume_id (string) – The ID of the EBS volume to be attached.

instance_id (string) – The ID of the EC2 instance to attach the volume to.

device (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.attach_volume vol-12345678 i-87654321 /dev/sdh
```

`salt.modules.boto_ec2.`**`create_image`**(*ami_name, instance_id=None, instance_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no_reboot=False, dry_run=False, filters=None*)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:

```
salt myminion boto_ec2.create_image ami_name instance_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags='{"mytag": "value"}'␣
↪description='this is my ami'
```

(continues on next page)

(continued from previous page)

```

```

`salt.modules.boto_ec2.`**`create_key`**`(`*key_name, save_path, region=None, key=None, keyid=None, profile=None*`)`

Creates a key and saves it to a given path. Returns the private key.

CLI Example:

```
salt myminion boto_ec2.create_key mykey /root/
```

`salt.modules.boto_ec2.`**`create_network_interface`**`(`*name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None*`)`

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345␣
↪description=my_eni groups=['my_group']
```

`salt.modules.boto_ec2.`**`create_tags`**`(`*resource_ids, tags, region=None, key=None, keyid=None, profile=None*`)`

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags (dict) – Dictionary of name/value pairs. To create only a tag name, pass ” as the value.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'
```

`salt.modules.boto_ec2.`**`create_volume`**`(`*zone_name, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, wait_for_creation=False, region=None, key=None, keyid=None, profile=None*`)`

Create an EBS volume to an availability zone.

zone_name (string) – The Availability zone name of the EBS volume to be created.

size

(int) – The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.

snapshot_id (string) – The snapshot ID from which the new volume will be created.

volume_type

(string) - The type of the volume. Valid volume types for AWS can be found here: http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html

iops (int) - The provisioned IOPS you want to associate with this volume.

encrypted (bool) - Specifies whether the volume should be encrypted.

kms_key_id

(string) - If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

wait_for_creation (bool) - Whether or not to wait for volume creation to complete.

returns (string) - created volume id on success, error message on failure.

CLI Example:

```
salt-call boto_ec2.create_volume us-east-1a size=10
salt-call boto_ec2.create_volume us-east-1a snapshot_id=snap-0123abcd
```

`salt.modules.boto_ec2.`**`delete_key`**(*key_name, region=None, key=None, keyid=None, profile=None*)

Deletes a key. Always returns True

CLI Example:

```
salt myminion boto_ec2.delete_key mykey
```

`salt.modules.boto_ec2.`**`delete_network_interface`**(*name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None*)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
↪description=my_eni groups=['my_group']
```

`salt.modules.boto_ec2.`**`delete_tags`**(*resource_ids, tags, region=None, key=None, keyid=None, profile=None*)

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags

(dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names. If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted. If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_tags vol-12345678 '{"Name": "myVolume01"}'
salt-call boto_ec2.delete_tags vol-12345678 '["Name","MountPoint"]'
```

`salt.modules.boto_ec2.`**`delete_volume`**(*volume_id, instance_id=None, device=None, force=False, region=None, key=None, keyid=None, profile=None*)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be deleted.

force (bool) – Forces deletion even if the device has not yet been detached from its instance.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_volume vol-12345678
```

`salt.modules.boto_ec2.`**`detach_network_interface`**`(`*name=None, network_interface_id=None, attachment_id=None, force=False, region=None, key=None, keyid=None, profile=None*`)`

Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.detach_network_interface my_eni
```

`salt.modules.boto_ec2.`**`detach_volume`**`(`*volume_id, instance_id=None, device=None, force=False, wait_for_detachement=False, region=None, key=None, keyid=None, profile=None*`)`

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be detached.

instance_id (string) – The ID of the EC2 instance from which it will be detached.

device (string) – The device on the instance through which the volume is exposted (e.g. /dev/sdh)

force

(bool) – Forces detachment if the previous detachment attempt did not occur cleanly. This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.

wait_for_detachement (bool) - Whether or not to wait for volume detachement to complete.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

`salt.modules.boto_ec2.`**`disassociate_eip_address`**`(`*public_ip=None, association_id=None, region=None, key=None, keyid=None, profile=None*`)`

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either 'association_id' or 'public_ip', depending on whether you're dealing with a VPC or EC2 Classic address.

public_ip (string) – Public IP address, for EC2 Classic allocations.

association_id (string) – Association ID for a VPC-bound EIP.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`exists`**(*instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None*)

Given an instance id, check to see if the given instance id exists.

Returns True if the given instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:

```
salt myminion boto_ec2.exists myinstance
```

`salt.modules.boto_ec2.`**`find_images`**(*ami_name=None, executable_by=None, owners=None, image_ids=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False*)

Given image properties, find and return matching AMI ids

CLI Examples:

```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

`salt.modules.boto_ec2.`**`find_instances`**(*instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False, in_states=None, filters=None*)

Given instance properties, find and return matching instance ids

CLI Examples:

```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}'
```

`salt.modules.boto_ec2.`**`get_all_eip_addresses`**(*addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None*)

Get public addresses of some, or all EIPs associated with the current account.

addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

returns (list) - A list of the requested EIP addresses

CLI Example:

```
salt-call boto_ec2.get_all_eip_addresses
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`get_all_tags`**(*filters=None, region=None, key=None, keyid=None, profile=None*)

Describe all tags matching the filter criteria, or all tags in the account otherwise.

New in version 2018.3.0.

filters (dict) - Additional constraints on which volumes to return. Note that valid filters vary extensively depending on the resource type. When in doubt, search first without a filter and then use the returned data to help fine-tune your search. You can generally garner the resource type from its ID (e.g. *vol-XXXXX* is a volume, *i-XXXXX* is an instance, etc.

CLI Example:

```
salt-call boto_ec2.get_all_tags '{"tag:Name": myInstanceNameTag, resource-type:
↪instance}'
```

salt.modules.boto_ec2.**get_all_volumes**(*volume_ids=None, filters=None, return_objs=False, region=None, key=None, keyid=None, profile=None*)

Get a list of all EBS volumes, optionally filtered by provided 'filters' param

New in version 2016.11.0.

volume_ids (list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.

filters (dict) - Additional constraints on which volumes to return. Valid filters are:

- attachment.attach-time - The time stamp when the attachment initiated.
- attachment.delete-on-termination - Whether the volume is deleted on instance termination.
- attachment.device - The device name that is exposed to the instance (for example, /dev/sda1).
- attachment.instance-id - The ID of the instance the volume is attached to.
- attachment.status - The attachment state (attaching | attached | detaching | detached).
- availability-zone - The Availability Zone in which the volume was created.
- create-time - The time stamp when the volume was created.
- encrypted - The encryption status of the volume.
- size - The size of the volume, in GiB.
- snapshot-id - The snapshot from which the volume was created.
- status - The status of the volume (creating | available | in-use | deleting | deleted | error).
- tag:key=value - The key/value combination of a tag assigned to the resource.
- volume-id - The volume ID.
- volume-type - The Amazon EBS volume type. This can be `gp2` for General Purpose SSD, `io1` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic volumes.

return_objs (bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects

returns (list) - A list of the requested values: Either the volume IDs or, if return_objs is `True`, boto.ec2.volume.Volume objects.

CLI Example:

```
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'
```

salt.modules.boto_ec2.**get_attribute**(*attribute, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None*)

Get an EC2 instance attribute.

CLI Example:

```
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.`**`get_eip_address_info`**(*addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None*)

Get 'interesting' info about some, or all EIPs associated with the current account.

addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

returns (list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.

CLI Example:

```
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`get_id`**(*name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None*)

Given instance properties, return the instance id if it exists.

CLI Example:

```
salt myminion boto_ec2.get_id myinstance
```

`salt.modules.boto_ec2.`**`get_key`**(*key_name, region=None, key=None, keyid=None, profile=None*)

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn't CLI Example:

```
salt myminion boto_ec2.get_key mykey
```

`salt.modules.boto_ec2.`**`get_keys`**(*keynames=None, filters=None, region=None, key=None, keyid=None, profile=None*)

Gets all keys or filters them by name and returns a list. keynames (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict) :: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:

```
salt myminion boto_ec2.get_keys
```

`salt.modules.boto_ec2.`**`get_network_interface`**`(`*name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None*`)`

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface name=my_eni
```

`salt.modules.boto_ec2.`**`get_network_interface_id`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface_id name=my_eni
```

`salt.modules.boto_ec2.`**`get_tags`**`(`*instance_id=None, keyid=None, key=None, profile=None, region=None*`)`

Given an instance_id, return a list of tags associated with that instance.

returns (list) - list of tags as key/value pairs

CLI Example:

```
salt myminion boto_ec2.get_tags instance_id
```

`salt.modules.boto_ec2.`**`get_unassociated_eip_address`**`(`*domain='standard', region=None, key=None, keyid=None, profile=None*`)`

Return the first unassociated EIP

domain Indicates whether the address is an EC2 address or a VPC address (standard|vpc).

CLI Example:

```
salt-call boto_ec2.get_unassociated_eip_address
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`get_zones`**`(`*region=None, key=None, keyid=None, profile=None*`)`

Get a list of AZs for the configured region.

CLI Example:

```
salt myminion boto_ec2.get_zones
```

`salt.modules.boto_ec2.`**`import_key`**`(`*key_name, public_key_material, region=None, key=None, keyid=None, profile=None*`)`

Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: - OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys) - Base64 encoded DER format - SSH public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:

```
salt myminion boto_ec2.import mykey publickey
```

`salt.modules.boto_ec2.`**`modify_network_interface_attribute`**(*name=None, network_interface_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None*)

Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.modify_network_interface_attribute my_eni attr=description␣
↪value='example description'
```

`salt.modules.boto_ec2.`**`release_eip_address`**(*public_ip=None, allocation_id=None, region=None, key=None, keyid=None, profile=None*)

Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

public_ip (string) - The public IP address - for EC2 elastic IPs.

allocation_id (string) - The Allocation ID - for VPC elastic IPs.

returns (bool) - True on success, False on failure

CLI Example:

```
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

`salt.modules.boto_ec2.`**`run`**(*image_id, name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type='m1.small', placement=None, kernel_id=None, ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interface_id=None, network_interface_name=None, region=None, key=None, keyid=None, profile=None, network_interfaces=None*)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```

image_id (string) – The ID of the image to run.

name (string) - The name of the instance.

tags (dict of key: value pairs) - tags to apply to the instance.

key_name (string) – The name of the key pair with which to launch instances.

security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances

user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

instance_type (string) – The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.

placement (string) – The Availability Zone to launch the instance into.

kernel_id (string) – The ID of the kernel with which to launch the instances.

ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.

monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.

vpc_id (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.

vpc_name (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.

subnet_id (string) – The subnet ID within which to launch the instances for VPC.

subnet_name (string) – The name of a subnet within which to launch the instances for VPC.

private_ip_address (string) – If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).

block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) - A string representation of a BlockDeviceMapping structure (dict) - A dict describing a BlockDeviceMapping structure

YAML example:

```
device-maps:
    /dev/sdb:
        ephemeral_name: ephemeral0
    /dev/sdc:
        ephemeral_name: ephemeral1
    /dev/sdd:
        ephemeral_name: ephemeral2
    /dev/sde:
        ephemeral_name: ephemeral3
    /dev/sdf:
        size: 20
        volume_type: gp2
```

disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

security_group_ids (list of strings) – The ID(s) of the VPC security groups with which to associate instances.

security_group_names (list of strings) – The name(s) of the VPC security groups with which to associate instances.

additional_info (string) – Specifies additional information to make available to the instance(s).

tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are:"default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.

network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

network_interface_id (string) - ID of the network interface to attach to the instance

network_interface_name (string) - Name of the network interface to attach to the instance

`salt.modules.boto_ec2.`**`set_attribute`**(*attribute*, *attribute_value*, *instance_name=None*, *instance_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:

```
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_
↪instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck

- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.`**`set_volumes_tags`**(*tag_maps, authoritative=False, dry_run=False, region=None, key=None, keyid=None, profile=None*)

New in version 2016.11.0.

tag_maps (list) List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of get_all_volumes() above, and 'tags' is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is ('pending', 'rebooting', 'running', 'stopping', 'stopped').

YAML example fragment:

```
- filters:
    attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
    attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
  in_states:
  - stopped
  - terminated
- filters:
    instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative (bool) If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

dry_run (bool) If true, don't change anything, just return a dictionary describing any changes which would have been applied.

returns (dict) A dict describing status and any changes.

`salt.modules.boto_ec2.`**`terminate`**(*instance_id=None, name=None, region=None, key=None, keyid=None, profile=None, filters=None*)

Terminate the instance described by instance_id or name.

CLI Example:

```
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```

`salt.modules.boto_ec2.`**`unassign_private_ip_addresses`**(*network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None*)

Unassigns one or more secondary private IP addresses from a network interface

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_
↪eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

21.9.47 salt.modules.boto_efs module

Connection module for Amazon EFS

New in version 2017.7.0.

configuration This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/efs/latest/ug/
    access-control-managing-permissions.html

http://boto3.readthedocs.io/en/latest/guide/
    configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```
efs.keyid: GKTADJGHEIQSXMKKRBJ08H
efs.key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration

```
efs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to speficy key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

`salt.modules.boto_efs.`**`create_file_system`**`(`*name, performance_mode='generalPurpose', keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs*`)`

Creates a new, empty file system.

name (string) - The name for the new file system

performance_mode (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO

creation_token (string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

returns (dict) - A dict of the data for the elastic file system

CLI Example:

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

`salt.modules.boto_efs.`**`create_mount_target`**`(`*filesystemid, subnetid, ipaddress=None, securitygroups=None, keyid=None, key=None, profile=None, region=None, **kwargs*`)`

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

You can create one mount target in each Availability Zone in your VPC. All EC2 instances in a VPC within a given Availability Zone share a single mount target for a given file system.

If you have multiple subnets in an Availability Zone, you create a mount target in one of the subnets. EC2 instances do not need to be in the same subnet as the mount target in order to access their file system.

filesystemid (string) - ID of the file system for which to create the mount target.

subnetid (string) - ID of the subnet to add the mount target in.

ipaddress

(string) - Valid IPv4 address within the address range of the specified subnet.

securitygroups

(list[string]) - Up to five VPC security group IDs, of the form sg-xxxxxxxx. These must be for the same VPC as subnet specified.

returns (dict) - A dict of the response data

CLI Example:

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

`salt.modules.boto_efs.`**`create_tags`**`(`*filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs*`)`

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in the request already exists on the file system, this operation overwrites its value with the value provided in the request.

filesystemid (string) - ID of the file system for whose tags will be modified.

tags (dict) - The tags to add to the file system

CLI Example:

```
salt 'my-minion' boto_efs.create_tags
```

salt.modules.boto_efs.**delete_file_system**(*filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs*)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists and you can't access any contents of the deleted file system. You can't delete a file system that is in use. That is, if the file system has any mount targets, you must first delete them.

filesystemid (string) - ID of the file system to delete.

CLI Example:

```
salt 'my-minion' boto_efs.delete_file_system filesystemid
```

salt.modules.boto_efs.**delete_mount_target**(*mounttargetid, keyid=None, key=None, profile=None, region=None, **kwargs*)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance in your VPC via another mount target.

mounttargetid (string) - ID of the mount target to delete

CLI Example:

```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

salt.modules.boto_efs.**delete_tags**(*filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs*)

Deletes the specified tags from a file system.

filesystemid (string) - ID of the file system for whose tags will be removed.

tags (list[string]) - The tag keys to delete to the file system

CLI Example:

```
salt 'my-minion' boto_efs.delete_tags
```

salt.modules.boto_efs.**get_file_systems**(*filesystemid=None, keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs*)

Get all EFS properties or a specific instance property if filesystemid is specified

filesystemid (string) - ID of the file system to retrieve properties

creation_token (string) - A unique token that identifies an EFS. If fileysystem created via create_file_system this would either be explictitly passed in or set to name. You can limit your search with this.

returns (list[dict]) - list of all elastic file system properties

CLI Example:

```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

salt.modules.boto_efs.**get_mount_targets**(*filesystemid=None*, *mounttargetid=None*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified

filesystemid

(string) - ID of the file system whose mount targets to list Must be specified if mounttargetid is not

mounttargetid

(string) - ID of the mount target to have its properties returned Must be specified if filesystemid is not

returns (list[dict]) - list of all mount point properties

CLI Example:

```
salt 'my-minion' boto_efs.get_mount_targets
```

salt.modules.boto_efs.**get_tags**(*filesystemid*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Return the tags associated with an EFS instance.

filesystemid (string) - ID of the file system whose tags to list

returns (list) - list of tags as key/value pairs

CLI Example:

```
salt 'my-minion' boto_efs.get_tags efs-id
```

salt.modules.boto_efs.**set_security_groups**(*mounttargetid*, *securitygroup*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Modifies the set of security groups in effect for a mount target

mounttargetid (string) - ID of the mount target whose security groups will be modified

securitygroups (list[string]) - list of no more than 5 VPC security group IDs.

CLI Example:

```
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-group
```

21.9.48 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_elasticache.`**`authorize_cache_security_group_ingress`**`(`*name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None*`)`

Authorize network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.authorize_cache_security_group_ingress␣
↪myelasticachesg myec2sg 879879
```

`salt.modules.boto_elasticache.`**`create`**`(`*name, num_cache_nodes=None, engine=None, cache_node_type=None, replication_group_id=None, engine_version=None, cache_parameter_group_name=None, cache_subnet_group_name=None, cache_security_group_names=None, security_group_ids=None, snapshot_arns=None, preferred_availability_zone=None, preferred_maintenance_window=None, port=None, notification_topic_arn=None, auto_minor_version_upgrade=None, wait=None, region=None, key=None, keyid=None, profile=None*`)`

Create a cache cluster.

CLI example:

```
salt myminion boto_elasticache.create myelasticache 1 redis cache.t1.micro
cache_security_group_names='["myelasticachesg"]'
```

`salt.modules.boto_elasticache.`**`create_cache_security_group`**`(`*name, description, region=None, key=None, keyid=None, profile=None*`)`

Create a cache security group.

CLI example:

```
salt myminion boto_elasticache.create_cache_security_group myelasticachesg 'My⊠
↪Cache Security Group'
```

`salt.modules.boto_elasticache.`**`create_replication_group`**(*name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None*)

Create replication group.

CLI example:

```
salt myminion boto_elasticache.create_replication_group myelasticache⊠
↪myprimarycluster description
```

`salt.modules.boto_elasticache.`**`create_subnet_group`**(*name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:

```
salt myminion boto_elasticache.create_subnet_group my-subnet-group                ⊠
↪"group description" subnet_ids='[subnet-12345678, subnet-87654321]'
↪region=us-east-1
```

`salt.modules.boto_elasticache.`**`delete`**(*name, wait=False, region=None, key=None, keyid=None, profile=None*)

Delete a cache cluster.

CLI example:

```
salt myminion boto_elasticache.delete myelasticache
```

`salt.modules.boto_elasticache.`**`delete_cache_security_group`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete a cache security group.

CLI example:

```
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg 'My⊠
↪Cache Security Group'
```

`salt.modules.boto_elasticache.`**`delete_replication_group`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an ElastiCache replication group.

CLI example:

```
salt myminion boto_elasticache.delete_replication_group my-replication-group      ⊠
↪           region=us-east-1
```

salt.modules.boto_elasticache.**delete_subnet_group**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an ElastiCache subnet group.

CLI example:

```
salt myminion boto_elasticache.delete_subnet_group my-subnet-group
↪ region=us-east-1
```

salt.modules.boto_elasticache.**describe_replication_group**(*name, region=None, key=None, keyid=None, profile=None, parameter=None*)

Get replication group information.

CLI example:

```
salt myminion boto_elasticache.describe_replication_group mygroup
```

salt.modules.boto_elasticache.**exists**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if a cache cluster exists.

CLI example:

```
salt myminion boto_elasticache.exists myelasticache
```

salt.modules.boto_elasticache.**get_all_cache_subnet_groups**(*name=None, region=None, key=None, keyid=None, profile=None*)

Return a list of all cache subnet groups with details

CLI example:

```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.**get_cache_subnet_group**(*name, region=None, key=None, keyid=None, profile=None*)

Get information about a cache subnet group.

CLI example:

```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

salt.modules.boto_elasticache.**get_config**(*name, region=None, key=None, keyid=None, profile=None*)

Get the configuration for a cache cluster.

CLI example:

```
salt myminion boto_elasticache.get_config myelasticache
```

salt.modules.boto_elasticache.**get_group_host**(*name, region=None, key=None, keyid=None, profile=None*)

Get hostname from replication cache group

CLI example:

```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

`salt.modules.boto_elasticache.`**`get_node_host`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Get hostname from cache node

CLI example:

```
salt myminion boto_elasticache.get_node_host myelasticache
```

`salt.modules.boto_elasticache.`**`group_exists`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Check to see if a replication group exists.

CLI example:

```
salt myminion boto_elasticache.group_exists myelasticache
```

`salt.modules.boto_elasticache.`**`list_cache_subnet_groups`**`(`*name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Return a list of all cache subnet group names

CLI example:

```
salt myminion boto_elasticache.list_subnet_groups region=us-east-1
```

`salt.modules.boto_elasticache.`**`revoke_cache_security_group_ingress`**`(`*name*, *ec2_security_group_name*, *ec2_security_group_owner_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Revoke network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.revoke_cache_security_group_ingress␣
↪myelasticachesg myec2sg 879879
```

`salt.modules.boto_elasticache.`**`subnet_group_exists`**`(`*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Check to see if an ElastiCache subnet group exists.

CLI example:

```
salt myminion boto_elasticache.subnet_group_exists my-param-group          ␣
↪region=us-east-1
```

21.9.49 salt.modules.boto_elasticsearch_domain module

Connection module for Amazon Elasticsearch Service

New in version 2016.11.0.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_function*) return:

```
domain:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends boto3

`salt.modules.boto_elasticsearch_domain.`**`add_tags`**(*DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, **kwargs*)

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value tag_
↪b=tag_value
```

`salt.modules.boto_elasticsearch_domain.`**`create`**(*DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None*)

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain \
      {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
      'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
      {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
      'Iops': 0} \
      {"Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {
↪"AWS": "*"}, "Action": "es:*", \
       "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
       "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]} \
      {"AutomatedSnapshotStartHour": 0} \
      {"rest.action.multi.allow_explicit_index": "true"}
```

`salt.modules.boto_elasticsearch_domain.`**`delete`**(*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```
salt myminion boto_elasticsearch_domain.delete mydomain
```

`salt.modules.boto_elasticsearch_domain.`**`describe`**(*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.describe mydomain
```

`salt.modules.boto_elasticsearch_domain.`**`exists`**(*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_elasticsearch_domain.exists mydomain
```

`salt.modules.boto_elasticsearch_domain.`**`list_tags`**(*DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None*)

List tags of a trail

Returns

- {...}
- {...}

Return type tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

salt.modules.boto_elasticsearch_domain.**remove_tags**(*TagKeys, DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_elasticsearch_domain.**status**(*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.status mydomain
```

salt.modules.boto_elasticsearch_domain.**update**(*DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None*)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:

```
salt myminion boto_elasticsearch_domain.update mydomain \
      {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
      'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
      {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
      'Iops': 0} \
      {"Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {
↪"AWS": "*"}, "Action": "es:*", \
       "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
       "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]} \
      {"AutomatedSnapshotStartHour": 0} \
      {"rest.action.multi.allow_explicit_index": "true"}
```

21.9.50 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

configuration This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto >= 2.33.0

`salt.modules.boto_elb.`**`apply_security_groups`**(*name, security_groups, region=None, key=None, keyid=None, profile=None*)

Apply security groups to ELB.

CLI example:

```
salt myminion boto_elb.apply_security_groups myelb '["mysecgroup1"]'
```

`salt.modules.boto_elb.`**`attach_subnets`**(*name, subnets, region=None, key=None, keyid=None, profile=None*)

Attach ELB to subnets.

CLI example:

```
salt myminion boto_elb.attach_subnets myelb '["mysubnet"]'
```

`salt.modules.boto_elb.`**`create`**(*name, availability_zones, listeners, subnets=None, security_groups=None, scheme='internet-facing', region=None, key=None, keyid=None, profile=None*)

Create an ELB

CLI example to create an ELB:

```
salt myminion boto_elb.create myelb '["us-east-1a", "us-east-1e"]' '{"elb_port":␣
↪443, "elb_protocol": "HTTPS", ...}' region=us-east-1
```

salt.modules.boto_elb.**create_listeners**(*name, listeners, region=None, key=None, keyid=None, profile=None*)

Create listeners on an ELB.

CLI example:

```
salt myminion boto_elb.create_listeners myelb '[["HTTPS", "HTTP", 443, 80,
↪"arn:aws:iam::11  11111:server-certificate/mycert"]]'
```

salt.modules.boto_elb.**create_policy**(*name, policy_name, policy_type, policy, region=None, key=None, keyid=None, profile=None*)

Create an ELB policy.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.create_policy myelb mypolicy LBCookieStickinessPolicyType '
↪{"CookieExpirationPeriod": 3600}'
```

salt.modules.boto_elb.**delete**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an ELB.

CLI example to delete an ELB:

```
salt myminion boto_elb.delete myelb region=us-east-1
```

salt.modules.boto_elb.**delete_listeners**(*name, ports, region=None, key=None, keyid=None, profile=None*)

Delete listeners on an ELB.

CLI example:

```
salt myminion boto_elb.delete_listeners myelb '[80,443]'
```

salt.modules.boto_elb.**delete_policy**(*name, policy_name, region=None, key=None, keyid=None, profile=None*)

Delete an ELB policy.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.delete_policy myelb mypolicy
```

salt.modules.boto_elb.**delete_tags**(*name, tags, region=None, key=None, keyid=None, profile=None*)

Add the tags on an ELB

name name of the ELB

tags list of tags to remove

CLI Example:

```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']
```

salt.modules.boto_elb.**deregister_instances**(*name, instances, region=None, key=None, keyid=None, profile=None*)

Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- `True`: instance(s) deregistered successfully
- `False`: instance(s) failed to be deregistered
- `None`: instance(s) not valid or not registered, no action taken

CLI example:

```
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

`salt.modules.boto_elb.`**`detach_subnets`**(*name, subnets, region=None, key=None, keyid=None, profile=None*)

Detach ELB from subnets.

CLI example:

```
salt myminion boto_elb.detach_subnets myelb '["mysubnet"]'
```

`salt.modules.boto_elb.`**`disable_availability_zones`**(*name, availability_zones, region=None, key=None, keyid=None, profile=None*)

Disable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.disable_availability_zones myelb '["us-east-1a"]'
```

`salt.modules.boto_elb.`**`enable_availability_zones`**(*name, availability_zones, region=None, key=None, keyid=None, profile=None*)

Enable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.enable_availability_zones myelb '["us-east-1a"]'
```

`salt.modules.boto_elb.`**`exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an ELB exists.

CLI example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

`salt.modules.boto_elb.`**`get_all_elbs`**(*region=None, key=None, keyid=None, profile=None*)

Return all load balancers associated with an account

CLI example:

```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

`salt.modules.boto_elb.`**`get_attributes`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if attributes are set on an ELB.

CLI example:

```
salt myminion boto_elb.get_attributes myelb
```

`salt.modules.boto_elb.`**`get_elb_config`**(*name, region=None, key=None, keyid=None, profile=None*)

Get an ELB configuration.

CLI example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

`salt.modules.boto_elb.`**`get_health_check`**(*name, region=None, key=None, keyid=None, profile=None*)

Get the health check configured for this ELB.

CLI example:

```
salt myminion boto_elb.get_health_check myelb
```

`salt.modules.boto_elb.`**`get_instance_health`**(*name, region=None, key=None, keyid=None, profile=None, instances=None*)

Get a list of instances and their health state

CLI example:

```
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1 instances=
↪"[instance_id,instance_id]"
```

`salt.modules.boto_elb.`**`list_elbs`**(*region=None, key=None, keyid=None, profile=None*)

Return names of all load balancers associated with an account

CLI example:

```
salt myminion boto_elb.list_elbs region=us-east-1
```

`salt.modules.boto_elb.`**`listener_dict_to_tuple`**(*listener*)

Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI example:

```
salt myminion boto_elb.listener_dict_to_tuple '{"elb_port":80,"instance_port":80,
↪"elb_protocol":"HTTP"}'
```

`salt.modules.boto_elb.`**`register_instances`**(*name, instances, region=None, key=None, keyid=None, profile=None*)

Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- `True`: instance(s) registered successfully
- `False`: instance(s) failed to be registered

CLI example:

```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]"
```

`salt.modules.boto_elb.`**`set_attributes`**(*name, attributes, region=None, key=None, keyid=None, profile=None*)

Set attributes on an ELB.

name (string) Name of the ELB instance to set attributes for

attributes A dict of attributes to set.

Valid attributes are:

access_log (dict)

enabled (bool) Enable storage of access logs.

s3_bucket_name (string) The name of the S3 bucket to place logs.

s3_bucket_prefix (string) Prefix for the log file name.

emit_interval (int) Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

connection_draining (dict)

enabled (bool) Enable connection draining.

timeout (int) Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

cross_zone_load_balancing (dict)

enabled (bool) Enable cross-zone load balancing.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true",
↪"s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/", "emit_interval": "5
↪"}}' region=us-east-1
```

`salt.modules.boto_elb.`**`set_backend_policy`**(*name, port, policies=None, region=None, key=None, keyid=None, profile=None*)

Set the policies of an ELB backend server.

CLI example:

salt myminion boto_elb.set_backend_policy myelb 443 ”[policy1,policy2]”

`salt.modules.boto_elb.`**`set_health_check`**(*name, health_check, region=None, key=None, keyid=None, profile=None*)

Set attributes on an ELB.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

`salt.modules.boto_elb.`**`set_instances`**(*name, instances, test=False, region=None, key=None, keyid=None, profile=None*)

Set the instances assigned to an ELB to exactly the list given

CLI example:

```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances="[instance_
↪id,instance_id]"
```

`salt.modules.boto_elb.`**`set_listener_policy`**(*name, port, policies=None, region=None, key=None, keyid=None, profile=None*)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

`salt.modules.boto_elb.`**`set_tags`**(*name, tags, region=None, key=None, keyid=None, profile=None*)

Add the tags on an ELB

New in version 2016.3.0.

name name of the ELB

tags dict of name/value pair tags

CLI Example:

```
salt myminion boto_elb.set_tags my-elb-name "{'Tag1': 'Value', 'Tag2': 'Another␣
↪Value'}"
```

21.9.51 salt.modules.boto_elbv2 module

Connection module for Amazon ALB

New in version 2017.7.0.

configuration This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto_elbv2.`**`create_target_group`**`(`*name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/', health_check_interval_seconds=30, health_check_timeout_seconds=5, healthy_threshold_count=5, unhealthy_threshold_count=2*`)`

Create target group if not present.

name (string) - The name of the target group.

protocol (string) - The protocol to use for routing traffic to the targets

port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

vpc_id (string) - The identifier of the virtual private cloud (VPC).

health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

health_check_port (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

health_check_path (string) - The ping path that is the destination on the targets for health checks. The default is /.

health_check_interval_seconds (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

health_check_timeout_seconds (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

healthy_threshold_count (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

unhealthy_threshold_count (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

returns (bool) - True on success, False on failure.

CLI example: .. code-block:: bash

salt myminion boto_elbv2.create_target_group learn1give1 protocol=HTTP port=54006 vpc_id=vpc-deadbeef

salt.modules.boto_elbv2.**delete_target_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

name (string) - Target Group Name or Amazon Resource Name (ARN).

returns (bool) - True on success, False on failure.

CLI example:

```
salt myminion boto_elbv2.delete_target_group arn:aws:elasticloadbalancing:us-west-
↪2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```

salt.modules.boto_elbv2.**deregister_targets**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deregister targets to a target froup of an ALB. `targets` is either a instance id string or a list of instance id's.

Returns:

- `True`: instance(s) deregistered successfully
- `False`: instance(s) failed to be deregistered

CLI example:

```
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.**describe_target_health**(*name*, *targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the curret health check status for targets in a target group.

CLI example:

```
salt myminion boto_elbv2.describe_target_health arn:aws:elasticloadbalancing:us-
↪west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163 targets=["i-
↪isdf23ifjf"]
```

`salt.modules.boto_elbv2.`**`register_targets`**(*name, targets, region=None, key=None, keyid=None, profile=None*)

Register targets to a target froup of an ALB. `targets` is either a instance id string or a list of instance id's.

Returns:

- `True`: instance(s) registered successfully
- `False`: instance(s) failed to be registered

CLI example:

```
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"
```

`salt.modules.boto_elbv2.`**`target_group_exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an target group exists.

CLI example:

```
salt myminion boto_elbv2.target_group_exists arn:aws:elasticloadbalancing:us-west-
↪2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```

21.9.52 salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

configuration This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
iam.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_iam.`**`add_user_to_group`**`(`*user_name, group_name, region=None, key=None, keyid=None, profile=None*`)`

Add user to group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

`salt.modules.boto_iam.`**`associate_profile_to_role`**`(`*profile_name, role_name, region=None, key=None, keyid=None, profile=None*`)`

Associate an instance profile with an IAM role.

CLI Example:

```
salt myminion boto_iam.associate_profile_to_role myirole myiprofile
```

`salt.modules.boto_iam.`**`attach_group_policy`**`(`*policy_name, group_name, region=None, key=None, keyid=None, profile=None*`)`

Attach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

`salt.modules.boto_iam.`**`attach_role_policy`**`(`*policy_name, role_name, region=None, key=None, keyid=None, profile=None*`)`

Attach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.attach_role_policy mypolicy myrole
```

`salt.modules.boto_iam.`**`attach_user_policy`**`(`*policy_name, user_name, region=None, key=None, keyid=None, profile=None*`)`

Attach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.attach_user_policy mypolicy myuser
```

`salt.modules.boto_iam.`**`build_policy`**`(`*region=None, key=None, keyid=None, profile=None*`)`

Build a default assume role policy.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.build_policy
```

`salt.modules.boto_iam.`**`create_access_key`**`(`*user_name, region=None, key=None, keyid=None, profile=None*`)`

Create access key id for a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_access_key myuser
```

salt.modules.boto_iam.**create_group**(*group_name, path=None, region=None, key=None, keyid=None, profile=None*)

Create a group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_group group
```

salt.modules.boto_iam.**create_instance_profile**(*name, region=None, key=None, keyid=None, profile=None*)

Create an instance profile.

CLI Example:

```
salt myminion boto_iam.create_instance_profile myiprofile
```

salt.modules.boto_iam.**create_login_profile**(*user_name, password, region=None, key=None, keyid=None, profile=None*)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_login_profile user_name password
```

salt.modules.boto_iam.**create_policy**(*policy_name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

Create a policy.

CLI Example:

```
salt myminios boto_iam.create_policy mypolicy '{"Version": "2012-10-17",
↪"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"], "Resource
↪": ["arn:aws:s3:::my-bucket/shared/*"]},]}'
```

salt.modules.boto_iam.**create_policy_version**(*policy_name, policy_document, set_as_default=None, region=None, key=None, keyid=None, profile=None*)

Create a policy version.

CLI Example:

```
salt myminios boto_iam.create_policy_version mypolicy '{"Version": "2012-10-17",
↪"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"], "Resource
↪": ["arn:aws:s3:::my-bucket/shared/*"]},]}'
```

salt.modules.boto_iam.**create_role**(*name, policy_document=None, path=None, region=None, key=None, keyid=None, profile=None*)

Create an instance role.

CLI Example:

```
salt myminion boto_iam.create_role myrole
```

`salt.modules.boto_iam.`**`create_role_policy`**(*role_name, policy_name, policy, region=None, key=None, keyid=None, profile=None*)

Create or modify a role policy.

CLI Example:

```
salt myminion boto_iam.create_role_policy myirole mypolicy '{"MyPolicy":
↪"Statement": [{"Action": ["sqs:*"], "Effect": "Allow", "Resource": [
↪"arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
```

`salt.modules.boto_iam.`**`create_saml_provider`**(*name, saml_metadata_document, region=None, key=None, keyid=None, profile=None*)

Create SAML provider

CLI Example:

```
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_metadata_
↪document
```

`salt.modules.boto_iam.`**`create_user`**(*user_name, path=None, region=None, key=None, keyid=None, profile=None*)

Create a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_user myuser
```

`salt.modules.boto_iam.`**`deactivate_mfa_device`**(*user_name, serial, region=None, key=None, keyid=None, profile=None*)

Deactivates the specified MFA device and removes it from association with the user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

`salt.modules.boto_iam.`**`delete_access_key`**(*access_key_id, user_name=None, region=None, key=None, keyid=None, profile=None*)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_access_key myuser
```

`salt.modules.boto_iam.`**`delete_group`**(*group_name, region=None, key=None, keyid=None, profile=None*)

Delete a group policy.

CLI Example:

```
.. code-block:: bash
```

salt myminion boto_iam.delete_group mygroup `salt.modules.boto_iam.`**`delete_group_policy`**(*group_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a group policy.

CLI Example:

```
.. code-block:: bash
```

salt myminion boto_iam.delete_group_policy mygroup mypolicy

`salt.modules.boto_iam.`**`delete_instance_profile`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an instance profile.

CLI Example:

```
salt myminion boto_iam.delete_instance_profile myiprofile
```

`salt.modules.boto_iam.`**`delete_login_profile`**(*user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.delete_login_profile user_name
```

`salt.modules.boto_iam.`**`delete_policy`**(*policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a policy.

CLI Example:

```
salt myminion boto_iam.delete_policy mypolicy
```

`salt.modules.boto_iam.`**`delete_policy_version`**(*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a policy version.

CLI Example:

```
salt myminion boto_iam.delete_policy_version mypolicy v1
```

`salt.modules.boto_iam.`**`delete_role`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an IAM role.

CLI Example:

```
salt myminion boto_iam.delete_role myirole
```

`salt.modules.boto_iam.`**`delete_role_policy`**(*role_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a role policy.

CLI Example:

```
salt myminion boto_iam.delete_role_policy myirole mypolicy
```

`salt.modules.boto_iam.`**`delete_saml_provider`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Delete SAML provider

CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

`salt.modules.boto_iam.`**`delete_server_cert`**`(`*cert_name, region=None, key=None, keyid=None, profile=None*`)`

Deletes a certificate from Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

`salt.modules.boto_iam.`**`delete_user`**`(`*user_name, region=None, key=None, keyid=None, profile=None*`)`

Delete a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

`salt.modules.boto_iam.`**`delete_user_policy`**`(`*user_name, policy_name, region=None, key=None, keyid=None, profile=None*`)`

Delete a user policy.

CLI Example:

```
salt myminion boto_iam.delete_user_policy myuser mypolicy
```

`salt.modules.boto_iam.`**`delete_virtual_mfa_device`**`(`*serial, region=None, key=None, keyid=None, profile=None*`)`

Deletes the specified virtual MFA device.

CLI Example:

```
salt myminion boto_iam.delete_virtual_mfa_device serial_num
```

`salt.modules.boto_iam.`**`describe_role`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Get information for a role.

CLI Example:

```
salt myminion boto_iam.describe_role myirole
```

`salt.modules.boto_iam.`**`detach_group_policy`**`(`*policy_name, group_name, region=None, key=None, keyid=None, profile=None*`)`

Detach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

`salt.modules.boto_iam.`**`detach_role_policy`**(*policy_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

`salt.modules.boto_iam.`**`detach_user_policy`**(*policy_name*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

`salt.modules.boto_iam.`**`disassociate_profile_from_role`**(*profile_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disassociate an instance profile from an IAM role.

CLI Example:

```
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

`salt.modules.boto_iam.`**`export_roles`**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

> salt-call boto_iam.export_roles –out=txt | sed "s/local: //" > iam_roles.sls

`salt.modules.boto_iam.`**`export_users`**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

> salt-call boto_iam.export_users –out=txt | sed "s/local: //" > iam_users.sls

`salt.modules.boto_iam.`**`get_account_id`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a the AWS account id associated with the used credentials.

CLI Example:

```
salt myminion boto_iam.get_account_id
```

`salt.modules.boto_iam.`**`get_account_policy`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_account_policy
```

`salt.modules.boto_iam.`**`get_all_access_keys`**`(`*user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None*`)`

Get all access keys from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_access_keys myuser
```

`salt.modules.boto_iam.`**`get_all_group_policies`**`(`*group_name, region=None, key=None, keyid=None, profile=None*`)`

Get a list of policy names from a group.

CLI Example:

```
salt myminion boto_iam.get_all_group_policies mygroup
```

`salt.modules.boto_iam.`**`get_all_groups`**`(`*path_prefix='/', region=None, key=None, keyid=None, profile=None*`)`

Get and return all IAM group details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

> salt-call boto_iam.get_all_groups

`salt.modules.boto_iam.`**`get_all_instance_profiles`**`(`*path_prefix='/', region=None, key=None, keyid=None, profile=None*`)`

Get and return all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

> salt-call boto_iam.get_all_instance_profiles

`salt.modules.boto_iam.`**`get_all_mfa_devices`**`(`*user_name, region=None, key=None, keyid=None, profile=None*`)`

Get all MFA devices associated with an IAM user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_all_mfa_devices user_name
```

`salt.modules.boto_iam.`**`get_all_roles`**`(`*path_prefix=None, region=None, key=None, keyid=None, profile=None*`)`

Get and return all IAM role details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

> salt-call boto_iam.get_all_roles

`salt.modules.boto_iam.`**`get_all_user_policies`**`(`*user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None*`)`

Get all user policies.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_user_policies myuser
```

`salt.modules.boto_iam.`**`get_all_users`**`(`*path_prefix='/', region=None, key=None, keyid=None, profile=None*`)`

Get and return all IAM user details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

salt-call boto_iam.get_all_users

`salt.modules.boto_iam.`**`get_group`**`(`*group_name, region=None, key=None, keyid=None, profile=None*`)`

Get group information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

`salt.modules.boto_iam.`**`get_group_members`**`(`*group_name, region=None, key=None, keyid=None, profile=None*`)`

Get group information.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

`salt.modules.boto_iam.`**`get_group_policy`**`(`*group_name, policy_name, region=None, key=None, keyid=None, profile=None*`)`

Retrieves the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group_policy mygroup policyname
```

`salt.modules.boto_iam.`**`get_policy`**`(`*policy_name, region=None, key=None, keyid=None, profile=None*`)`

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

`salt.modules.boto_iam.`**`get_policy_version`**`(`*policy_name, version_id, region=None, key=None, keyid=None, profile=None*`)`

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

`salt.modules.boto_iam.`**`get_role_policy`**`(`*role_name, policy_name, region=None, key=None, keyid=None, profile=None*`)`

Get a role policy.

CLI Example:

```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

salt.modules.boto_iam.**get_saml_provider**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider document.

CLI Example:

```
salt myminion boto_iam.get_saml_provider arn
```

salt.modules.boto_iam.**get_saml_provider_arn**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider

CLI Example:

```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

salt.modules.boto_iam.**get_server_certificate**(*cert_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_server_certificate mycert_name
```

salt.modules.boto_iam.**get_user**(*user_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get user information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user myuser
```

salt.modules.boto_iam.**get_user_policy**(*user_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieves the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```

salt.modules.boto_iam.**instance_profile_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an instance profile exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

`salt.modules.boto_iam.`**`list_attached_group_policies`**`(`*group_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None*`)`

List entities attached to the given group.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.`**`list_attached_role_policies`**`(`*role_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None*`)`

List entities attached to the given role.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.`**`list_attached_user_policies`**`(`*user_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None*`)`

List entities attached to the given user.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.`**`list_entities_for_policy`**`(`*policy_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None*`)`

List entities that a policy is attached to.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.`**`list_instance_profiles`**`(`*path_prefix='/', region=None, key=None, keyid=None, profile=None*`)`

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

> salt-call boto_iam.list_instance_profiles

`salt.modules.boto_iam.`**`list_policies`**`(`*region=None, key=None, keyid=None, profile=None*`)`

List policies.

CLI Example:

```
salt myminion boto_iam.list_policies
```

`salt.modules.boto_iam.`**`list_policy_versions`**`(`*policy_name, region=None, key=None, keyid=None, profile=None*`)`

List versions of a policy.

CLI Example:

```
salt myminion boto_iam.list_policy_versions mypolicy
```

`salt.modules.boto_iam.`**`list_role_policies`**(*role_name, region=None, key=None, keyid=None, profile=None*)

Get a list of policy names from a role.

CLI Example:

```
salt myminion boto_iam.list_role_policies myirole
```

`salt.modules.boto_iam.`**`list_saml_providers`**(*region=None, key=None, keyid=None, profile=None*)

List SAML providers.

CLI Example:

```
salt myminion boto_iam.list_saml_providers
```

`salt.modules.boto_iam.`**`policy_exists`**(*policy_name, region=None, key=None, keyid=None, profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

`salt.modules.boto_iam.`**`policy_version_exists`**(*policy_name, version_id, region=None, key=None, keyid=None, profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

`salt.modules.boto_iam.`**`profile_associated`**(*role_name, profile_name, region, key, keyid, profile*)

Check to see if an instance profile is associated with an IAM role.

CLI Example:

```
salt myminion boto_iam.profile_associated myirole myiprofile
```

`salt.modules.boto_iam.`**`put_group_policy`**(*group_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None*)

Adds or updates the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_group_policy mygroup policyname policyrules
```

`salt.modules.boto_iam.`**`put_user_policy`**(*user_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None*)

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_user_policy myuser policyname policyrules
```

`salt.modules.boto_iam.`**`remove_user_from_group`**`(`*group_name*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Remove user from group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.remove_user_from_group mygroup myuser
```

`salt.modules.boto_iam.`**`role_exists`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Check to see if an IAM role exists.

CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

`salt.modules.boto_iam.`**`set_default_policy_version`**`(`*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Set the default version of a policy.

CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```

`salt.modules.boto_iam.`**`update_account_password_policy`**`(`*allow_users_to_change_password=None*, *hard_expiry=None*, *max_password_age=None*, *minimum_password_length=None*, *password_reuse_prevention=None*, *require_lowercase_characters=None*, *require_numbers=None*, *require_symbols=None*, *require_uppercase_characters=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Update the password policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_account_password_policy True
```

`salt.modules.boto_iam.`**`update_assume_role_policy`**`(`*role_name*, *policy_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Update an assume role policy for a role.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"..."}'
```

salt.modules.boto_iam.**update_saml_provider**(*name*, *saml_metadata_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update SAML provider.

CLI Example:

```
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_
↪document
```

salt.modules.boto_iam.**upload_server_cert**(*cert_name*, *cert_body*, *private_key*, *cert_chain=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Upload a certificate to Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

Parameters

- **cert_name** – The name for the server certificate. Do not include the path in this value.
- **cert_body** – The contents of the public key certificate in PEM-encoded format.
- **private_key** – The contents of the private key in PEM-encoded format.
- **cert_chain** – The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** – The path for the server certificate.
- **region** – The name of the region to connect to.
- **key** – The key to be used in order to connect
- **keyid** – The keyid to be used in order to connect
- **profile** – The profile that contains a dict of region, key, keyid

Returns True / False

salt.modules.boto_iam.**user_exists_in_group**(*user_name*, *group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

21.9.53 salt.modules.boto_iot module

Connection module for Amazon IoT

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iot.keyid: GKTADJGHEIQSXMKKRBJ08H
iot.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
iot.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

`salt.modules.boto_iot.`**`attach_principal_policy`**(*policyName, principal, region=None, key=None, keyid=None, profile=None*)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:

```
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID
```

`salt.modules.boto_iot.`**`create_policy`**(*policyName, policyDocument, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:

```
salt myminion boto_iot.create_policy my_policy \
      '{"Version":"2015-12-12",\
      "Statement":[{"Effect":"Allow",\
                    "Action":["iot:Publish"],\
                    "Resource":["arn:::::topic/foo/bar"]}]}'
```

`salt.modules.boto_iot.`**`create_policy_version`**(*policyName, policyDocument, setAsDefault=False, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a new version of a policy.

Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:

```
salt myminion boto_iot.create_policy_version my_policy \
       '{"Statement":[{"Effect":"Allow","Action":["iot:Publish"],"Resource":[
↪"arn::::topic/foo/bar"]}]}'
```

`salt.modules.boto_iot.`**`create_thing_type`**(*thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a thing type.

Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.create_thing_type mythingtype \
      thingtype_description_string '["searchable_attr_1", "searchable_attr_2"]'
```

`salt.modules.boto_iot.`**`create_topic_rule`**(*ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a topic rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.create_topic_rule my_rule "SELECT * FROM 'some/thing'" \
    '[{"lambda":{"functionArn":"arn:::::something"}},{"sns":{\
    "targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

`salt.modules.boto_iot.`**`delete_policy`**(*policyName, region=None, key=None, keyid=None, profile=None*)

Given a policy name, delete it.

Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy mypolicy
```

`salt.modules.boto_iot.`**`delete_policy_version`**(*policyName, policyVersionId, region=None, key=None, keyid=None, profile=None*)

Given a policy name and version, delete it.

Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy_version mypolicy version
```

`salt.modules.boto_iot.`**`delete_thing_type`**(*thingTypeName, region=None, key=None, keyid=None, profile=None*)

Given a thing type name, delete it.

Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.delete_thing_type mythingtype
```

`salt.modules.boto_iot.`**`delete_topic_rule`**`(`*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_rule myrule
```

`salt.modules.boto_iot.`**`deprecate_thing_type`**`(`*thingTypeName*, *undoDeprecate=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.deprecate_thing_type mythingtype
```

`salt.modules.boto_iot.`**`describe_policy`**`(`*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy mypolicy
```

`salt.modules.boto_iot.`**`describe_policy_version`**`(`*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy_version mypolicy version
```

`salt.modules.boto_iot.`**`describe_thing_type`**`(`*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.describe_thing_type mythingtype
```

salt.modules.boto_iot.**describe_topic_rule**(*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a topic rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_topic_rule myrule
```

salt.modules.boto_iot.**detach_principal_policy**(*policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach the specified policy from the specified principal (certificate or other credential.)

Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.

CLI Example:

```
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```

salt.modules.boto_iot.**list_policies**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all policies

Returns list of policies

CLI Example:

```
salt myminion boto_iot.list_policies
```

Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.**list_policy_versions**(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the versions available for the given policy.

CLI Example:

```
salt myminion boto_iot.list_policy_versions mypolicy
```

Example Return:

```
policyVersions:
  - {...}
  - {...}
```

salt.modules.boto_iot.**list_principal_policies**(*principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the policies attached to the given principal.

CLI Example:

```
salt myminion boto_iot.list_principal_policies myprincipal
```

Example Return:

```
policies:
  - {...}
  - {...}
```

`salt.modules.boto_iot.`**`list_topic_rules`**(*topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None*)

List all rules (for a given topic, if specified)

Returns list of rules

CLI Example:

```
salt myminion boto_iot.list_topic_rules
```

Example Return:

```
rules:
  - {...}
  - {...}
```

`salt.modules.boto_iot.`**`policy_exists`**(*policyName, region=None, key=None, keyid=None, profile=None*)

Given a policy name, check to see if the given policy exists.

Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:

```
salt myminion boto_iot.policy_exists mypolicy
```

`salt.modules.boto_iot.`**`policy_version_exists`**(*policyName, policyVersionId, region=None, key=None, keyid=None, profile=None*)

Given a policy name and version ID, check to see if the given policy version exists.

Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:

```
salt myminion boto_iot.policy_version_exists mypolicy versionid
```

`salt.modules.boto_iot.`**`replace_topic_rule`**(*ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None*)

Given a valid config, replace a topic rule with the new values.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.thing' \
    '[{"lambda":{"functionArn":"arn:::::something"}},{"sns":{\
    "targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

`salt.modules.boto_iot.`**`set_default_policy_version`**(*policyName, policyVersionId, region=None, key=None, keyid=None, profile=None*)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.

Returns {changed: true} if the policy version was set {changed: False} if the policy version was not set.

CLI Example:

```
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

`salt.modules.boto_iot.`**`thing_type_exists`**(*thingTypeName, region=None, key=None, keyid=None, profile=None*)

Given a thing type name, check to see if the given thing type exists

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.thing_type_exists mythingtype
```

`salt.modules.boto_iot.`**`topic_rule_exists`**(*ruleName, region=None, key=None, keyid=None, profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:

```
salt myminion boto_iot.topic_rule_exists myrule
```

21.9.54 salt.modules.boto_kinesis module

Connection module for Amazon Kinesis

New in version 2017.7.0.

configuration This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kinesis.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto_kinesis.`**`create_stream`**`(`*stream_name, num_shards, region=None, key=None, keyid=None, profile=None*`)`

Create a stream with name stream_name and initial number of shards num_shards.

CLI example:

```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

`salt.modules.boto_kinesis.`**`decrease_stream_retention_period`**`(`*stream_name, retention_hours, region=None, key=None, keyid=None, profile=None*`)`

Decrease stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-
↪east-1
```

`salt.modules.boto_kinesis.`**`delete_stream`**`(`*stream_name, region=None, key=None, keyid=None, profile=None*`)`

Delete the stream with name stream_name. This cannot be undone! All data will be lost!!

CLI example:

```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

`salt.modules.boto_kinesis.`**`disable_enhanced_monitoring`**`(`*stream_name, metrics, region=None, key=None, keyid=None, profile=None*`)`

Disable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to",
↪ "disable"] region=us-east-1
```

`salt.modules.boto_kinesis.`**`enable_enhanced_monitoring`**`(`*stream_name, metrics, region=None, key=None, keyid=None, profile=None*`)`

Enable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics", "to",
↪"enable"] region=us-east-1
```

`salt.modules.boto_kinesis.`**`exists`**`(`*stream_name, region=None, key=None, keyid=None, profile=None*`)`

Check if the stream exists. Returns False and the error if it does not.

CLI example:

```
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

`salt.modules.boto_kinesis.`**`get_info_for_reshard`**`(`*stream_details*`)`

Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of OpenShards. Returns (min_hash_key, max_hash_key, stream_details)

CLI example:

```
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

`salt.modules.boto_kinesis.`**`get_stream_when_active`**(*stream_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.

CLI example:

```
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
```

`salt.modules.boto_kinesis.`**`increase_stream_retention_period`**(*stream_name*, *retention_hours*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Increase stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N region=us-
↪east-1
```

`salt.modules.boto_kinesis.`**`list_streams`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all streams visible to the current account

CLI example:

```
salt myminion boto_kinesis.list_streams
```

`salt.modules.boto_kinesis.`**`long_int`**(*hash_key*)

The hash key is a 128-bit int, sent as a string. It's necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility

CLI example:

```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

Returns long object if python 2.X, int object if python 3.X

`salt.modules.boto_kinesis.`**`reshard`**(*stream_name*, *desired_size*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must past in force=True; otherwise, the function will dry run.

CLI example:

```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns True if a split or merge was found/performed, False if nothing is needed

21.9.55 salt.modules.boto_kms

Connection module for Amazon KMS

New in version 2015.8.0.

configuration This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile: keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs region: us-east-1

depends boto

`salt.modules.boto_kms.`**`create_alias`**(*alias_name, target_key_id, region=None, key=None, keyid=None, profile=None*)

Create a display name for a key.

CLI example:

```
salt myminion boto_kms.create_alias 'alias/mykey' key_id
```

`salt.modules.boto_kms.`**`create_grant`**(*key_id, grantee_principal, retiring_principal=None, operations=None, constraints=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None*)

Adds a grant to a key to specify who can access the key and under what conditions.

CLI example:

```
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::1111111:/role/
↪myrole' operations='["Encrypt","Decrypt"]'
```

`salt.modules.boto_kms.`**`create_key`**(*policy=None, description=None, key_usage=None, region=None, key=None, keyid=None, profile=None*)

Creates a master key.

CLI example:

```
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

`salt.modules.boto_kms.`**`decrypt`**(*ciphertext_blob, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None*)

Decrypt ciphertext.

CLI example:

```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

`salt.modules.boto_kms.`**`describe_key`**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get detailed information about a key.

CLI example:

```
salt myminion boto_kms.describe_key 'alias/mykey'
```

`salt.modules.boto_kms.`**`disable_key`**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Mark key as disabled.

CLI example:

```
salt myminion boto_kms.disable_key 'alias/mykey'
```

`salt.modules.boto_kms.`**`disable_key_rotation`**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable key rotation for specified key.

CLI example:

```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

`salt.modules.boto_kms.`**`enable_key`**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Mark key as enabled.

CLI example:

```
salt myminion boto_kms.enable_key 'alias/mykey'
```

`salt.modules.boto_kms.`**`enable_key_rotation`**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable key rotation for specified key.

CLI example:

```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

`salt.modules.boto_kms.`**`encrypt`**(*key_id*, *plaintext*, *encryption_context=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Encrypt plaintext into cipher text using specified key.

CLI example:

```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username":
↪"myuser"}'
```

`salt.modules.boto_kms.`**`generate_data_key`**(*key_id*, *encryption_context=None*, *number_of_bytes=None*, *key_spec=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Generate a secure data key.

CLI example:

```
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_
↪spec=AES_128
```

`salt.modules.boto_kms.`**`generate_data_key_without_plaintext`**(*key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None*)

Generate a secure data key without a plaintext copy of the key.

CLI example:

```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_
↪of_bytes=1024 key_spec=AES_128
```

`salt.modules.boto_kms.`**`generate_random`**(*number_of_bytes=None, region=None, key=None, keyid=None, profile=None*)

Generate a random string.

CLI example:

```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

`salt.modules.boto_kms.`**`get_key_policy`**(*key_id, policy_name, region=None, key=None, keyid=None, profile=None*)

Get the policy for the specified key.

CLI example:

```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

`salt.modules.boto_kms.`**`get_key_rotation_status`**(*key_id, region=None, key=None, keyid=None, profile=None*)

Get status of whether or not key rotation is enabled for a key.

CLI example:

```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

`salt.modules.boto_kms.`**`key_exists`**(*key_id, region=None, key=None, keyid=None, profile=None*)

Check for the existence of a key.

CLI example:

```
salt myminion boto_kms.key_exists 'alias/mykey'
```

`salt.modules.boto_kms.`**`list_grants`**(*key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None*)

List grants for the specified key.

CLI example:

```
salt myminion boto_kms.list_grants 'alias/mykey'
```

salt.modules.boto_kms.**list_key_policies**(*key_id*, *limit=None*, *marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List key_policies for the specified key.

CLI example:

```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

salt.modules.boto_kms.**put_key_policy**(*key_id*, *policy_name*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a key policy to the specified key.

CLI example:

```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

salt.modules.boto_kms.**re_encrypt**(*ciphertext_blob*, *destination_key_id*, *source_encryption_context=None*, *destination_encryption_context=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reencrypt encrypted data with a new master key.

CLI example:

```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{
↪"Statement":...}'
```

salt.modules.boto_kms.**revoke_grant**(*key_id*, *grant_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Revoke a grant from a key.

CLI example:

```
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

salt.modules.boto_kms.**update_key_description**(*key_id*, *description*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update a key's description.

CLI example:

```
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

21.9.56 salt.modules.boto_lambda module

Connection module for Amazon Lambda

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_function*) return:

```
function:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

`salt.modules.boto_lambda.`**`add_permission`**(*FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None*)

Add a permission to a lambda function.

Returns {added: true} if the permission was added and returns {added: False} if the permission was not added.

CLI Example:

```
salt myminion boto_lamba.add_permission my_function my_id "lambda:*" \
                   s3.amazonaws.com aws:arn::::bucket-name \
                   aws-account-id
```

`salt.modules.boto_lambda.`**`alias_exists`**(*FunctionName, Name, region=None, key=None, keyid=None, profile=None*)

Given a function name and alias name, check to see if the given alias exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

`salt.modules.boto_lambda.`**`create_alias`**(*FunctionName, Name, FunctionVersion, Description=”, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an alias to a function.

Returns {created: true} if the alias was created and returns {created: False} if the alias was not created.

CLI Example:

```
salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An alias"
```

`salt.modules.boto_lambda.`**`create_event_source_mapping`**(*EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None*)

Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:

```
salt myminion boto_lamba.create_event_source_mapping arn::::eventsource⊠
↪myfunction LATEST
```

`salt.modules.boto_lambda.`**`create_function`**(*FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description=”, Timeout=3, MemorySize=128, Publish=False, WaitForRole=False, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None*)

New in version 2017.7.0.

Given a valid config, create a function.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns `{'created': True}` if the function was created and `{created: False}` if the function was not created.

CLI Example:

```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_file.my_
↪function my_function.zip
```

salt.modules.boto_lambda.**delete_alias**(*FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_alias myfunction myalias
```

salt.modules.boto_lambda.**delete_event_source_mapping**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-
↪5e91b9ecd0fa
```

salt.modules.boto_lambda.**delete_function**(*FunctionName*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_function myfunction
```

salt.modules.boto_lambda.**describe_alias**(*FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_alias myalias
```

salt.modules.boto_lambda.**describe_event_source_mapping**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_event_source_mapping uuid
```

salt.modules.boto_lambda.**describe_function**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_function myfunction
```

salt.modules.boto_lambda.**event_source_mapping_exists**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.**function_exists**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name, check to see if the given function name exists.

Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_lambda.function_exists myfunction
```

salt.modules.boto_lambda.**get_event_source_mapping_ids**(*EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source and function name, return a list of mapping IDs

CLI Example:

```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

salt.modules.boto_lambda.**get_permissions**(*FunctionName*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get resource permissions for the given lambda function

Returns dictionary of permissions, by statement ID

CLI Example:

```
salt myminion boto_lamba.get_permissions my_function

permissions: {...}
```

salt.modules.boto_lambda.**list_function_versions**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the versions available for the given function.

Returns list of function versions

CLI Example:

```
versions:
  - {...}
  - {...}
```

`salt.modules.boto_lambda.`**`list_functions`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all Lambda functions visible in the current scope.

CLI Example:

```
salt myminion boto_lambda.list_functions
```

`salt.modules.boto_lambda.`**`remove_permission`**(*FunctionName*, *StatementId*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```
salt myminion boto_lamba.remove_permission my_function my_id
```

`salt.modules.boto_lambda.`**`update_alias`**(*FunctionName*, *Name*, *FunctionVersion=None*, *Description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_alias my_lambda my_alias $LATEST
```

`salt.modules.boto_lambda.`**`update_event_source_mapping`**(*UUID*, *FunctionName=None*, *Enabled=None*, *BatchSize=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_event_source_mapping uuid FunctionName=new_
↪function
```

`salt.modules.boto_lambda.`**`update_function_code`**(*FunctionName*, *ZipFile=None*, *S3Bucket=None*, *S3Key=None*, *S3ObjectVersion=None*, *Publish=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_code my_function ZipFile=function.zip
```

`salt.modules.boto_lambda.`**`update_function_config`**(*FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None*)

New in version 2017.7.0.

Update the named lambda function to the configuration.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns `{'updated': True}` if the function was updated, and `{'updated': False}` if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_config my_function my_role my_file.my_
↪function "my lambda function"
```

21.9.57 salt.modules.boto_rds

Connection module for Amazon RDS

New in version 2015.8.0.

configuration This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto_rds.`**`create`**(*name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, db_cluster_identifier=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_key_id=None, domain=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, region=None, promotion_tier=None, key=None, keyid=None, profile=None*)

Create an RDS Instance

CLI example to create an RDS Instance:

```
salt myminion boto_rds.create myrds 10 db.t2.micro MySQL sqlusr sqlpassw
```

`salt.modules.boto_rds.`**`create_option_group`**(*name, engine_name, major_engine_version, option_group_description, tags=None, region=None, key=None, keyid=None, profile=None*)

Create an RDS option group

CLI example to create an RDS option group:

```
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6
↪"group description"
```

`salt.modules.boto_rds.`**`create_parameter_group`**(*name, db_parameter_group_family, description, tags=None, region=None, key=None, keyid=None, profile=None*)

Create an RDS parameter group

CLI example to create an RDS parameter group:

```
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6                    ␣
↪    "group description"
```

salt.modules.boto_rds.**create_read_replica**(*name, source_name, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, db_subnet_group_name=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, region=None, key=None, keyid=None, profile=None*)

Create an RDS read replica

CLI example to create an RDS read replica:

```
salt myminion boto_rds.create_read_replica replicaname source_name
```

salt.modules.boto_rds.**create_subnet_group**(*name, description, subnet_ids, tags=None, region=None, key=None, keyid=None, profile=None*)

Create an RDS subnet group

CLI example to create an RDS subnet group:

```
salt myminion boto_rds.create_subnet_group my-subnet-group            "group⊠
↪description" '[subnet-12345678, subnet-87654321]'          region=us-east-1
```

salt.modules.boto_rds.**delete**(*name, skip_final_snapshot=None, final_db_snapshot_identifier=None, region=None, key=None, keyid=None, profile=None, tags=None, wait_for_deletion=True, timeout=180*)

Delete an RDS instance.

CLI example:

```
salt myminion boto_rds.delete myrds skip_final_snapshot=True                ⊠
↪region=us-east-1
```

salt.modules.boto_rds.**delete_option_group**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an RDS option group.

CLI example:

```
salt myminion boto_rds.delete_option_group my-opt-group                region=us-
↪east-1
```

salt.modules.boto_rds.**delete_parameter_group**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an RDS parameter group.

CLI example:

```
salt myminion boto_rds.delete_parameter_group my-param-group                ⊠
↪region=us-east-1
```

salt.modules.boto_rds.**delete_subnet_group**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an RDS subnet group.

CLI example:

```
salt myminion boto_rds.delete_subnet_group my-subnet-group                    ⊠
↪region=us-east-1
```

`salt.modules.boto_rds.`**`describe`**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return RDS instance details.

CLI example:

```
salt myminion boto_rds.describe myrds
```

`salt.modules.boto_rds.`**`describe_db_instances`**(*name=None*, *filters=None*, *jmespath='DBInstances'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a detailed listing of some, or all, DB Instances visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:

```
salt myminion boto_rds.describe_db_instances jmespath='DBInstances[*].
↪DBInstanceIdentifier'
```

`salt.modules.boto_rds.`**`describe_db_subnet_groups`**(*name=None*, *filters=None*, *jmespath='DBSubnetGroups'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a detailed listing of some, or all, DB Subnet Groups visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI example:

```
salt myminion boto_rds.describe_db_subnet_groups
```

`salt.modules.boto_rds.`**`describe_parameter_group`**(*name*, *Filters=None*, *MaxRecords=None*, *Marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of *DBParameterGroup* descriptions. CLI example to description of parameter group:

```
salt myminion boto_rds.describe_parameter_group parametergroupname            ⊠
↪region=us-east-1
```

`salt.modules.boto_rds.`**`describe_parameters`**(*name*, *Source=None*, *MaxRecords=None*, *Marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of *DBParameterGroup* parameters. CLI example to description of parameters

```
salt myminion boto_rds.describe_parameters parametergroupname                 ⊠
↪region=us-east-1
```

`salt.modules.boto_rds.`**`exists`**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an RDS exists.

CLI example:

```
salt myminion boto_rds.exists myrds region=us-east-1
```

`salt.modules.boto_rds.`**`get_endpoint`**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return the endpoint of an RDS instance.

CLI example:

```
salt myminion boto_rds.get_endpoint myrds
```

`salt.modules.boto_rds.`**`modify_db_instance`**(*name, allocated_storage=None, allow_major_version_upgrade=None, apply_immediately=None, auto_minor_version_upgrade=None, backup_retention_period=None, ca_certificate_identifier=None, character_set_name=None, copy_tags_to_snapshot=None, db_cluster_identifier=None, db_instance_class=None, db_name=None, db_parameter_group_name=None, db_port_number=None, db_security_groups=None, db_subnet_group_name=None, domain=None, domain_iam_role_name=None, engine_version=None, iops=None, kms_key_id=None, license_model=None, master_user_password=None, monitoring_interval=None, monitoring_role_arn=None, multi_az=None, new_db_instance_identifier=None, option_group_name=None, preferred_backup_window=None, preferred_maintenance_window=None, promotion_tier=None, publicly_accessible=None, storage_encrypted=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, vpc_security_group_ids=None, region=None, key=None, keyid=None, profile=None*)

Modify settings for a DB instance. CLI example to description of parameters

```
salt myminion boto_rds.modify_db_instance db_instance_identifier region=us-east-1
```

`salt.modules.boto_rds.`**`option_group_exists`**(*name, tags=None, region=None, key=None, keyid=None, profile=None*)

Check to see if an RDS option group exists.

CLI example:

```
salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1
```

`salt.modules.boto_rds.`**`parameter_group_exists`**(*name, tags=None, region=None, key=None, keyid=None, profile=None*)

Check to see if an RDS parameter group exists.

CLI example:

```
salt myminion boto_rds.parameter_group_exists myparametergroup ␣
↪region=us-east-1
```

`salt.modules.boto_rds.`**`subnet_group_exists`**(*name, tags=None, region=None, key=None, keyid=None, profile=None*)

Check to see if an RDS subnet group exists.

CLI example:

```
salt myminion boto_rds.subnet_group_exists my-param-group                  ⊠
↪region=us-east-1
```

salt.modules.boto_rds.**update_parameter_group**(*name, parameters, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None*)

Update an RDS parameter group.

CLI example:

```
salt myminion boto_rds.update_parameter_group my-param-group                  ⊠
↪parameters='{"back_log":1, "binlog_cache_size":4096}'                 region=us-
↪east-1
```

21.9.58 salt.modules.boto_route53

Connection module for Amazon Route53

New in version 2014.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

If a region is not specified, the default is 'universal', which is what the boto_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

salt.modules.boto_route53.**add_record**(*name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5*)

Add a record to a zone.

CLI example:

```
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.
↪org A
```

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry_on_rate_limit* was deprecated for this argument. Users can still use *retry_on_rate_limit* to ensure backwards compatibility, but please migrate to using the favored *retry_on_errors* argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument *rate_limit_retries* was deprecated for this arguments. Users can still use *rate_limit_retries* to ensure backwards compatibility, but please migrate to using the favored *error_retries* argument instead.

`salt.modules.boto_route53.`**`create_healthcheck`**`(`*ip_addr=None, fqdn=None, region=None, key=None, keyid=None, profile=None, port=53, hc_type='TCP', resource_path='', string_match=None, request_interval=30, failure_threshold=3, retry_on_errors=True, error_retries=5*`)`

Create a Route53 healthcheck

New in version 2018.3.0.

ip_addr

IP address to check. ip_addr or fqdn is required.

fqdn

Domain name of the endpoint to check. ip_addr or fqdn is required

port

Port to check

hc_type

Healthcheck type. HTTP | HTTPS | HTTP_STR_MATCH | HTTPS_STR_MATCH | TCP

resource_path

Path to check

string_match

If hc_type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource

request_interval

The number of seconds between the time that Amazon Route 53 gets a response from your endpoint and the time that it sends the next health-check request.

failure_threshold

The number of consecutive health checks that an endpoint must pass or fail for Amazon Route 53 to change the current status of the endpoint from unhealthy to healthy or vice versa.

region

Region endpoint to connect to

key

AWS key

keyid

AWS keyid

profile

AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_healthcheck 192.168.0.1
salt myminion boto_route53.create_healthcheck 192.168.0.1 port=443 hc_type=HTTPS ⊠
↪                                                    resource_path=/ fqdn=blog.
↪saltstack.furniture
```

`salt.modules.boto_route53.`**`create_hosted_zone`**(*domain_name*, *caller_ref=None*, *comment=''*, *private_zone=False*, *vpc_id=None*, *vpc_name=None*, *vpc_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

domain_name The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

caller_ref A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. It can take several minutes for the change to replicate globally, and change from PENDING to INSYNC status. Thus it's best to provide some value for this where possible, since duplicate calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created. On the other hand, if a zone is created with a given caller_ref, then deleted, a second attempt to create a zone with the same caller_ref will fail until that caller_ref is flushed from the Route53 system, which can take upwards of 24 hours.

comment Any comments you want to include about the hosted zone.

private_zone Set True if creating a private hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored when creating a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored when creating a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

region Region endpoint to connect to.

key AWS key to bind with.

keyid AWS keyid to bind with.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto_route53.create_hosted_zone example.org
```

`salt.modules.boto_route53.`**`create_zone`**(*zone*, *private=False*, *vpc_id=None*, *vpc_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a Route53 hosted zone.

New in version 2015.8.0.

zone DNS zone to create

private True/False if the zone will be a private zone

vpc_id VPC ID to associate the zone to (required if private is True)

vpc_region VPC Region (required if private is True)

region region endpoint to connect to

key AWS key

keyid AWS keyid

profile AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_zone example.org
```

`salt.modules.boto_route53.`**`delete_record`**(*name*, *zone*, *record_type*, *identifier=None*, *all_records=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*, *retry_on_rate_limit=None*, *rate_limit_retries=None*, *retry_on_errors=True*, *error_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry_on_rate_limit* was deprecated for this argument. Users can still use *retry_on_rate_limit* to ensure backwards compatibility, but please migrate to using the favored *retry_on_errors* argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument *rate_limit_retries* was deprecated for this arguments. Users can still use *rate_limit_retries* to ensure backwards compatibility, but please migrate to using the favored *error_retries* argument instead.

`salt.modules.boto_route53.`**`delete_zone`**(*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

`salt.modules.boto_route53.`**`describe_hosted_zones`**(*zone_id=None*, *domain_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the 'all' and 'single' description types.

zone_id The unique identifier for the Hosted Zone

domain_name The FQDN of the Hosted Zone (including final period)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.
↪        profile='{"region": "us-east-1", "keyid": "A12345678AB", "key":
↪"xblahblahblah"}'
```

`salt.modules.boto_route53.`**`get_record`**(*name*, *zone*, *record_type*, *fetch_all=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *split_dns=False*, *private_zone=False*, *identifier=None*, *retry_on_rate_limit=None*, *rate_limit_retries=None*, *retry_on_errors=True*, *error_retries=5*)

Get a record from a zone.

CLI example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry_on_rate_limit* was deprecated for this argument. Users can still use *retry_on_rate_limit* to ensure backwards compatibility, but please migrate to using the favored *retry_on_errors* argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument *rate_limit_retries* was deprecated for this arguments. Users can still use *rate_limit_retries* to ensure backwards compatibility, but please migrate to using the favored *error_retries* argument instead.

`salt.modules.boto_route53.`**`list_all_zones_by_id`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, by their IDs, all hosted zones in the bound account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

`salt.modules.boto_route53.`**`list_all_zones_by_name`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, by their FQDNs, all hosted zones in the bound account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

`salt.modules.boto_route53.`**`update_record`**(*name*, *value*, *zone*, *record_type*, *identifier=None*, *ttl=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*, *retry_on_rate_limit=None*, *rate_limit_retries=None*, *retry_on_errors=True*, *error_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.
↪org A
```

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry_on_rate_limit* was deprecated for this argument. Users can still use *retry_on_rate_limit* to ensure backwards compatibility, but please migrate to using the favored *retry_on_errors* argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument *rate_limit_retries* was deprecated for this arguments. Users can still use *rate_limit_retries* to ensure backwards compatibility, but please migrate to using the favored *error_retries* argument instead.

`salt.modules.boto_route53.`**`zone_exists`**(*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *retry_on_rate_limit=None*, *rate_limit_retries=None*, *retry_on_errors=True*, *error_retries=5*)

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

retry_on_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry_on_rate_limit* was deprecated for this argument. Users can still use *retry_on_rate_limit* to ensure backwards compatibility, but please migrate to using the favored *retry_on_errors* argument instead.

error_retries Amount of times to attempt to query if the zone exists. The previously used argument *rate_limit_retries* was deprecated for this arguments. Users can still use *rate_limit_retries* to ensure backwards compatibility, but please migrate to using the favored *error_retries* argument instead.

21.9.59 salt.modules.boto_s3_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

`salt.modules.boto_s3_bucket.`**`create`**(*Bucket*, *ACL=None*, *LocationConstraint=None*, *GrantFullControl=None*, *GrantRead=None*, *GrantReadACP=None*, *GrantWrite=None*, *GrantWriteACP=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket \
                 GrantFullControl='emailaddress=example@example.com' \
                 GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"
↪' \
                 GrantReadACP='emailaddress="exampl@example.com",id=
↪"2345678909876432"' \
                 LocationConstraint=us-west-1
```

`salt.modules.boto_s3_bucket.`**`delete`**(*Bucket*, *MFA=None*, *RequestPayer=None*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

`salt.modules.boto_s3_bucket.`**`delete_cors`**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

`salt.modules.boto_s3_bucket.`**`delete_lifecycle_configuration`**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

`salt.modules.boto_s3_bucket.`**`delete_objects`**(*Bucket*, *Delete*, *MFA=None*, *RequestPayer=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, …]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key: myobject]}'
```

`salt.modules.boto_s3_bucket.`**`delete_policy`**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

`salt.modules.boto_s3_bucket.`**`delete_replication`**`(`*Bucket, region=None, key=None, keyid=None, profile=None*`)`

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

`salt.modules.boto_s3_bucket.`**`delete_tagging`**`(`*Bucket, region=None, key=None, keyid=None, profile=None*`)`

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

`salt.modules.boto_s3_bucket.`**`delete_website`**`(`*Bucket, region=None, key=None, keyid=None, profile=None*`)`

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_website my_bucket
```

`salt.modules.boto_s3_bucket.`**`describe`**`(`*Bucket, region=None, key=None, keyid=None, profile=None*`)`

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_s3_bucket.describe mybucket
```

`salt.modules.boto_s3_bucket.`**`empty`**`(`*Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None*`)`

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

`salt.modules.boto_s3_bucket.`**`exists`**`(`*Bucket, region=None, key=None, keyid=None, profile=None*`)`

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

`salt.modules.boto_s3_bucket.`**`list`**(*region=None, key=None, keyid=None, profile=None*)

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
  - {...}
  - {...}
```

`salt.modules.boto_s3_bucket.`**`list_object_versions`**(*Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

`salt.modules.boto_s3_bucket.`**`list_objects`**(*Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

`salt.modules.boto_s3_bucket.`**`put_acl`**(*Bucket, ACL=None, AccessControlPolicy=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
                GrantFullControl='emailaddress=example@example.com' \
                GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"
↪' \
                GrantReadACP='emailaddress="exampl@example.com",id=
↪"2345678909876432"'
```

`salt.modules.boto_s3_bucket.`**`put_cors`**(*Bucket, CORSRules, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_cors my_bucket '[{\
      "AllowedHeaders":[],\
      "AllowedMethods":["GET"],\
      "AllowedOrigins":["*"],\
      "ExposeHeaders":[],\
      "MaxAgeSeconds":123,\
}]'
```

`salt.modules.boto_s3_bucket.`**`put_lifecycle_configuration`**(*Bucket, Rules, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '[{\
      "Expiration": {...},\
      "ID": "idstring",\
      "Prefix": "prefixstring",\
      "Status": "enabled",\
      "Transitions": [{...},],\
      "NoncurrentVersionTransitions": [{...},],\
      "NoncurrentVersionExpiration": {...},\
}]'
```

`salt.modules.boto_s3_bucket.`**`put_logging`**(*Bucket, TargetBucket=None, TargetPrefix=None, TargetGrants=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[{...}]' prefix
```

`salt.modules.boto_s3_bucket.`**`put_notification_configuration`**(*Bucket, TopicConfigurations=None, QueueConfigurations=None, LambdaFunctionConfigurations=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
        [{...}] \
        [{...}] \
        [{...}]
```

`salt.modules.boto_s3_bucket.`**`put_policy`**`(`*Bucket, Policy, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, update the policy for a bucket.

Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

`salt.modules.boto_s3_bucket.`**`put_replication`**`(`*Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, update the replication configuration for a bucket.

Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.`**`put_request_payment`**`(`*Bucket, Payer, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

`salt.modules.boto_s3_bucket.`**`put_tagging`**`(`*Bucket, region=None, key=None, keyid=None, profile=None, **kwargs*`)`

Given a valid config, update the tags for a bucket.

Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.`**`put_versioning`**`(`*Bucket, Status, MFADelete=None, MFA=None, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled
```

`salt.modules.boto_s3_bucket.`**`put_website`**`(`*Bucket, ErrorDocument=None, IndexDocument=None, RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None*`)`

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix":
↪"index.html"}'
```

21.9.60 salt.modules.boto_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

configuration This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
secgroup.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_secgroup.`**`authorize`**(*name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False*)

Add a new rule to an existing security group.

CLI example:

```
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_
↪port=80 cidr_ip='['10.0.0.0/8', '192.168.0.0/24']'
```

`salt.modules.boto_secgroup.`**`convert_to_group_ids`**(*groups, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

CLI example:

```
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc-89yhh7h
```

`salt.modules.boto_secgroup.`**`create`**`(`*name, description, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*`)`

Create a security group.

CLI example:

```
salt myminion boto_secgroup.create mysecgroup 'My Security Group'
```

`salt.modules.boto_secgroup.`**`delete`**`(`*name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None*`)`

Delete a security group.

CLI example:

```
salt myminion boto_secgroup.delete mysecgroup
```

`salt.modules.boto_secgroup.`**`delete_tags`**`(`*tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None*`)`

Deletes tags from a security group.

New in version 2016.3.0.

tags a list of tags to remove

name the name of the security group

group_id the group id of the security group (in lie of a name/vpc combo)

vpc_name the name of the vpc to search the named group for

vpc_id the id of the vpc, in lieu of the vpc_name

region the amazon region

key amazon key

keyid amazon keyid

profile amazon profile

CLI example:

```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1','TAG_TO_DELETE2']␣
↪security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

`salt.modules.boto_secgroup.`**`exists`**`(`*name=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, group_id=None*`)`

Check to see if a security group exists.

CLI example:

```
salt myminion boto_secgroup.exists mysecgroup
```

`salt.modules.boto_secgroup.`**`get_all_security_groups`**`(`*groupnames=None, group_ids=None, filters=None, region=None, key=None, keyid=None, profile=None*`)`

Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames` argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name` filter instead.

The valid keys for the `filters` argument can be found in AWS's API documentation.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{group-name: mygroup}
↪'
```

`salt.modules.boto_secgroup.`**`get_config`**(*name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None*)

Get the configuration for a security group.

CLI example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

`salt.modules.boto_secgroup.`**`get_group_id`**(*name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Get a Group ID given a Group Name or Group Name and VPC ID

CLI example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```

`salt.modules.boto_secgroup.`**`revoke`**(*name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False*)

Remove a rule from an existing security group.

CLI example:

```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_
↪port=80 cidr_ip='10.0.0.0/8'
```

`salt.modules.boto_secgroup.`**`set_tags`**(*tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None*)

Sets tags on a security group.

New in version 2016.3.0.

tags a dict of key:value pair of tags to set on the security group

name the name of the security group

group_id the group id of the security group (in lie of a name/vpc combo)

vpc_name the name of the vpc to search the named group for

vpc_id the id of the vpc, in lieu of the vpc_name

region the amazon region

key amazon key

keyid amazon keyid

profile amazon profile

CLI example:

```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}"␣
↪security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

21.9.61 salt.modules.boto_sns

Connection module for Amazon SNS

configuration This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

`salt.modules.boto_sns.`**`create`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Create an SNS topic.

CLI example to create a topic:

```
salt myminion boto_sns.create mytopic region=us-east-1
```

`salt.modules.boto_sns.`**`delete`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Delete an SNS topic.

CLI example to delete a topic:

```
salt myminion boto_sns.delete mytopic region=us-east-1
```

`salt.modules.boto_sns.`**`exists`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Check to see if an SNS topic exists.

CLI example:

```
salt myminion boto_sns.exists mytopic region=us-east-1
```

`salt.modules.boto_sns.`**`get_all_subscriptions_by_topic`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

`salt.modules.boto_sns.`**`get_all_topics`**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of the all topics..

CLI example:

```
salt myminion boto_sns.get_all_topics
```

`salt.modules.boto_sns.`**`get_arn`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns the full ARN for a given topic name.

CLI example:

```
salt myminion boto_sns.get_arn mytopic
```

`salt.modules.boto_sns.`**`subscribe`**(*topic*, *protocol*, *endpoint*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Subscribe to a Topic.

CLI example to delete a topic:

```
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-
↪endpoint region=us-east-1
```

`salt.modules.boto_sns.`**`unsubscribe`**(*topic*, *subscription_arn*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

21.9.62 salt.modules.boto_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

configuration This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

`salt.modules.boto_sqs.`**`create`**(*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

`salt.modules.boto_sqs.`**`delete`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```

`salt.modules.boto_sqs.`**`exists`**(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if a queue exists.

CLI Example:

```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

`salt.modules.boto_sqs.`**`get_attributes`**(*name, region=None, key=None, keyid=None, profile=None*)

Return attributes currently set on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.get_attributes myqueue
```

`salt.modules.boto_sqs.`**`list_`**(*prefix=", region=None, key=None, keyid=None, profile=None*)

Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.list region=us-east-1
```

`salt.modules.boto_sqs.`**`set_attributes`**`(`*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}
↪' region=us-east-1
```

21.9.63 salt.modules.boto_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.6

configuration This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_vpc*) return:

```
vpcs:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
↪name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
↪region=us-west-2
```

Check to see if VPC peering connection is pending

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.`**`accept_vpc_peering_connection`**(*conn_id=”, name=”, region=None, key=None, keyid=None, profile=None, dry_run=False*)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

Parameters

- **conn_id** – The ID to use. String type.
- **name** – The name of this VPC peering connection. String type.
- **region** – The AWS region to use. Type string.

- **key** – The key to use for this connection. Type string.
- **keyid** – The key id to use.
- **profile** – The profile to use.
- **dry_run** – The dry_run flag to set.

Returns dict

Warning: Please specify either the `vpc_peering_connection_id` or `name` but not both. Specifying both will result in an error!

CLI Example:

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-
↪2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.`**`associate_dhcp_options_to_vpc`**(*dhcp_options_id, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402
↪'
```

`salt.modules.boto_vpc.`**`associate_network_acl_to_subnet`**(*network_acl_id=None, subnet_id=None, network_acl_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None*)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
        network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
        network_acl_id='myacl' subnet_id='mysubnet'
```

`salt.modules.boto_vpc.`**`associate_route_table`**(*route_table_id=None, subnet_id=None, route_table_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None*)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:

```
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' \
        subnet_name='mysubnet'
```

`salt.modules.boto_vpc.`**`check_vpc`**(*vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

`salt.modules.boto_vpc.`**`create`**(*cidr_block, instance_tenancy=None, vpc_name=None, enable_dns_support=None, enable_dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a valid CIDR block, create a VPC.

An optional instance_tenancy argument can be provided. If provided, the valid values are 'default' or 'dedicated'

An optional vpc_name argument can be provided.

Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

`salt.modules.boto_vpc.`**`create_customer_gateway`**(*vpn_connection_type, ip_address, bgp_asn, customer_gateway_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a valid VPN connection type, a static IP address and a customer gateway's Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

`salt.modules.boto_vpc.`**`create_dhcp_options`**(*domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, dhcp_options_name=None, tags=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added vpc_name and vpc_id arguments

CLI Example:

```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \
        domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \
        netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \
        vpc_name='myvpc'
```

`salt.modules.boto_vpc.`**`create_internet_gateway`**(*internet_gateway_name=None, vpc_id=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.create_internet_gateway \
        internet_gateway_name=myigw vpc_name=myvpc
```

`salt.modules.boto_vpc.`**`create_nat_gateway`**(*subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None, keyid=None, profile=None*)

Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

`salt.modules.boto_vpc.`**`create_network_acl`**(*vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:

```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

`salt.modules.boto_vpc.`**`create_network_acl_entry`**(*network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None*)

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' \
        'all' 'deny' '0.0.0.0/0' egress=true
```

`salt.modules.boto_vpc.`**`create_route`**(*route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, internet_gateway_name=None, instance_id=None, interface_id=None, vpc_peering_connection_id=None, vpc_peering_connection_name=None, region=None, key=None, keyid=None, profile=None, nat_gateway_id=None, nat_gateway_subnet_name=None, nat_gateway_subnet_id=None*)

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

`salt.modules.boto_vpc.`**`create_route_table`**(*vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Creates a route table.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \
        route_table_name='myroutetable'
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \
        route_table_name='myroutetable'
```

`salt.modules.boto_vpc.`**`create_subnet`**(*vpc_id=None, cidr_block=None, vpc_name=None, availability_zone=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None, auto_assign_public_ipv4=False*)

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \
        subnet_name='mysubnet' cidr_block='10.0.0.0/25'
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \
        subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```

`salt.modules.boto_vpc.`**`customer_gateway_exists`**(*customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID, check if the customer gateway ID exists.

Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gatway_name=mycgw
```

`salt.modules.boto_vpc.`**`delete`**(*vpc_id=None, name=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID or VPC name, delete the VPC.

Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:

```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

`salt.modules.boto_vpc.`**`delete_customer_gateway`**(*customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID or name, delete the customer gateway.

Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.

Changed in version 2015.8.0: Added customer_gateway_name argument

CLI Example:

```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

`salt.modules.boto_vpc.`**`delete_dhcp_options`**(*dhcp_options_id=None, dhcp_options_name=None, region=None, key=None, keyid=None, profile=None*)

Delete dhcp options by id or name.

New in version 2015.8.0.

CLI Example:

```
salt mymininon boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

`salt.modules.boto_vpc.`**`delete_internet_gateway`**(*internet_gateway_id=None, internet_gateway_name=None, detach=False, region=None, key=None, keyid=None, profile=None*)

Delete an internet gateway (by name or id).

Returns True if the internet gateway was deleted and otherwise False.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

`salt.modules.boto_vpc.`**`delete_nat_gateway`**(*nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None, wait_for_delete=False, wait_for_delete_retries=5*)

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

nat_gateway_id Id of the NAT Gateway

releaes_eips whether to release the elastic IPs associated with the given NAT Gateway Id

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

`salt.modules.boto_vpc.`**`delete_network_acl`**(*network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None, keyid=None, profile=None*)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \
        disassociate=false
```

```
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \
        disassociate=true
```

`salt.modules.boto_vpc.`**`delete_network_acl_entry`**(*network_acl_id=None, rule_number=None, egress=None, network_acl_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a network acl entry.

CLI Example:

```
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

`salt.modules.boto_vpc.`**`delete_route`**(*route_table_id=None, destination_cidr_block=None, route_table_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a route.

CLI Example:

```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

`salt.modules.boto_vpc.`**`delete_route_table`**(*route_table_id=None, route_table_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

`salt.modules.boto_vpc.`**`delete_subnet`**(*subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added subnet_name argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.`**`delete_vpc_peering_connection`**(*conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None, dry_run=False*)

Delete a VPC peering connection.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

dry_run If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-
↪west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.`**`describe`**(*vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID describe its properties.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

`salt.modules.boto_vpc.`**`describe_nat_gateways`**(*nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None*)

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7
↪'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

`salt.modules.boto_vpc.`**`describe_route_table`**(*route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```

`salt.modules.boto_vpc.`**`describe_route_tables`**(*route_table_id=None, route_table_name=None, vpc_id=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

`salt.modules.boto_vpc.`**`describe_subnet`**(*subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```

`salt.modules.boto_vpc.`**`describe_subnets`**`(`*subnet_ids=None, subnet_names=None, vpc_id=None, cidr=None, region=None, key=None, keyid=None, profile=None*`)`

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnets
```

```
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-
↪ba1987cd']
```

```
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
```

```
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

`salt.modules.boto_vpc.`**`describe_vpc_peering_connection`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the `active`, `pending-acceptance` or `provisioning` state.

New in version 2016.11.0.

Parameters

- **`name`** – The string name for this VPC peering connection
- **`region`** – The aws region to use
- **`key`** – Your aws key
- **`keyid`** – The key id associated with this aws account
- **`profile`** – The profile to use

Returns dict

CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

`salt.modules.boto_vpc.`**`describe_vpcs`**`(`*vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Describe all VPCs, matching the filter criteria if provided.

Returns a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```

`salt.modules.boto_vpc.`**`dhcp_options_exists`**(*dhcp_options_id=None, name=None, dhcp_options_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Check if a dhcp option exists.

Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

`salt.modules.boto_vpc.`**`disassociate_network_acl`**(*subnet_id=None, vpc_id=None, subnet_name=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet ID, disassociates a network acl.

CLI Example:

```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.`**`disassociate_route_table`**(*association_id, region=None, key=None, keyid=None, profile=None*)

Dissassociates a route table.

association_id The Route Table Association ID to disassociate

CLI Example:

```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

`salt.modules.boto_vpc.`**`exists`**(*vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID, check to see if the given VPC ID exists.

Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:

```
salt myminion boto_vpc.exists myvpc
```

`salt.modules.boto_vpc.`**`get_dhcp_options`**(*dhcp_options_name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None*)

Return a dict with the current values of the requested DHCP options set

CLI Example:

```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcpoptionsname'
```

New in version 2016.3.0.

`salt.modules.boto_vpc.`**`get_id`**(*name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given VPC properties, return the VPC id if a match is found.

CLI Example:

```
salt myminion boto_vpc.get_id myvpc
```

`salt.modules.boto_vpc.`**`get_resource_id`**(*resource, name=None, resource_id=None, region=None, key=None, keyid=None, profile=None*)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

`salt.modules.boto_vpc.`**`get_subnet_association`**(*subnets, region=None, key=None, keyid=None, profile=None*)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
```

```
salt myminion boto_vpc.get_subnet_association ['subnet-61b47516','subnet-2cb9785b
↪']
```

`salt.modules.boto_vpc.`**`is_peering_connection_pending`**(*conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None*)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-
↪west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.`**`nat_gateway_exists`**(*nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None*)

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'
```

`salt.modules.boto_vpc.`**`network_acl_exists`**`(`*network_acl_id=None, name=None, network_acl_name=None, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn't exist.

CLI Example:

```
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'
```

`salt.modules.boto_vpc.`**`peering_connection_pending_from_vpc`**`(`*conn_id=None, conn_name=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*`)`

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

vpc_id Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.

vpc_name Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

`salt.modules.boto_vpc.`**`replace_network_acl_entry`**`(`*network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None*`)`

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' \
        'all' 'deny' '0.0.0.0/0' egress=true
```

`salt.modules.boto_vpc.`**`replace_route`**(*route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, instance_id=None, interface_id=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None*)

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

`salt.modules.boto_vpc.`**`replace_route_table_association`**(*association_id, route_table_id, region=None, key=None, keyid=None, profile=None*)

Replaces a route table association.

CLI Example:

```
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-
↪1f382e7d'
```

`salt.modules.boto_vpc.`**`request_vpc_peering_connection`**(*requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None, dry_run=False*)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer_vpc_id.

name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

dry_run If True, skip application and return status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da␣
↪name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da␣
↪region=us-west-2
```

`salt.modules.boto_vpc.`**`resource_exists`**(*resource, name=None, resource_id=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text} on error.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

`salt.modules.boto_vpc.`**`route_exists`**(*destination_cidr_block, route_table_name=None, route_table_id=None, gateway_id=None, instance_id=None, interface_id=None, tags=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None*)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_
↪id='local' route_table_name='test'
```

`salt.modules.boto_vpc.`**`route_table_exists`**(*route_table_id=None, name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Checks if a route table exists.

CLI Example:

```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

`salt.modules.boto_vpc.`**`subnet_exists`**(*subnet_id=None, name=None, subnet_name=None, cidr=None, tags=None, zones=None, region=None, key=None, keyid=None, profile=None*)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument Deprecated name argument

CLI Example:

```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

21.9.64 salt.modules.bower

Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

`salt.modules.bower.`**`install`**(*pkg*, *dir*, *pkgs=None*, *runas=None*, *env=None*)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

pkg A package name in any format accepted by Bower, including a version identifier

dir The target directory in which to install the package

pkgs A list of package names in the same format as the `pkg` parameter

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project

salt '*' bower.install jquery#2.0 /path/to/project
```

`salt.modules.bower.`**`list_`**(*dir*, *runas=None*, *env=None*)

List installed Bower packages.

dir The directory whose packages will be listed

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

`salt.modules.bower.`**`prune`**(*dir*, *runas=None*, *env=None*)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

dir The directory whose packages will be pruned

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

`salt.modules.bower.`**`uninstall`**(*pkg*, *dir*, *runas=None*, *env=None*)

Uninstall a Bower package.

pkg A package name in any format accepted by Bower

dir The target directory from which to uninstall the package

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same `env` format as the *cmd.run* execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

21.9.65 salt.modules.bridge

Module for gathering and managing bridging information

`salt.modules.bridge.`**`add`**`(`*br=None*`)`

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

`salt.modules.bridge.`**`addif`**`(`*br=None, iface=None*`)`

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

`salt.modules.bridge.`**`delete`**`(`*br=None*`)`

Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

`salt.modules.bridge.`**`delif`**`(`*br=None, iface=None*`)`

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

`salt.modules.bridge.`**`find_interfaces`**`(`**args*`)`

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

`salt.modules.bridge.`**`interfaces`**`(`*br=None*`)`

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

`salt.modules.bridge.`**`list_`**`()`

Returns the machine's bridges list

CLI Example:

```
salt '*' bridge.list
```

`salt.modules.bridge.`**`show`**`(`*br=None*`)`

Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

`salt.modules.bridge.`**`stp`**`(`*br=None, state='disable', iface=None*`)`

Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

21.9.66 salt.modules.bsd_shadow

Manage the password database on BSD systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

`salt.modules.bsd_shadow.`**`default_hash`**`()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.bsd_shadow.`**`del_password`**`(`*name*`)`

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.bsd_shadow.`**`info`**`(`*name*`)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info someuser
```

salt.modules.bsd_shadow.**set_change**(*name*, *change*)

Sets the time at which the password expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of `0` sets the password to never expire.

CLI Example:

```
salt '*' shadow.set_change username 1419980400
```

salt.modules.bsd_shadow.**set_expire**(*name*, *expire*)

Sets the time at which the account expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of `0` sets the account to never expire.

CLI Example:

```
salt '*' shadow.set_expire username 1419980400
```

salt.modules.bsd_shadow.**set_password**(*name*, *password*)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:

`python -c "import crypt; print crypt.crypt('password', ciphersalt)"`

Note: When constructing the `ciphersalt` string, you must escape any dollar signs, to avoid them being interpolated by the shell.

`'password'` is, of course, the password for which you want to generate a hash.

`ciphersalt` is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for `crpyt(3)`. On NetBSD, additional information is available in `passwd.conf(5)`.

It is important to make sure that a supported cipher is used.

CLI Example:

```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

21.9.67 salt.modules.btrfs

Module for managing BTRFS file systems.

salt.modules.btrfs.**add**(*mountpoint*, **devices*, ***kwargs*)

Add a devices to a BTRFS filesystem.

General options:

- **nodiscard**: Do not perform whole device TRIM
- **force**: Force overwrite existing filesystem on the disk

CLI Example:

```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.`**`convert`**`(`*device*, *permanent=False*, *keeplf=False*`)`

Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- **permanent**: Specify if the migration should be permanent (false by default)
- **keeplf**: **Keep `lost+found` of the partition (removed by default**, but still in the image, if not permanent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

`salt.modules.btrfs.`**`defragment`**`(`*path*`)`

Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a moun tpoint of the filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

`salt.modules.btrfs.`**`delete`**`(`*mountpoint*, **devices*, ***kwargs*`)`

Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.`**`devices`**`()`

Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

`salt.modules.btrfs.`**`features`**`()`

List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

`salt.modules.btrfs.`**`info`**`(`*device*`)`

Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```

`salt.modules.btrfs.`**`mkfs`**`(`**devices*, ***kwargs*`)`

Create a file system on the specified device. By default wipes out with force.

General options:

- **allocsize**: Specify the BTRFS offset from the start of the device.
- **bytecount**: Specify the size of the resultant filesystem.
- **nodesize**: Node size.
- **leafsize**: Specify the nodesize, the tree block size in which btrfs stores data.
- **noforce**: Prevent force overwrite when an existing filesystem is detected on the device.
- **sectorsize**: Specify the sectorsize, the minimum data block allocation unit.
- **nodiscard**: Do not perform whole device TRIM operation by default.
- **uuid**: Pass UUID or pass True to generate one.

Options:

- **dto**: **(raid0|raid1|raid5|raid6|raid10|single|dup)** Specify how the data must be spanned across the devices specified.
- **mto**: **(raid0|raid1|raid5|raid6|raid10|single|dup)** Specify how metadata must be spanned across the devices specified.
- **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

`salt.modules.btrfs.`**`properties`**(*obj*, *type=None*, *set=None*)

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:

- **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].
- **force**: Force overwrite existing filesystem on the disk
- **set**: <key=value,key1=value1...> Options for a filesystem properties.

CLI Example:

```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

`salt.modules.btrfs.`**`resize`**(*mountpoint*, *size*)

Resize filesystem.

General options:

- **mountpoint**: Specify the BTRFS mountpoint to resize.
- **size**: ([+/-]<newsize>[kKmMgGtTpPeE]|max) Specify the new size of the target.

CLI Example:

```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

salt.modules.btrfs.**subvolume_create**(*name*, *dest=None*, *qgroupids=None*)

Create subvolume *name* in *dest*.

Return True if the subvolume is created, False is the subvolume is already there.

name Name of the new subvolume

dest If not given, the subvolume will be created in the current directory, if given will be in /dest/name

qgroupids Add the newly created subcolume to a qgroup. This parameter is a list

CLI Example:

```
salt '*' btrfs.subvolume_create var
salt '*' btrfs.subvolume_create var dest=/mnt
salt '*' btrfs.subvolume_create var qgroupids='[200]'
```

salt.modules.btrfs.**subvolume_delete**(*name=None*, *names=None*, *commit=None*)

Delete the subvolume(s) from the filesystem

The user can remove one single subvolume (name) or multiple of then at the same time (names). One of the two parameters needs to specified.

Please, refer to the documentation to understand the implication on the transactions, and when the subvolume is really deleted.

Return True if the subvolume is deleted, False is the subvolume was already missing.

name Name of the subvolume to remove

names List of names of subvolumes to remove

commit

- 'after': Wait for transaction commit at the end
- 'each': Wait for transaction commit after each delete

CLI Example:

```
salt '*' btrfs.subvolume_delete /var/volumes/tmp
salt '*' btrfs.subvolume_delete /var/volumes/tmp commit=after
```

salt.modules.btrfs.**subvolume_exists**(*path*)

Check if a subvolume is present in the filesystem.

path Mount point for the subvolume (full path)

CLI Example:

```
salt '*' btrfs.subvolume_exists /mnt/var
```

salt.modules.btrfs.**subvolume_find_new**(*name*, *last_gen*)

List the recently modified files in a subvolume

name Name of the subvolume

last_gen Last transid marker from where to compare

CLI Example:

```
salt '*' btrfs.subvolume_find_new /var/volumes/tmp 1024
```

salt.modules.btrfs.**subvolume_get_default**(*path*)

Get the default subvolume of the filesystem path

path Mount point for the subvolume

CLI Example:

```
salt '*' btrfs.subvolume_get_default /var/volumes/tmp
```

`salt.modules.btrfs.`**`subvolume_list`**(*path*, *parent_id=False*, *absolute=False*, *ogeneration=False*, *generation=False*, *subvolumes=False*, *uuid=False*, *parent_uuid=False*, *sent_subvolume_uuid=False*, *snapshots=False*, *readonly=False*, *deleted=False*, *generation_cmp=None*, *ogeneration_cmp=None*, *sort=None*)

List the subvolumes present in the filesystem.

path Mount point for the subvolume

parent_id Print parent ID

absolute Print all the subvolumes in the filesystem and distinguish between absolute and relative path with respect to the given <path>

ogeneration Print the ogeneration of the subvolume

generation Print the generation of the subvolume

subvolumes Print only subvolumes below specified <path>

uuid Print the UUID of the subvolume

parent_uuid Print the parent uuid of subvolumes (and snapshots)

sent_subvolume_uuid Print the UUID of the sent subvolume, where the subvolume is the result of a receive operation

snapshots Only snapshot subvolumes in the filesystem will be listed

readonly Only readonly subvolumes in the filesystem will be listed

deleted Only deleted subvolumens that are ye not cleaned

generation_cmp List subvolumes in the filesystem that its generation is >=, <= or = value. '+' means >= value, '-' means <= value, If there is neither '+' nor '-', it means = value

ogeneration_cmp List subvolumes in the filesystem that its ogeneration is >=, <= or = value

sort List subvolumes in order by specified items. Possible values: * rootid * gen * ogen * path You can add '+' or '-' in front of each items, '+' means ascending, '-' means descending. The default is ascending. You can combite it in a list.

CLI Example:

```
salt '*' btrfs.subvolume_list /var/volumes/tmp
salt '*' btrfs.subvolume_list /var/volumes/tmp path=True
salt '*' btrfs.subvolume_list /var/volumes/tmp sort='[-rootid]'
```

`salt.modules.btrfs.`**`subvolume_set_default`**(*subvolid*, *path*)

Set the subvolume as default

subvolid ID of the new default subvolume

path Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_set_default 257 /var/volumes/tmp
```

`salt.modules.btrfs.`**`subvolume_show`**`(`*path*`)`

Show information of a given subvolume

path Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_show /var/volumes/tmp
```

`salt.modules.btrfs.`**`subvolume_snapshot`**`(`*source, dest=None, name=None, read_only=False*`)`

Create a snapshot of a source subvolume

source Source subvolume from where to create the snapshot

dest If only dest is given, the subvolume will be named as the basename of the source

name Name of the snapshot

read_only Create a read only snapshot

CLI Example:

```
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp dest=/.snapshots
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp name=backup
```

`salt.modules.btrfs.`**`subvolume_sync`**`(`*path, subvolids=None, sleep=None*`)`

Wait until given subvolume are completely removed from the filesystem after deletion.

path Mount point for the filesystem

subvolids List of IDs of subvolumes to wait for

sleep Sleep N seconds betwenn checks (default: 1)

CLI Example:

```
salt '*' btrfs.subvolume_sync /var/volumes/tmp
salt '*' btrfs.subvolume_sync /var/volumes/tmp subvolids='[257]'
```

`salt.modules.btrfs.`**`usage`**`(`*path*`)`

Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

`salt.modules.btrfs.`**`version`**`()`

Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```

21.9.68 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

`salt.modules.cabal.`**`install`**`(`*pkg=None, pkgs=None, user=None, install_global=False, env=None*`)`

Install a cabal package.

pkg A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install

pkgs A list of packages names in same format as `pkg`

user The user to run cabal install with

install_global Install package globally instead of locally

env Environment variables to set when invoking cabal. Uses the same `env` format as the *`cmd.run`* execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

`salt.modules.cabal.`**`list_`**(*pkg=None*, *user=None*, *installed=False*, *env=None*)

List packages matching a search string.

pkg Search string for matching package names

user The user to run cabal list with

installed If True, only return installed packages.

env Environment variables to set when invoking cabal. Uses the same `env` format as the *`cmd.run`* execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

`salt.modules.cabal.`**`uninstall`**(*pkg*, *user=None*, *env=None*)

Uninstall a cabal package.

pkg The package to uninstall

user The user to run ghc-pkg unregister with

env Environment variables to set when invoking cabal. Uses the same `env` format as the *`cmd.run`* execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

`salt.modules.cabal.`**`update`**(*user=None*, *env=None*)

Updates list of known packages.

user The user to run cabal update with

env Environment variables to set when invoking cabal. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' cabal.update
```

21.9.69 salt.modules.capirca_acl module

Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Robert Ankeny <robankeny@google.com>

maturity new

depends capirca

platform unix

Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

`salt.modules.capirca_acl.`**`get_filter_config`**(*platform, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d'*)

Return the configuration of a policy filter.

platform The name of the Capirca platform.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: `True` When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: `acl` The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `True` Merge the CLI variables with the pillar. Default: `True`.

only_lower_merge: `False` Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: `True` Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:$
no ipv4 access-list my-filter
ipv4 access-list my-filter
 remark $Id:$
 remark my-term
 deny ipv4 any eq 1234 any
 deny ipv4 any eq 1235 any
 remark my-other-term
 permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      terms:
        - my-term:
            source_port: [1234, 1235]
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
```

`salt.modules.capirca_acl.`**`get_filter_pillar`**(*filter_name, pillar_key='acl', pillarenv=None, saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name The name of the filter.

pillar_key The root key of the whole policy config.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.capirca_acl.`**`get_policy_config`**(*platform, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d'*)

Return the configuration of the whole policy.

platform The name of the Capirca platform.

filters List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: `True` When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: `acl` The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `True` Merge the CLI variables with the pillar. Default: `True`.

only_lower_merge: `False` Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: `True` Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
    family inet {
        replace:
        /*
        ** $Id:$
        ** $Date:$
        ** $Revision:$
        **
        */
        filter my-filter {
            term my-term {
                from {
                    source-port [ 1234 1235 ];
                }
                then {
                    reject;
                }
            }
            term my-other-term {
                from {
                    protocol tcp;
                    source-port 5678-5680;
                }
                then accept;
            }
        }
    }
}
firewall {
    family inet {
```

(continues on next page)

(continued from previous page)

```
        replace:
        /*
        ** $Id:$
        ** $Date:$
        ** $Revision:$
        **
        */
        filter my-other-filter {
            interface-specific;
            term dummy-term {
                from {
                    protocol [ tcp udp ];
                }
                then {
                    reject;
                }
            }
        }
    }
}
```

The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      options:
        - not-interface-specific
      terms:
        - my-term:
            source_port: [1234, 1235]
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
  - my-other-filter:
      terms:
        - dummy-term:
            protocol:
              - tcp
              - udp
            action: reject
```

`salt.modules.capirca_acl.`**`get_term_config`**(*platform, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', source_service=None, destination_service=None, **term_fields*)

Return the configuration of a single policy term.

platform The name of the Capirca platform.

filter_name The name of the policy filter.

term_name The name of the term.

filter_options Additional filter options. These options are platform-specific. E.g.: `inet6`, `bridge`, `object-group`, See the complete list of options.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: 1234
            source_address:
                - 1.2.3.4/32
                - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`** Merge the CLI variables with the pillar. Default: `True`.

revision_id Add a comment in the term config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the *`file state`*.

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

Note: The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter

- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except

- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude

- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.
↪3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
 remark term-name
 permit ip host 1.2.3.4 host 5.6.7.8
exit
```

`salt.modules.capirca_acl.`**`get_term_pillar`**(*filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name The name of the filter.

term_name The name of the term.

pillar_key: **`acl`** The root key of the whole policy config. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

21.9.70 salt.modules.cassandra

Cassandra NoSQL Database Module

depends

- pycassa Cassandra Python adapter

configuration The location of the 'nodetool' command, host, and thrift port needs to be specified via pillar:

```
cassandra.nodetool: /usr/local/bin/nodetool
cassandra.host: localhost
cassandra.thrift_port: 9160
```

`salt.modules.cassandra.`**`column_families`**(*keyspace=None*)

Return existing column families for all keyspaces or just the provided one.

CLI Example:

```
salt '*' cassandra.column_families
salt '*' cassandra.column_families <keyspace>
```

`salt.modules.cassandra.`**`column_family_definition`**(*keyspace, column_family*)

Return a dictionary of column family definitions for the given keyspace/column_family

CLI Example:

```
salt '*' cassandra.column_family_definition <keyspace> <column_family>
```

`salt.modules.cassandra.`**`compactionstats`**()

Return compactionstats info

CLI Example:

```
salt '*' cassandra.compactionstats
```

salt.modules.cassandra.**info**()
Return cassandra node info

CLI Example:

```
salt '*' cassandra.info
```

salt.modules.cassandra.**keyspaces**()
Return existing keyspaces

CLI Example:

```
salt '*' cassandra.keyspaces
```

salt.modules.cassandra.**netstats**()
Return netstats info

CLI Example:

```
salt '*' cassandra.netstats
```

salt.modules.cassandra.**ring**()
Return cassandra ring info

CLI Example:

```
salt '*' cassandra.ring
```

salt.modules.cassandra.**tpstats**()
Return tpstats info

CLI Example:

```
salt '*' cassandra.tpstats
```

salt.modules.cassandra.**version**()
Return the cassandra version

CLI Example:

```
salt '*' cassandra.version
```

21.9.71 salt.modules.cassandra_cql

Cassandra Database Module

New in version 2015.5.0.

This module works with Cassandra v2 and v3 and hence generates queries based on the internal schema of said version.

depends DataStax Python Driver for Apache Cassandra https://github.com/datastax/python-driver pip install cassandra-driver

referenced by Salt's cassandra_cql returner

configuration The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
  cluster: 192.168.50.10
  port: 9000
```

Example configuration in the config for a cluster:

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with ssl options:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
    ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3
```

`salt.modules.cassandra_cql.`**`cql_query`**(*query, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Run a query on a Cassandra cluster and return a dictionary.

Parameters

- **query** (*str*) – The query to execute.
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.
- **params** (*str*) – The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:

```
salt 'cassandra-server' cassandra_cql.cql_query "SELECT * FROM users_by_name
↪WHERE first_name = 'jane'"
```

`salt.modules.cassandra_cql.`**`cql_query_with_prepare`**(*query, statement_name, statement_arguments, callback_errors=None, contact_points=None, port=None, cql_user=None, cql_pass=None, **kwargs*)

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs – it will not return anything and we don't currently have a mechanism for handling a future that will return results.

Parameters

- **query** (*str*) – The query to execute.
- **statement_name** (*str*) – Name to assign the prepared statement in the __context__ dictionary
- **statement_arguments** (*list[str]*) – Bind parameters for the SQL statement
- **async** (*bool*) – Run this query in asynchronous mode
- **callback_errors** (*Function callable*) – Function to call after query runs if there is an error
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.
- **params** (*str*) – The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:

```
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO␣
↪USERS (first_name, last_name) VALUES (?, ?)"            statement_arguments=[
↪'John','Doe'], asynchronous=True

# Select data, should not be asynchronous because there is not currently a␣
↪facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM␣
↪USERS WHERE first_name=?"             statement_arguments=['John']
```

`salt.modules.cassandra_cql.`**`create_keyspace`**(*keyspace, replication_strategy='SimpleStrategy', replication_factor=1, replication_datacenters=None, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Create a new keyspace in Cassandra.

Parameters

- **keyspace** (*str*) – The keyspace name
- **replication_strategy** (*str*) – either *SimpleStrategy* or *NetworkTopologyStrategy*
- **replication_factor** (*int*) – number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication_datacenters** (*str | dict[str, int]*) – string or dict of datacenter names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type dict

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace

salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace replication_
↪strategy=NetworkTopologyStrategy          replication_datacenters='{"datacenter_1
↪": 3, "datacenter_2": 2}'
```

`salt.modules.cassandra_cql.`**`create_user`**(*username, password, superuser=False, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Create a new cassandra user with credentials and superuser status.

Parameters

- **username** (*str*) – The name of the new user.
- **password** (*str*) – The password of the new user.

- **superuser** (*bool*) – Is the new user going to be a superuser? default: False
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret

salt 'minion1' cassandra_cql.create_user username=joe password=secret␣
↪superuser=True

salt 'minion1' cassandra_cql.create_user username=joe password=secret␣
↪superuser=True contact_points=minion1
```

`salt.modules.cassandra_cql.`**`drop_keyspace`**(*keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

- **keyspace** (*str*) – The keyspace to drop.
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test

salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

`salt.modules.cassandra_cql.`**`grant_permission`**(*username, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Grant permissions to a user.

Parameters

- **username** (*str*) – The name of the user to grant permissions to.
- **resource** (*str*) – The resource (keyspace or table), if None, permissions for all resources are granted.

- **resource_type** (*str*) – The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) – A permission name (e.g. select), if None, all permissions are granted.
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.grant_permission

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace␣
↪permission=select

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table␣
↪resource_type=table         permission=select contact_points=minion1
```

`salt.modules.cassandra_cql.`**`info`**(*contact_points=None, port=None, cql_user=None, cql_pass=None*)

Show the Cassandra information for this cluster.

Parameters

- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The information for this Cassandra cluster.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.info

salt 'minion1' cassandra_cql.info contact_points=minion1
```

`salt.modules.cassandra_cql.`**`keyspace_exists`**(*keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None*)

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str :param contact_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact_points: str | list[str] :param cql_user: The Cassandra user if authentication is turned on. :type cql_user: str :param cql_pass: The Cassandra user password if authentication is turned on. :type cql_pass: str :param port: The Cassandra cluster port, defaults to None. :type port: int :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:

```
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system
```

`salt.modules.cassandra_cql.`**`list_column_families`**(*keyspace=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

Parameters

- **keyspace** (*str*) – The keyspace to provide the column families for, optional.
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The column families in this Cassandra cluster.

Return type list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_column_families

salt 'minion1' cassandra_cql.list_column_families contact_points=minion1

salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

`salt.modules.cassandra_cql.`**`list_keyspaces`**(*contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List keyspaces in a Cassandra cluster.

Parameters

- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The keyspaces in this Cassandra cluster.

Return type list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_keyspaces

salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1 port=9000
```

`salt.modules.cassandra_cql.`**`list_permissions`**(*username=None*, *resource=None*, *resource_type='keyspace'*, *permission=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List permissions.

Parameters

- **username** (*str*) – The name of the user to list permissions for.
- **resource** (*str*) – The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource_type** (*str*) – The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) – A permission name (e.g. select), if None, all permissions are listed.
- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns Dictionary of permissions.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_permissions

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace␣
↪permission=select

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table␣
↪resource_type=table            permission=select contact_points=minion1
```

`salt.modules.cassandra_cql.`**`list_users`**(*contact_points=None, port=None, cql_user=None, cql_pass=None*)

List existing users in this Cassandra cluster.

Parameters

- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** (*int*) – The Cassandra cluster port, defaults to None.
- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.

Returns The list of existing users.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_users

salt 'minion1' cassandra_cql.list_users contact_points=minion1
```

`salt.modules.cassandra_cql.`**`version`**(*contact_points=None, port=None, cql_user=None, cql_pass=None*)

Show the Cassandra version.

Parameters

- **contact_points** (*str | list[str]*) – The Cassandra cluster addresses, can either be a string or a list of IPs.

- **cql_user** (*str*) – The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) – The Cassandra user password if authentication is turned on.
- **port** (*int*) – The Cassandra cluster port, defaults to None.

Returns The version for this Cassandra cluster.

Return type str

CLI Example:

```
salt 'minion1' cassandra_cql.version

salt 'minion1' cassandra_cql.version contact_points=minion1
```

21.9.72 salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

Note: A new app (and thus new connections) is created for each task execution

`salt.modules.celery.`**`run_task`**(*task_name, args=None, kwargs=None, broker=None, backend=None, wait_for_result=False, timeout=None, propagate=True, interval=0.5, no_ack=True, raise_timeout=True, config=None*)

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \
backend=redis://localhost wait_for_result=true
```

task_name The task name, e.g. tasks.sleep

args Task arguments as a list

kwargs Task keyword arguments

broker Broker for celeryapp, see celery documentation

backend Result backend for celeryapp, see celery documentation

wait_for_result Wait until task result is read from result backend and return result, Default: False

timeout Timeout waiting for result from celery, see celery AsyncResult.get documentation

propagate Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True

interval Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

no_ack see celery AsyncResult.get documentation. Default: True

raise_timeout Raise timeout exception if waiting for task result times out. Default: False

config Config dict for celery app, See celery documentation

21.9.73 salt.modules.ceph module

Module to provide ceph control with salt.

depends

- ceph_cfg Python module

New in version 2016.11.0.

`salt.modules.ceph.`**`ceph_version`**`()`

Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

`salt.modules.ceph.`**`cluster_quorum`**`(`*`**kwargs`*`)`

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`cluster_status`**`(`*`**kwargs`*`)`

Get the cluster status, including health if in quorum

CLI Example:

```
salt '*' ceph.cluster_status \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`keyring_auth_add`**`(`*`**kwargs`*`)`

Add keyring to authorized list

CLI Example:

```
salt '*' ceph.keyring_auth_add \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`keyring_auth_del`**`(`***kwargs*`)`

Remove keyring from authorised list

CLI Example:

```
salt '*' ceph.keyring_osd_auth_del \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`keyring_auth_list`**`(`***kwargs*`)`

List all cephx authorization keys

CLI Example:

```
salt '*' ceph.keyring_auth_list \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.`**`keyring_create`**`(`***kwargs*`)`

Create keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_create \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`keyring_present`**`(`***kwargs*`)`

Returns `True` if the keyring is present on disk, otherwise `False`

CLI Example:

```
salt '*' ceph.keyring_present \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`keyring_purge`**`(`*`**kwargs`*`)`

Delete keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_purge \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

If no ceph config file is found, this command will fail.

`salt.modules.ceph.`**`keyring_save`**`(`*`**kwargs`*`)`

Create save keyring locally

CLI Example:

```
salt '*' ceph.keyring_save \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of `admin`, `mon`, `osd`, `rgw`, `mds`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`mds_create`**`(`*`**kwargs`*`)`

Create a mds

CLI Example:

```
salt '*' ceph.mds_create \
        'name' = 'mds.name' \
        'port' = 1000, \
        'addr' = 'fqdn.example.org' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with `mds.`)

port (required) Port to which the MDS will listen

addr (required) Address or IP address for the MDS to listen

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**mds_destroy**(***kwargs*)

Remove a mds

CLI Example:

```
salt '*' ceph.mds_destroy \
        'name' = 'mds.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with `mds.`)

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**mon_active**(***kwargs*)

Returns `True` if the mon daemon is running, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_active \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**mon_create**(***kwargs*)

Create a mon node

CLI Example:

```
salt '*' ceph.mon_create \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**mon_is**(***kwargs*)

Returns `True` if the target is a mon node, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_is \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.**mon_quorum**(***kwargs*)

Returns `True` if the mon daemon is in the quorum, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_quorum \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**mon_status**(***kwargs*)

Get status from mon daemon

CLI Example:

```
salt '*' ceph.mon_status \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

salt.modules.ceph.**osd_activate**(***kwargs*)

Activate an OSD

CLI Example:

```
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

salt.modules.ceph.**osd_discover**()

List all OSD by cluster

CLI Example:

```
salt '*' ceph.osd_discover
```

salt.modules.ceph.**osd_prepare**(***kwargs*)

Prepare an OSD

CLI Example:

```
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \
        'journal_dev'='device' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid' \
        'osd_fs_type'='xfs' \
        'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \
        'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```

cluster_uuid The device to store the osd data on.

journal_dev The journal device. defaults to osd_dev.

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster date will be added too. Defaults to the value found in local config.

osd_fs_type set the file system to store OSD data with. Defaults to "xfs".

osd_uuid set the OSD data UUID. If set will return if OSD with data UUID already exists.

journal_uuid set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

`salt.modules.ceph.`**`partition_is`**`(`*dev*`)`

Check whether a given device path is a partition or a full disk.

CLI Example:

```
salt '*' ceph.partition_is /dev/sdc1
```

`salt.modules.ceph.`**`partition_list`**`()`

List partitions by disk

CLI Example:

```
salt '*' ceph.partition_list
```

`salt.modules.ceph.`**`partition_list_journal`**`()`

List all OSD journal partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_journal
```

`salt.modules.ceph.`**`partition_list_osd`**`()`

List all OSD data partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_osd
```

`salt.modules.ceph.`**`pool_add`**`(`*pool_name, **kwargs*`)`

Create a pool

CLI Example:

```
salt '*' ceph.pool_add pool_name \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

pg_num Default to 8

pgp_num Default to pg_num

pool_type can take values "replicated" or "erasure"

erasure_code_profile The "erasure_code_profile"

crush_ruleset The crush map rule set

`salt.modules.ceph.`**`pool_del`**`(`*pool_name, **kwargs*`)`

Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.`**`pool_list`**`(`***kwargs*`)`

List all pools

CLI Example:

```
salt '*' ceph.pool_list \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.`**`purge`**`(`***kwargs*`)`

purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.`**`rgw_create`**`(`***kwargs*`)`

Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \
        'name' = 'rgw.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The RGW client name. Must start with `rgw.`

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`rgw_destroy`**`(`***kwargs*`)`

Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \
        'name' = 'rgw.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The RGW client name (must start with `rgw.`)

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`rgw_pools_create`**`(`*`**kwargs`*`)`
Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`rgw_pools_missing`**`(`*`**kwargs`*`)`
Show pools missing for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_missing
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`zap`**`(`*`target=None, **kwargs`*`)`
Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev'='/dev/vdc' \
      'cluster_name'='ceph' \
      'cluster_uuid'='cluster_uuid'
```

dev The block device to format.

cluster_name The cluster name. Defaults to `ceph`.

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

21.9.74 salt.modules.chassis

Glue execution module to link to the *`fx2 proxymodule`*.

Depends: *`iDRAC Remote execution module (salt.modules.dracr)`*

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for *`salt.modules.dracr`*.

This execution module calls through to a function in the fx2 proxy module called `chconfig`. That function looks up the function passed in the `cmd` parameter in *`salt.modules.dracr`* and calls it.

New in version 2015.8.2.

`salt.modules.chassis.`**`chassis_credentials`**`()`

`salt.modules.chassis.`**`cmd`**`(`*`cmd, *args, **kwargs`*`)`

21.9.75 salt.modules.chef

Execute chef in server or solo mode

`salt.modules.chef.`**`client`**`(`*whyrun=False*, *localmode=False*, *logfile=None*, ***kwargs*`)`

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

server The chef server URL

client_key Set the client key file location

config The configuration file to use

config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

environment Set the Chef Environment on the node

group Group to set privilege to

json-attributes Load attributes from a JSON file or URL

localmode Point chef-client at local repository if True

log_level Set the log level (debug, info, warn, error, fatal)

logfile Set the log file location

node-name The node name for this client

override-runlist Replace current run list with specified items for a single run

pid Set the PID file location, defaults to /tmp/chef-client.pid

run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.

runlist Permanently replace current run list with specified items

user User to set privilege to

validation_key Set the validation key file location, used for registering new clients

whyrun Enable whyrun mode when set to True

`salt.modules.chef.`**`solo`**`(`*whyrun=False*, *logfile=None*, ***kwargs*`)`

Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

config The configuration file to use

environment Set the Chef Environment on the node

group Group to set privilege to

json-attributes Load attributes from a JSON file or URL

log_level Set the log level (debug, info, warn, error, fatal)

logfile Set the log file location

node-name The node name for this client

override-runlist Replace current run list with specified items for a single run

recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.

user User to set privilege to

whyrun Enable whyrun mode when set to True

21.9.76 salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)

New in version 2014.1.0.

`salt.modules.chocolatey.`**`add_source`**`(`*name*, *source_location*, *username=None*, *password=None*`)`

Instructs Chocolatey to add a source.

name The name of the source to be added as a chocolatey repository.

source Location of the source you want to work with.

username Provide username for chocolatey sources that need authentication credentials.

password Provide password for chocolatey sources that need authentication credentials.

CLI Example:

```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user>
↪password=<password>
```

`salt.modules.chocolatey.`**`bootstrap`**`(`*force=False*`)`

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

Note that if PowerShell is installed, you may have to restart the host machine for Chocolatey to work.

force Run the bootstrap process even if Chocolatey is found in the path.

CLI Example:

```
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True
```

`salt.modules.chocolatey.`**`chocolatey_version`**`()`

Returns the version of Chocolatey installed on the minion.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

`salt.modules.chocolatey.`**`disable_source`**`(`*name*`)`

Instructs Chocolatey to disable a source.

name Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

`salt.modules.chocolatey.`**`enable_source`**`(`*name*`)`

Instructs Chocolatey to enable a source.

name Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```

`salt.modules.chocolatey.`**`install`**`(`*name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None*`)`

Instructs Chocolatey to install a package.

Parameters

- **`name`** (*`str`*) – The name of the package to be installed. Only accepts a single argument. Required.
- **`version`** (*`str`*) – Install a specific version of the package. Defaults to latest version. Default is None.
- **`source`** (*`str`*) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

  Alternate Sources:

  - cygwin
  - python
  - ruby
  - webpi
  - windowsfeatures
- **`force`** (*`bool`*) – Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **`pre_versions`** (*`bool`*) – Include pre-release packages. Default is False.
- **`install_args`** (*`str`*) – A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.
- **`override_args`** (*`bool`*) – Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is None.
- **`force_x86`** (*`bool`*) – Force x86 (32bit) installation on 64 bit systems. Default is False.
- **`package_args`** (*`str`*) – Arguments you want to pass to the package. Default is None.
- **`allow_multiple`** (*`bool`*) – Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

  New in version 2017.7.0.
- **`execution_timeout`** (*`str`*) –
- **`execution timeout value you want to pass to the installation process. Default is None.`** (*`Chocolatey`*) – New in version 2018.3.0.

Returns The output of the `chocolatey` command

Return type str

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

`salt.modules.chocolatey.`**`install_cygwin`**(*name, install_args=None, override_args=False*)

Instructs Chocolatey to install a package via Cygwin.

name The name of the package to be installed. Only accepts a single argument.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_
↪args=True
```

`salt.modules.chocolatey.`**`install_gem`**(*name, version=None, install_args=None, override_args=False*)

Instructs Chocolatey to install a package via Ruby's Gems.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_
↪args=True
```

`salt.modules.chocolatey.`**`install_missing`**(*name, version=None, source=None*)

Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls *`chocolatey.install`* instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

source Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

salt.modules.chocolatey.**install_python**(*name*, *version=None*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Python's easy_install.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_
↪args=True
```

salt.modules.chocolatey.**install_webpi**(*name*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

name The name of the package to be installed. Only accepts a single argument.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_
↪args=True
```

salt.modules.chocolatey.**install_windowsfeatures**(*name*)

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

name The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

salt.modules.chocolatey.**list_**(*narrow=None*, *all_versions=False*, *pre_versions=False*, *source=None*, *local_only=False*, *exact=False*)

Instructs Chocolatey to pull a vague package list from the repository.

Parameters

- **narrow** (*str*) – Term used to narrow down results. Searches against name/description/tag. Default is None.

- **`all_versions`** (*bool*) – Display all available package versions in results. Default is False.
- **`pre_versions`** (*bool*) – Display pre-release packages in results. Default is False.
- **`source`** (*str*) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **`local_only`** (*bool*) – Display packages only installed locally. Default is False.
- **`exact`** (*bool*) – Display only packages that match `narrow` exactly. Default is False.

  New in version 2017.7.0.

Returns A dictionary of results.

Return type dict

CLI Example:

```
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

`salt.modules.chocolatey.`**`list_webpi`**`()`

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

Returns List of webpi packages

Return type str

CLI Example:

```
salt '*' chocolatey.list_webpi
```

`salt.modules.chocolatey.`**`list_windowsfeatures`**`()`

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

Returns List of Windows Features

Return type str

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

`salt.modules.chocolatey.`**`uninstall`**`(`*name, version=None, uninstall_args=None, override_args=False*`)`

Instructs Chocolatey to uninstall a package.

name The name of the package to be uninstalled. Only accepts a single argument.

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version> uninstall_
↪args=<args> override_args=True
```

`salt.modules.chocolatey.`**`update`**(*name*, *source=None*, *pre_versions=False*)

Instructs Chocolatey to update packages on the system.

name The name of the package to update, or "all" to update everything installed on the system.

source Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

pre_versions Include pre-release packages in comparison. Defaults to False.

CLI Example:

```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

`salt.modules.chocolatey.`**`upgrade`**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will install the package if not installed.

Parameters

- **`name`** (*`str`*) – The name of the package to update, or "all" to update everything installed on the system.
- **`version`** (*`str`*) – Install a specific version of the package. Defaults to latest version.
- **`source`** (*`str`*) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **`force`** (*`bool`*) – Reinstall the **same** version already installed
- **`pre_versions`** (*`bool`*) – Include pre-release packages in comparison. Defaults to False.
- **`install_args`** (*`str`*) – A list of install arguments you want to pass to the installation process i.e product key or feature list
- **`override_args`** (*`str`*) – Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments
- **`force_x86`** – Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- **`package_args`** – A list of arguments you want to pass to the package

Returns Results of the `chocolatey` command

Return type str

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

`salt.modules.chocolatey.`**`version`**`(`*name, check_remote=False, source=None, pre_versions=False*`)`

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

Parameters

- **name** (*str*) – The name of the package to check. Required.
- **check_remote** (*bool*) – Get the version number of the latest package from the remote feed. Default is False.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.
- **pre_versions** (*bool*) – Include pre-release packages in comparison. Default is False.

Returns A dictionary of currently installed software and versions

Return type dict

CLI Example:

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

21.9.77 salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.chronos.`**`has_job`**`(`*name*`)`

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

`salt.modules.chronos.`**`job`**`(`*name*`)`

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

`salt.modules.chronos.`**`jobs`**`()`

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

`salt.modules.chronos.`**`rm_job`**`(`*name*`)`

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.`**`update_job`**`(`*name, config*`)`

Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

21.9.78 salt.modules.cimc module

Module to provide Cisco UCS compatibility to Salt

codeauthor `Spencer Ervin <spencer_ervin@hotmail.com>`

maturity new

depends none

platform unix

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

`Cisco UCS Proxy Module`

About

This execution module was designed to handle connections to a Cisco UCS server. This module adds support to send connections directly to the device through the rest API.

`salt.modules.cimc.`**`activate_backup_image`**`(`*reset=False*`)`

Activates the firmware backup image.

CLI Example:

Parameters **`reset`** (*`bool`*) – Reset the CIMC device on activate.

```
salt '*' cimc.activate_backup_image
salt '*' cimc.activate_backup_image reset=True
```

`salt.modules.cimc.`**`create_user`**`(`*uid=None, username=None, password=None, priv=None*`)`

Create a CIMC user with username and password.

Parameters

- **`uid`** (*`int`*) – The user ID slot to create the user account in.
- **`username`** (*`str`*) – The name of the user.
- **`password`** (*`str`*) – The clear text password of the user.
- **`priv`** (*`str`*) – The privilege level of the user.

CLI Example:

```
salt '*' cimc.create_user 11 username=admin password=foobar priv=admin
```

salt.modules.cimc.**get_bios_defaults**()

Get the default values of BIOS tokens.

CLI Example:

```
salt '*' cimc.get_bios_defaults
```

salt.modules.cimc.**get_bios_settings**()

Get the C240 server BIOS token values.

CLI Example:

```
salt '*' cimc.get_bios_settings
```

salt.modules.cimc.**get_boot_order**()

Retrieves the configured boot order table.

CLI Example:

```
salt '*' cimc.get_boot_order
```

salt.modules.cimc.**get_cpu_details**()

Get the CPU product ID details.

CLI Example:

```
salt '*' cimc.get_cpu_details
```

salt.modules.cimc.**get_disks**()

Get the HDD product ID details.

CLI Example:

```
salt '*' cimc.get_disks
```

salt.modules.cimc.**get_ethernet_interfaces**()

Get the adapter Ethernet interface details.

CLI Example:

```
salt '*' cimc.get_ethernet_interfaces
```

salt.modules.cimc.**get_fibre_channel_interfaces**()

Get the adapter fibre channel interface details.

CLI Example:

```
salt '*' cimc.get_fibre_channel_interfaces
```

salt.modules.cimc.**get_firmware**()

Retrieves the current running firmware versions of server components.

CLI Example:

```
salt '*' cimc.get_firmware
```

salt.modules.cimc.**get_hostname**()

Retrieves the hostname from the device.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_hostname
```

`salt.modules.cimc.`**`get_ldap`**`()`

Retrieves LDAP server details.

CLI Example:

```
salt '*' cimc.get_ldap
```

`salt.modules.cimc.`**`get_management_interface`**`()`

Retrieve the management interface details.

CLI Example:

```
salt '*' cimc.get_management_interface
```

`salt.modules.cimc.`**`get_memory_token`**`()`

Get the memory RAS BIOS token.

CLI Example:

```
salt '*' cimc.get_memory_token
```

`salt.modules.cimc.`**`get_memory_unit`**`()`

Get the IMM/Memory unit product ID details.

CLI Example:

```
salt '*' cimc.get_memory_unit
```

`salt.modules.cimc.`**`get_network_adapters`**`()`

Get the list of network adapaters and configuration details.

CLI Example:

```
salt '*' cimc.get_network_adapters
```

`salt.modules.cimc.`**`get_ntp`**`()`

Retrieves the current running NTP configuration.

CLI Example:

```
salt '*' cimc.get_ntp
```

`salt.modules.cimc.`**`get_pci_adapters`**`()`

Get the PCI adapter product ID details.

CLI Example:

```
salt '*' cimc.get_disks
```

`salt.modules.cimc.`**`get_power_configuration`**`()`

Get the configuration of the power settings from the device. This is only available on some C-Series servers.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_power_configuration
```

salt.modules.cimc.**get_power_supplies**()

Retrieves the power supply unit details.

CLI Example:

```
salt '*' cimc.get_power_supplies
```

salt.modules.cimc.**get_snmp_config**()

Get the snmp configuration details.

CLI Example:

```
salt '*' cimc.get_snmp_config
```

salt.modules.cimc.**get_syslog**()

Get the Syslog client-server details.

CLI Example:

```
salt '*' cimc.get_syslog
```

salt.modules.cimc.**get_syslog_settings**()

Get the Syslog configuration settings from the system.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_syslog_settings
```

salt.modules.cimc.**get_system_info**()

Get the system information.

CLI Example:

```
salt '*' cimc.get_system_info
```

salt.modules.cimc.**get_users**()

Get the CIMC users.

CLI Example:

```
salt '*' cimc.get_users
```

salt.modules.cimc.**get_vic_adapters**()

Get the VIC adapter general profile details.

CLI Example:

```
salt '*' cimc.get_vic_adapters
```

salt.modules.cimc.**get_vic_uplinks**()

Get the VIC adapter uplink port details.

CLI Example:

```
salt '*' cimc.get_vic_uplinks
```

`salt.modules.cimc.`**`mount_share`**(*name=None, remote_share=None, remote_file=None, mount_type='nfs', username=None, password=None*)

Mounts a remote file through a remote share. Currently, this feature is supported in version 1.5 or greater. The remote share can be either NFS, CIFS, or WWW.

Some of the advantages of CIMC Mounted vMedia include: Communication between mounted media and target stays local (inside datacenter) Media mounts can be scripted/automated No vKVM requirements for media connection Multiple share types supported Connections supported through all CIMC interfaces

Note: CIMC Mounted vMedia is enabled through BIOS configuration.

Parameters

- **name** (*str*) – The name of the volume on the CIMC device.
- **remote_share** (*str*) – The file share link that will be used to mount the share. This can be NFS, CIFS, or WWW. This
- **be the directory path and not the full path to the remote file.** (*must*) –
- **remote_file** (*str*) – The name of the remote file to mount. It must reside within remote_share.
- **mount_type** (*str*) – The type of share to mount. Valid options are nfs, cifs, and www.
- **username** (*str*) – An optional requirement to pass credentials to the remote share. If not provided, an
- **connection attempt will be made.** (*unauthenticated*) –
- **password** (*str*) – An optional requirement to pass a password to the remote share. If not provided, an
- **connection attempt will be made.** –

CLI Example:

```
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_
↪file=sl1huu.iso

salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs remote_
↪file=sl1huu.iso username=bob password=badpassword
```

`salt.modules.cimc.`**`reboot`**()

Power cycling the server.

CLI Example:

```
salt '*' cimc.reboot
```

`salt.modules.cimc.`**`set_hostname`**(*hostname=None*)

Sets the hostname on the server.

New in version 2019.2.0.

Parameters **hostname** (*str*) – The new hostname to set.

CLI Example:

```
salt '*' cimc.set_hostname foobar
```

salt.modules.cimc.**set_logging_levels**(*remote=None*, *local=None*)

Sets the logging levels of the CIMC devices. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

Parameters

- **remote** (*str*) – The logging level for SYSLOG logs.
- **local** (*str*) – The logging level for the local device.

CLI Example:

```
salt '*' cimc.set_logging_levels remote=error local=notice
```

salt.modules.cimc.**set_ntp_server**(*server1=”*, *server2=”*, *server3=”*, *server4=”*)

Sets the NTP servers configuration. This will also enable the client NTP service.

Parameters

- **server1** (*str*) – The first IP address or FQDN of the NTP servers.
- **server2** (*str*) – The second IP address or FQDN of the NTP servers.
- **server3** (*str*) – The third IP address or FQDN of the NTP servers.
- **server4** (*str*) – The fourth IP address or FQDN of the NTP servers.

CLI Example:

```
salt '*' cimc.set_ntp_server 10.10.10.1

salt '*' cimc.set_ntp_server 10.10.10.1 foo.bar.com
```

salt.modules.cimc.**set_power_configuration**(*policy=None*, *delayType=None*, *delayValue=None*)

Sets the power configuration on the device. This is only available for some C-Series servers.

New in version 2019.2.0.

Parameters

- **policy** (*str*) – The action to be taken when chassis power is restored after
- **unexpected power loss. This can be one of the following** (*an*) – reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.

  stay-off: The server remains off until it is manually restarted.

  last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.
- **delayType** (*str*) – If the selected policy is reset, the restart can be
- **with this option. This can be one of the following** (*delayed*) – fixed: The server restarts after a fixed delay.

  random: The server restarts after a random delay.
- **delayValue** (*int*) – If a fixed delay is selected, once chassis power is
- **and the Cisco IMC has finished rebooting, the system waits for** (*restored*) –

- **specified number of seconds before restarting the server. Enter an** (*the*) –
- **between 0 and 240.** (*integer*) –

CLI Example:

```
salt '*' cimc.set_power_configuration stay-off

salt '*' cimc.set_power_configuration reset fixed 0
```

`salt.modules.cimc.`**`set_syslog_server`**(*server=None, type='primary'*)

Set the SYSLOG server on the host.

Parameters

- **server** (*str*) – The hostname or IP address of the SYSLOG server.
- **type** (*str*) – Specifies the type of SYSLOG server. This can either be primary (default) or secondary.

CLI Example:

```
salt '*' cimc.set_syslog_server foo.bar.com

salt '*' cimc.set_syslog_server foo.bar.com primary

salt '*' cimc.set_syslog_server foo.bar.com secondary
```

`salt.modules.cimc.`**`set_user`**(*uid=None, username=None, password=None, priv=None, status=None*)

Sets a CIMC user with specified configurations.

New in version 2019.2.0.

Parameters

- **uid** (*int*) – The user ID slot to create the user account in.
- **username** (*str*) – The name of the user.
- **password** (*str*) – The clear text password of the user.
- **priv** (*str*) – The privilege level of the user.
- **status** (*str*) – The account status of the user.

CLI Example:

```
salt '*' cimc.set_user 11 username=admin password=foobar priv=admin active
```

`salt.modules.cimc.`**`tftp_update_bios`**(*server=None, path=None*)

Update the BIOS firmware through TFTP.

Parameters

- **server** (*str*) – The IP address or hostname of the TFTP server.
- **path** (*str*) – The TFTP path and filename for the BIOS image.

CLI Example:

```
salt '*' cimc.tftp_update_bios foo.bar.com HP-SL2.cap
```

`salt.modules.cimc.`**`tftp_update_cimc`**(*server=None, path=None*)

Update the CIMC firmware through TFTP.

Parameters

- **server** (*str*) – The IP address or hostname of the TFTP server.
- **path** (*str*) – The TFTP path and filename for the CIMC image.

CLI Example:

```
salt '*' cimc.tftp_update_cimc foo.bar.com HP-SL2.bin
```

21.9.79 salt.modules.ciscoconfparse_mod module

Execution module for ciscoconfparse

New in version 2019.2.0.

This module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), including: Cisco IOS, Cisco Nexus, Cisco IOS-XR, Cisco IOS-XR, Cisco ASA, Arista EOS, Brocade, HP Switches, Dell PowerConnect Switches, or Extreme Networks devices. In newer versions, `ciscoconfparse` provides support for brace-delimited configuration style as well, for platforms such as: Juniper Junos, Palo Alto, or F5 Networks.

See http://www.pennington.net/py/ciscoconfparse/index.html for further details.

depends ciscoconfparse

This module depends on the Python library with the same name, `ciscoconfparse` - to install execute: `pip install ciscoconfparse`.

`salt.modules.ciscoconfparse_mod.`**`filter_lines`**(*config=None, config_path=None, parent_regex=None, child_regex=None, saltenv='base'*)

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether `child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

Note that the return list contains the elements that matched the parent condition, the `parent_regex` regular expression. Therefore, the `parent` field will always have a valid value, while `match` and `child` may default to `False` and `None` respectively when there is not child match.

CLI Example:

```
salt '*' ciscoconfparse.filter_lines config_path=https://bit.ly/2mAdq7z parent_
↪regex='Gigabit' child_regex='shutdown'
```

Example output (for the example above):

```
[
    {
        'parent': 'interface GigabitEthernet1',
        'match': False,
        'child': None
    },
    {
```

(continues on next page)

(continued from previous page)

```
        'parent': 'interface GigabitEthernet2',
        'match': True,
        'child': ' shutdown'
    },
    {
        'parent': 'interface GigabitEthernet3',
        'match': True,
        'child': ' shutdown'
    }
]
```

`salt.modules.ciscoconfparse_mod.`**`find_lines`**`(`*config=None, config_path=None, regex=None, saltenv='base'*`)`

Return all the lines (as text) that match the expression in the `regex` argument.

config The configuration sent as text.

> **Note:** This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

regex The regular expression to match the lines against.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines config_path=https://bit.ly/2mAdq7z regex='ip
↪address'
```

Output example:

```
cisco-ios-router:
    -  ip address dhcp
    -  ip address 172.20.0.1 255.255.255.0
    -  no ip address
```

`salt.modules.ciscoconfparse_mod.`**`find_lines_w_child`**`(`*config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base'*`)`

Return a list of parent lines (as text) matching the regular expression `parent_regex` that have children lines matching `child_regex`.

config The configuration sent as text.

> **Note:** This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: **False** Whether to ignore the white spaces.

saltenv: **base** Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2mAdq7z
↪parent_line='line con' child_line='stopbits'
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2uIRxau
↪parent_regex='ge-(.*)' child_regex='unit \d+'
```

`salt.modules.ciscoconfparse_mod.`**`find_lines_wo_child`**(*config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base'*)

Return a list of parent `ciscoconfparse.IOSCfgLine` lines as text, which matched the `parent_regex` and whose children did *not* match `child_regex`. Only the parent `ciscoconfparse.IOSCfgLine` text lines will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

config The configuration sent as text.

Note: This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: **False** Whether to ignore the white spaces.

saltenv: **base** Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_wo_child config_path=https://bit.ly/2mAdq7z
↪parent_line='line con' child_line='stopbits'
```

`salt.modules.ciscoconfparse_mod.`**`find_objects`**(*config=None, config_path=None, regex=None, saltenv='base'*)

Return all the line objects that match the expression in the `regex` argument.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines`

config The configuration sent as text.

Note: This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

regex The regular expression to match the lines against.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects'](config_path='salt://path/to/
↪config.txt',
                                                  regex='Gigabit')
for obj in objects:
    print(obj.text)
```

`salt.modules.ciscoconfparse_mod.`**`find_objects_w_child`**(*config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base'*)

Parse through the children of all parent lines matching `parent_regex`, and return a list of child objects, which matched the `child_regex`.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines_w_child`

config The configuration sent as text.

Note: This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: **`False`** Whether to ignore the white spaces.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects_w_child'](config_path='https://
↪bit.ly/2mAdq7z',
                                                          parent_regex='line con',
                                                          child_regex='stopbits')
for obj in objects:
    print(obj.text)
```

`salt.modules.ciscoconfparse_mod.`**`find_objects_wo_child`**(*config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base'*)

Return a list of parent `ciscoconfparse.IOSCfgLine` objects, which matched the `parent_regex` and whose children did *not* match `child_regex`. Only the parent `ciscoconfparse.IOSCfgLine` objects will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines_wo_child`

config The configuration sent as text.

Note: This argument is ignored when `config_path` is specified.

config_path The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

parent_regex The regular expression to match the parent lines against.

child_regex The regular expression to match the child lines against.

ignore_ws: `False` Whether to ignore the white spaces.

saltenv: `base` Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects_wo_child'](config_path='https://
↪bit.ly/2mAdq7z',
                                                            parent_regex='line con
↪',
                                                            child_regex='stopbits')
for obj in objects:
    print(obj.text)
```

21.9.80 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *`salt.proxy.cisconso`*.

`salt.modules.cisconso.`**`apply_rollback`**(*datastore*, *name*)

Apply a system rollback

Parameters

- **`datastore`** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **`name`** (`str`) – an ID of the rollback to restore

```
salt cisco-nso cisconso.apply_rollback 52
```

`salt.modules.cisconso.`**`get_data`**(*datastore*, *path*)

Get the configuration of the device tree at the given path

Parameters

- **datastore** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list`, `str` OR `tuple`) – The device path to set the value at, a list of element names in order, / separated

Returns The network configuration at that tree

Return type `dict`

```
salt cisco-nso cisconso.get_data running 'devices/ex0'
```

`salt.modules.cisconso.`**`get_rollback`**`(`*name*`)`

Get the backup of stored a configuration rollback

Parameters **name** (`str`) – Typically an ID of the backup

Return type `str`

Returns the contents of the rollback snapshot

```
salt cisco-nso cisconso.get_rollback 52
```

`salt.modules.cisconso.`**`get_rollbacks`**`()`

Get a list of stored configuration rollbacks

```
salt cisco-nso cisconso.get_rollbacks
```

`salt.modules.cisconso.`**`info`**`()`

Return system information for grains of the NSO proxy minion

```
salt '*' cisconso.info
```

`salt.modules.cisconso.`**`set_data_value`**`(`*datastore, path, data*`)`

Set a data entry in a datastore

Parameters

- **datastore** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list`, `str` OR `tuple`) – The device path to set the value at, a list of element names in order, / separated
- **data** (`dict`) – The new value at the given path

Return type `bool`

Returns `True` if successful, otherwise error.

```
salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.20/24
```

21.9.81 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

`salt.modules.cloud.`**`action`**`(`*fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs*`)`

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

`salt.modules.cloud.`**`create`**(*provider, names, opts=None, **kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.
↪micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

`salt.modules.cloud.`**`destroy`**(*names*)

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

`salt.modules.cloud.`**`full_query`**(*query_type='list_nodes_full'*)

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

`salt.modules.cloud.`**`get_instance`**(*name, provider=None*)

Return details on an instance.

Similar to the cloud action show_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```

`salt.modules.cloud.`**`has_instance`**(*name, provider=None*)

Return true if the instance is found on a provider

CLI Example:

```
salt minionname cloud.has_instance myinstance
```

`salt.modules.cloud.`**`list_images`**(*provider='all'*)

List cloud provider images for the given providers

CLI Example:

```
salt minionname cloud.list_images my-gce-config
```

`salt.modules.cloud.`**`list_locations`**(*provider='all'*)

List cloud provider locations for the given providers

CLI Example:

```
salt minionname cloud.list_locations my-gce-config
```

`salt.modules.cloud.`**`list_sizes`**(*provider='all'*)

List cloud provider sizes for the given providers

CLI Example:

```
salt minionname cloud.list_sizes my-gce-config
```

`salt.modules.cloud.`**`map_run`**(*path=None*, ***kwargs*)

Execute a salt cloud map file

Cloud Map data can be retrieved from several sources:

- a local file (provide the path to the file to the 'path' argument)
- a JSON-formatted map directly (provide the appropriately formatted to using the 'map_data' argument)
- the Salt Pillar (provide the map name of under 'pillar:cloud:maps' to the 'map_pillar' argument)

Note: Only one of these sources can be read at a time. The options are listed in their order of precedence.

CLI Examples:

```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run path=/path/to/cloud.map
salt minionname cloud.map_run map_pillar='<map_pillar>'
  .. versionchanged:: 2018.3.1
salt minionname cloud.map_run map_data='<actual map data>'
```

`salt.modules.cloud.`**`network_create`**(*provider*, *names*, ***kwargs*)

Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24
↪'
```

`salt.modules.cloud.`**`network_list`**(*provider*)

List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

`salt.modules.cloud.`**`profile_`**(*profile*, *names*, *vm_overrides=None*, *opts=None*, ***kwargs*)

Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

`salt.modules.cloud.`**`query`**(*query_type='list_nodes'*)

List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

`salt.modules.cloud.`**`select_query`**(*query_type='list_nodes_select'*)

List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

`salt.modules.cloud.`**`virtual_interface_create`**(*provider, names, **kwargs*)

Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_
↪name='salt'
```

`salt.modules.cloud.`**`virtual_interface_list`**(*provider, names, **kwargs*)

List virtual interfaces on a server

CLI Example:

```
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

`salt.modules.cloud.`**`volume_attach`**(*provider, names, **kwargs*)

Attach volume to a server

CLI Example:

```
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device='/
↪dev/xvdf'
```

`salt.modules.cloud.`**`volume_create`**(*provider, names, **kwargs*)

Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

`salt.modules.cloud.`**`volume_delete`**(*provider, names, **kwargs*)

Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

`salt.modules.cloud.`**`volume_detach`**(*provider, names, **kwargs*)

Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

`salt.modules.cloud.`**`volume_list`**(*provider*)

List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

21.9.82 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

`salt.modules.cmdmod.`**`exec_code`**(*lang, code, cwd=None, args=None, **kwargs*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from `cmd.run_all` except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese"' args='["arg1", "arg2"]' env='{"FOO":
↪"bar"}'
```

`salt.modules.cmdmod.`**`exec_code_all`**(*lang, code, cwd=None, args=None, **kwargs*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from `cmd.run_all` except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
salt '*' cmd.exec_code_all ruby 'puts "cheese"' args='["arg1", "arg2"]' env='{"FOO
↪": "bar"}'
```

`salt.modules.cmdmod.`**`has_exec`**(*cmd*)

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

`salt.modules.cmdmod.`**`powershell`**(*cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, success_retcodes=None, **kwargs*)

Execute the passed PowerShell command and return the output as a dictionary.

Other `cmd.*` functions (besides `cmd.powershell_all`) return the raw text output of the command. This function appends `| ConvertTo-JSON` to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use `cmd.run` with the `shell=powershell` option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

> **Warning:** This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

> **Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (*str*) – The powershell command to run.
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) – Environment variables to be set prior to execution.

  > **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.
  >
  > ```
  > salt myminion cmd.powershell 'some command' env='{"FOO": "bar"}'
  > ```
- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

  New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset_system_locale** (*bool*) – Resets the system locale
- **saltenv** (*str*) – The salt environment to use. Default is 'base'
- **depth** (*int*) – The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.

- **encode_cmd** (*bool*) – Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.
- **success_retcodes** (*list*) –

This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **`stdin_raw_newlines`** (*bool*) –

False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

Returns

dict A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

`salt.modules.cmdmod.`**`powershell_all`**(*cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', quiet=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, force_list=False, success_retcodes=None, **kwargs*)

Execute the passed PowerShell command and return a dictionary with a result field representing the output of the command, as well as other fields showing us what the PowerShell invocation wrote to `stderr`, the process id, and the exit code of the invocation.

This function appends `| ConvertTo-JSON` to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it's very normal for the Powershell output to be exactly that. Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead we treat this as a special case and one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field of the return dictionary will be an empty list.
- If the value of the `force_list` parameter is `False`, then the return dictionary **will not have a result key added to it**. We aren't setting `result` to `None` in this case, because `None` is the Python representation of "null" in JSON. (We likewise can't use `False` for the equivalent reason.)

If Powershell's output is not an empty string and Python cannot parse its content, then a `CommandExecutionError` exception will be raised.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is other than `list` then one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field will be a singleton list with the Python object as its sole member.
- If the value of the `force_list` parameter is `False`, then the value of `result` will be the unmodified Python object.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is `list`, then the value of `result` will be the unmodified Python object. The `force_list` parameter has no effect in this case.

Note: An example of why the `force_list` parameter is useful is as follows: The Powershell command `dir x | Convert-ToJson` results in

- no output when x is an empty directory.
- a dictionary object when x contains just one item.
- a list of dictionary objects when x contains multiple items.

By setting `force_list` to `True` we will always end up with a list of dictionary items, representing files, no matter how many files x contains. Conversely, if `force_list` is `False`, we will end up with no `result` key in our return dictionary when x is an empty directory, and a dictionary object when x contains just one file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use `cmd.run_all` in combination with `shell=powershell`.

The remaining fields in the return dictionary are described in more detail in the `Returns` section.

Example:

```
salt '*' cmd.run_all '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run_all 'Get-NetTCPConnection' shell=powershell
```

New in version 2018.3.0.

Warning: This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (*str*) – The powershell command to run.
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) – Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.powershell_all 'some command' env='{"FOO": "bar"}
↪'
```

- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset_system_locale** (*bool*) – Resets the system locale

- **`ignore_retcode`** – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`saltenv`** (*str*) – The salt environment to use. Default is 'base'
- **`depth`** (*int*) – The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`
- **`encode_cmd`** (*bool*) – Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.
- **`force_list`** (*bool*) – The purpose of this parameter is described in the preamble of this function's documentation. Default value is False.
- **`success_retcodes`** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`stdin_raw_newlines`** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

Returns

A dictionary with the following entries:

result For a complete description of this field, please refer to this function's preamble. **This key will not be added to the dictionary when force_list is False and Powershell's output is the empty string.**

stderr What the PowerShell invocation wrote to `stderr`.

pid The process id of the PowerShell invocation

retcode This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with `| ConvertTo-JSON` appended) is `False` this should be non-0. Likewise if PowerShell exited with `$LASTEXITCODE` set to some non-0 value, then `retcode` will end up with this value.

Return type dict

CLI Example:

```
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

CLI Example:

```
salt '*' cmd.powershell_all "dir mydirectory" force_list=True
```

`salt.modules.cmdmod.`**`retcode`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, success_retcodes=None, **kwargs*)

Execute a shell command and return the command's return code.

Parameters

- **`cmd`** (*`str`*) – The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **`runas`** (*`str`*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.retcode 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **`password`** (*`str`*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **`group`** (*`str`*) – Group to run command as. Not currently supported on Windows.
- **`shell`** (*`str`*) – Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.retcode 'some command' env='{"FOO": "bar"}'
  ```

- **`clean_env`** (*`bool`*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **`template`** (*`str`*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`rstrip`** (*`bool`*) – Strip all whitespace off the end of output before it is returned.

- **`umask`** (*`str`*) – The umask (in octal) to use when running the command.
- **`output_encoding`** (*`str`*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

  New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`timeout`** (*`int`*) – A timeout in seconds for the executed process to return.
- **`use_vt`** (*`bool`*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*`list`*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **`stdin_raw_newlines`** (*`bool`*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

Return type int

Return type None

Returns Return Code as an int or None if there was an exception.

CLI Example:

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run`**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *group=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_encoding=None*, *output_loglevel='debug'*, *log_callback=None*, *hide_output=False*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *bg=False*, *password=None*, *encoded_cmd=False*, *raise_err=False*, *prepend_path=None*, *success_retcodes=None*, ***kwargs*)

Execute the passed command and return the output as a string

Parameters

- **`cmd`** (*`str`*) – The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **`runas`** (*`str`*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

  > **Warning:** For versions 2018.3.3 and above on macosx while using runas, on linux while using run, to pass special characters to the command you need to escape the characters on the shell.
  >
  > Example:
  >
  > ```
  > cmd.run 'echo '\''h=\"baz\"'\''' runas=macuser
  > ```

- **`group`** (*`str`*) – Group to run command as. Not currently supported on Windows.
- **`password`** (*`str`*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **`shell`** (*`str`*) – Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) – If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **`bg`** (*`bool`*) – If `True`, run command in background and do not await or deliver it's results

  New in version 2016.3.0.
- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  > **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run 'some command' env='{"FOO": "bar"}'
```

- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.
- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.
- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.
- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.
- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded_cmd** (*bool*) – Specify if the supplied command is encoded. Only applies to shell 'powershell'.

- **raise_err** (*bool*) – If `True` and the command has a nonzero exit code, a CommandExecutionError exception will be raised.

> **Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.
>
> The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

Parameters

- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run "ls -l | awk '/foo/{print \\$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \\$2}
↪'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run "Get-ChildItem C:\\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run "grep f" stdin='one\\ntwo\\nthree\\nfour\\nfive\\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.`**`run_all`**`(`*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False, prepend_path=None, success_retcodes=None, **kwargs*`)`

Execute the passed command and return a dict of return data

Parameters

- **cmd** (*str*) – The command to run. ex: `ls -lart /home`
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_all 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** (*str*) – Group to run command as. Not currently supported on Windows.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_all 'some command' env='{"FOO": "bar"}'
  ```

- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

New in version 2018.3.0.

- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded_cmd** (*bool*) – Specify if the supplied command is encoded. Only applies to shell 'powershell'.

  New in version 2018.3.0.

- **redirect_stderr** (*bool*) – If set to `True`, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **bg** (*bool*) – If `True`, run command in background and do not await or deliver its results

  New in version 2016.3.6.

- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run_bg`**(*cmd, cwd=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, timeout=None, output_encoding=None, output_loglevel='debug', log_callback=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', password=None, prepend_path=None, success_retcodes=None, **kwargs*)

Execute the passed command in the background and return it's PID

Note: If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend `systemd-run --scope` to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

Parameters

- **cmd** (*str*) – The command to run. ex: `ls -lart /home`
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **group** (*str*) – Group to run command as. Not currently supported on Windows.
- **shell** (*str*) – Shell to execute under. Defaults to the system default shell.

- **`output_encoding`** (*`str`*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

  New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **`runas`** (*`str`*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_bg 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **`password`** (*`str`*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **`shell`** – Specify an alternate shell. Defaults to the system's default shell.

- **`python_shell`** (*`bool`*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_bg 'some command' env='{"FOO": "bar"}'
  ```

- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.
- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **timeout** (*int*) – A timeout in seconds for the executed process to return.

> **Warning:** This function does not process commands through a shell unless the `python_shell` argument is set to `True`. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.
>
> The use of `python_shell=True` means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`.

Parameters

- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **stdin_raw_newlines** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \\
↪$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

`salt.modules.cmdmod.`**`run_chroot`**(*root, cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=True, binds=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='quiet', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, success_retcodes=None, **kwargs*)

New in version 2014.7.0.

This function runs *`cmd.run_all`* wrapped within a chroot, with dev and proc mounted in the chroot

Parameters

- **`root`** (*`str`*) – Path to the root of the jail to use.
- **`stdin`** (*`str`*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **`runas`** (*`str`*) – User to run script as.
- **`group`** (*`str`*) – Group to run script as.
- **`shell`** (*`str`*) – Shell to execute under. Defaults to the system default shell.
- **`cmd`** (*`str`*) – The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`runas`** – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **`shell`** – Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **`binds`** (*`list`*) – List of directories that will be exported inside the chroot with the bind option.

  New in version 3000.
- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_chroot 'some command' env='{"FOO": "bar"}'
  ```
- **`clean_env`** (*`dict`*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **`template`** (*`str`*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`rstrip`** (*`bool`*) – Strip all whitespace off the end of output before it is returned.
- **`umask`** (*`str`*) – The umask (in octal) to use when running the command.

- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

  New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Parar str stdin A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

success_retcodes: This parameter will be allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```

`salt.modules.cmdmod.`**`run_stderr`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, prepend_path=None, success_retcodes=None, **kwargs*)

Execute a command and only return the standard error

Parameters

- **`cmd`** (*`str`*) – The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **`runas`** (*`str`*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_stderr 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **`password`** (*`str`*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **`group`** (*`str`*) – Group to run command as. Not currently supported on Windows.
- **`shell`** (*`str`*) – Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_stderr 'some command' env='{"FOO": "bar"}'
  ```

- **`clean_env`** (*`bool`*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **`prepend_path`** (*`str`*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **stdin_raw_newlines** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stderr "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run_stdout`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, prepend_path=None, success_retcodes=None, **kwargs*)

Execute a command, and only return the standard out

Parameters

- **cmd** (*str*) – The command to run. ex: `ls -lart /home`
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  > **Warning:** For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.
  >
  > Example:
  >
  > ```
  > cmd.run_stdout 'echo '\''h=\"baz\"'\''' runas=macuser
  > ```

- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** (*str*) – Group to run command as. Not currently supported on Windows.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **`env`** (*`dict`*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_stdout 'some command' env='{"FOO": "bar"}'
  ```

- **`clean_env`** (*`bool`*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **`prepend_path`** (*`str`*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **`template`** (*`str`*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`rstrip`** (*`bool`*) – Strip all whitespace off the end of output before it is returned.
- **`umask`** (*`str`*) – The umask (in octal) to use when running the command.
- **`output_encoding`** (*`str`*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

  New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`hide_output`** (*`bool`*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **`timeout`** (*`int`*) – A timeout in seconds for the executed process to return.

- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **stdin_raw_newlines** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`script`**(*source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, saltenv='base', use_vt=False, bg=False, password=None, success_retcodes=None, **kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

Parameters

- **source** (*str*) – The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) – String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it:

  ```
  salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
  ```
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).

- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Note: For Window's users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

```
Domain/user
```

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **group** (*str*) – Group to run script as. Not currently supported on Windows.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **bg** (*bool*) – If True, run script in background and do not await or deliver it's results
- **env** (*dict*) – Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script 'some command' env='{"FOO": "bar"}'
```

- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **`output_loglevel`** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`hide_output`** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **`timeout`** (*int*) – If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **`use_vt`** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **`stdin_raw_newlines`** (*bool*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile.
↪txt' shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`script_retcode`**(*source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template='jinja', umask=None, timeout=None, reset_system_locale=True, saltenv='base', output_encoding=None, output_loglevel='debug', log_callback=None, use_vt=False, password=None, success_retcodes=None, **kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

Parameters

- **source** (*str*) – The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) – String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **group** (*str*) – Group to run script as. Not currently supported on Windows.
- **shell** (*str*) – Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) – If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.script_retcode 'some command' env='{"FOO": "bar"}
  ↪'
  ```
- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **`output_loglevel`** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`timeout`** (*int*) – If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **`use_vt`** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*list*) –

This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **`stdin_raw_newlines`** (*bool*) –

False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcode salt://scripts/windows_task.ps1 args=' -Input
↪c:\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`shell`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, password=None, prepend_path=None, success_retcodes=None, **kwargs*)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- **cmd** (*str*) – The command to run. ex: `ls -lart /home`
- **cwd** (*str*) – The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) – A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) – Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.shell 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **group** (*str*) – Group to run command as. Not currently supported on Windows.
- **password** (*str*) – Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** (*int*) – Shell to execute under. Defaults to the system default shell.
- **bg** (*bool*) – If True, run command in background and do not await or deliver its results
- **env** (*dict*) – Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.shell 'some command' env='{"FOO": "bar"}'
  ```

- **clean_env** (*bool*) – Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) – $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) – If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) – Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) – The umask (in octal) to use when running the command.
- **output_encoding** (*str*) – Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) – Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) – If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) – If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) – A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) – Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Warning: This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Parameters

- **success_retcodes** (*list*) –

  This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **`stdin_raw_newlines`** (*`bool`*) –

  False If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.`**`shell_info`**(*shell*, *list_modules=False*)

New in version 2016.11.0.

Provides information about a shell or script languages which often use `#!`. The values returned are dependent on the shell or scripting languages all return the `installed`, `path`, `version`, `version_raw`

Parameters

- **`shell`** (*`str`*) – Name of the shell. Support shells/script languages include
- **`cmd, perl, php, powershell, python, ruby and zsh`** (*`bash,`*) –
- **`list_modules`** (*`bool`*) – True to list modules available to the shell.
- **`only lists powershell modules.`** (*`Currently`*) –

Returns A dictionary of information about the shell

Return type dict

```
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': <True, False or None>,
 '<attribute>': '<attribute value>'}
```

Note:

- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.
- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor Damon Atkins <https://github.com/damon-atkins>

`salt.modules.cmdmod.`**`shells`**`()`

Lists the valid shells on this system via the /etc/shells file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

`salt.modules.cmdmod.`**`tty`**`(`*device*, *echo=''*`)`

Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.`**`which`**`(`*cmd*`)`

Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

`salt.modules.cmdmod.`**`which_bin`**`(`*cmds*`)`

Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'
```

21.9.83 salt.modules.composer

Use composer to install PHP dependencies for a directory

`salt.modules.composer.`**`did_composer_install`**`(`*dir*`)`

Test to see if the vendor directory exists in this directory

dir Directory location of the composer.json file

CLI Example:

```
salt '*' composer.did_composer_install /var/www/application
```

`salt.modules.composer.`**`install`**(*directory*, *composer=None*, *php=None*, *runas=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*, *env=None*)

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

directory Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

prefer_source –prefer-source option of composer.

prefer_dist –prefer-dist option of composer.

no_scripts –no-scripts option of composer.

no_plugins –no-plugins option of composer.

optimize –optimize-autoloader option of composer. Recommended for production.

no_dev –no-dev option for composer. Recommended for production.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

env A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.install /var/www/application

salt '*' composer.install /var/www/application              no_dev=True
↪optimize=True
```

`salt.modules.composer.`**`selfupdate`**(*composer=None*, *php=None*, *runas=None*, *quiet=False*, *composer_home='/root'*)

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

CLI Example:

```
salt '*' composer.selfupdate
```

`salt.modules.composer.`**`update`**(*directory*, *composer=None*, *php=None*, *runas=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*, *env=None*)

Update composer dependencies for a directory.

If *composer install* has not yet been run, this runs *composer install* instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

directory Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

prefer_source –prefer-source option of composer.

prefer_dist –prefer-dist option of composer.

no_scripts –no-scripts option of composer.

no_plugins –no-plugins option of composer.

optimize –optimize-autoloader option of composer. Recommended for production.

no_dev –no-dev option for composer. Recommended for production.

quiet –quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

env A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.update /var/www/application

salt '*' composer.update /var/www/application              no_dev=True
→optimize=True
```

21.9.84 salt.modules.config

Return config information

`salt.modules.config.`**`backup_mode`**(*backup=''*)

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

`salt.modules.config.`**`dot_vals`**(*value*)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

`salt.modules.config.`**`gather_bootstrap_script`**`(`*bootstrap=None*`)`

Download the salt-bootstrap script, and return its location

bootstrap URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

`salt.modules.config.`**`get`**`(`*key, default='', delimiter=':', merge=None, omit_opts=False, omit_pillar=False, omit_master=False, omit_grains=False*`)`

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the `default` argument. If this argument is not specified, `default` falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key, in the sub-dictionary corresponding to the `pkg` key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The `:` (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The `delimiter` argument was added, to allow delimiters other than `:` to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

Note: Minion configuration options built into Salt (like those defined *here*) will *always* be defined in the Minion configuration and thus *cannot be overridden by grains or pillar data*. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

Arguments

delimiter New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

merge New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

Note: The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'bar': 1, 'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

`salt.modules.config.`**`items`**`()`

Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

CLI Example:

```
salt '*' config.items
```

`salt.modules.config.`**`manage_mode`**`(`*mode*`)`

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

`salt.modules.config.`**`merge`**`(`*value, default=", omit_opts=False, omit_master=False, omit_pillar=False*`)`

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

`salt.modules.config.`**`option`**`(`*value, default=None, omit_opts=False, omit_grains=False, omit_pillar=False, omit_master=False, omit_all=False, wildcard=False*`)`

Returns the setting for the specified config value. The priority for matches is the same as in `config.get`, only this function does not recurse into nested data structures. Another difference between this function and `config.get` is that it comes with a set of "sane defaults". To view these, you can run the following command:

```
salt '*' config.option '*' omit_all=True wildcard=True
```

default The default value if no match is found. If not specified, then the fallback default will be an empty string, unless `wildcard=True`, in which case the return will be an empty dictionary.

omit_opts [False] Pass as `True` to exclude matches from the minion configuration file

omit_grains [False] Pass as `True` to exclude matches from the grains

omit_pillar [False] Pass as `True` to exclude matches from the pillar data

omit_master [False] Pass as `True` to exclude matches from the master configuration file

omit_all [True] Shorthand to omit all of the above and return matches only from the "sane defaults".

New in version 3000.

wildcard [False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using `wildcard=True` with a `key` of `'foo.ba*` could return a dictionary like so:

```
{'foo.bar': True, 'foo.baz': False}
```

New in version 3000.

CLI Example:

```
salt '*' config.option redis.host
```

`salt.modules.config.`**`valid_fileproto`**`(`*uri*`)`

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```

21.9.85 salt.modules.consul

Interact with Consul

https://www.consul.io

`salt.modules.consul.`**`acl_clone`**`(`*consul_url=None, token=None, **kwargs*`)`

Information about an ACL token.

Parameters

- **`consul_url`** – The Consul server URL.
- **`id`** – Unique identifier for the ACL to update.

Returns Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.`**`acl_create`**`(`*consul_url=None, token=None, **kwargs*`)`

Create a new ACL token.

Parameters

- **`consul_url`** – The Consul server URL.
- **`name`** – Meaningful indicator of the ACL's purpose.
- **`type`** – Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **`rules`** – The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_create
```

`salt.modules.consul.`**`acl_delete`**`(`*consul_url=None, token=None, **kwargs*`)`

Delete an ACL token.

Parameters

- **`consul_url`** – The Consul server URL.
- **`id`** – Unique identifier for the ACL to update.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.`**`acl_info`**(*consul_url=None*, ***kwargs*)

Information about an ACL token.

Parameters

- **`consul_url`** – The Consul server URL.
- **`id`** – Unique identifier for the ACL to update.

Returns Information about the ACL requested.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.`**`acl_list`**(*consul_url=None*, *token=None*, ***kwargs*)

List the ACL tokens.

Parameters **`consul_url`** – The Consul server URL.

Returns List of ACLs

CLI Example:

```
salt '*' consul.acl_list
```

`salt.modules.consul.`**`acl_update`**(*consul_url=None*, *token=None*, ***kwargs*)

Update an ACL token.

Parameters

- **`consul_url`** – The Consul server URL.
- **`name`** – Meaningful indicator of the ACL's purpose.
- **`id`** – Unique identifier for the ACL to update.
- **`type`** – Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **`rules`** – The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_update
```

`salt.modules.consul.`**`agent_check_deregister`**(*consul_url=None*, *token=None*, *checkid=None*)

The agent will take care of deregistering the check from the Catalog.

Parameters

- **`consul_url`** – The Consul server URL.
- **`checkid`** – The ID of the check to deregister from Consul.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```

`salt.modules.consul.`**`agent_check_fail`**(*consul_url=None*, *token=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

Parameters

- **`consul_url`** – The Consul server URL.
- **`checkid`** – The ID of the check to deregister from Consul.
- **`note`** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing check into
↪critical state.'
```

`salt.modules.consul.`**`agent_check_pass`**(*consul_url=None*, *token=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

Parameters

- **`consul_url`** – The Consul server URL.
- **`checkid`** – The ID of the check to mark as passing.
- **`note`** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing check into
↪passing state.'
```

`salt.modules.consul.`**`agent_check_register`**(*consul_url=None*, *token=None*, ***kwargs*)

The register endpoint is used to add a new check to the local agent.

Parameters

- **`consul_url`** – The Consul server URL.
- **`name`** – The description of what the check is for.
- **`id`** – The unique name to use for the check, if not provided 'name' is used.
- **`notes`** – Human readable description of the check.
- **`script`** – If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **`http`** – Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **`ttl`** – If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **`interval`** – Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/
↪bin/check_mem.py' interval='15s'
```

`salt.modules.consul.`**`agent_check_warn`**(*consul_url=None*, *token=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

Parameters

- **`consul_url`** – The Consul server URL.
- **`checkid`** – The ID of the check to deregister from Consul.
- **`note`** – A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into
↪warning state.'
```

`salt.modules.consul.`**`agent_checks`**(*consul_url=None*, *token=None*)

Returns the checks the local agent is managing

Parameters **`consul_url`** – The Consul server URL.

Returns Returns the checks the local agent is managing

CLI Example:

```
salt '*' consul.agent_checks
```

`salt.modules.consul.`**`agent_join`**(*consul_url=None*, *token=None*, *address=None*, ***kwargs*)

Triggers the local agent to join a node

Parameters

- **`consul_url`** – The Consul server URL.
- **`address`** – The address for the agent to connect to.
- **`wan`** – Causes the agent to attempt to join using the WAN pool.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_join address='192.168.1.1'
```

`salt.modules.consul.`**`agent_leave`**(*consul_url=None*, *token=None*, *node=None*)

Used to instruct the agent to force a node into the left state.

Parameters

- **`consul_url`** – The Consul server URL.
- **`node`** – The node the agent will force into left state

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

`salt.modules.consul.`**`agent_maintenance`**(*consul_url=None*, *token=None*, ***kwargs*)

Manages node maintenance mode

Parameters

- **`consul_url`** – The Consul server URL.
- **`enable`** – The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- **`reason`** – If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

`salt.modules.consul.`**`agent_members`**(*consul_url=None*, *token=None*, ***kwargs*)

Returns the members as seen by the local serf agent

Parameters **`consul_url`** – The Consul server URL.

Returns Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

`salt.modules.consul.`**`agent_self`**(*consul_url=None*, *token=None*)

Returns the local node configuration

Parameters **`consul_url`** – The Consul server URL.

Returns Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

`salt.modules.consul.`**`agent_service_deregister`**(*consul_url=None*, *token=None*, *serviceid=None*)

Used to remove a service.

Parameters

- **`consul_url`** – The Consul server URL.
- **`serviceid`** – A serviceid describing the service.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

`salt.modules.consul.`**`agent_service_maintenance`**(*consul_url=None*, *token=None*, *serviceid=None*, ***kwargs*)

Used to place a service into maintenance mode.

Parameters

- **consul_url** – The Consul server URL.
- **serviceid** – A name of the service.
- **enable** – Whether the service should be enabled or disabled.
- **reason** – A human readable message of why the service was enabled or disabled.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis' enable='True' reason=
↪'Down for upgrade'
```

`salt.modules.consul.`**`agent_service_register`**(*consul_url=None, token=None, **kwargs*)

The used to add a new service, with an optional health check, to the local agent.

Parameters

- **consul_url** – The Consul server URL.
- **name** – A name describing the service.
- **address** – The address used by the service, defaults to the address of the agent.
- **port** – The port used by the service.
- **id** – Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** – Identifying tags for service, string or list.
- **script** – If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** – Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **check_ttl** – If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **check_interval** – Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]'
↪address="127.0.0.1" port="8080" check_script="/usr/local/bin/check_redis.py"
↪interval="10s"
```

`salt.modules.consul.`**`agent_services`**(*consul_url=None, token=None*)

Returns the services the local agent is managing

Parameters **consul_url** – The Consul server URL.

Returns Returns the services the local agent is managing

CLI Example:

```
salt '*' consul.agent_services
```

`salt.modules.consul.`**`catalog_datacenters`**(*consul_url=None*, *token=None*)

Return list of available datacenters from catalog.

Parameters **`consul_url`** – The Consul server URL.

Returns The list of available datacenters.

CLI Example:

```
salt '*' consul.catalog_datacenters
```

`salt.modules.consul.`**`catalog_deregister`**(*consul_url=None*, *token=None*, ***kwargs*)

Deregisters a node, service, or check

Parameters

- **`consul_url`** – The Consul server URL.
- **`node`** – The node to deregister.
- **`datacenter`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **`checkid`** – The ID of the health check to deregister.
- **`serviceid`** – The ID of the service to deregister.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' serviceid='redis_server1' checkid=
↪'redis_check1'
```

`salt.modules.consul.`**`catalog_node`**(*consul_url=None*, *token=None*, *node=None*, ***kwargs*)

Information about the registered node.

Parameters

- **`consul_url`** – The Consul server URL.
- **`node`** – The node to request information about.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Information about the requested node.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.`**`catalog_nodes`**(*consul_url=None*, *token=None*, ***kwargs*)

Return list of available nodes from catalog.

Parameters

- **`consul_url`** – The Consul server URL.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns The list of available nodes.

CLI Example:

```
salt '*' consul.catalog_nodes
```

`salt.modules.consul.`**`catalog_register`**(*consul_url=None*, *token=None*, ***kwargs*)
Registers a new node, service, or check

Parameters

- **`consul_url`** – The Consul server URL.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **`node`** – The node to register.
- **`address`** – The address of the node.
- **`service`** – The service that will be registered.
- **`service_address`** – The address that the service listens on.
- **`service_port`** – The port for the service.
- **`service_id`** – A unique identifier for the service, if this is not provided "name" will be used.
- **`service_tags`** – Any tags associated with the service.
- **`check`** – The name of the health check to register
- **`check_status`** – The initial status of the check, must be one of unknown, passing, warning, or critical.
- **`check_service`** – The service that the check is performed against.
- **`check_id`** – Unique identifier for the service.
- **`check_notes`** – An opaque field that is meant to hold human-readable text.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' address='192.168.1.1' service='redis
↪' service_address='127.0.0.1' service_port='8080' service_id='redis_server1'
```

`salt.modules.consul.`**`catalog_service`**(*consul_url=None*, *token=None*, *service=None*, ***kwargs*)
Information about the registered service.

Parameters

- **`consul_url`** – The Consul server URL.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **`tag`** – Filter returned services with tag parameter.

Returns Information about the requested service.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.`**`catalog_services`**(*consul_url=None*, *token=None*, ***kwargs*)
Return list of available services rom catalog.

Parameters

- **consul_url** – The Consul server URL.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns The list of available services.

CLI Example:

```
salt '*' consul.catalog_services
```

salt.modules.consul.**delete**(*consul_url=None*, *token=None*, *key=None*, ***kwargs*)

Delete values from Consul

Parameters

- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.
- **recurse** – Delete values recursively beginning at the value of key.
- **cas** – This flag is used to turn the DELETE into a Check-And-Set operation.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

salt.modules.consul.**event_fire**(*consul_url=None*, *token=None*, *name=None*, ***kwargs*)

List the ACL tokens.

Parameters

- **consul_url** – The Consul server URL.
- **name** – The name of the event to fire.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** – Filter by node name.
- **service** – Filter by service name.
- **tag** – Filter by tag name.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

salt.modules.consul.**event_list**(*consul_url=None*, *token=None*, ***kwargs*)

List the recent events.

Parameters

- **consul_url** – The Consul server URL.
- **name** – The name of the event to fire.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_list
```

`salt.modules.consul.`**`get`**(*consul_url=None*, *key=None*, *token=None*, *recurse=False*, *decode=False*, *raw=False*)

Get key from Consul

Parameters

- **`consul_url`** – The Consul server URL.
- **`key`** – The key to use as the starting point for the list.
- **`recurse`** – Return values recursively beginning at the value of key.
- **`decode`** – By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **`raw`** – Simply return the decoded value of the key.

Returns The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consul will return other information about the key, the raw option will return only the raw value.

`salt.modules.consul.`**`health_checks`**(*consul_url=None*, *token=None*, *service=None*, ***kwargs*)

Health information about the registered service.

Parameters

- **`consul_url`** – The Consul server URL.
- **`service`** – The service to request health information about.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_checks service='redis1'
```

`salt.modules.consul.`**`health_node`**(*consul_url=None*, *token=None*, *node=None*, ***kwargs*)

Health information about the registered node.

Parameters

- **`consul_url`** – The Consul server URL.
- **`node`** – The node to request health information about.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_node node='node1'
```

`salt.modules.consul.`**`health_service`**(*consul_url=None*, *token=None*, *service=None*, ***kwargs*)

Health information about the registered service.

Parameters

- **`consul_url`** – The Consul server URL.
- **`service`** – The service to request health information about.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **`tag`** – Filter returned services with tag parameter.
- **`passing`** – Filter results to only nodes with all checks in the passing state.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_service service='redis1'

salt '*' consul.health_service service='redis1' passing='True'
```

`salt.modules.consul.`**`health_state`**(*consul_url=None*, *token=None*, *state=None*, ***kwargs*)

Returns the checks in the state provided on the path.

Parameters

- **`consul_url`** – The Consul server URL.
- **`state`** – The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **`dc`** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'

salt '*' consul.health_state service='redis1' passing='True'
```

`salt.modules.consul.`**`list_`**(*consul_url=None*, *token=None*, *key=None*, ***kwargs*)

List keys in Consul

Parameters

- **`consul_url`** – The Consul server URL.
- **`key`** – The key to use as the starting point for the list.

Returns The list of keys.

CLI Example:

```
salt '*' consul.list
salt '*' consul.list key='web'
```

salt.modules.consul.**put**(*consul_url=None*, *token=None*, *key=None*, *value=None*, ***kwargs*)

Put values into Consul

Parameters

- **consul_url** – The Consul server URL.
- **key** – The key to use as the starting point for the list.
- **value** – The value to set the key to.
- **flags** – This can be used to specify an unsigned value between 0 and 2^64-1. Clients can choose to use this however makes sense for their application.
- **cas** – This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** – This flag is used to turn the PUT into a lock acquisition operation.
- **release** – This flag is used to turn the PUT into a lock release operation.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.put key='web/key1' value="Hello there"

salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-c380-
↪5280-12fd-8810be175592'

salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-c380-
↪5280-12fd-8810be175592'
```

salt.modules.consul.**session_create**(*consul_url=None*, *token=None*, ***kwargs*)

Used to create a session.

Parameters

- **consul_url** – The Consul server URL.
- **lockdelay** – Duration string using a "s" suffix for seconds. The default is 15s.
- **node** – Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** – A human-readable name for the session
- **checks** – A list of associated health checks. It is highly recommended that, if you override this list, you include the default "serfHealth".
- **behavior** – Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** – Session is invalidated if it is not renewed before the TTL expires

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.session_create node='node1' name='my-session' behavior='delete'
↪ttl='3600s'
```

salt.modules.consul.**session_destroy**(*consul_url=None*, *token=None*, *session=None*, ***kwargs*)
Destroy session

Parameters

- **consul_url** – The Consul server URL.
- **session** – The ID of the session to destroy.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**session_info**(*consul_url=None*, *token=None*, *session=None*, ***kwargs*)
Information about a session

Parameters

- **consul_url** – The Consul server URL.
- **session** – The ID of the session to return information about.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**session_list**(*consul_url=None*, *token=None*, *return_list=False*, ***kwargs*)
Used to list sessions.

Parameters

- **consul_url** – The Consul server URL.
- **dc** – By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **return_list** – By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

Returns A list of all available sessions.

CLI Example:

```
salt '*' consul.session_list
```

salt.modules.consul.**status_leader**(*consul_url=None*, *token=None*)
Returns the current Raft leader

Parameters **consul_url** – The Consul server URL.

Returns The address of the Raft leader.

CLI Example:

```
salt '*' consul.status_leader
```

`salt.modules.consul.`**`status_peers`**`(`*consul_url, token=None*`)`

Returns the current Raft peer set

Parameters **`consul_url`** – The Consul server URL.

Returns Retrieves the Raft peers for the datacenter in which the agent is running.

CLI Example:

```
salt '*' consul.status_peers
```

21.9.86 salt.modules.container_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the *`lxc`*, *`nspawn`*, and `docker` execution modules. They provide for common logic to be re-used for common actions.

`salt.modules.container_resource.`**`cache_file`**`(`*source*`)`

Wrapper for cp.cache_file which raises an error if the file was unable to be cached.

CLI Example:

```
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

`salt.modules.container_resource.`**`copy_to`**`(`*name, source, dest, container_type=None, path=None, exec_driver=None, overwrite=False, makedirs=False*`)`

Common logic for copying files to containers

path path to the container parent (for LXC only) default: /var/lib/lxc (system default)

CLI Example:

```
salt mymininion container_resource.copy_to mycontainer /local/file/path /container/
↪file/path container_type=docker exec_driver=nsenter
```

`salt.modules.container_resource.`**`run`**`(`*name, cmd, container_type=None, exec_driver=None, output=None, no_start=False, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, path=None, use_vt=False, keep_env=None*`)`

Common logic for running shell commands in containers

path path to the container parent (for LXC only) default: /var/lib/lxc (system default)

CLI Example:

```
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker
↪exec_driver=nsenter output=stdout
```

21.9.87 salt.modules.cp

Minion side functions for salt-cp

`salt.modules.cp.`**`cache_dir`**(*path*, *saltenv='base'*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*)

Download and cache everything under a directory from the master

include_pat [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

exclude_pat [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

New in version 2014.7.0.

CLI Examples:

```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

`salt.modules.cp.`**`cache_file`**(*path*, *saltenv='base'*, *source_hash=None*)

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

source_hash If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_files`**(*paths*, *saltenv='base'*)

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master

CLI Example:

```
salt '*' cp.cache_files salt://pathto/file1,salt://pathto/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.conf?
↪saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?
↪saltenv=config2
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_local_file`**(*path*)

Cache a local file on the minion in the localfiles cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

`salt.modules.cp.`**`cache_master`**(*saltenv='base'*)

Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

`salt.modules.cp.`**`envs`**()

List available environments for fileserver

CLI Example

```
salt '*' cp.envs
```

`salt.modules.cp.`**`get_dir`**(*path, dest, saltenv='base', template=None, gzip=None, **kwargs*)

Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

get_dir supports the same template and gzip arguments as get_file.

`salt.modules.cp.`**`get_file`**(*path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs*)

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the *gzip* named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`get_file_str`**(*path*, *saltenv='base'*)

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```
salt '*' cp.get_file_str salt://my/file
```

`salt.modules.cp.`**`get_template`**(*path*, *dest*, *template='jinja'*, *saltenv='base'*, *makedirs=False*, ***kwargs*)

Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non breaking old API.

CLI Example:

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

`salt.modules.cp.`**`get_url`**(*path*, *dest=''*, *saltenv='base'*, *makedirs=False*, *source_hash=None*)

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from a URL.

path A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

dest The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`''`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

Note: To simply return the file contents instead, set destination to `None`. This works with `salt://`, `http://`, `https://` and `file://` URLs. The files fetched by `http://` and `https://` will not be cached.

---

saltenv [base] Salt fileserver envrionment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

source_hash If `path` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

`salt.modules.cp.`**`hash_file`**(*path*, *saltenv='base'*)

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

`salt.modules.cp.`**`is_cached`**(*path*, *saltenv='base'*)

Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

`salt.modules.cp.`**`list_master`**(*saltenv='base'*, *prefix="*)

List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

`salt.modules.cp.`**`list_master_dirs`**(*saltenv='base'*, *prefix="*)

List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

`salt.modules.cp.`**`list_master_symlinks`**(*saltenv='base'*, *prefix="*)

List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

`salt.modules.cp.`**`list_minion`**(*saltenv='base'*)

List all of the files cached on the minion

CLI Example:

```
salt '*' cp.list_minion
```

`salt.modules.cp.`**`list_states`**(*saltenv='base'*)

List all of the available state modules in an environment

CLI Example:

```
salt '*' cp.list_states
```

`salt.modules.cp.`**`push`**(*path*, *keep_symlinks=False*, *upload_path=None*, *remove_source=False*)

WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

keep_symlinks Keep the path value without resolving its canonical form

upload_path Provide a different path inside the master's minion files cachedir

remove_source Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

`salt.modules.cp.`**`push_dir`**(*path*, *glob=None*, *upload_path=None*)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

upload_path Provide a different path and directory name inside the master's minion files cachedir

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

`salt.modules.cp.`**`recv`**(*files*, *dest*)

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

`salt.modules.cp.`**`recv_chunked`**(*dest*, *chunk*, *append=False*, *compressed=True*, *mode=None*)

This function receives files copied to the minion using `salt-cp` and is not intended to be used directly on the CLI.

`salt.modules.cp.`**`stat_file`**(*path*, *saltenv='base'*, *octal=True*)

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```

21.9.88 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

`salt.modules.cpan.`**`install`**(*module*)

Install a Perl module from CPAN

CLI Example:

```
salt '*' cpan.install Template::Alloy
```

`salt.modules.cpan.`**`list_`**()

List installed Perl modules, and the version installed

CLI Example:

```
salt '*' cpan.list
```

`salt.modules.cpan.`**`remove`**(*module*, *details=False*)

Attempt to remove a Perl module that was installed from CPAN. Because the `cpan` command doesn't actually support "uninstall"-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:

```
salt '*' cpan.remove Old::Package
```

`salt.modules.cpan.`**`show`**(*module*)

Show information about a specific Perl module

CLI Example:

```
salt '*' cpan.show Template::Alloy
```

`salt.modules.cpan.`**`show_config`**()

Return a dict of CPAN configuration values

CLI Example:

```
salt '*' cpan.show_config
```

21.9.89 salt.modules.cron

Work with cron

Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

`salt.modules.cron.`**`list_tab`**(*user*)

Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.`**`ls`**(*user*)

This function is an alias of `list_tab`.

> Return the contents of the specified user's crontab
>
> CLI Example:
>
> ```
> salt '*' cron.list_tab root
> ```

`salt.modules.cron.`**`raw_cron`**(*user*)

Return the contents of the user's crontab

CLI Example:

```
salt '*' cron.raw_cron root
```

`salt.modules.cron.`**`rm`**(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

This function is an alias of `rm_job`.

> Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.
>
> CLI Example:
>
> ```
> salt '*' cron.rm_job root /usr/local/weekly
> salt '*' cron.rm_job root /usr/bin/foo dayweek=1
> ```

`salt.modules.cron.`**`rm_env`**(*user, name*)

Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

`salt.modules.cron.`**`rm_job`**(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.`**`rm_special`**(*user, cmd, special=None, identifier=None*)

Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_special root /usr/bin/foo
```

`salt.modules.cron.`**`set_env`**(*user*, *name*, *value=None*)

Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

`salt.modules.cron.`**`set_job`**(*user*, *minute*, *hour*, *daymonth*, *month*, *dayweek*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

`salt.modules.cron.`**`set_special`**(*user*, *special*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

`salt.modules.cron.`**`write_cron_file`**(*user*, *path*)

Writes the contents of a file to a user's crontab

CLI Example:

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

`salt.modules.cron.`**`write_cron_file_verbose`**(*user*, *path*)

Writes the contents of a file to a user's crontab and return error message on error

CLI Example:

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

21.9.90 salt.modules.csf

Support for Config Server Firewall (CSF)

maintainer Mostafa Hussein <mostafa.hussein91@gmail.com>

maturity new

platform Linux

`salt.modules.csf.`**`allow`**`(`*ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment=''*`)`

Add an rule to csf allowed hosts See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

`salt.modules.csf.`**`allow_port`**`(`*port, proto='tcp', direction='both'*`)`

Like allow_ports, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

`salt.modules.csf.`**`allow_ports`**`(`*ports, proto='tcp', direction='in'*`)`

Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:

```
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

`salt.modules.csf.`**`build_directions`**`(`*direction*`)`

`salt.modules.csf.`**`deny`**`(`*ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment=''*`)`

Add an rule to csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

`salt.modules.csf.`**`disable`**`()`

Disable csf permanently CLI Example:

```
salt '*' csf.disable
```

`salt.modules.csf.`**`disable_testing_mode`**`()`

`salt.modules.csf.`**`enable`**`()`

Activate csf if not running CLI Example:

```
salt '*' csf.enable
```

`salt.modules.csf.`**`enable_testing_mode`**`()`

`salt.modules.csf.`**`exists`**`(`*method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment=''*`)`

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found. CLI Example:

```
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

`salt.modules.csf.`**`get_option`**`(`*option*`)`

`salt.modules.csf.`**`get_ports`**`(`*proto='tcp', direction='in'*`)`

Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc..

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.**get_skipped_nics**(*ipv6=False*)

salt.modules.csf.**get_testing_status**()

salt.modules.csf.**reload**()
Restart csf CLI Example:

```
salt '*' csf.reload
```

salt.modules.csf.**remove_rule**(*method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment="*)

salt.modules.csf.**remove_temp_rule**(*ip*)

salt.modules.csf.**running**()
Check csf status CLI Example:

```
salt '*' csf.running
```

salt.modules.csf.**set_option**(*option, value*)

salt.modules.csf.**skip_nic**(*nic, ipv6=False*)

salt.modules.csf.**skip_nics**(*nics, ipv6=False*)

salt.modules.csf.**split_option**(*option*)

salt.modules.csf.**tempallow**(*ip=None, ttl=None, port=None, direction=None, comment="*)
Add an rule to the temporary ip allow list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='# Temp dev
↪ssh access'
```

salt.modules.csf.**tempdeny**(*ip=None, ttl=None, port=None, direction=None, comment="*)
Add a rule to the temporary ip deny list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='# Brute force
↪attempt'
```

salt.modules.csf.**unallow**(*ip*)
Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.unallow 127.0.0.1
```

salt.modules.csf.**undeny**(*ip*)
Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.undeny 127.0.0.1
```

21.9.91 salt.modules.cyg

Manage cygwin packages.

Module file to accompany the cyg state.

`salt.modules.cyg.`**`check_valid_package`**(*package*, *cyg_arch='x86_64'*, *mirrors=None*)

Check if the package is valid on the given mirrors.

Parameters

- **`package`** – The name of the package
- **`cyg_arch`** – The cygwin architecture
- **`mirrors`** – any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

`salt.modules.cyg.`**`install`**(*packages=None*, *cyg_arch='x86_64'*, *mirrors=None*)

Install one or several packages.

packages [None] The packages to install

cyg_arch [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]'
```

`salt.modules.cyg.`**`list_`**(*package=''*, *cyg_arch='x86_64'*)

List locally installed packages.

package [''] package name to check. else all

cyg_arch : Cygwin architecture to use Options are x86 and x86_64

CLI Example:

```
salt '*' cyg.list
```

`salt.modules.cyg.`**`uninstall`**(*packages*, *cyg_arch='x86_64'*, *mirrors=None*)

Uninstall one or several packages.

packages The packages to uninstall.

cyg_arch [x86_64] Specify the architecture to remove the package from Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]"
```

`salt.modules.cyg.`**`update`**(*cyg_arch='x86_64'*, *mirrors=None*)

Update all packages.

cyg_arch [x86_64] Specify the cygwin architecture update Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]"
```

21.9.92 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service.running:
    - provider: daemontools
```

`salt.modules.daemontools.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' daemontools.available foo
```

`salt.modules.daemontools.`**`disabled`**`(`*name*`)`

Return True if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

`salt.modules.daemontools.`**`enabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable ./run file exist - a file named "down" does not exist

New in version 2015.5.7.

name Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

`salt.modules.daemontools.`**`full_restart`**`(`*name*`)`

Calls daemontools.restart() function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

`salt.modules.daemontools.`**`get_all`**`()`

Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

`salt.modules.daemontools.`**`missing`**`(`*name*`)`

The inverse of daemontools.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' daemontools.missing foo
```

`salt.modules.daemontools.`**`reload_`**`(`*name*`)`

Wrapper for term()

CLI Example:

```
salt '*' daemontools.reload <service name>
```

`salt.modules.daemontools.`**`restart`**`(`*name*`)`

Restart service via daemontools. This will stop/start service

CLI Example:

```
salt '*' daemontools.restart <service name>
```

`salt.modules.daemontools.`**`start`**`(`*name*`)`

Starts service via daemontools

CLI Example:

```
salt '*' daemontools.start <service name>
```

`salt.modules.daemontools.`**`status`**`(`*name, sig=None*`)`

Return the status for a service via daemontools, return pid if running

CLI Example:

```
salt '*' daemontools.status <service name>
```

`salt.modules.daemontools.`**`stop`**`(`*name*`)`

Stops service via daemontools

CLI Example:

```
salt '*' daemontools.stop <service name>
```

`salt.modules.daemontools.`**`term`**`(`*name*`)`

Send a TERM to service via daemontools

CLI Example:

```
salt '*' daemontools.term <service name>
```

21.9.93 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

`salt.modules.data.`**`cas`**`(`*key, value, old_value*`)`

Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

`salt.modules.data.`**`clear`**`()`

Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

`salt.modules.data.`**`dump`**`(`*new_data*`)`

Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{'eggs': 'spam'}'
```

`salt.modules.data.`**`get`**`(`*key, default=None*`)`

Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get '["key1", "key2"]'
```

`salt.modules.data.`**`has_key`**`(`*key*`)`

Check if key is in the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.has_key <mykey>
```

`salt.modules.data.`**`items`**`()`

Get items from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.items
```

`salt.modules.data.`**`keys`**`()`

Get all keys from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.keys
```

`salt.modules.data.`**`load`**`()`

Return all of the data in the minion datastore

CLI Example:

```
salt '*' data.load
```

`salt.modules.data.`**`pop`**`(`*key, default=None*`)`

Pop (return & delete) a value from the minion datastore

New in version 2015.5.2.

CLI Example:

```
salt '*' data.pop <key> "there was no val"
```

`salt.modules.data.`**`update`**(*key*, *value*)

Update a key with a value in the minion datastore

CLI Example:

```
salt '*' data.update <key> <value>
```

`salt.modules.data.`**`values`**()

Get values from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.values
```

21.9.94 salt.modules.datadog_api

An execution module that interacts with the Datadog API

The following parameters are required for all functions.

api_key The datadog API key

app_key The datadog application key

Full argument reference is available on the Datadog API reference page https://docs.datadoghq.com/api/

`salt.modules.datadog_api.`**`cancel_downtime`**(*api_key=None*, *app_key=None*, *scope=None*, *id=None*)

Cancel a downtime by id or by scope.

CLI Example:

```
salt-call datadog.cancel_downtime scope='host:app01' \
                                  api_key='0123456789' \
                                  app_key='9876543210'`
```

Arguments - Either scope or id is required.

Parameters

- **`id`** – The downtime ID
- **`scope`** – The downtime scope

`salt.modules.datadog_api.`**`post_event`**(*api_key=None*, *app_key=None*, *title=None*, *text=None*, *date_happened=None*, *priority=None*, *host=None*, *tags=None*, *alert_type=None*, *aggregation_key=None*, *source_type_name=None*)

Post an event to the Datadog stream.

CLI Example

```
salt-call datadog.post_event api_key='0123456789' \
                             app_key='9876543210' \
                             title='Salt Highstate' \
```

(continues on next page)

(continued from previous page)

```
                              text="Salt highstate was run on $(salt-call grains.
↪get id)" \
                              tags='["service:salt", "event:highstate"]'
```

Required arguments

Parameters

- **title** – The event title. Limited to 100 characters.
- **text** – The body of the event. Limited to 4000 characters. The text supports markdown.

Optional arguments

Parameters

- **date_happened** – POSIX timestamp of the event.
- **priority** – The priority of the event ('normal' or 'low').
- **host** – Host name to associate with the event.
- **tags** – A list of tags to apply to the event.
- **alert_type** – "error", "warning", "info" or "success".
- **aggregation_key** – An arbitrary string to use for aggregation, max length of 100 characters.
- **source_type_name** – The type of event being posted.

salt.modules.datadog_api.**schedule_downtime**(*scope, api_key=None, app_key=None, monitor_id=None, start=None, end=None, message=None, recurrence=None, timezone=None, test=False*)

Schedule downtime for a scope of monitors.

CLI Example:

```
salt-call datadog.schedule_downtime 'host:app2' \
                                    stop=$(date --date='30 minutes' +%s) \
                                    app_key='0123456789' \
                                    api_key='9876543210'
```

Optional arguments

Parameters

- **monitor_id** – The ID of the monitor
- **start** – Start time in seconds since the epoch
- **end** – End time in seconds since the epoch
- **message** – A message to send in a notification for this downtime
- **recurrence** – Repeat this downtime periodically
- **timezone** – Specify the timezone

21.9.95 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

depends

- dnspython Python module

configuration If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key
              (default='HMAC-MD5.SIG-ALG.REG.INT').
    Other possible values: hmac-sha1, hmac-sha224, hmac-sha256,
        hmac-sha384, hmac-sha512
```

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```
{"keyname.": "keycontent"}
```

`salt.modules.ddns.`**`add_host`**(*zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53, **kwargs*)

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

`salt.modules.ddns.`**`delete`**(*zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5, port=53, **kwargs*)

Delete a DNS record.

CLI Example:

```
salt ns1 ddns.delete example.com host1 A
```

`salt.modules.ddns.`**`delete_host`**(*zone, name, nameserver='127.0.0.1', timeout=5, port=53, **kwargs*)

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt ns1 ddns.delete_host example.com host1
```

`salt.modules.ddns.`**`update`**(*zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False, port=53, **kwargs*)

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

21.9.96 salt.modules.deb_apache

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

`salt.modules.deb_apache.`**`a2disconf`**`(`*conf*`)`

New in version 2016.3.0.

Runs a2disconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2disconf security
```

`salt.modules.deb_apache.`**`a2dismod`**`(`*mod*`)`

Runs a2dismod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.deb_apache.`**`a2dissite`**`(`*site*`)`

Runs a2dissite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

`salt.modules.deb_apache.`**`a2enconf`**`(`*conf*`)`

New in version 2016.3.0.

Runs a2enconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

`salt.modules.deb_apache.`**`a2enmod`**`(`*mod*`)`

Runs a2enmod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.deb_apache.`**`a2ensite`**`(`*site*`)`

Runs a2ensite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```

`salt.modules.deb_apache.`**`check_conf_enabled`**`(`*conf*`)`

New in version 2016.3.0.

Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

`salt.modules.deb_apache.`**`check_mod_enabled`**`(`*mod*`)`

Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

`salt.modules.deb_apache.`**`check_site_enabled`**`(`*site*`)`

Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

21.9.97 salt.modules.deb_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.

`salt.modules.deb_postgres.`**`cluster_create`**`(`*version, name='main', port=None, locale=None, encoding=None, datadir=None*`)`

Adds a cluster to the Postgres server.

CLI Example:

```
salt '*' postgres.cluster_create '9.3'

salt '*' postgres.cluster_create '9.3' 'main'

salt '*' postgres.cluster_create '9.3' locale='fr_FR'
```

`salt.modules.deb_postgres.`**`cluster_exists`**`(`*version, name='main'*`)`

Checks if a given version and name of a cluster exists.

CLI Example:

```
salt '*' postgres.cluster_exists '9.3'

salt '*' postgres.cluster_exists '9.3' 'main'
```

`salt.modules.deb_postgres.`**`cluster_list`**`(`*verbose=False*`)`

Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:

```
salt '*' postgres.cluster_list

salt '*' postgres.cluster_list verbose=True
```

`salt.modules.deb_postgres.`**`cluster_remove`**(*version*, *name='main'*, *stop=False*)

Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:

```
salt '*' postgres.cluster_remove '9.3'

salt '*' postgres.cluster_remove '9.3' 'main'

salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

21.9.98 salt.modules.debuild_pkgbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

`salt.modules.debuild_pkgbuild.`**`build`**(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-
↪libnacl.control
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

`salt.modules.debuild_pkgbuild.`**`make_repo`**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the GPG key ID.

Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc. These pillar values are assumed to be filenames which are present in `gnupghome`. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_keyname: gpg_pkg_key.pem
gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

`salt.modules.debuild_pkgbuild.`**`make_src_pkg`**(*dest_dir, spec, sources, env=None, saltenv='base', runas='root'*)

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-
↪libnacl.control.tar.xz
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

dest_dir Absolute path for directory to write source package

spec Absolute path to spec file or equivalent

sources Absolute path to source files to build source package from

env [None] A list or dictionary of environment variables to be set prior to execution. Example:

```
- env:
    - DEB_BUILD_OPTIONS: 'nocheck'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

saltenv: base

Salt environment variables

runas [root] New in version 2019.2.1.

User to create the files and directories

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

21.9.99 salt.modules.debconfmod

Support for Debconf

`salt.modules.debconfmod.`**`get_selections`**(*fetchempty=True*)

Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}
```

CLI Example:

```
salt '*' debconf.get_selections
```

`salt.modules.debconfmod.`**`set_`**(*package*, *question*, *type*, *value*, **extra*)

Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

`salt.modules.debconfmod.`**`set_file`**(*path*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://pathto/pkg.selections
```

`salt.modules.debconfmod.`**`set_template`**(*path*, *template*, *context*, *defaults*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a template.

path location of the file containing the package selections

template template format

context variables to add to the template environment

default default values for the template environment

CLI Example:

```
salt '*' debconf.set_template salt://pathto/pkg.selections.jinja jinja None None
```

`salt.modules.debconfmod.`**`show`**`(`*name*`)`

Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn't know about a package, we return None.

CLI Example:

```
salt '*' debconf.show <package name>
```

21.9.100 salt.modules.debian_ip

The networking module for Debian-based distros

References:

- http://www.debian.org/doc/manuals/debian-reference/ch05.en.html

`salt.modules.debian_ip.`**`apply_network_settings`**`(`***settings*`)`

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.debian_ip.`**`build_bond`**`(`*iface, **settings*`)`

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.debian_ip.`**`build_interface`**`(`*iface, iface_type, enabled, **settings*`)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.debian_ip.`**`build_network_settings`**`(`***settings*`)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.debian_ip.`**`build_routes`**`(`*iface, **settings*`)`

Add route scripts for a network interface using up commands.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.debian_ip.`**`down`**`(`*iface*, *iface_type*`)`
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0 eth
```

`salt.modules.debian_ip.`**`get_bond`**`(`*iface*`)`
Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.debian_ip.`**`get_interface`**`(`*iface*`)`
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.debian_ip.`**`get_network_settings`**`()`
Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.debian_ip.`**`get_routes`**`(`*iface*`)`
Return the routes for the interface

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.debian_ip.`**`up`**`(`*iface*, *iface_type*`)`
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0 eth
```

21.9.101 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see here.

`salt.modules.debian_service.`**`available`**`(`*name*`)`
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.debian_service.`**`disable`**`(`*name*, ***kwargs*`)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.debian_service.`**`disabled`**`(`*name*`)`

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.debian_service.`**`enable`**`(`*name*, ***kwargs*`)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.debian_service.`**`enabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.debian_service.`**`force_reload`**`(`*name*`)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.debian_service.`**`get_all`**`()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.debian_service.`**`get_disabled`**`()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.debian_service.`**`get_enabled`**`()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.debian_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.debian_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.debian_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.debian_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.debian_service.`**`status`**`(`*name, sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (*`str`*) – The name of the service to check
- **`sig`** (*`str`*) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.debian_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

21.9.102 salt.modules.defaults

Module to work with salt formula defaults files

`salt.modules.defaults.`**`deepcopy`**`(`*source*`)`

Allows deep copy of objects in formulas.

> By default, Python does not copy objects, it creates bindings between a target and an object.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.`**`get`**(*key*, *default=''*)

defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

`salt.modules.defaults.`**`merge`**(*dest*, *src*, *merge_lists=False*, *in_place=True*)

Allows deep merging of dicts in formulas.

merge_lists [False] If True, it will also merge lists instead of replace their items.

in_place [True] If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

> CLI Example: .. code-block:: bash
>
> salt '*' default.merge a=b d=e

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.`**`update`**(*dest*, *defaults*, *merge_lists=True*, *in_place=True*)

Allows to set defaults for group of data set e.g. group for nodes.

> This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.
>
> Example:

```
group01:
  defaults:
    enabled: True
    extra:
      - test
      - stage
  nodes:
    host01:
      index: foo
      upstream: bar
    host02:
      index: foo2
      upstream: bar2
```

```
{% do salt['defaults.update'](group01.nodes, group01.defaults) %}
```

> Each node will look like the following:

```
host01:
  enabled: True
  index: foo
  upstream: bar
  extra:
    - test
    - stage
```

merge_lists [True] If True, it will also merge lists instead of replace their items.

in_place [True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

21.9.103 salt.modules.devmap

Device-Mapper module

`salt.modules.devmap.`**`multipath_flush`**`(`*device*`)`

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

`salt.modules.devmap.`**`multipath_list`**`()`

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

21.9.104 salt.modules.dig

Compendium of generic DNS utilities. The 'dig' command line tool must be installed in order to use this module.

`salt.modules.dig.`**`A`**`(`*host, nameserver=None*`)`

Return the A record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.`**`AAAA`**`(`*host, nameserver=None*`)`

Return the AAAA record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.`**`MX`**`(`*domain, resolve=False, nameserver=None*`)`

Return a list of lists for the MX of `domain`.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.`**`NS`**`(`*domain, resolve=True, nameserver=None*`)`

Return a list of IPs of the nameservers for `domain`

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.`**`SPF`**`(`*domain, record='SPF', nameserver=None*`)`

Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

`salt.modules.dig.`**`TXT`**`(`*host, nameserver=None*`)`

Return the TXT record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.TXT google.com
```

`salt.modules.dig.`**`check_ip`**`(`*addr*`)`

Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:

```
salt ns1 dig.check_ip 127.0.0.1
salt ns1 dig.check_ip 1111:2222:3333:4444:5555:6666:7777:8888
```

21.9.105 salt.modules.disk

Module for managing disks and blockdevices

`salt.modules.disk.`**`blkid`**`(`*device=None, token=None*`)`

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

device Device name from the system

token Any valid token used for the search

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
salt '*' disk.blkid token='UUID=6a38ee5-7235-44e7-8b22-816a403bad5d'
salt '*' disk.blkid token='TYPE=ext4'
```

`salt.modules.disk.`**`dump`**`(`*device, args=None*`)`

Return all contents of dumpe2fs for a specified device

CLI Example: .. code-block:: bash

salt '*' disk.dump /dev/sda1

`salt.modules.disk.`**`format_`**(*device*, *fs_type='ext4'*, *inode_size=None*, *lazy_itable_init=None*, *fat=None*, *force=False*)

Format a filesystem onto a device

New in version 2016.11.0.

device The device in which to create the new filesystem

fs_type The type of filesystem to create

inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

fat FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

`salt.modules.disk.`**`fstype`**(*device*)

Return the filesystem name of the specified device

New in version 2016.11.0.

device The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

`salt.modules.disk.`**`hdparms`**(*disks*, *args=None*)

Retrieve all info's for all disks parse 'em into a nice dict (which, considering hdparms output, is quite a hassle)

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt '*' disk.hdparms /dev/sda

`salt.modules.disk.`**`hpa`**(*disks*, *size=None*)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

> **Warning:** Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

`salt.modules.disk.`**`inodeusage`**`(`*args=None*`)`
Return inode usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.inodeusage
```

`salt.modules.disk.`**`iostat`**`(`*interval=1, count=5, disks=None*`)`
Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

`salt.modules.disk.`**`percent`**`(`*args=None*`)`
Return partition information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.percent /var
```

`salt.modules.disk.`**`resize2fs`**`(`*device*`)`
Resizes the filesystem.

CLI Example: .. code-block:: bash

salt '*' disk.resize2fs /dev/sda1

`salt.modules.disk.`**`smart_attributes`**`(`*dev, attributes=None, values=None*`)`
Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

`salt.modules.disk.`**`tune`**`(`*device, **kwargs*`)`
Set attributes for the specified device

CLI Example:

```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: `read-ahead`, `filesystem-read-ahead`, `read-only`, `read-write`.

See the `blockdev(8)` manpage for a more complete description of these options.

`salt.modules.disk.`**`usage`**`(`*args=None*`)`

Return usage information for volumes mounted on this minion

Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks

CLI Example:

```
salt '*' disk.usage
```

`salt.modules.disk.`**`wipe`**`(`*device*`)`

Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

21.9.106 salt.modules.djangomod

Manage Django sites

`salt.modules.djangomod.`**`collectstatic`**`(`*settings_module, bin_env=None, no_post_process=False, ignore=None, dry_run=False, clear=False, link=False, no_default_ignore=False, pythonpath=None, env=None, runas=None*`)`

Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```
salt '*' django.collectstatic <settings_module>
```

`salt.modules.djangomod.`**`command`**`(`*settings_module, command, bin_env=None, pythonpath=None, env=None, runas=None, *args, **kwargs*`)`

Run arbitrary django management command

CLI Example:

```
salt '*' django.command <settings_module> <command>
```

`salt.modules.djangomod.`**`createsuperuser`**`(`*settings_module, username, email, bin_env=None, database=None, pythonpath=None, env=None, runas=None*`)`

Create a super user for the database. This function defaults to use the `--noinput` flag which prevents the creation of a password for the superuser.

CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

`salt.modules.djangomod.`**`loaddata`**`(`*settings_module, fixtures, bin_env=None, database=None, pythonpath=None, env=None*`)`

Load fixture data

Fixtures: comma separated list of fixtures to load

CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

`salt.modules.djangomod.`**`migrate`**(*settings_module*, *app_label=None*, *migration_name=None*, *bin_env=None*, *database=None*, *pythonpath=None*, *env=None*, *noinput=True*, *runas=None*)

Run migrate

Execute the Django-Admin migrate command (requires Django 1.7 or higher).

New in version 3000.

settings_module Specifies the settings module to use. The settings module should be in Python package syntax, e.g. mysite.settings. If this isn't provided, django-admin will use the DJANGO_SETTINGS_MODULE environment variable.

app_label Specific app to run migrations for, instead of all apps. This may involve running other apps' migrations too, due to dependencies.

migration_name Named migration to be applied to a specific app. Brings the database schema to a state where the named migration is applied, but no later migrations in the same app are applied. This may involve unapplying migrations if you have previously migrated past the named migration. Use the name zero to unapply all migrations for an app.

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

database Database to migrate. Defaults to 'default'.

pythonpath Adds the given filesystem path to the Python import search path. If this isn't provided, django-admin will use the PYTHONPATH environment variable.

env A list of environment variables to be set prior to execution.

Example:

```
module.run:
  - name: django.migrate
  - settings_module: my_django_app.settings
  - env:
    - DATABASE_USER: 'mydbuser'
```

noinput Suppresses all user prompts. Defaults to True.

runas The user name to run the command as.

CLI Example:

```
salt '*' django.migrate <settings_module>
salt '*' django.migrate <settings_module> <app_label>
salt '*' django.migrate <settings_module> <app_label> <migration_name>
```

`salt.modules.djangomod.`**`syncdb`**(*settings_module*, *bin_env=None*, *migrate=False*, *database=None*, *pythonpath=None*, *env=None*, *noinput=True*, *runas=None*)

Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the `migrate` option can be passed as `True` calling the migrations to run after the syncdb completes

NOTE: The syncdb command was deprecated in Django 1.7 and removed in Django 1.9. For Django versions 1.9 or higher use the *migrate* command instead.

CLI Example:

```
salt '*' django.syncdb <settings_module>
```

21.9.107 salt.modules.dnsmasq

Module for managing dnsmasq

`salt.modules.dnsmasq.`**`fullversion`**`()`

Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

`salt.modules.dnsmasq.`**`get_config`**`(`*config_file='/etc/dnsmasq.conf'*`)`

Dumps all options from the config file.

config_file The location of the config file from which to obtain contents. Defaults to `/etc/dnsmasq.conf`.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

`salt.modules.dnsmasq.`**`set_config`**`(`*config_file='/etc/dnsmasq.conf', follow=True, **kwargs*`)`

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.

If a config option currently appears multiple times (such as dhcp-host, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the config_file.

Parameters

- **`config_file`** (*string*) – config file where settings should be updated / added.
- **`follow`** (*bool*) – attempt to set the config option inside any file within the `conf-dir` where it has already been enabled.
- **`kwargs`** – key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.com
```

`salt.modules.dnsmasq.`**`version`**`()`

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```

21.9.108 salt.modules.dnsutil

Compendium of generic DNS utilities.

Note: Some functions in the `dnsutil` execution module depend on `dig`.

`salt.modules.dnsutil.`**`A`**`(`*host*, *nameserver=None*`)`

Return the A record(s) for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dnsutil.A www.google.com
```

`salt.modules.dnsutil.`**`AAAA`**`(`*host*, *nameserver=None*`)`

Return the AAAA record(s) for `host`.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnsutil.AAAA www.google.com
```

`salt.modules.dnsutil.`**`MX`**`(`*domain*, *resolve=False*, *nameserver=None*`)`

Return a list of lists for the MX of `domain`.

If the 'resolve' argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

`salt.modules.dnsutil.`**`NS`**`(`*domain*, *resolve=True*, *nameserver=None*`)`

Return a list of IPs of the nameservers for `domain`

If 'resolve' is False, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

`salt.modules.dnsutil.`**`SPF`**`(`*domain*, *record='SPF'*, *nameserver=None*`)`

Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

`salt.modules.dnsutil.`**`check_ip`**`(`*ip_addr*`)`

Check that string ip_addr is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

`salt.modules.dnsutil.`**`hosts_append`**(*hostsfile='/etc/hosts', ip_addr=None, entries=None*)

Append a single line to the /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

`salt.modules.dnsutil.`**`hosts_remove`**(*hostsfile='/etc/hosts', entries=None*)

Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

`salt.modules.dnsutil.`**`parse_hosts`**(*hostsfile='/etc/hosts', hosts=None*)

Parse /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```

`salt.modules.dnsutil.`**`parse_zone`**(*zonefile=None, zone=None*)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:

```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

`salt.modules.dnsutil.`**`serial`**(*zone='', update=False*)

Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone

update: store an updated version of the serial in a grain

If `update` is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored

If `update` is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

21.9.109 salt.modules.dockercompose module

Module to import docker-compose via saltstack

New in version 2016.3.0.

maintainer Jean Praloran <jeanpralo@gmail.com>

maturity new

depends docker-compose>=1.5

platform all

Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

Installation Prerequisites

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using `pip.install`:

```
salt myminion pip.install docker-compose>=1.5.0
```

How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto '
database:
image: mongo:3.0
command: mongod --smallfiles --quiet --logpath=/dev/null
'
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

Docker-compose method supported

- up
- restart
- stop

- start
- pause
- unpause
- kill
- rm
- ps
- pull
- build

Functions

- **docker-compose.yml management**
    - *dockercompose.create*
    - *dockercompose.get*
- **Manage containers**
    - *dockercompose.restart*
    - *dockercompose.stop*
    - *dockercompose.pause*
    - *dockercompose.unpause*
    - *dockercompose.start*
    - *dockercompose.kill*
    - *dockercompose.rm*
    - *dockercompose.up*
- **Manage containers image:**
    - *dockercompose.pull*
    - *dockercompose.build*
- **Gather information about containers:**
    - *dockercompose.ps*
- **Manage service definitions:**
    - *dockercompose.service_create*
    - *dockercompose.service_upsert*
    - *dockercompose.service_remove*
    - *dockercompose.service_set_tag*

Detailed Function Documentation

`salt.modules.dockercompose.`**`build`**`(`*path*, *service_names=None*`)`

Build image for containers in the docker-compose file, service_names is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the *build* keyword

path Path where the docker-compose file is stored on the server

service_names If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`create`**`(`*path*, *docker_compose*`)`

Create and validate a docker-compose file into a directory

path Path where the docker-compose file will be stored on the server

docker_compose docker_compose file

CLI Example:

```
salt mymininion dockercompose.create /path/where/docker-compose/stored content
```

`salt.modules.dockercompose.`**`get`**`(`*path*`)`

Get the content of the docker-compose file into a directory

path Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

`salt.modules.dockercompose.`**`kill`**`(`*path*, *service_names=None*`)`

Kill containers in the docker-compose file, service_names is a python list, if omitted kill all containers

path Path where the docker-compose file is stored on the server

service_names If specified will kill only the specified services

CLI Example:

```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`pause`**`(`*path*, *service_names=None*`)`

Pause running containers in the docker-compose file, service_names is a python list, if omitted pause all containers

path Path where the docker-compose file is stored on the server

service_names If specified will pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`ps`**`(`*path*`)`

List all running containers and report some information about them

path Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

`salt.modules.dockercompose.`**`pull`**`(`*path, service_names=None*`)`

Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images

path Path where the docker-compose file is stored on the server

service_names If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`restart`**`(`*path, service_names=None*`)`

Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers

path Path where the docker-compose file is stored on the server

service_names If specified will restart only the specified services

CLI Example:

```
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`rm`**`(`*path, service_names=None*`)`

Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers

path Path where the docker-compose file is stored on the server

service_names If specified will remove only the specified stopped services

CLI Example:

```
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`service_create`**`(`*path, service_name, definition*`)`

Create the definition of a docker-compose service This fails when the service already exists This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server

service_name Name of the service to create

definition Service definition as yaml or json string

CLI Example:

```
salt myminion dockercompose.service_create /path/where/docker-compose/stored
↪service_name definition
```

`salt.modules.dockercompose.`**`service_remove`**`(`*path*, *service_name*`)`

Remove the definition of a docker-compose service This does not rm the container This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server

service_name Name of the service to remove

CLI Example:

```
salt myminion dockercompose.service_remove /path/where/docker-compose/stored␣
↪service_name
```

`salt.modules.dockercompose.`**`service_set_tag`**`(`*path*, *service_name*, *tag*`)`

Change the tag of a docker-compose service This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server

service_name Name of the service to remove

tag Name of the tag (often used as version) that the service image should have

CLI Example:

```
salt myminion dockercompose.service_create /path/where/docker-compose/stored␣
↪service_name tag
```

`salt.modules.dockercompose.`**`service_upsert`**`(`*path*, *service_name*, *definition*`)`

Create or update the definition of a docker-compose service This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

path Path where the docker-compose file is stored on the server

service_name Name of the service to create

definition Service definition as yaml or json string

CLI Example:

```
salt myminion dockercompose.service_upsert /path/where/docker-compose/stored␣
↪service_name definition
```

`salt.modules.dockercompose.`**`start`**`(`*path*, *service_names=None*`)`

Start containers in the docker-compose file, service_names is a python list, if omitted start all containers

path Path where the docker-compose file is stored on the server

service_names If specified will start only the specified services

CLI Example:

```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`stop`**`(`*path*, *service_names=None*`)`

Stop running containers in the docker-compose file, service_names is a python list, if omitted stop all containers

path Path where the docker-compose file is stored on the server

service_names If specified will stop only the specified services

CLI Example:

```
salt myminion dockercompose.stop /path/where/docker-compose/stored
salt myminion dockercompose.stop  /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`unpause`**`(`*path*, *service_names=None*`)`

Un-Pause containers in the docker-compose file, service_names is a python list, if omitted unpause all containers

path Path where the docker-compose file is stored on the server

service_names If specified will un-pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.`**`up`**`(`*path*, *service_names=None*`)`

Create and start containers defined in the docker-compose.yml file located in path, service_names is a python list, if omitted create and start all containers

path Path where the docker-compose file is stored on the server

service_names If specified will create and start only the specified services

CLI Example:

```
salt myminion dockercompose.up /path/where/docker-compose/stored
salt myminion dockercompose.up /path/where/docker-compose/stored '[janus]'
```

21.9.110 salt.modules.dockermod

Management of Docker Containers

New in version 2015.8.0.

Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *`pip.install`*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

Authentication

If you have previously performed a `docker login` from the minion, then the credentials saved in `~/.docker/config.json` will be used for any actions which require authentication. If not, then credentials can be configured in any of the following locations:

- Minion config file

- Grains
- Pillar data
- Master config file (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

Important: Versions prior to 3000 require that Docker credentials are configured in Pillar data. Be advised that Pillar data is still recommended though, because this keeps the configuration from being stored on the Minion.

Also, keep in mind that if one gets your `~/.docker/config.json`, the password can be decoded from its contents.

The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

Note: As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying `hub` in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. `https://index.docker.io/v1/`).

More than one registry can be configured. Salt will look for Docker credentials in the `docker-registries` Pillar key, as well as any key ending in `-docker-registries`. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the *`docker.login`* function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

Note: For Salt releases before 2016.3.7 and 2016.11.4, *`docker.login`* is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the *Executing Commands Within a Running Container* section for more details on how this config parameter is used.

These configuration options are retrieved using *`config.get`* (click the link for further information).

Executing Commands Within a Running Container

Note: With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:

- lxc-attach: Default for older versions of docker
- nsenter: Enters container namespace to run command
- docker-exec: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see *`config.get`*) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either nsenter or lxc-attach) based on the `Execution Driver` value returned from `docker info`. docker-exec will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a `USER` directive was used to run as a non-privileged user, docker-exec would be unable to perform the action as root. Salt can still use docker-exec as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the *`cmd`* module. They are as follows:

- *`docker.retcode`*
- *`docker.run`*
- *`docker.run_all`*
- *`docker.run_stderr`*
- *`docker.run_stdout`*
- *`docker.script`*
- *`docker.script_retcode`*

Detailed Function Documentation

class `salt.modules.dockermod.`**`DockerJSONDecoder`**(**, object_hook=None, parse_float=None, parse_int=None, parse_constant=None, strict=True, object_pairs_hook=None*)

`decode`(*s, _w=None*)
Return the Python representation of `s` (a `str` instance containing a JSON document).

`salt.modules.dockermod.`**`apply_`**(*name, mods=None, **kwargs*)
New in version 2019.2.0.

Apply states! This function will call highstate or state.sls based on the arguments passed in, `apply` is intended to be the main gateway for all state executions.

CLI Example:

```
salt 'docker' docker.apply web01
salt 'docker' docker.apply web01 test
salt 'docker' docker.apply web01 test,pkgs
```

`salt.modules.dockermod.`**`build`**(*path=None, repository=None, tag=None, cache=True, rm=True, api_response=False, fileobj=None, dockerfile=None, buildargs=None*)
Changed in version 2018.3.0: If the built image should be tagged, then the repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Builds a docker image from a Dockerfile or a URL

path Path to directory on the Minion containing a Dockerfile

repository Optional repository name for the image being built

New in version 2018.3.0.

tag [latest] Tag name for the image (required if `repository` is passed)

New in version 2018.3.0.

image Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

cache [True] Set to `False` to force the build process not to use the Docker image cache, and pull all required intermediate image layers

rm [True] Remove intermediate containers created during build

api_response [False] If `True`: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

fileobj Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file `path` argument. This argument should not be used from the CLI, only from other Salt code.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version 2016.11.0.

buildargs A dictionary of build arguments provided to the docker build process.

RETURN DATA

A dictionary containing one or more of the following keys:

- `Id` - ID of the newly-built image

- `Time_Elapsed` - Time in seconds taken to perform the build
- `Intermediate_Containers` - IDs of containers created during the course of the build process

  (Only present if rm=False)
- **`Images` - A dictionary containing one or more of the following keys:**
  - `Already_Pulled` - Layers that that were already present on the Minion
  - `Pulled` - Layers that that were pulled

  (Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)
- `Status` - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

  (Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)

CLI Example:

```
salt myminion docker.build /path/to/docker/build/dir
salt myminion docker.build https://github.com/myuser/myrepo.git␣
↪repository=myimage tag=latest
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
↪different repository=myimage tag=dev
```

`salt.modules.dockermod.`**`call`**(*name*, *function*, **args*, ***kwargs*)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

name Container name or ID

function Salt execution module function

CLI Example:

```
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

`salt.modules.dockermod.`**`commit`**(*name*, *repository*, *tag='latest'*, *message=None*, *author=None*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Commits a container, thereby promoting it to an image. Equivalent to running the `docker commit` Docker CLI command.

name Container name or ID to commit

repository Repository name for the image being committed

New in version 2018.3.0.

tag [latest] Tag name for the image

New in version 2018.3.0.

image Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

message Commit message (Optional)

author Author name (Optional)

RETURN DATA

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.commit mycontainer myuser/myimage mytag
```

`salt.modules.dockermod.`**`compare_container`**(*first*, *second*, *ignore=None*)

This function is an alias of `compare_containers`.

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from `docker.compare_container` to `docker.compare_containers` (old function name remains as an alias)

Compare two containers' Config and and HostConfig and return any differences between the two.

first Name or ID of first container

second Name or ID of second container

ignore A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:

```
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname
```

`salt.modules.dockermod.`**`compare_container_networks`**(*first*, *second*)

New in version 2018.3.0.

Returns the differences between two containers' networks. When a network is only present one of the two containers, that network's diff will simply be represented with `True` for the side of the diff in which the network is present) and `False` for the side of the diff in which the network is absent.

This function works by comparing the contents of both containers' `Networks` keys (under `NetworkSettings`) in the return data from *`docker.inspect_container`*. Because each network contains some items that either A) only set at runtime, B) naturally varying from container to container, or both, by default the following keys in each network are examined:

- **Aliases**
- **Links**
- **IPAMConfig**

The exception to this is if `IPAMConfig` is unset (i.e. null) in one container but not the other. This happens when no static IP configuration is set, and automatic IP configuration is in effect. So, in order to report on changes between automatic IP configuration in one container and static IP configuration in another container (as we need to do for the *`docker_container.running`* state), automatic IP configuration will also be checked in these cases.

This function uses the *`docker.compare_container_networks`* minion config option to determine which keys to examine. This provides flexibility in the event that features added in a future Docker release necessitate changes to how Salt compares networks. In these cases, rather than waiting for a new Salt release one can just set *docker.compare_container_networks*.

Changed in version 3000: This config option can now also be set in pillar data and grains. Additionally, it can be set in the master config file, provided that `pillar_opts` is enabled on the minion.

Note: The checks for automatic IP configuration described above only apply if `IPAMConfig` is among the keys set for static IP checks in *docker.compare_container_networks*.

---

first Name or ID of first container (old)

second Name or ID of second container (new)

CLI Example:

```
salt myminion docker.compare_container_networks foo bar
```

`salt.modules.dockermod.`**`compare_containers`**(*first*, *second*, *ignore=None*)

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from `docker.compare_container` to `docker.compare_containers` (old function name remains as an alias)

Compare two containers' Config and and HostConfig and return any differences between the two.

first Name or ID of first container

second Name or ID of second container

ignore A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:

```
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname
```

`salt.modules.dockermod.`**`compare_networks`**(*first*, *second*, *ignore='Name, Id, Created, Containers'*)

New in version 2018.3.0.

Compare two networks and return any differences between the two

first Name or ID of first container

second Name or ID of second container

ignore [Name,Id,Created,Containers] A comma-separated list (or Python list) of keys to ignore when comparing.

CLI Example:

```
salt myminion docker.compare_network foo bar
```

`salt.modules.dockermod.`**`connect_container_to_network`**(*container*, *net_id*, ***kwargs*)

New in version 2015.8.3.

Changed in version 2017.7.0: Support for `ipv4_address` argument added

Changed in version 2018.3.0: All arguments are now passed through to connect_container_to_network(), allowing for any new arguments added to this function to be supported automagically.

Connect container to network. See the connect_container_to_network() docs for information on supported arguments.

container Container name or ID

net_id Network name or ID

CLI Examples:

```
salt myminion docker.connect_container_to_network web-1 mynet
salt myminion docker.connect_container_to_network web-1 mynet ipv4_address=10.20.
↪0.10
salt myminion docker.connect_container_to_network web-1␣
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.`**`connected`**`(`*name*, *verbose=False*`)`

New in version 2018.3.0.

Return a list of running containers attached to the specified network

name Network name

verbose [False] If `True`, return extended info about each container (IP configuration, etc.)

CLI Example:

```
salt myminion docker.connected net_name
```

`salt.modules.dockermod.`**`copy_from`**`(`*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*`)`

Copy a file from inside a container to the Minion

name Container name

source Path of the file on the container's filesystem

dest Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

makedirs [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (`True` if successful, otherwise `False`)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

`salt.modules.dockermod.`**`copy_to`**`(`*name*, *source*, *dest*, *exec_driver=None*, *overwrite=False*, *makedirs=False*`)`

Copy a file from the host into a container

name Container name

source File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileserver.

dest Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

makedirs [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (`True` if successful, otherwise `False`)

CLI Example:

```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

`salt.modules.dockermod.`**`create`**(*image, name=None, start=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs*)

Create a new container

image Image from which to create the container

name Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).

start [False] If `True`, start container after creating it

New in version 2018.3.0.

skip_translate This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment␣
↪environment="{'FOO': 'bar'}"
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

ignore_collisions [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

CONTAINER CONFIGURATION ARGUMENTS

auto_remove (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

binds Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path> - host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context> - host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a Python list, however in cases where both ro/rw and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:

- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds="['/srv/www:/var/www:ro,Z']"`
- `binds="['/srv/www:/var/www:rw,Z']"`
- `binds=/srv/www:/var/www:Z`

Note: The second and third examples above are equivalent to each other, as are the last two examples.

blkio_weight Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

blkio_weight_device Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

cap_add List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add="[SYS_ADMIN, MKNOD]"`

cap_drop List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_drop=SYS_ADMIN,MKNOD`,
- `cap_drop="[SYS_ADMIN, MKNOD]"`

command (or *cmd*) Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

cpuset_cpus (or *cpuset*) CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:

- `cpuset_cpus="0-3"`
- `cpuset="0,1"`

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:

- `cpuset_mems="0-3"`
- `cpuset_mems="0,1"`

cpu_group The length of a CPU period in microseconds

Example: `cpu_group=100000`

cpu_period Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`

detach [False] If `True`, run the container's command in the background (daemon mode)

Example: `detach=True`

devices List of host devices to expose within the container

Examples:

- `devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"`

- `devices="['/dev/net/tun', '/dev/xvda1:/dev/xvda1', '/dev/xvdb1:/dev/xvdb1:r']"`

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`.

Examples:

- `device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"`
- `device_read_bps="['/dev/sda:100mb', '/dev/sdb:5mb']"`

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"`

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb` or `gb`.

Examples:

- `device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"`
- `device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"`

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"`

dns List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns=8.8.8.8,8.8.4.4`
- `dns="['8.8.8.8', '8.8.4.4']"`

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file

Example: `dns_opt=ndots:9`

dns_search List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns_search=foo1.domain.tld,foo2.domain.tld`
- `dns_search="[foo1.domain.tld, foo2.domain.tld]"`

domainname The domain name to use for the container

Example: `domainname=domain.tld`

entrypoint Entrypoint for the container. Either a string (e.g. `"mycmd --arg1 --arg2"`) or a Python list (e.g. `"['mycmd', '--arg1', '--arg2']"`)

Examples:

- `entrypoint="cat access.log"`
- `entrypoint="['cat', 'access.log']"`

environment (or *env*) Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:

- `environment='VAR1=value,VAR2=value'`
- `environment="['VAR1=value', 'VAR2=value']"`
- `environment="{'VAR1': 'value', 'VAR2': 'value'}"`

extra_hosts Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:

- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts="['web1:10.9.8.7', 'web2:10.9.8.8']"`
- `extra_hosts="{'web1': '10.9.8.7', 'web2': '10.9.8.8'}"`

Note: To skip IP address validation, use `validate_ip_addrs=False`

group_add List of additional group names and/or IDs that the container process will run as

Examples:

- `group_add=web,network`
- `group_add="['web', 'network']"`

hostname Hostname of the container. If not provided, and if a `name` has been provided, the `hostname` will default to the `name` that was passed.

Example: `hostname=web1`

Warning: If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

interactive (or *stdin_open*): False Leave stdin open, even if not attached

Examples:

- `interactive=True`
- `stdin_open=True`

ipc_mode (or *ipc*) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues

- `host`: use the host's shared memory, semaphores and message queues

Examples:

- `ipc_mode=container:foo`
- `ipc=host`

Warning: Using `host` gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

Example: `isolation=hyperv`

Note: The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

labels (or *label*) Add metadata to the container. Labels can be set both with and without values:

Examples:

- `labels=foo,bar=baz`
- `labels="['foo', 'bar=baz']"`

Changed in version 2018.3.0: Labels both with and without values can now be mixed. Earlier releases only permitted one method or the other.

links Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, ether as a comma separated list or a Python list.

Examples:

- `links=web1:link1,web2:link2`,
- `links="['web1:link1', 'web2:link2']"`
- `links="{'web1': 'link1', 'web2': 'link2'}"`

log_driver Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- `log_driver=syslog`

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

---

log_opt Config options for the `log_driver` config option. Requires Docker 1.6 or newer.

Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"`
- `log_opt="['syslog-address=tcp://192.168.0.42', 'syslog-facility=daemon']"`
- `log_opt="{'syslog-address': 'tcp://192.168.0.42', 'syslog-facility': 'daemon'}"`

lxc_conf Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"`
- `lxc_conf="['lxc.utsname=docker', 'lxc.arch=x86_64']"`
- `lxc_conf="{'lxc.utsname': 'docker', 'lxc.arch': 'x86_64'}"`

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. `512M`, `2G`, etc.). A value of `0` (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to `-1` to disable swap. A value of `0` means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

network_disabled [False] If `True`, networking will be disabled within the container

Example: `network_disabled=True`

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

Warning: Using `host` mode gives the container full access to the hosts system's services (such as D-Bus), and is therefore considered insecure.

Examples:

- `network_mode=null`
- `network_mode=container:web1`

oom_kill_disable Whether to disable OOM killer

Example: `oom_kill_disable=False`

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

Example: `oom_score_adj=500`

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

Example: `pid_mode=host`

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

Example: `pids_limit=2000`

port_bindings (or *publish*) Bind exposed ports which were exposed using the `ports` argument to *`docker.create`*. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

- `port_bindings="5000:5000,2123:2123/udp,8080"`
- `port_bindings="['5000:5000', '2123:2123/udp', 8080]"`

Port bindings can also include ranges:

- `port_bindings="14505-14506:4505-4506"`

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

ports A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:

- `ports=1111,2222/udp`
- `ports="[1111, '2222/udp']"`

privileged [False] If `True`, runs the exec process with extended privileges

Example: `privileged=True`

publish_all_ports (or *publish_all*): False Publish all ports to the host

Example: `publish_all_ports=True`

read_only [False] If `True`, mount the container's root filesystem as read only

Example: `read_only=True`

restart_policy (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

Examples:

- `restart_policy=on-failure:5`
- `restart_policy=always`

security_opt Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:

- `security_opt=apparmor:unconfined,param2:value2`
- `security_opt='["apparmor:unconfined", "param2:value2"]'`

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size Size of /dev/shm

Example: `shm_size=128M`

stop_signal The signal used to stop the container. The default is `SIGTERM`.

Example: `stop_signal=SIGRTMIN+3`

stop_timeout Timeout to stop the container, in seconds

Example: `stop_timeout=5`

storage_opt Storage driver options for the container

Examples:

- `storage_opt='dm.basesize=40G'`
- `storage_opt="['dm.basesize=40G']"`
- `storage_opt="{'dm.basesize': '40G'}"`

sysctls (or *sysctl*) Set sysctl options for the container

Examples:

- `sysctl='fs.nr_open=1048576,kernel.pid_max=32768'`
- `sysctls="['fs.nr_open=1048576', 'kernel.pid_max=32768']"`
- `sysctls="{'fs.nr_open': '1048576', 'kernel.pid_max': '32768'}"`

tmpfs A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option *cannot* be passed as a comma-separated list.

Examples:

- `tmpfs="['/run:rw,noexec,nosuid,size=65536k', '/var/lib/mysql:rw, noexec,nosuid,size=600m']"`
- `tmpfs="{'/run': 'rw,noexec,nosuid,size=65536k', '/var/lib/mysql': 'rw,noexec,nosuid,size=600m'}"`

tty [False] Attach TTYs

Example: `tty=True`

ulimits (or *ulimit*) List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:

- `ulimits="nofile=1024:1024,nproc=60"`
- `ulimits="['nofile=1024:1024', 'nproc=60']"`

user User under which to run exec process

Example: `user=foo`

userns_mode (or *user_ns_mode*) Sets the user namsepace mode, when the user namespace remapping option is enabled.

Example: `userns_mode=host`

volumes (or *volume*) List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:

- `volumes=/mnt/vol1,/mnt/vol2`
- `volume="['/mnt/vol1', '/mnt/vol2']"`

volumes_from Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo`, `volumes_from=foo,bar`, `volumes_from="[foo, bar]"`

volume_driver Sets the container's volume driver

Example: `volume_driver=foobar`

working_dir (or *workdir*) Working directory inside the container

Examples:

- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

RETURN DATA

A dictionary containing the following keys:

- `Id` - ID of the newly-created container

- `Name` - Name of the newly-created container

CLI Example:

```
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True
↪command=bash
```

`salt.modules.dockermod.`**`create_network`**(*name*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *client_timeout=60*, ***kwargs*)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Create a new network

Note: This function supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the *NETWORK CONFIGURATION ARGUMENTS* and *IP ADDRESS MANAGEMENT (IPAM)* sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

name Network name

skip_translate This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

ignore_collisions [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

Note: When validating subnets, whether or not the IP portion of the subnet is a valid subnet boundary will not be checked. The IP will portion will be validated, and the subnet size will be checked to confirm it is a valid number (1-32 for IPv4, 1-128 for IPv6).

New in version 2018.3.0.

NETWORK CONFIGURATION ARGUMENTS

driver Network driver

Example: `driver=macvlan`

driver_opts (or *driver_opt*, or *options*) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `driver_opts='macvlan_mode=bridge,parent=eth0'`
- `driver_opts="['macvlan_mode=bridge', 'parent=eth0']"`
- `driver_opts="{'macvlan_mode': 'bridge', 'parent': 'eth0'}"`

check_duplicate [True] If `True`, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option providess a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

Example: `check_duplicate=False`

internal [False] If `True`, restricts external access to the network

Example: `internal=True`

labels Add metadata to the network. Labels can be set both with and without values:

Examples (*with* values):

- `labels="label1=value1,label2=value2"`
- `labels="['label1=value1', 'label2=value2']"`
- `labels="{'label1': 'value1', 'label2': 'value2'}"`

Examples (*without* values):

- `labels=label1,label2`
- `labels="['label1', 'label2']"`

enable_ipv6 (or *ipv6*) [False] Enable IPv6 on the network

Example: `enable_ipv6=True`

Note: While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the Docker IPv6 docs for information on how to do this.

---

attachable [False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

Example: `attachable=True`

Note: While support for this option was added in API version 1.24, its value was not added to the inpsect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

---

scope Specify the network's scope (`local`, `global` or `swarm`)

Example: `scope=local`

ingress [False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

Example: `ingress=True`

IP ADDRESS MANAGEMENT (IPAM)

This function supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM arguments as shown below, as individual arguments on the Salt CLI. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument. See the **CLI Examples** below. These docs also have more information on these arguments.

IPAM ARGUMENTS

ipam_driver IPAM driver to use, if different from the default one

Example: `ipam_driver=foo`

ipam_opts Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `ipam_opts='foo=bar,baz=qux'`
- `ipam_opts="['foo=bar', 'baz=quz']"`
- `ipam_opts="{'foo': 'bar', 'baz': 'qux'}"`

IPAM POOL ARGUMENTS

subnet Subnet in CIDR format that represents a network segment

Example: `subnet=192.168.50.0/25`

iprange (or *ip_range*) Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

Example: `iprange=192.168.50.64/26`

gateway IPv4 gateway for the master subnet

Example: `gateway=192.168.50.1`

aux_addresses (or *aux_address*) A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

Examples:

- `aux_addresses='foo.bar.tld=192.168.50.10,hello.world.tld=192.168.50.11'`
- `aux_addresses="['foo.bar.tld=192.168.50.10', 'hello.world.tld=192.168.50.11']"`

  - `aux_addresses="{'foo.bar.tld': '192.168.50.10', 'hello.world.tld': '192.168.50.11'}"`

CLI Examples:

```
salt myminion docker.create_network web_network driver=bridge
# IPv4
salt myminion docker.create_network macvlan_network driver=macvlan driver_opts="{
↪'parent':'eth0'}" gateway=172.20.0.1 subnet=172.20.0.0/24
# IPv4 and IPv6
salt myminion docker.create_network mynet ipam_pools='[{"subnet": "10.0.0.0/24",
↪"gateway": "10.0.0.1"}, {"subnet": "fe3f:2180:26:1::60/123", "gateway":
↪"fe3f:2180:26:1::61"}]'
```

`salt.modules.dockermod.`**`create_volume`**`(`*name*, *driver=None*, *driver_opts=None*`)`

Create a new volume

New in version 2015.8.4.

name name of volume

driver Driver of the volume

driver_opts Options for the driver volume

CLI Example:

```
salt myminion docker.create_volume my_volume driver=local
```

`salt.modules.dockermod.`**`dangling`**`(`*prune=False*, *force=False*`)`

Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:

- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using *`docker.load`* (or the `docker load` Docker CLI command), but not tagged.

prune [False] Remove these images

force [False] If `True`, and if `prune=True`, then forcibly remove these images.

RETURN DATA

If `prune=False`, the return data will be a list of dangling image IDs.

If `prune=True`, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:

- `Comment` - Any error encountered when trying to prune a dangling image

  (Only present if prune failed)
- `Removed` - A boolean (`True` if prune was successful, `False` if not)

CLI Example:

```
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

`salt.modules.dockermod.`**`depends`**`(`*name*`)`

Returns the containers and images, if any, which depend on the given image

name Name or ID of image

RETURN DATA

A dictionary containing the following keys:

- `Containers` - A list of containers which depend on the specified image
- `Images` - A list of IDs of images which depend on the specified image

CLI Example:

```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

`salt.modules.dockermod.`**`diff`**`(`*name*`)`

Get information on changes made to container's filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.

name Container name or ID

RETURN DATA

A dictionary containing any of the following keys:

- `Added` - A list of paths that were added.
- `Changed` - A list of paths that were changed.
- `Deleted` - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```
salt myminion docker.diff mycontainer
```

`salt.modules.dockermod.`**`disconnect_all_containers_from_network`**`(`*network_id*`)`

New in version 2018.3.0.

Runs *`docker.disconnect_container_from_network`* on all containers connected to the specified network, and returns the names of all containers that were disconnected.

network_id Network name or ID

CLI Examples:

```
salt myminion docker.disconnect_all_containers_from_network mynet
salt myminion docker.disconnect_all_containers_from_network⏎
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.`**`disconnect_container_from_network`**`(`*container, network_id*`)`

New in version 2015.8.3.

Disconnect container from network

container Container name or ID

network_id Network name or ID

CLI Examples:

```
salt myminion docker.disconnect_container_from_network web-1 mynet
salt myminion docker.disconnect_container_from_network web-1⏎
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

(continues on next page)

(continued from previous page)

```
```

`salt.modules.dockermod.`**`exists`**`(`*name*`)`

Check if a given container exists

name Container name or ID

RETURN DATA

A boolean (`True` if the container exists, otherwise `False`)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.`**`export`**`(`*name, path, overwrite=False, makedirs=False, compression=None, **kwargs*`)`

Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

name Container name or ID

path Absolute path on the Minion where the container will be exported

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `path` argument, an error will be raised.

makedirs [False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

compression [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires xz-utils, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

push [False] If `True`, the container will be pushed to the master using *`cp.push`*.

Note: This requires *`file_recv`* to be set to `True` on the Master.

RETURN DATA

A dictionary will containing the following keys:

- `Path` - Path of the file that was exported
- `Push` - Reports whether or not the file was successfully pushed to the Master

  (Only present if push=True)
- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the export

CLI Examples:

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

`salt.modules.dockermod.`**`get_client_args`**`(`*limit=None*`)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's `create_container` function.

Changed in version 2018.3.0: Added ability to limit the input to specific client functions

Many functions in Salt have been written to support the full list of arguments for a given function in the docker-py Low-level API. However, depending on the version of docker-py installed on the minion, the available arguments may differ. This function will get the arguments for various functions in the installed version of docker-py, to be used as a reference.

limit An optional list of categories for which to limit the return. This is useful if only a specific set of arguments is desired, and also keeps other function's argspecs from needlessly being examined.

AVAILABLE LIMITS

- `create_container` - arguments accepted by create_container() (used by *`docker.create`*)
- `host_config` - arguments accepted by create_host_config() (used to build the host config for *`docker.create`*)
- `connect_container_to_network` - arguments used by connect_container_to_network() to construct an endpoint config when connecting to a network (used by *`docker.connect_container_to_network`*)
- `create_network` - arguments accepted by create_network() (used by *`docker.create_network`*)
- `ipam_config` - arguments used to create an IPAM pool (used by *`docker.create_network`* in the process of constructing an IPAM config dictionary)

CLI Example:

```
salt myminion docker.get_client_args
salt myminion docker.get_client_args logs
salt myminion docker.get_client_args create_container,connect_container_to_network
```

`salt.modules.dockermod.`**`highstate`**`(`*name, saltenv='base', **kwargs*`)`

Apply a highstate to the running container

New in version 2019.2.0.

The container does not need to have Salt installed, but Python is required.

name Container name or ID

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

CLI Example:

```
salt myminion docker.highstate compassionate_mirzakhani
```

`salt.modules.dockermod.`**`history`**`(`*name, quiet=False*`)`

Return the history for an image. Equivalent to running the `docker history` Docker CLI command.

name Container name or ID

quiet [False] If `True`, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
    - FROM scratch
    - ADD↩
↪file:ef063ed0ae9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2 in /
    - CMD [/bin/bash]
    - MAINTAINER NGINX Docker Maintainers "docker-maint@nginx.com"
    - apt-key adv --keyserver pgp.mit.edu --recv-keys↩
↪573BFD6B3D8FBC641079A6ABABF5BD827BD9BF62
    - echo "deb http://nginx.org/packages/mainline/debian/ wheezy nginx" >> /
↪etc/apt/sources.list
    - ENV NGINX_VERSION=1.7.10-1~wheezy
    - apt-get update &&     apt-get install -y ca-certificates nginx=${NGINX_
↪VERSION} &&     rm -rf /var/lib/apt/lists/*
    - ln -sf /dev/stdout /var/log/nginx/access.log
    - ln -sf /dev/stderr /var/log/nginx/error.log
    - VOLUME [/var/cache/nginx]
    - EXPOSE map[80/tcp:{} 443/tcp:{}]
    - CMD [nginx -g daemon off;]
            https://github.com/saltstack/salt/pull/22421
```

RETURN DATA

If `quiet=False`, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- `Command` - The command executed in this build step
- `Id` - Layer ID
- `Size` - Cumulative image size, in bytes
- `Size_Human` - Cumulative image size, in human-readable units
- `Tags` - Tag(s) assigned to this layer
- `Time_Created_Epoch` - Time this build step was completed (Epoch time)
- `Time_Created_Local` - Time this build step was completed (Minion's local timezone)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.`**`images`**(*verbose=False*, ***kwargs*)

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

all [False] If `True`, untagged images will also be returned

verbose [False] If `True`, a `docker inspect` will be run on each image returned.

RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```
salt myminion docker.images
salt myminion docker.images all=True
```

`salt.modules.dockermod.`**`import_`**`(`*source*, *repository*, *tag='latest'*, *api_response=False*`)`

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Imports content from a local tarball or a URL as a new docker image

source Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileserver (i.e. `salt://path/to/rootfs/tarball.tar.xz`. To import a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

repository Repository name for the image being imported

New in version 2018.3.0.

tag [latest] Tag name for the image

New in version 2018.3.0.

image Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

api_response [False] If `True` an `api_response` key will be present in the return data, containing the raw output from the Docker API.

RETURN DATA

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/
↪centos:7
```

`salt.modules.dockermod.`**`info`**`()`

Returns a dictionary of system-wide information. Equivalent to running the `docker info` Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

`salt.modules.dockermod.`**`inspect`**`(`*name*`)`

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- *`docker.inspect_container`*
- *`docker.inspect_image`*
- *`docker.inspect_volume`*
- *`docker.inspect_network`*

The first of these to find a match will be returned.

name Container/image/volume/network name or ID

RETURN DATA

A dictionary of container/image/volume/network information

CLI Example:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

`salt.modules.dockermod.`**`inspect_container`**`(`*name*`)`

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

name Container name or ID

RETURN DATA

A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

`salt.modules.dockermod.`**`inspect_image`**`(`*name*`)`

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

Note: To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

name Image name or ID

RETURN DATA

A dictionary of image information

CLI Examples:

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

`salt.modules.dockermod.`**`inspect_network`**`(`*network_id*`)`

Inspect Network

network_id ID of network

CLI Example:

```
salt myminion docker.inspect_network
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.`**`inspect_volume`**`(`*name*`)`

Inspect Volume

New in version 2015.8.4.

name Name of volume

CLI Example:

```
salt myminion docker.inspect_volume my_volume
```

`salt.modules.dockermod.`**`kill`**`(`*name*`)`

Kill all processes in a running container instead of performing a graceful shutdown

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be killed

CLI Example:

```
salt myminion docker.kill mycontainer
```

`salt.modules.dockermod.`**`layers`**`(`*name*`)`

Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one correspnding to the passed name) appearing last.

name Image name or ID

CLI Example:

```
salt myminion docker.layers centos:7
```

`salt.modules.dockermod.`**`list_containers`**`(`***kwargs*`)`

Returns a list of containers by name. This is different from `docker.ps` in that `docker.ps` returns its results organized by container ID.

all [False] If `True`, stopped containers will be included in return data

CLI Example:

```
salt myminion docker.inspect_image <image>
```

`salt.modules.dockermod.`**`list_tags`**`()`

Returns a list of tagged images

CLI Example:

```
salt myminion docker.list_tags
```

`salt.modules.dockermod.`**`load`**`(`*path*, *repository=None*, *tag=None*`)`

Changed in version 2018.3.0: If the loaded image should be tagged, then the repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).

path Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

repository If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo using `docker.tag`. If a repository name is provided, then the `tag` argument is also required.

New in version 2018.3.0.

tag Tag name to go along with the repository name, if the loaded image is to be tagged.

New in version 2018.3.0.

image Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Layers` - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- `Image` - Name of tag applied to topmost layer

  (Only present if tag was specified and tagging was successful)
- `Time_Elapsed` - Time in seconds taken to load the file
- `Warning` - Message describing any problems encountered in attemp to tag the topmost layer

  (Only present if tag was specified and tagging failed)

CLI Example:

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar repository=myuser/
↪myimage tag=mytag
```

`salt.modules.dockermod.`**`login`**`(`**registries*`)`

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to *just* those registries. If no registry URLs are provided, Salt will attempt to login to *all* configured registries.

RETURN DATA

A dictionary containing the following keys:

- `Results` - A dictionary mapping registry URLs to the authentication result. `True` means a successful login, `False` means a failed login.
- `Errors` - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

`salt.modules.dockermod.`**`logs`**`(`*name*, ***kwargs*`)`

Changed in version 2018.3.0: Support for all of docker-py's logs() function's arguments, with the exception of `stream`.

Returns the logs for the container. An interface to docker-py's logs() function.

name Container name or ID

stdout [True] Return stdout lines

stderr [True] Return stdout lines

timestamps [False] Show timestamps

tail [all] Output specified number of lines at the end of logs. Either an integer number of lines or the string `all`.

since Show logs since the specified time, passed as a UNIX epoch timestamp. Optionally, if timelib is installed on the minion the timestamp can be passed as a string which will be resolved to a date using `timelib.strtodatetime()`.

follow [False] If `True`, this function will block until the container exits and return the logs when it does. The default behavior is to return what is in the log at the time this function is executed.

CLI Examples:

```
# All logs
salt myminion docker.logs mycontainer
# Last 100 lines of log
salt myminion docker.logs mycontainer tail=100
# Just stderr
salt myminion docker.logs mycontainer stdout=False
# Logs since a specific UNIX timestamp
salt myminion docker.logs mycontainer since=1511688459
# Flexible format for "since" argument (requires timelib)
salt myminion docker.logs mycontainer since='1 hour ago'
salt myminion docker.logs mycontainer since='1 week ago'
salt myminion docker.logs mycontainer since='1 fortnight ago'
```

`salt.modules.dockermod.`**`networks`**`(`*names=None, ids=None*`)`

Changed in version 2017.7.0: The `names` and `ids` can be passed as a comma-separated list now, as well as a Python list.

Changed in version 2018.3.0: The `Containers` key for each network is no longer always empty.

List existing networks

names Filter by name

ids Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks⏎
↪ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.`**`pause`**`(`*name*`)`

Pauses a container

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

`salt.modules.dockermod.`**`pid`**(*name*)

Returns the PID of a container

name Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

`salt.modules.dockermod.`**`port`**(*name*, *private_port=None*)

Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

name Container name or ID

> Changed in version 2019.2.0: This value can now be a pattern expression (using the pattern-matching characters defined in fnmatch). If a pattern expression is used, this function will return a dictionary mapping container names which match the pattern to the mappings for those containers. When no pattern expression is used, a dictionary of the mappings for the specified container name will be returned.

private_port [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. `5000`), or as a port number plus the protocol (i.e. `5000/udp`).

> If this argument is omitted, all port mappings will be returned.

RETURN DATA

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

`salt.modules.dockermod.`**`prune`**(*containers=False*, *networks=False*, *images=False*, *build=False*, *volumes=False*, *system=None*, ***filters*)

New in version 2019.2.0.

Prune Docker's various subsystems

Note: This requires docker-py version 2.1.0 or later.

containers [False] If `True`, prunes stopped containers (documentation)

images [False] If `True`, prunes unused images (documentation)

networks [False] If `False`, prunes unreferenced networks (documentation)

build [False] If `True`, clears the builder cache

> **Note:** Only supported in Docker 17.07.x and newer. Additionally, filters do not apply to this argument.

volumes [False] If `True`, prunes unreferenced volumes (documentation)

system If `True`, prunes containers, images, networks, and builder cache. Assumed to be `True` if none of `containers`, `images`, `networks`, or `build` are set to `True`.

Note: `volumes=True` must still be used to prune volumes

---

filters

- `dangling=True` (images only) - remove only dangling images
- `until=<timestamp>` - only remove objects created before given timestamp. Not applicable to volumes. See the documentation links above for examples of valid time expressions.
- `label` - only remove objects matching the label expression. Valid expressions include `labelname` or `labelname=value`.

CLI Examples:

```
salt myminion docker.prune system=True
salt myminion docker.prune system=True until=12h
salt myminion docker.prune images=True dangling=True
salt myminion docker.prune images=True label=foo,bar=baz
```

`salt.modules.dockermod.`**`ps_`**(*filters=None*, ***kwargs*)

Returns information about the Docker containers on the Minion. Equivalent to running the `docker ps` Docker CLI command.

all [False] If `True`, stopped containers will also be returned

host: False If `True`, local host's network topology will be included

verbose [False] If `True`, a `docker inspect` will be run on each container returned.

filters: None A dictionary of filters to be processed on the container list. Available filters:

- exited (int): Only containers with specified exit code
- status (str): One of restarting, running, paused, exited
- label (str): format either "key" or "key=value"

RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

`salt.modules.dockermod.`**`pull`**(*image*, *insecure_registry=False*, *api_response=False*, *client_timeout=60*)

Changed in version 2018.3.0: If no tag is specified in the `image` argument, all tags for the image will be pulled. For this reason is it recommended to pass `image` using the `repo:tag` notation.

Pulls an image from a Docker registry

image Image to be pulled

insecure_registry [False] If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response [False] If `True`, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

Note: This may result in a **lot** of additional return data, especially for larger images.

---

client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **`Layers`** - **A dictionary containing one or more of the following keys**:
  - `Already_Pulled` - Layers that that were already present on the Minion
  - `Pulled` - Layers that that were pulled
- `Status` - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- `Time_Elapsed` - Time in seconds taken to perform the pull

CLI Example:

```
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

`salt.modules.dockermod.`**`push`**`(`*image*, *insecure_registry=False*, *api_response=False*, *client_timeout=60*`)`

Changed in version 2015.8.4: The `Id` and `Image` keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

image Image to be pushed. If just the repository name is passed, then all tagged images for the specified repo will be pushed. If the image name is passed in `repo:tag` notation, only the specified image will be pushed.

insecure_registry [False] If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response [False] If `True`, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **`Layers`** - **A dictionary containing one or more of the following keys**:
  - `Already_Pushed` - Layers that that were already present on the Minion
  - `Pushed` - Layers that that were pushed
- `Time_Elapsed` - Time in seconds taken to perform the push

CLI Example:

```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

`salt.modules.dockermod.`**`remove_network`**`(`*network_id*`)`

Remove a network

network_id Network name or ID

CLI Examples:

```
salt myminion docker.remove_network mynet
salt myminion docker.remove_network␣
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.`**`remove_volume`**`(`*name*`)`

Remove a volume

New in version 2015.8.4.

name Name of volume

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

`salt.modules.dockermod.`**`rename`**`(`*name, new_name*`)`

New in version 2017.7.0.

Renames a container. Returns `True` if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then `False` will be returned.

name Name or ID of existing container

new_name New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

`salt.modules.dockermod.`**`resolve_image_id`**`(`*name*`)`

New in version 2018.3.0.

Given an image name (or partial image ID), return the full image ID. If no match is found among the locally-pulled images, then `False` will be returned.

CLI Examples:

```
salt myminion docker.resolve_image_id foo
salt myminion docker.resolve_image_id foo:bar
salt myminion docker.resolve_image_id 36540f359ca3
```

`salt.modules.dockermod.`**`resolve_tag`**`(`*name, **kwargs*`)`

New in version 2017.7.2.

Changed in version 2018.3.0: Instead of matching against pulled tags using *`docker.list_tags`*, this function now simply inspects the passed image name using *`docker.inspect_image`* and returns the first matching tag. If no matching tags are found, it is assumed that the passed image is an untagged image ID, and the full ID is returned.

Inspects the specified image name and returns the first matching tag in the inspect results. If the specified image is not pulled locally, this function will return `False`.

name Image name to resolve. If the image is found but there are no tags, this means that the image name passed was an untagged image. In this case the image ID will be returned.

all [False] If `True`, a list of all matching tags will be returned. If the image is found but there are no tags, then a list will still be returned, but it will simply contain the image ID.

New in version 2018.3.0.

tags Deprecated since version 2018.3.0.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag centos:7 all=True
salt myminion docker.resolve_tag c9f378ac27d9
```

`salt.modules.dockermod.`**`restart`**`(`*name, timeout=10*`)`

Restarts a container

name Container name or ID

timeout [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `restarted` - If restart was successful, this key will be present and will be set to `True`.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

`salt.modules.dockermod.`**`retcode`**`(`*name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None*`)`

Run *`cmd.retcode`* within a container

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`rm_`**`(`*name*, *force=False*, *volumes=False*, ***kwargs*`)`

Removes a container

name Container name or ID

force [False] If `True`, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

stop [False] If `True`, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

New in version 2017.7.0.

timeout Optional timeout to be passed to *`docker.stop`* if stopping the container.

New in version 2018.3.0.

volumes [False] Also remove volumes associated with container

RETURN DATA

A list of the IDs of containers which were removed

CLI Example:

```
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

`salt.modules.dockermod.`**`rmi`**`(`**names*, ***kwargs*`)`

Removes an image

name Name (in `repo:tag` notation) or ID of image.

force [False] If `True`, the image will be removed even if the Minion has containers created from that image

prune [True] If `True`, untagged parent image layers will be removed as well, set this to `False` to keep them.

RETURN DATA

A dictionary will be returned, containing the following two keys:

- `Layers` - A list of the IDs of image layers that were removed
- `Tags` - A list of the tags that were removed
- `Errors` - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

`salt.modules.dockermod.`**`run`**`(`*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*`)`

Run *`cmd.run`* within a container

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`run_all`**`(`*name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None*`)`

Run `cmd.run_all` within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`run_container`**`(`*image, name=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, bg=False, replace=False, force=False, networks=None, **kwargs*`)`

New in version 2018.3.0.

Equivalent to `docker run` on the Docker CLI. Runs the container, waits for it to exit, and returns the container's logs when complete.

Note: Not to be confused with `docker.run`, which provides a `cmd.run`-like interface for executing commands in a running container.

This function accepts the same arguments as `docker.create`, with the exception of `start`. In addition, it accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Finally, the `bg` argument described below can be used to optionally run the container in the background (the default behavior is to block until the container exits).

bg [False] If `True`, this function will not wait for the container to exit and will not return its logs. It will however return the container's name and ID, allowing for `docker.logs` to be used to view the logs.

> **Note:** The logs will be inaccessible once the container exits if `auto_remove` is set to `True`, so keep this in mind.

replace [False] If `True`, and if the named container already exists, this will remove the existing container. The default behavior is to return a `False` result when the container already exists.

force [False] If `True`, and the named container already exists, *and* `replace` is also set to `True`, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

networks Networks to which the container should be connected. If automatic IP configuration is being used, the networks can be a simple list of network names. If custom IP configuration is being used, then this argument must be passed as a dictionary.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪sh
# Run container in the background
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪sh bg=True
# Connecting to two networks using automatic IP configuration
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
↪networks=net1,net2
# net1 using automatic IP, net2 using static IPv4 address
salt myminion docker.run_container myuser/myimage command='perl /scripts/sync.py'
↪networks='{"net1": {}, "net2": {"ipv4_address": "192.168.27.12"}}'
```

`salt.modules.dockermod.`**`run_stderr`**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.run_stderr` within a container

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`run_stdout`**`(`*name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None*`)`

Run *`cmd.run_stdout`* within a container

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`save`**`(`*name, path, overwrite=False, makedirs=False, compression=None, **kwargs*`)`

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

name Name or ID of image. Specify a specific tag by using the `repo:tag` notation.

path Absolute path on the Minion where the image will be exported

overwrite [False] Unless this option is set to `True`, then if the destination file exists an error will be raised.

makedirs [False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

compression [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires xz-utils, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

Note: Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with *`docker.export`* since the image(s) will first be saved and then the compression done afterwards.

push [False] If `True`, the container will be pushed to the master using *`cp.push`*.

Note: This requires *`file_recv`* to be set to `True` on the Master.

RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Push` - Reports whether or not the file was successfully pushed to the Master

  (Only present if push=True)
- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the save

CLI Examples:

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

`salt.modules.dockermod.`**`script`**(*name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None*)

Run *`cmd.script`* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

name Container name or ID

source Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

args A string containing additional command-line options to pass to the script.

template [None] Templating engine to use on the script before running.

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the script

output_loglevel [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"
↪'
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

`salt.modules.dockermod.`**`script_retcode`**(*name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None*)

Run *`cmd.script_retcode`* within a container

name Container name or ID

source Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

args A string containing additional command-line options to pass to the script.

template [None] Templating engine to use on the script before running.

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the script

output_loglevel [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh 'arg1
↪arg2 "arg 3"'
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

`salt.modules.dockermod.`**`search`**(*name, official=False, trusted=False*)

Searches the registry for an image

name Search keyword

official [False] Limit results to official builds

trusted [False] Limit results to trusted builds

RETURN DATA

A dictionary with each key being the name of an image, and the following information for each image:

- `Description` - Image description
- `Official` - A boolean (`True` if an official build, `False` if not)
- `Stars` - Number of stars the image has on the registry
- `Trusted` - A boolean (`True` if a trusted build, `False` if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

`salt.modules.dockermod.`**`signal_`**(*name, signal*)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage.

name Container name or ID

signal Signal to send to container

RETURN DATA

If the signal was successfully sent, `True` will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

`salt.modules.dockermod.`**`sls`**(*name*, *mods=None*, ***kwargs*)

Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

name Container name or ID

mods [None] A string containing comma-separated list of SLS with defined states to apply to the container.

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

`salt.modules.dockermod.`**`sls_build`**(*repository*, *tag='latest'*, *base='opensuse/python'*, *mods=None*, *dryrun=False*, ***kwargs*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

repository Repository name for the image to be built

New in version 2018.3.0.

tag [latest] Tag name for the image to be built

New in version 2018.3.0.

name Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

base [opensuse/python] Name or ID of the base image

mods A string containing comma-separated list of SLS with defined states to apply to the base image.

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

dryrun: False when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

RETURN DATA

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:

```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

`salt.modules.dockermod.`**`start_`**`(`*name*`)`

Start a container

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

`salt.modules.dockermod.`**`state`**`(`*name*`)`

Returns the state of the container

name Container name or ID

RETURN DATA

A string representing the current state of the container (either `running`, `paused`, or `stopped`)

CLI Example:

```
salt myminion docker.state mycontainer
```

`salt.modules.dockermod.`**`stop`**`(`*name, timeout=None, **kwargs*`)`

Stops a running container

name Container name or ID

unpause [False] If `True` and the container is paused, it will be unpaused before attempting to stop the container.

timeout Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the `stop_timeout` argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

`salt.modules.dockermod.`**`tag_`**`(`*name*, *repository*, *tag='latest'*, *force=False*`)`

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Tag an image into a repository and return `True`. If the tag was unsuccessful, an error will be raised.

name ID of image

repository Repository name for the image to be built

New in version 2018.3.0.

tag [latest] Tag name for the image to be built

New in version 2018.3.0.

image Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

force [False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer mytag
```

`salt.modules.dockermod.`**`top`**`(`*name*`)`

Runs the *docker top* command on a specific container

name Container name or ID

CLI Example:

RETURN DATA

A list of dictionaries containing information about each process

```
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

`salt.modules.dockermod.`**`unpause`**`(`*name*`)`

Unpauses a container

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

`salt.modules.dockermod.`**`version`**`()`

Returns a dictionary of Docker version information. Equivalent to running the `docker version` Docker CLI command.

CLI Example:

```
salt myminion docker.version
```

`salt.modules.dockermod.`**`volumes`**`(`*filters=None*`)`

List existing volumes

New in version 2015.8.4.

filters There is one available filter: dangling=true

CLI Example:

```
salt myminion docker.volumes filters="{'dangling': True}"
```

`salt.modules.dockermod.`**`wait`**`(`*name, ignore_already_stopped=False, fail_on_exit_status=False*`)`

Wait for the container to exit gracefully, and return its exit code

Note: This function will block until the container is stopped.

name Container name or ID

ignore_already_stopped Boolean flag that prevents execution to fail, if a container is already stopped.

fail_on_exit_status Boolean flag to report execution as failure if `exit_status` is different than 0.

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `exit_status` - Exit status for the container
- `comment` - Only present if the container is already stopped

CLI Example:

```
salt myminion docker.wait mycontainer
```

21.9.111 salt.modules.dpkg_lowpkg

Support for DEB packages

`salt.modules.dpkg_lowpkg.`**`bin_pkg_info`**`(`*path, saltenv='base'*`)`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver envrionment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg_lowpkg.`**`file_dict`**`(`**packages*`)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg_lowpkg.`**`file_list`**`(`**packages*`)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg_lowpkg.`**`info`**`(`**packages, **kwargs*`)`

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

packages The names of the packages for which to return information.

failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

`salt.modules.dpkg_lowpkg.`**`list_pkgs`**`(`**packages*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

```
Virtual package resolution requires aptitude. Because this function
uses dpkg, virtual packages will be reported as not installed.
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

`salt.modules.dpkg_lowpkg.`**`unpurge`**(**packages*)

Change package selection for each package specified to 'install'

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

21.9.112 salt.modules.drac

Manage Dell DRAC

`salt.modules.drac.`**`change_password`**(*username, password, uid=None*)

Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

`salt.modules.drac.`**`create_user`**(*username, password, permissions, users=None*)

Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.drac.`**`delete_user`**`(`*username*, *uid=None*`)`

Delete a user

CLI Example:

```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

`salt.modules.drac.`**`email_alerts`**`(`*action*`)`

Enable/Disable email alerts

CLI Example:

```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

`salt.modules.drac.`**`list_users`**`()`

List all DRAC users

CLI Example:

```
salt dell drac.list_users
```

`salt.modules.drac.`**`nameservers`**`(`**ns*`)`

Configure the nameservers on the DRAC

CLI Example:

```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```

`salt.modules.drac.`**`network_info`**`()`

Return Network Configuration

CLI Example:

```
salt dell drac.network_info
```

`salt.modules.drac.`**`server_hardreset`**`()`

Performs a reset (reboot) operation on the managed server.

CLI Example:

```
salt dell drac.server_hardreset
```

`salt.modules.drac.`**`server_poweroff`**`()`

Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

`salt.modules.drac.`**`server_poweron`**`()`

Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

`salt.modules.drac.`**`server_pxe`**`()`

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

`salt.modules.drac.`**`server_reboot`**`()`

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

`salt.modules.drac.`**`set_network`**`(`*ip*, *netmask*, *gateway*`)`

Configure Network

CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

`salt.modules.drac.`**`set_permissions`**`(`*username*, *permissions*, *uid=None*`)`

Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.drac.`**`set_snmp`**`(`*community*`)`

Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

`salt.modules.drac.`**`syslog`**`(`*server*, *enable=True*`)`

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

`salt.modules.drac.`**`system_info`**`()`

Return System information

CLI Example:

```
salt dell drac.system_info
```

21.9.113 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

`salt.modules.dracr.`**`bare_rac_cmd`**`(`*cmd, host=None, admin_username=None, admin_password=None*`)`

`salt.modules.dracr.`**`change_password`**`(`*username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None*`)`

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

`salt.modules.dracr.`**`create_user`**`(`*username, password, permissions, users=None, host=None, admin_username=None, admin_password=None*`)`

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection

- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.dracr.`**`delete_user`**`(`*username, uid=None, host=None, admin_username=None, admin_password=None*`)`

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

`salt.modules.dracr.`**`deploy_password`**`(`*username, password, host=None, admin_username=None, admin_password=None, module=None*`)`

Change the QuickDeploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker.

`salt.modules.dracr.`**`deploy_snmp`**`(`*snmp, host=None, admin_username=None, admin_password=None, module=None*`)`

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:

```
salt dell dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

`salt.modules.dracr.`**`email_alerts`**`(`*action, host=None, admin_username=None, admin_password=None*`)`

Enable/Disable email alerts

CLI Example:

```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

`salt.modules.dracr.`**`get_chassis_datacenter`**`(`*host=None, admin_username=None, admin_password=None*`)`

Get the datacenter of the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`get_chassis_location`**`(`*host=None, admin_username=None, admin_password=None*`)`

Get the location of the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`get_chassis_name`**`(`*host=None, admin_username=None, admin_password=None*`)`

Get the name of a chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`get_dns_dracname`**`(`*host=None, admin_username=None, admin_password=None*`)`

`salt.modules.dracr.`**`get_general`**`(`*cfg_sec, cfg_var, host=None, admin_username=None, admin_password=None*`)`

`salt.modules.dracr.`**`get_slotname`**`(`*slot, host=None, admin_username=None, admin_password=None*`)`

Get the name of a slot number in the chassis.

slot The number of the slot for which to obtain the name.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
   admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`idrac_general`**`(`*blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None*`)`

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

Parameters

- **blade_name** – Name of the blade to run the command on
- **command** – Command like to pass to racadm
- **idrac_password** – Password for the iDRAC if different from the CMC
- **host** – Chassis hostname
- **admin_username** – CMC username
- **admin_password** – CMC password

Returns stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

`salt.modules.dracr.`**`inventory`**(*host=None, admin_username=None, admin_password=None*)

`salt.modules.dracr.`**`list_slotnames`**(*host=None, admin_username=None, admin_password=None*)

List the names of all slots in the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`list_users`**(*host=None, admin_username=None, admin_password=None, module=None*)

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

`salt.modules.dracr.`**`nameservers`**(*ns, host=None, admin_username=None, admin_password=None, module=None*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
    admin_username=root admin_password=calvin module=server-1
    host=192.168.1.1
```

`salt.modules.dracr.`**`network_info`**(*host=None, admin_username=None, admin_password=None, module=None*)

Return Network Configuration

CLI Example:

```
salt dell dracr.network_info
```

`salt.modules.dracr.`**`server_hardreset`**`(`*host=None, admin_username=None, admin_password=None, module=None*`)`

Performs a reset (reboot) operation on the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

`salt.modules.dracr.`**`server_power`**`(`*status, host=None, admin_username=None, admin_password=None, module=None*`)`

status One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.`**`server_poweroff`**`(`*host=None, admin_username=None, admin_password=None, module=None*`)`

Powers down the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

`salt.modules.dracr.`**`server_poweron`**`(`*host=None, admin_username=None, admin_password=None, module=None*`)`

Powers up the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

`salt.modules.dracr.`**`server_powerstatus`**(*host=None, admin_username=None, admin_password=None, module=None*)

return the power status for the passed module

CLI Example:

```
salt dell drac.server_powerstatus
```

`salt.modules.dracr.`**`server_pxe`**(*host=None, admin_username=None, admin_password=None*)

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

`salt.modules.dracr.`**`server_reboot`**(*host=None, admin_username=None, admin_password=None, module=None*)

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.`**`set_chassis_datacenter`**(*location, host=None, admin_username=None, admin_password=None*)

Set the location of the chassis.

location The name of the datacenter to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`set_chassis_location`**(*location, host=None, admin_username=None, admin_password=None*)

Set the location of the chassis.

location The name of the location to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_chassis_name**(*name, host=None, admin_username=None, admin_password=None*)

Set the name of the chassis.

name The name to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_dns_dracname**(*name, host=None, admin_username=None, admin_password=None*)

salt.modules.dracr.**set_general**(*cfg_sec, cfg_var, val, host=None, admin_username=None, admin_password=None*)

salt.modules.dracr.**set_network**(*ip, netmask, gateway, host=None, admin_username=None, admin_password=None*)

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
    admin_username=root admin_password=calvin host=192.168.1.1
```

salt.modules.dracr.**set_niccfg**(*ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin_username=None, admin_password=None, module=None*)

salt.modules.dracr.**set_nicvlan**(*vlan=None, host=None, admin_username=None, admin_password=None, module=None*)

salt.modules.dracr.**set_permissions**(*username, permissions, uid=None, host=None, admin_username=None, admin_password=None*)

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
     [USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users

- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.dracr.`**`set_slotname`**`(`*slot, name, host=None, admin_username=None, admin_password=None*`)`

Set the name of a slot in a chassis.

slot The slot number to change.

name The name to set. Can only be 15 characters long.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.`**`set_snmp`**`(`*community, host=None, admin_username=None, admin_password=None*`)`

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

`salt.modules.dracr.`**`syslog`**`(`*server, enable=True, host=None, admin_username=None, admin_password=None, module=None*`)`

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

`salt.modules.dracr.`**`system_info`**`(`*host=None, admin_username=None, admin_password=None, module=None*`)`

Return System information

CLI Example:

```
salt dell dracr.system_info
```

`salt.modules.dracr.`**`update_firmware`**`(`*filename, host=None, admin_username=None, admin_password=None*`)`

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

`salt.modules.dracr.`**`update_firmware_nfs_or_cifs`**(*filename, share, host=None, admin_username=None, admin_password=None*)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs          firmware.exe //IP-Address/
↪share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs          firmware.exe IP-address:/
↪share
```

21.9.114 salt.modules.drbd

DRBD administration module

`salt.modules.drbd.`**`overview`**()

Show status of the DRBD devices, support two nodes only.

CLI Example:

```
salt '*' drbd.overview
```

21.9.115 salt.modules.dummyproxy_pkg module

Package support for the dummy proxy used by the test suite

`salt.modules.dummyproxy_pkg.`**`install`**(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*)

`salt.modules.dummyproxy_pkg.`**`installed`**(*name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs*)

`salt.modules.dummyproxy_pkg.`**`list_pkgs`**(*versions_as_list=False, **kwargs*)

`salt.modules.dummyproxy_pkg.`**`remove`**(*name=None, pkgs=None, **kwargs*)

`salt.modules.dummyproxy_pkg.`**`upgrade`**(*name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs*) `salt.modules.dummyproxy_pkg.`**`version`**`(`**names*, ***kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.116 salt.modules.dummyproxy_service module

Provide the service module for the dummy proxy used in integration tests

`salt.modules.dummyproxy_service.`**`enabled`**`(`*name*, *sig=None*`)`

Only the 'redbull' service is 'enabled' in the test

New in version 2016.11.3.

`salt.modules.dummyproxy_service.`**`get_all`**`()`

Return a list of all available services

New in version 2016.11.3.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.dummyproxy_service.`**`list_`**`()`

Return a list of all available services.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.list
```

`salt.modules.dummyproxy_service.`**`restart`**`(`*name*, *sig=None*`)`

Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.dummyproxy_service.`**`running`**`(`*name*, *sig=None*`)`

Return whether this service is running.

New in version 2016.11.3.

`salt.modules.dummyproxy_service.`**`start`**`(`*name*, *sig=None*`)`

Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.dummyproxy_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.dummyproxy_service.`**`stop`**`(`*name*, *sig=None*`)`

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

21.9.117 salt.modules.ebuildpkg

Support for Portage

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

---

optdepends

- portage Python adapter

For now all package names *MUST* include the package category, i.e. `'vim'` will not work, `'app-editors/vim'` will.

`salt.modules.ebuildpkg.`**`check_db`**`(`**names*, ***kwargs*`)`

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key `found`, which will be a boolean value denoting if a match was found in the package database.
2. If `found` is `False`, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in `category/pkgname` format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

`salt.modules.ebuildpkg.`**`check_extra_requirements`**`(`*pkgname*, *pkgver*`)`

Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.1::gentoo[nls,
↪fortran]'
```

`salt.modules.ebuildpkg.`**`depclean`**`(`*name=None*, *slot=None*, *fromrepo=None*, *pkgs=None*`)`

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

name The name of the package to be cleaned.

slot Restrict the remove to a specific slot. Ignored if `name` is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

pkgs Clean multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

`salt.modules.ebuildpkg.`**`ex_mod_init`**(*low*)

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for /etc/portage/package.* configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

See also:

`ebuild.ex_mod_init` is called automatically when a state invokes a pkg state on a Gentoo system. `salt.states.pkg.mod_init()`

`ebuild.ex_mod_init` uses `portage_config.enforce_nice_config` to do the lifting. *`salt.modules.portage_config.enforce_nice_config()`*

CLI Example:

```
salt '*' pkg.ex_mod_init
```

`salt.modules.ebuildpkg.`**`install`**(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, *slot=None*, *fromrepo=None*, *uses=None*, *binhost=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add refresh=True to sync the portage tree before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the "sources" option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to sync the portage tree before installing.

version Install a specific version of the package, e.g. 1.0.9-r1. Ignored if "pkgs" or "sources" is passed.

slot Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

fromrepo Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

uses Similar to slot, but specifies a list of use flag. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

pkgs A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar","~category/
↪package:slot::repository[use]"]'
```

sources A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"},{"bar": "salt://bar.
↪tbz2"}]'
```

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.ebuildpkg.`**`latest_version`**(**names, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.ebuildpkg.`**`list_pkgs`**(*versions_as_list=False, **kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.ebuildpkg.`**`list_upgrades`**(*refresh=True, backtrack=3, **kwargs*)

List all available package upgrades.

refresh Whether or not to sync the portage tree before checking for upgrades.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: ´3´).

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.ebuildpkg.`**`porttree_matches`**`(`*name*`)`

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. "dev-python/paramiko").

`salt.modules.ebuildpkg.`**`purge`**`(`*name=None, slot=None, fromrepo=None, pkgs=None, **kwargs*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if name is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.ebuildpkg.`**`refresh_db`**`()`

Update the portage tree using the first available method from the following list:

- emaint sync
- eix-sync
- emerge-webrsync
- emerge –sync

To prevent the portage tree from being synced within one day of the previous sync, add the following pillar data for this minion:

```
portage:
  sync_wait_one_day: True
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.ebuildpkg.`**`remove`**`(`*name=None, slot=None, fromrepo=None, pkgs=None, **kwargs*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via emerge –unmerge.

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if `name` is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.ebuildpkg.`**`update`**`(`*pkg, slot=None, fromrepo=None, refresh=False, binhost=None*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Updates the passed package (emerge –update package)

slot Restrict the update to a particular slot. It will update to the latest version within the slot.

fromrepo Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

`salt.modules.ebuildpkg.`**`upgrade`**(*refresh=True*, *binhost=None*, *backtrack=3*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: ´3´).

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.ebuildpkg.`**`upgrade_available`**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.ebuildpkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.ebuildpkg.`**`version_clean`**(*version*)

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

`salt.modules.ebuildpkg.`**`version_cmp`**(*pkg1*, *pkg2*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

21.9.118 salt.modules.eix

Support for Eix

salt.modules.eix.**sync**()

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

salt.modules.eix.**update**()

Update the eix database

CLI Example:

```
salt '*' eix.update
```

21.9.119 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

depends elasticsearch-py

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'
  proxies:
    - http: http://proxy:3128
    - https: http://proxy:1080
```

When specifying proxies the requests backend will be used and the 'proxies' data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.

`salt.modules.elasticsearch.`**`alias_create`**(*indices*, *alias*, *hosts=None*, *body=None*, *profile=None*, *source=None*)

Create an alias for a specific index/indices

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

alias Alias name

body Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

source URL of file specifying optional definition such as routing or filter. Cannot be used in combination with `body`.

CLI example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

`salt.modules.elasticsearch.`**`alias_delete`**(*indices*, *aliases*, *hosts=None*, *body=None*, *profile=None*, *source=None*)

Delete an alias of an index

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

`salt.modules.elasticsearch.`**`alias_exists`**(*aliases*, *indices=None*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given alias exists

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_exists None testindex
```

`salt.modules.elasticsearch.`**`alias_get`**(*indices=None*, *aliases=None*, *hosts=None*, *profile=None*)

Check for the existence of an alias and if it exists, return it

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_get testindex
```

`salt.modules.elasticsearch.`**`cluster_get_settings`**(*flat_settings=False*, *include_defaults=False*, *hosts=None*, *profile=None*)

New in version 3000.

Return Elasticsearch cluster settings.

flat_settings Return settings in flat format.

include_defaults Whether to return all default clusters setting.

CLI example:

```
salt myminion elasticsearch.cluster_get_settings
```

`salt.modules.elasticsearch.`**`cluster_health`**(*index=None, level='cluster', local=False, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster health.

index Limit the information returned to a specific index

level Specify the level of detail for returned information, default 'cluster', valid choices are: 'cluster', 'indices', 'shards'

local Return local information, do not retrieve the state from master node

CLI example:

```
salt myminion elasticsearch.cluster_health
```

`salt.modules.elasticsearch.`**`cluster_put_settings`**(*body=None, flat_settings=False, hosts=None, profile=None*)

New in version 3000.

Set Elasticsearch cluster settings.

body The settings to be updated. Can be either 'transient' or 'persistent' (survives cluster restart) http://www.elastic.co/guide/en/elasticsearch/reference/current/cluster-update-settings.html

flat_settings Return settings in flat format.

CLI example:

```
salt myminion elasticsearch.cluster_put_settings '{"persistent": {"indices.
↪recovery.max_bytes_per_sec": "50mb"}}'
salt myminion elasticsearch.cluster_put_settings '{"transient": {"indices.
↪recovery.max_bytes_per_sec": "50mb"}}'
```

`salt.modules.elasticsearch.`**`cluster_stats`**(*nodes=None, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster stats.

nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

CLI example:

```
salt myminion elasticsearch.cluster_stats
```

`salt.modules.elasticsearch.`**`document_create`**(*index, doc_type, body=None, id=None, hosts=None, profile=None, source=None*)

Create a document in a specified index

index Index name where the document should reside

doc_type Type of the document

body Document to store

source URL of file specifying document to store. Cannot be used in combination with `body`.

id Optional unique document identifier for specified doc_type (empty for random)

CLI example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

salt.modules.elasticsearch.**document_delete**(*index*, *doc_type*, *id*, *hosts=None*, *profile=None*)

Delete a document from an index

index Index name where the document resides

doc_type Type of the document

id Document identifier

CLI example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_
↪8U80wQZ
```

salt.modules.elasticsearch.**document_exists**(*index*, *id*, *doc_type='_all'*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given document exists

index Index name where the document resides

id Document identifier

doc_type Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.**document_get**(*index*, *id*, *doc_type='_all'*, *hosts=None*, *profile=None*)

Check for the existence of a document and if it exists, return it

index Index name where the document resides

id Document identifier

doc_type Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.**flush_synced**(*hosts=None*, *profile=None*, ***kwargs*)

New in version 3000.

Perform a normal flush, then add a generated unique marker (sync_id) to all shards. http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-synced-flush.html

index (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to '_all'.

ignore_unavailable (Optional, boolean) If true, missing or closed indices are not included in the response. Defaults to false.

allow_no_indices (Optional, boolean) If true, the request does not return an error if a wildcard expression or _all value retrieves only missing or closed indices. This parameter also applies to index aliases that point to a missing or closed index.

expand_wildcards (Optional, string) Controls what kind of indices that wildcard expressions can expand to.

Valid values are:

```
all - Expand to open and closed indices.
open - Expand only to open indices.
closed - Expand only to closed indices.
none - Wildcard expressions are not accepted.
```

The defaults settings for the above parameters depend on the API being used.

CLI example:

```
salt myminion elasticsearch.flush_synced index='index1,index2' ignore_
↪unavailable=True allow_no_indices=True expand_wildcards='all'
```

`salt.modules.elasticsearch.`**`index_close`**(*index*, *allow_no_indices=True*, *expand_wildcards='open'*, *ignore_unavailable=True*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Close specified index.

index Index to be closed

allow_no_indices Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

ignore_unavailable Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_close testindex
```

`salt.modules.elasticsearch.`**`index_create`**(*index*, *body=None*, *hosts=None*, *profile=None*, *source=None*)

Create an index

index Index name

body Index definition, such as settings and mappings as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

source URL to file specifying index definition. Cannot be used in combination with `body`.

CLI example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings" : {"index" : {
↪"number_of_shards" : 3, "number_of_replicas" : 2}}}'
```

`salt.modules.elasticsearch.`**`index_delete`**(*index*, *hosts=None*, *profile=None*)

Delete an index

index Index name

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

`salt.modules.elasticsearch.`**`index_exists`**(*index*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index exists

index Index name

CLI example:

```
salt myminion elasticsearch.index_exists testindex
```

`salt.modules.elasticsearch.`**`index_get`**(*index*, *hosts=None*, *profile=None*)

Check for the existence of an index and if it exists, return it

index Index name

CLI example:

```
salt myminion elasticsearch.index_get testindex
```

`salt.modules.elasticsearch.`**`index_get_settings`**(*hosts=None*, *profile=None*, ***kwargs*)

New in version 3000.

Check for the existence of an index and if it exists, return its settings http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-get-settings.html

index (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to '_all'.

name (Optional, string) The name of the settings that should be included

allow_no_indices (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'

flat_settings (Optional, boolean) Return settings in flat format

ignore_unavailable (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

include_defaults (Optional, boolean) Whether to return all default setting for each of the indices.

local (Optional, boolean) Return local information, do not retrieve the state from master node

The defaults settings for the above parameters depend on the API version being used.

CLI example:

```
salt myminion elasticsearch.index_get_settings index=testindex
```

`salt.modules.elasticsearch.`**`index_open`**(*index*, *allow_no_indices=True*, *expand_wildcards='closed'*, *ignore_unavailable=True*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Open specified index.

index Index to be opened

allow_no_indices Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'

ignore_unavailable Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_open testindex
```

`salt.modules.elasticsearch.`**`index_put_settings`**(*body=None*, *hosts=None*, *profile=None*, *source=None*, ***kwargs*)

New in version 3000.

Update existing index settings https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-update-settings.html

body The index settings to be updated.

source URL to file specifying index definition. Cannot be used in combination with `body`.

index (Optional, string) A comma-separated list of index names; use _all or empty string to perform the operation on all indices

allow_no_indices (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'

flat_settings (Optional, boolean) Return settings in flat format (default: false)

ignore_unavailable (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

master_timeout (Optional, time units) Explicit operation timeout for connection to master node

preserve_existing (Optional, boolean) Whether to update existing settings. If set to true existing settings on an index remain unchanged, the default is false

The defaults settings for the above parameters depend on the API version being used.

..**note**:: Elasticsearch time units can be found here: https://www.elastic.co/guide/en/elasticsearch/reference/current/common-options.html#time-units

CLI example:

```
salt myminion elasticsearch.index_put_settings index=testindex body='{"settings"
↪: {"index" : {"number_of_replicas" : 2}}}'
```

`salt.modules.elasticsearch.`**`index_template_create`**(*name*, *body=None*, *hosts=None*, *profile=None*, *source=None*)

Create an index template

name Index template name

body Template definition as specified in http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

source URL to file specifying template definition. Cannot be used in combination with `body`.

CLI example:

```
salt myminion elasticsearch.index_template_create testindex_templ '{ "template":
↪"logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

`salt.modules.elasticsearch.`**`index_template_delete`**(*name*, *hosts=None*, *profile=None*)

Delete an index template (type) along with its data

name Index template name

CLI example:

```
salt myminion elasticsearch.index_template_delete testindex_templ user
```

`salt.modules.elasticsearch.`**`index_template_exists`**(*name*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index template exists

name Index template name

CLI example:

```
salt myminion elasticsearch.index_template_exists testindex_templ
```

`salt.modules.elasticsearch.`**`index_template_get`**(*name*, *hosts=None*, *profile=None*)

Retrieve template definition of index or index/type

name Index template name

CLI example:

```
salt myminion elasticsearch.index_template_get testindex_templ
```

`salt.modules.elasticsearch.`**`info`**(*hosts=None*, *profile=None*)

New in version 2017.7.0.

Return Elasticsearch information.

CLI example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

`salt.modules.elasticsearch.`**`mapping_create`**(*index*, *doc_type*, *body=None*, *hosts=None*, *profile=None*, *source=None*)

Create a mapping in a given index

index Index for the mapping

doc_type Name of the document type

body Mapping definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-put-mapping.html

source URL to file specifying mapping definition. Cannot be used in combination with `body`.

CLI example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : {
↪"properties" : { "message" : {"type" : "string", "store" : true } } } }'
```

`salt.modules.elasticsearch.`**`mapping_delete`**(*index*, *doc_type*, *hosts=None*, *profile=None*)

Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

index Index for the mapping

doc_type Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

`salt.modules.elasticsearch.`**`mapping_get`**(*index*, *doc_type*, *hosts=None*, *profile=None*)

Retrieve mapping definition of index or index/type

index Index for the mapping

doc_type Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_get testindex user
```

`salt.modules.elasticsearch.`**`node_info`**(*nodes=None, flat_settings=False, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch node information.

nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

flat_settings Flatten settings keys

CLI example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

`salt.modules.elasticsearch.`**`ping`**(*allow_failure=False, hosts=None, profile=None*)

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

allow_failure Throw exception if ping fails

CLI example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

`salt.modules.elasticsearch.`**`pipeline_create`**(*id, body, hosts=None, profile=None*)

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

id Pipeline id

body Pipeline definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

CLI example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my␣
↪custom pipeline", "processors": [{"set" : {"field": "collector_timestamp_millis
↪", "value": "{{_ingest.timestamp}}"}}]}'
```

`salt.modules.elasticsearch.`**`pipeline_delete`**(*id, hosts=None, profile=None*)

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

id Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

`salt.modules.elasticsearch.`**`pipeline_get`**(*id, hosts=None, profile=None*)

New in version 2017.7.0.

Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

id Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_get mypipeline
```

`salt.modules.elasticsearch.`**`pipeline_simulate`**(*id, body, verbose=False, hosts=None, profile=None*)

New in version 2017.7.0.

Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

id Pipeline id

body Pipeline definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

verbose Specify if the output should be more verbose

CLI example:

```
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs":[{"_index":
↪"index","_type":"type","_id":"id","_source":{"foo":"bar"}},{"_index":"index","_
↪type":"type","_id":"id","_source":{"foo":"rab"}}]}' verbose=True
```

`salt.modules.elasticsearch.`**`repository_create`**(*name, body, hosts=None, profile=None*)

New in version 2017.7.0.

Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.

name Repository name

body Repository definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html

CLI example:

```
salt myminion elasticsearch.repository_create testrepo '{"type":"fs","settings":{
↪"location":"/tmp/test","compress":true}}'
```

`salt.modules.elasticsearch.`**`repository_delete`**(*name, hosts=None, profile=None*)

New in version 2017.7.0.

Delete existing repository.

name Repository name

CLI example:

```
salt myminion elasticsearch.repository_delete testrepo
```

`salt.modules.elasticsearch.`**`repository_get`**(*name, local=False, hosts=None, profile=None*)

New in version 2017.7.0.

Get existing repository details.

name Repository name

local Retrieve only local information, default is false

CLI example:

```
salt myminion elasticsearch.repository_get testrepo
```

`salt.modules.elasticsearch.`**`repository_verify`**(*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain list of cluster nodes which successfully verified this repository.

name Repository name

CLI example:

```
salt myminion elasticsearch.repository_verify testrepo
```

`salt.modules.elasticsearch.`**`search_template_create`**(*id*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create search template by supplied definition

id Template ID

body Search template definition

CLI example:

```
salt myminion elasticsearch.search_template_create mytemplate '{"template":{"query
↪":{"match":{"title":"{{query_string}}"}}}}'
```

`salt.modules.elasticsearch.`**`search_template_delete`**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing search template definition.

id Template ID

CLI example:

```
salt myminion elasticsearch.search_template_delete mytemplate
```

`salt.modules.elasticsearch.`**`search_template_get`**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain existing search template definition.

id Template ID

CLI example:

```
salt myminion elasticsearch.search_template_get mytemplate
```

`salt.modules.elasticsearch.`**`snapshot_create`**(*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create snapshot in specified repository by supplied definition.

repository Repository name

snapshot Snapshot name

body Snapshot definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html

CLI example:

```
salt myminion elasticsearch.snapshot_create testrepo testsnapshot '{"indices":
↪"index_1,index_2","ignore_unavailable":true,"include_global_state":false}'
```

`salt.modules.elasticsearch.`**`snapshot_delete`**`(`*repository, snapshot, hosts=None, profile=None*`)`

New in version 2017.7.0.

Delete snapshot from specified repository.

repository Repository name

snapshot Snapshot name

CLI example:

```
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot
```

`salt.modules.elasticsearch.`**`snapshot_get`**`(`*repository, snapshot, ignore_unavailable=False, hosts=None, profile=None*`)`

New in version 2017.7.0.

Obtain snapshot residing in specified repository.

repository Repository name

snapshot Snapshot name, use _all to obtain all snapshots in specified repository

ignore_unavailable Ignore unavailable snapshots

CLI example:

```
salt myminion elasticsearch.snapshot_get testrepo testsnapshot
```

`salt.modules.elasticsearch.`**`snapshot_restore`**`(`*repository, snapshot, body=None, hosts=None, profile=None*`)`

New in version 2017.7.0.

Restore existing snapshot in specified repository by supplied definition.

repository Repository name

snapshot Snapshot name

body Restore definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html

CLI example:

```
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices":
↪"index_1,index_2","ignore_unavailable":true,"include_global_state":true}'
```

`salt.modules.elasticsearch.`**`snapshot_status`**`(`*repository=None, snapshot=None, ignore_unavailable=False, hosts=None, profile=None*`)`

New in version 2017.7.0.

Obtain status of all currently running snapshots.

repository Particular repository to look for snapshots

snapshot Snapshot name

ignore_unavailable Ignore unavailable snapshots

CLI example:

```
salt myminion elasticsearch.snapshot_status ignore_unavailable=True
```

21.9.120 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

`salt.modules.environ.`**`get`**`(`*key, default=''*`)`

Get a single salt process environment variable.

key String used as the key for environment lookup.

default If the key is not found in the environment, return this value. Default: ''

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

`salt.modules.environ.`**`has_value`**`(`*key, value=None*`)`

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key Must be a string. Used as key for environment lookup.

value: Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

`salt.modules.environ.`**`item`**`(`*keys, default=''*`)`

Get one or more salt process environment variables. Returns a dict.

keys Either a string or a list of strings that will be used as the keys for environment lookup.

default If the key is not found in the environment, return this value. Default: ''

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

`salt.modules.environ.`**`items`**`()`

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

`salt.modules.environ.`**`setenv`**`(`*environ, false_unsets=False, clear_all=False, update_minion=False, permanent=False*`)`

Set multiple salt process environment variables from a dict. Returns a dict.

environ Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the 'false_unsets' parameter for behavior when a value set to False.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

`salt.modules.environ.`**`setval`**(*key*, *val*, *false_unsets=False*, *permanent=False*)

Set a single salt process environment variable. Returns True on success.

key The environment key to set. Must be a string.

val The value to set. Must be a string or False. Refer to the 'false_unsets' parameter for behavior when set to False.

false_unsets If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

21.9.121 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

`salt.modules.eselect.`**`exec_action`**(*module*, *action*, *module_parameter=None*, *action_parameter=None*, *state_only=False*)

Execute an arbitrary action on a module.

module name of the module to be executed

action name of the module's action to be run

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

state_only don't return any output but only the success/failure of the operation

CLI Example (updating the `php` implementation used for `apache2`):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

`salt.modules.eselect.`**`get_current_target`**(*module*, *module_parameter=None*, *action_parameter=None*)

Get the currently selected target for the given module.

module name of the module to be queried for its current target

module_parameter additional params passed to the defined module

action_parameter additional params passed to the 'show' action

CLI Example (current target of system-wide `java-vm`):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of `kernel` symlink):

```
salt '*' eselect.get_current_target kernel
```

`salt.modules.eselect.`**`get_modules`**()

List available `eselect` modules.

CLI Example:

```
salt '*' eselect.get_modules
```

`salt.modules.eselect.`**`get_target_list`**(*module*, *action_parameter=None*)

List available targets for the given module.

module name of the module to be queried for its targets

action_parameter additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```
salt '*' eselect.get_target_list kernel
```

`salt.modules.eselect.`**`set_target`**(*module*, *target*, *module_parameter=None*, *action_parameter=None*)

Set the target for the given module. Target can be specified by index or name.

module name of the module for which a target should be set

target name of the target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

CLI Example (setting target of system-wide `java-vm`):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of `kernel` symlink):

```
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

21.9.122 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

New in version 2015.8.4.

Depends: *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called `ch_config`, which looks up the function passed in the `command` parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd <vsphere-function-name>` syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'exsi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

`salt.modules.esxi.`**`cmd`**`(`*command*, **args*, ***kwargs*`)`

`salt.modules.esxi.`**`get_details`**`()`

21.9.123 salt.modules.etcd_mod

Execution module to work with etcd

depends

- python-etcd

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar_opts* must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

`salt.modules.etcd_mod.`**`get_`**(*key*, *recurse=False*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.`**`ls_`**(*path='/'*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.`**`rm_`**(*key*, *recurse=False*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/key host=127.0.0.1 port=2379
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.`**`set_`**(*key*, *value*, *profile=None*, *ttl=None*, *directory=False*, ***kwargs*)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/key value host=127.0.0.1 port=2379
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

`salt.modules.etcd_mod.`**`tree`**(*path='/'*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree host=127.0.0.1 port=2379
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

`salt.modules.etcd_mod.`**`update`**(*fields*, *path=''*, *profile=None*, ***kwargs*)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
    'some': {
        'example': {
            'key': 'bar'
        }
    },
    'another': {
        'example': {
            'key': 'baz'
        }
    }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The 'path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
↪profile=my_etcd_config
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
↪host=127.0.0.1 port=2379
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}" path='/
↪some/root'
```

`salt.modules.etcd_mod.`**`watch`**(*key*, *recurse=False*, *profile=None*, *timeout=0*, *index=None*, ***kwargs*)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
salt myminion etcd.watch /patch/to/key host=127.0.0.1 port=2379
```

21.9.124 salt.modules.ethtool module

Module for running ethtool command

New in version 2016.3.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

`salt.modules.ethtool.`**`set_coalesce`**(*devname*, ***kwargs*)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off]↩
↪[rx_usecs=N] [rx_frames=N]
    [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_
↪irq=N] [tx_frames_irq=N]
    [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_
↪usecs_low=N] [tx_frames_low=N]
    [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_high=N] [tx_
↪frames_high=N]
    [sample_interval=N]
```

`salt.modules.ethtool.`**`set_offload`**(*devname*, ***kwargs*)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

`salt.modules.ethtool.`**`set_ring`**(*devname*, ***kwargs*)

Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

`salt.modules.ethtool.`**`show_coalesce`**(*devname*)

Queries the specified network device for coalescing information

CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

`salt.modules.ethtool.`**`show_driver`**(*devname*)

Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

`salt.modules.ethtool.`**`show_offload`**(*devname*)

Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

`salt.modules.ethtool.`**`show_ring`**(*devname*)

Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

21.9.125 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

`salt.modules.event.`**`fire`**`(`*data, tag*`)`

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data":"my event data"}' 'tag'
```

`salt.modules.event.`**`fire_master`**`(`*data, tag, preload=None*`)`

Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data":"my event data"}' 'tag'
```

`salt.modules.event.`**`send`**`(`*tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs*`)`

Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **`tag`** – A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.
- **`data`** – A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
- **`with_env`** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) – Include environment variables from the current shell environment in the event data as `environ`.. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.
- **`with_grains`** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) – Include grains from the current minion in the event data as `grains`.
- **`with_pillar`** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) – Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in *`state.sls`* from the Master, through an event on the Minion, then back to the Master.
- **`with_env_opts`** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) – Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.
- **`kwargs`** – Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via sudo. The following rule in sudoers will allow the `jenkins` user to run only the following command.

`/etc/sudoers` (allow preserving the environment):

```
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via sudo (preserve the environment):

```
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_
↪URL, GIT_BRANCH, GIT_COMMIT]
```

21.9.126 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.`**`attributes`**`(`*device, args=None*`)`

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

`salt.modules.extfs.`**`blocks`**`(`*device, args=None*`)`

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

`salt.modules.extfs.`**`dump`**`(`*device, args=None*`)`

Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

`salt.modules.extfs.`**`mkfs`**`(`*device, fs_type, **kwargs*`)`

Create a file system on the specified device

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments

- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- **blocks_per_group**: number of blocks in a block group
- **number_of_groups**: ext4 option for a virtual block group
- **bytes_per_inode**: set the bytes/inode ratio
- **inode_size**: size of the inode
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **blocks_file**: read bad blocks from file
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **test**: set to True to not actually create the file system (mke2fs -n)
- **number_of_inodes**: override default number of inodes
- **creator_os**: override "creator operating system" field
- **opts**: mount options (comma separated)
- **revision**: set the filesystem revision (default 1)
- **super**: write superblock and group descriptors only
- **fs_type**: set the filesystem type (REQUIRED)
- **usage_type**: how the filesystem is going to be used
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

`salt.modules.extfs.`**`tune`**`(`*device*, ***kwargs*`)`

Set attributes for the specified device (using tune2fs)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

- **max**: max mount count
- **count**: mount count
- **error**: error behavior
- **extended_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)

- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

21.9.127 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

class `salt.modules.file.`**`AttrChanges`**`(`*added*, *removed*`)`

`added`
Alias for field number 0

`removed`
Alias for field number 1

`salt.modules.file.`**`access`**`(`*path*, *mode*`)`
New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.`**`append`**`(`*path*, **args*, ***kwargs*`)`
New in version 0.9.5.

Append text to the end of a file

path path to file

***args** strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'

salt '*' file.append /etc/motd args="['cheese=spam','spam=cheese']"
```

salt.modules.file.**apply_template_on_contents**(*contents, template, context, defaults, saltenv*)

Return the contents after applying the templating engine

contents template string

template template format

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \
    contents='This is a {{ template }} string.' \
    template=jinja \
    "context={}" "defaults={'template': 'cool'}" \
    saltenv=base
```

salt.modules.file.**basename**(*path*)

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

salt.modules.file.**blockreplace**(*path, marker_start='#– start managed zone –', marker_end='#– end managed zone –', content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False*)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

path Filesystem path to the file to be edited

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content The content to be used between the two lines identified by marker_start and marker_stop.

append_if_not_found: False If markers are not found and set to `True` then, the markers and content will be appended to the file.

prepend_if_not_found: False If markers are not found and set to `True` then, the markers and content will be prepended to the file.

backup The file extension to use for a backup of the file if any edit is made. Set to `False` to skip making a backup.

dry_run: False If `True`, do not make any edits to the file and simply return the changes that *would* be made.

show_changes: True Controls how changes are presented. If `True`, this function will return a unified diff of the changes made. If False, then it will return a boolean (`True` if any changes were made, otherwise `False`).

append_newline: False Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is `None`.

Changed in version 2019.2.0: The default value of this argument will change to `None` to match the behavior of the *`file.blockreplace state`*

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT
↪EDIT --' \
'#-- end managed zone foobar --' $'10.0.1.1 foo.foobar\n10.0.1.2 bar.foobar' True
```

`salt.modules.file.`**`chattr`**(**files*, ***kwargs*)

New in version 2018.3.0.

Change the attributes of files. This function accepts one or more files and the following options:

operator Can be wither `add` or `remove`. Determines whether attributes should be added or removed from files

attributes One or more of the following characters: `aAcCdDeijPsStTu`, representing attributes to add to/remove from files

version a version number to assign to the file(s)

flags One or more of the following characters: `RVf`, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:

```
salt '*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '*' file.chattr foo3.txt operator=remove attributes=i version=2
```

`salt.modules.file.`**`check_file_meta`**(*name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None*)

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
↪'{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' base
```

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

---

name Path to file destination

sfn Template-processed source file contents

source URL to file source

source_sum File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

user Destination file user owner

group Destination file group owner

mode Destination file permissions mode

attrs Destination file attributes

New in version 2018.3.0.

saltenv Salt environment used to resolve source files

contents File contents

`salt.modules.file.`**`check_hash`**(*path, file_hash*)

Check if a file matches the given hash string

Returns `True` if the hash matches, otherwise `False`.

path Path to a file local to the minion.

hash The hash to check against the file specified in the `path` argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

`salt.modules.file.`**`check_managed`**(*name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, **kwargs*)

Check to see what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '
↪{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None
↪base
```

salt.modules.file.**check_managed_changes**(*name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, **kwargs*)

Return a dictionary of what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/
↪httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True
↪None None base
```

salt.modules.file.**check_perms**(*name, ret, user, group, mode, attrs=None, follow_symlinks=False*)

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if lsattr(1) is installed.

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

Changed in version 2014.1.3: `follow_symlinks` option added

salt.modules.file.**chgrp**(*path, group*)

Change the group of a file

path path to the file or directory

group group owner

CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

salt.modules.file.**chown**(*path, user, group*)

Chown a file, pass the file the desired user and group

path path to the file or directory

user user owner

group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.**comment**(*path, regex, char='#', backup='.bak'*)

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`)

char: # The character to be inserted at the beginning of a line in order to comment it out

backup: **`.bak`** The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspkr
```

`salt.modules.file.`**`comment_line`**(*path*, *regex*, *char='#'*, *cmnt=True*, *backup='.bak'*)

Comment or Uncomment a line in a text file.

Parameters

- **`path`** – string The full path to the text file.
- **`regex`** – string A regex expression that begins with ^ that will find the line you wish to comment. Can be as simple as `^color =`
- **`char`** – string The character used to comment a line in the type of file you're referencing. Default is #
- **`cmnt`** – boolean True to comment the line. False to uncomment the line. Default is True.
- **`backup`** – string The file extension to give the backup file. Default is `.bak` Set to False/None to not keep a backup.

Returns boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the `pcspkr` line in the `/etc/modules` file using the default `#` character and create a backup file named `modules.bak`

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

CLI Example:

The following example will uncomment the `log_level` setting in `minion` config file if it is set to either `warning`, `info`, or `debug` using the `#` character and create a backup file named `minion.bk`

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug)
↪' '#' False '.bk'
```

`salt.modules.file.`**`contains`**(*path*, *text*)

Deprecated since version 0.17.0: Use `search()` instead.

Return `True` if the file at `path` contains `text`

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`contains_glob`**(*path*, *glob_expr*)

Deprecated since version 0.17.0: Use `search()` instead.

Return `True` if the given glob matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

`salt.modules.file.`**`contains_regex`**(*path*, *regex*, *lchar=''*)

Deprecated since version 0.17.0: Use *`search()`* instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the lchar argument (leading char) is specified, it will strip *lchar* from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

`salt.modules.file.`**`copy`**(*src*, *dst*, *recurse=False*, *remove_existing=False*)

Copy a file or directory from source to dst

In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to cp -r on unix)

remove_existing will remove all files in the target directory, and then copy files from the source.

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *`states.file.managed`* and *`states.file.recurse`*.

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
↪existing=True
```

`salt.modules.file.`**`delete_backup`**(*path*, *backup_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to delete, as found using *`file.list_backups`*

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.
↪txt 0
```

`salt.modules.file.`**`directory_exists`**(*path*)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

`salt.modules.file.`**`dirname`**(*path*)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.`**`diskusage`**(*path*)

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.`**`extract_hash`**(*hash_fn*, *hash_type='sha256'*, *file_name=''*, *source=''*, *source_hash_name=None*)

Changed in version 2016.3.5: Prior to this version, only the `file_name` argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The *`file.managed`* state now also passes this function the source URI as well as the `source_hash_name` (if specified). In cases where `source_hash_name` is specified, it takes precedence over both the `file_name` and `source`. When it is not specified, `file_name` takes precedence over `source`. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when `source_hash_name` is specified. They will be used as fallback matches if there is no match to the `source_hash_name` value.

This routine is called from the *`file.managed`* state to pull a hash from a remote file. Regular expressions are used line by line on the `source_hash` file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then `None` will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
↪075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
↪20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

`salt.modules.file.`**`file_exists`**(*path*)

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

`salt.modules.file.`**`find`**`(`*path*, **args*, ***kwargs*`)`

Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```
name    = path-glob                 # case sensitive
iname   = path-glob                 # case insensitive
regex   = path-regex                # case sensitive
iregex  = path-regex                # case insensitive
type    = file-types                # match any listed type
user    = users                     # match any listed user
group   = groups                    # match any listed group
size    = [+-]number[size-unit]     # default unit = byte
mtime   = interval                  # modified since date
grep    = regex                     # search file contents
```

and/or actions:

```
delete [= file-types]               # default type = 'f'
exec    = command [arg ...]         # where {} is replaced by pathname
print  [= print-opts]
```

and/or depth criteria:

```
maxdepth = maximum depth to transverse in path
mindepth = minimum depth to transverse before checking files or directories
```

The default action is `print=path`

`path-glob`:

```
*                 = match zero or more chars
?                 = match any char
[abc]             = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]             = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}           = match a or b or c
```

`path-regex`: a Python Regex (regular expression) pattern to match pathnames

`file-types`: a string of one or more of the following:

```
a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket
```

`users`: a space and/or comma separated list of user names and/or uids

`groups`: a space and/or comma separated list of group names and/or gids

`size-unit`:

```
b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes
```

interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]

where:
    w: week
    d: day
    h: hour
    m: minute
    s: second
```

print-opts: a comma and/or space separated list of one or more of the following:

```
group: group name
md5:   MD5 digest of file contents
mode:  file permissions (as integer)
mtime: last modification time (as time_t)
name:  file basename
path:  file absolute path
size:  file size in bytes
type:  file type
user:  user name
```

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

`salt.modules.file.`**`get_devmm`**(*name*)

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

`salt.modules.file.`**`get_diff`**(*file1, file2, saltenv='base', show_filenames=True, show_changes=True, template=False, source_hash_file1=None, source_hash_file2=None*)

Return unified diff of two files

file1 The first file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, thuis had to be a file local to the minion.

file2 The second file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. `salt://somefile.txt`)

show_filenames: True Set to `False` to hide the filenames in the top two lines of the diff.

show_changes: True If set to `False`, and there are differences, then instead of a diff a simple message stating that show_changes is set to `False` will be returned.

template: False Set to `True` if two templates are being compared. This is not useful except for within states, with the `obfuscate_templates` option set to `True`.

New in version 2018.3.0.

source_hash_file1 If `file1` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

source_hash_file2 If `file2` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

`salt.modules.file.`**`get_gid`**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

path file or directory of which to get the gid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_group`**(*path*, *follow_symlinks=True*)

Return the group that owns a given file

path file or directory of which to get the group

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_hash`**(*path*, *form='sha256'*, *chunk_size=65536*)

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- **It does not return a string on error. The returned value of** `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

path path to the file or directory

form desired sum format

chunk_size amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

`salt.modules.file.`**`get_managed`**`(`*name, template, source, source_hash, source_hash_name, user, group, mode, attrs, saltenv, context, defaults, skip_verify=False, **kwargs*`)`

Return the managed file data for file.managed

name location where the file lives on the server

template template format

source managed source file

source_hash hash of the source file

source_hash_name When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

user Owner of file

group Group owner of file

mode Permissions of file

attrs Attributes of file

New in version 2018.3.0.

context Variables to add to the template context

defaults Default values of for context_dict

skip_verify If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.
↪conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

`salt.modules.file.`**`get_mode`**`(`*path, follow_symlinks=True*`)`

Return the mode of a file

path file or directory of which to get the mode

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added

`salt.modules.file.`**`get_selinux_context`**`(`*path*`)`

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

`salt.modules.file.`**`get_source_sum`**(*file_name='', source='', source_hash=None, source_hash_name=None, saltenv='base'*)

New in version 2016.11.0.

Used by *`file.get_managed`* to obtain the hash and hash type from the parameters specified below.

file_name Optional file name being managed, for matching with *`file.extract_hash`*.

source Source file, as used in *`file`* and other states. If `source_hash` refers to a file containing hashes, then this filename will be used to match a filename in that file. If the `source_hash` is a hash expression, then this argument will be ignored.

source_hash Hash file/expression, as used in *`file`* and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and *`file.extract_hash`* will be used to obtain a hash from it.

source_hash_name Specific file name to look for when `source_hash` refers to a remote file, used to disambiguate ambiguous matches.

saltenv: base Salt fileserver environment from which to retrieve the source_hash. This value will only be used when `source_hash` refers to a file on the Salt fileserver (i.e. one beginning with `salt://`).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↪gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↪gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↪gz source_hash=https://mydomain.tld/hashes.md5 source_hash_name=./dir2/foo.tar.
↪gz
```

`salt.modules.file.`**`get_sum`**(*path, form='sha256'*)

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 **(default)**
- sha384
- sha512

path path to the file or directory

form desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

`salt.modules.file.`**`get_uid`**(*path, follow_symlinks=True*)

Return the id of the user that owns a given file

path file or directory of which to get the uid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_user`**`(`*path*, *follow_symlinks=True*`)`
Return the user that owns a given file

path file or directory of which to get the user

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`gid_to_group`**`(`*gid*`)`
Convert the group id to the group name on this system

gid gid to convert to a group name

CLI Example:

```
salt '*' file.gid_to_group 0
```

`salt.modules.file.`**`grep`**`(`*path*, *pattern*, **opts*`)`
Grep for a string in the specified file

Note: This function's return value is slated for refinement in future versions of Salt

path Path to the file to be searched

> **Note:** Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern Pattern to match. For example: `test`, or `a[0-5]`

opts Additional command-line flags to pass to the grep command. For example: `-v`, or `-i -B2`

> **Note:** The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

`salt.modules.file.`**`group_to_gid`**`(`*group*`)`
Convert the group to the gid on this system

group group to convert to its gid

CLI Example:

```
salt '*' file.group_to_gid root
```

`salt.modules.file.`**`is_blkdev`**`(`*name*`)`

Check if a file exists and is a block device.

CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

`salt.modules.file.`**`is_chrdev`**`(`*name*`)`

Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

`salt.modules.file.`**`is_fifo`**`(`*name*`)`

Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

`salt.modules.file.`**`is_hardlink`**`(`*path*`)`

Check if the path is a hard link by verifying that the number of links is larger than 1

CLI Example:

```
salt '*' file.is_hardlink /path/to/link
```

`salt.modules.file.`**`is_link`**`(`*path*`)`

Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.file.`**`join`**`(`**args*`)`

Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

`salt.modules.file.`**`lchown`**`(`*path, user, group*`)`

Chown a file, pass the file the desired user and group without following symlinks.

path path to the file or directory

user user owner

group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.`**`line`**(*path*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*)

New in version 2015.8.0.

Edit a line in the configuration file. The `path` and `content` arguments are required, as well as passing in one of the `mode` options.

path Filesystem path to the file to be edited.

content Content of the line. Allowed to be empty if mode=delete.

match Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, match becomes the `content` value.

mode Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. This is based on the `content` argument.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

location Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

before Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

after Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

backup Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

quiet Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:        files dns" after="hosts:.
↪*?" mode='ensure'
```

Note: If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_
↪SPOOL=yes" mode="replace"
```

`salt.modules.file.`**`link`**(*src, path*)

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.`**`list_backups`**(*path, limit=None*)

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

limit Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.`**`list_backups_dir`**(*path, limit=None*)

Lists the previous versions of a directory backed up using Salt's *file state backup* system.

path The directory on the minion to check for backups

limit Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.`**`lsattr`**(*path*)

New in version 2018.3.0.

Changed in version 2018.3.1: If `lsattr` is not installed on the system, `None` is returned.

Changed in version 2018.3.4: If on `AIX`, `None` is returned even if in filesystem as lsattr on `AIX` is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If path is to a directory, an empty list is returned.

path path to file to obtain attributes of. File/directory must exist.

CLI Example:

```
salt '*' file.lsattr foo1.txt
```

`salt.modules.file.`**`lstat`**`(`*path*`)`

New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.`**`makedirs_`**`(`*path*, *user=None*, *group=None*, *mode=None*`)`

Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.`**`makedirs_perms`**`(`*name*, *user=None*, *group=None*, *mode='0755'*`)`

Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

`salt.modules.file.`**`manage_file`**`(`*name*, *sfn*, *ret*, *source*, *source_sum*, *user*, *group*, *mode*, *attrs*, *saltenv*, *backup*, *makedirs=False*, *template=None*, *show_changes=True*, *contents=None*, *dir_mode=None*, *follow_symlinks=True*, *skip_verify=False*, *keep_mode=False*, *encoding=None*, *encoding_errors='strict'*, ***kwargs*`)`

Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name location to place the file

sfn location of cached file on the minion

> This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.
>
> This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()

ret The initial state return data structure. Pass in `None` to use the default structure.

source file reference on the master

source_sum sum hash for source

user user owner

group group owner

backup backup_mode

attrs attributes to be set on file: " means remove all of them

New in version 2018.3.0.

makedirs make directories if they do not exist

template format of templating

show_changes Include diff in state return

contents: contents to be placed in the file

dir_mode mode for directories created with makedirs

skip_verify: False If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

keep_mode: False If `True`, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors: 'strict' Default is `'strict'`. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

New in version 2017.7.0.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '' '{}' salt://http/httpd.
↪conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' '' base ''
```

Changed in version 2014.7.0: `follow_symlinks` option added

`salt.modules.file.`**`mkdir`**(*dir_path, user=None, group=None, mode=None*)

Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

`salt.modules.file.`**`mknod`**(*name, ntype, major=0, minor=0, user=None, group=None, mode='0600'*)

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu mknod.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

`salt.modules.file.`**`mknod_blkdev`**(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

`salt.modules.file.`**`mknod_chrdev`**(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

`salt.modules.file.`**`mknod_fifo`**(*name, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

`salt.modules.file.`**`move`**(*src, dst*)

Move a file or directory

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

`salt.modules.file.`**`normpath`**(*path*)

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

`salt.modules.file.`**`open_files`**(*by_pid=False*)

Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

`salt.modules.file.`**`pardir`**()

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

`salt.modules.file.`**`patch`**(*originalfile*, *patchfile*, *options=''*, *dry_run=False*)

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile The full path to the file or directory to be patched

patchfile A patch file to apply to `originalfile`

options Options to pass to patch.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

`salt.modules.file.`**`path_exists_glob`**(*path*)

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

`salt.modules.file.`**`prepend`**(*path*, **args*, ***kwargs*)

New in version 2014.7.0.

Prepend text to the beginning of a file

path path to file

***args** strings to prepend to the file

CLI Example:

```
salt '*' file.prepend /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'

salt '*' file.prepend /etc/motd args="['cheese=spam','spam=cheese']"
```

`salt.modules.file.`**`psed`**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *flags='gMS'*, *escape_all=False*, *multi=False*)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited

before A pattern to find in order to replace with `after`

after Text that will replace `before`

limit: **`''`** An initial pattern to search for before searching for `before`

backup: **`.bak`** The file will be backed up before edit with this file extension; **WARNING**: each time `sed`/`comment`/`uncomment` is called will overwrite this backup

flags: **`gMS`**

Flags to modify the search. Valid values are:

- `g`: Replace all occurrences of the pattern, not just the first.
- `I`: Ignore case.
- `L`: Make `\w`, `\W`, `\b`, `\B`, `\s` and `\S` dependent on the locale.
- `M`: Treat multiple lines as a single line.
- `S`: Make . match all characters, including newlines.
- `U`: Make `\w`, `\W`, `\b`, `\B`, `\d`, `\D`, `\s` and `\S` dependent on Unicode.
- `X`: Verbose (whitespace is ignored).

multi: **`False`** If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.`**`read`**(*path*, *binary=False*)

New in version 2017.7.0.

Return the content of the file.

CLI Example:

```
salt '*' file.read /path/to/file
```

`salt.modules.file.`**`readdir`**`(`*path*`)`

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

`salt.modules.file.`**`readlink`**`(`*path*, *canonicalize=False*`)`

New in version 2014.1.0.

Return the path that a symlink points to If canonicalize is set to True, then it return the final target

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.file.`**`remove`**`(`*path*`)`

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

Changed in version 3000: The method now works on all types of file system entries, not just files, directories and symlinks.

`salt.modules.file.`**`rename`**`(`*src*, *dst*`)`

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

`salt.modules.file.`**`replace`**`(`*path*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *dry_run=False*, *search_only=False*, *show_changes=True*, *ignore_if_missing=False*, *preserve_inode=True*, *backslash_literal=False*`)`

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `search()`.

repl The replacement text

count: 0 Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int) A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str) How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: False New in version 2014.7.0.

If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: False New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

backup: .bak The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

dry_run: False If set to `True`, no changes will be made to the file, the function will just return the changes that would have been made (or a `True`/`False` value if `show_changes` is set to `False`).

search_only: False If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: True If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore_if_missing: False New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

preserve_inode: True New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using `backup` to create a backup copy).

backslash_literal: False New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (`=`) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address:
↪'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
↪'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags='[MULTILINE,⤶
↪IGNORECASE]'
```

`salt.modules.file.`**`restore_backup`**(*path*, *backup_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to restore, as found using `file.list_backups`

CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

`salt.modules.file.`**`restorecon`**(*path*, *recursive=False*)

Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

`salt.modules.file.`**`rmdir`**(*path*)

New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

`salt.modules.file.`**`search`**(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore_if_missing=False*, *multiline=False*)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to `replace()`.

multiline If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`sed`**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape_all=False*, *negate_match=False*)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited

before A pattern to find in order to replace with `after`

after Text that will replace `before`

limit: `''` An initial pattern to search for before searching for `before`

backup: `.bak` The file will be backed up before edit with this file extension; **WARNING:** each time `sed`/`comment`/`uncomment` is called will overwrite this backup

options: `-r -e` Options to pass to sed

flags: `g` Flags to modify the sed search; e.g., `i` for case-insensitive pattern matching

negate_match: False Negate the search command (`!`)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.`**`sed_contains`**(*path*, *text*, *limit=''*, *flags='g'*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`. Utilizes sed to perform the search (line-wise search).

Note: the `p` flag will be added to any flags you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`seek_read`**(*path*, *size*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and read it

path path to file

seek amount to read at once

offset offset to start into the file

CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

`salt.modules.file.`**`seek_write`**(*path*, *data*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and write to it

path path to file

data data to write to file

offset position in file to start writing

CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

`salt.modules.file.`**`set_mode`**(*path*, *mode*)

Set the mode of a file

path file or directory of which to set the mode

mode mode to set the path to

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

salt.modules.file.**set_selinux_context**(*path, user=None, role=None, type=None, range=None*)

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <user> <role> <type> <range>
salt '*' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u object_r
↪system_conf_t s0
```

salt.modules.file.**source_list**(*source, source_hash, saltenv*)

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum':
↪<md5sum>}' base
```

salt.modules.file.**stats**(*path, hash_type=None, follow_symlinks=True*)

Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

salt.modules.file.**statvfs**(*path*)

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

salt.modules.file.**symlink**(*src, path*)

Create a symbolic link (symlink, soft link) to a file

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.file.**touch**(*name, atime=None, mtime=None*)

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

atime: Access time in Unix epoch time

mtime: Last modification in Unix epoch time

CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

`salt.modules.file.`**`truncate`**`(`*path*, *length*`)`

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

path path to file

length offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

`salt.modules.file.`**`uid_to_user`**`(`*uid*`)`

Convert a uid to a user name

uid uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

`salt.modules.file.`**`uncomment`**`(`*path*, *regex*, *char='#'*, *backup='.bak'*`)`

Deprecated since version 0.17.0: Use `replace()` instead.

Uncomment specified commented lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()).

char: **#** The character to remove in order to uncomment a line

backup: **`.bak`** The file will be backed up before edit with this file extension; **WARNING**: each time `sed`/`comment`/`uncomment` is called will overwrite this backup

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.`**`user_to_uid`**`(`*user*`)`

Convert user name to a uid

user user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.`**`write`**`(`*path*, **args*, ***kwargs*`)`

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

path path to file

args strings to write to the file

CLI Example:

```
salt '*' file.write /etc/motd \
        "With all thine offerings thou shalt offer salt."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'

salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

21.9.128 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

`salt.modules.firewalld.`**`add_interface`**(*zone*, *interface*, *permanent=True*)

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

`salt.modules.firewalld.`**`add_masquerade`**(*zone=None*, *permanent=True*)

Enable masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

`salt.modules.firewalld.`**`add_port`**(*zone*, *port*, *permanent=True*, *force_masquerade=False*)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

force_masquerade when a zone is created ensure masquerade is also enabled on that zone.

`salt.modules.firewalld.`**`add_port_fwd`**(*zone*, *src*, *dest*, *proto='tcp'*, *dstaddr=''*, *permanent=True*, *force_masquerade=False*)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

force_masquerade when a zone is created ensure masquerade is also enabled on that zone.

`salt.modules.firewalld.`**`add_rich_rule`**(*zone*, *rule*, *permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_rich_rule zone 'rule'
```

`salt.modules.firewalld.`**`add_service`**(*service*, *zone=None*, *permanent=True*)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewalld.add_service ssh my_zone
```

`salt.modules.firewalld.`**`add_service_port`**(*service*, *port*)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_port zone 80
```

`salt.modules.firewalld.`**`add_service_protocol`**(*service*, *protocol*)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_protocol zone ssh
```

`salt.modules.firewalld.`**`add_source`**(*zone*, *source*, *permanent=True*)

Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

`salt.modules.firewalld.`**`allow_icmp`**(*zone*, *icmp*, *permanent=True*)

Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.allow_icmp zone echo-reply
```

`salt.modules.firewalld.`**`block_icmp`**`(`*zone, icmp, permanent=True*`)`

Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.block_icmp zone echo-reply
```

`salt.modules.firewalld.`**`default_zone`**`()`

Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewalld.default_zone
```

`salt.modules.firewalld.`**`delete_service`**`(`*name, restart=True*`)`

Delete an existing service

CLI Example:

```
salt '*' firewalld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_service my_service False
```

`salt.modules.firewalld.`**`delete_zone`**`(`*zone, restart=True*`)`

Delete an existing zone

CLI Example:

```
salt '*' firewalld.delete_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_zone my_zone False
```

`salt.modules.firewalld.`**`get_icmp_types`**`(`*permanent=True*`)`

Print predefined icmptypes

CLI Example:

```
salt '*' firewalld.get_icmp_types
```

`salt.modules.firewalld.`**`get_interfaces`**`(`*zone, permanent=True*`)`

List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_interfaces zone
```

`salt.modules.firewalld.`**`get_masquerade`**`(`*zone=None, permanent=True*`)`

Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.get_masquerade zone
```

`salt.modules.firewalld.`**`get_rich_rules`**(*zone*, *permanent=True*)

List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_rich_rules zone
```

`salt.modules.firewalld.`**`get_service_ports`**(*service*)

List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_ports zone
```

`salt.modules.firewalld.`**`get_service_protocols`**(*service*)

List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_protocols zone
```

`salt.modules.firewalld.`**`get_services`**(*permanent=True*)

Print predefined services

CLI Example:

```
salt '*' firewalld.get_services
```

`salt.modules.firewalld.`**`get_sources`**(*zone*, *permanent=True*)

List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_sources zone
```

`salt.modules.firewalld.`**`get_zones`**(*permanent=True*)

Print predefined zones

CLI Example:

```
salt '*' firewalld.get_zones
```

`salt.modules.firewalld.`**`list_all`**(*zone=None*, *permanent=True*)

List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewalld.list_all
```

List a specific zone

```
salt '*' firewalld.list_all my_zone
```

`salt.modules.firewalld.`**`list_icmp_block`**`(`*zone*, *permanent=True*`)`

List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewlld.list_icmp_block zone
```

`salt.modules.firewalld.`**`list_port_fwd`**`(`*zone*, *permanent=True*`)`

List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_port_fwd public
```

`salt.modules.firewalld.`**`list_ports`**`(`*zone*, *permanent=True*`)`

List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_ports
```

`salt.modules.firewalld.`**`list_services`**`(`*zone=None*, *permanent=True*`)`

List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.list_services
```

List a specific zone

```
salt '*' firewalld.list_services my_zone
```

`salt.modules.firewalld.`**`list_zones`**`(`*permanent=True*`)`

List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewalld.list_zones
```

`salt.modules.firewalld.`**`make_permanent`**`()`

Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.make_permanent
```

`salt.modules.firewalld.`**`new_service`**`(`*name*, *restart=True*`)`

Add a new service

CLI Example:

```
salt '*' firewalld.new_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_service my_service False
```

salt.modules.firewalld.new_zone(*zone*, *restart=True*)

Add a new zone

CLI Example:

```
salt '*' firewalld.new_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

salt.modules.firewalld.reload_rules()

Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.reload
```

salt.modules.firewalld.remove_interface(*zone*, *interface*, *permanent=True*)

Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

salt.modules.firewalld.remove_masquerade(*zone=None*, *permanent=True*)

Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewalld.remove_masquerade dmz
```

salt.modules.firewalld.remove_port(*zone*, *port*, *permanent=True*)

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port internal 443/tcp
```

salt.modules.firewalld.remove_port_fwd(*zone*, *src*, *dest*, *proto='tcp'*, *dstaddr=''*, *permanent=True*)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

salt.modules.firewalld.**remove_rich_rule**(*zone, rule, permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_rich_rule zone 'rule'
```

salt.modules.firewalld.**remove_service**(*service, zone=None, permanent=True*)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewalld.remove_service ssh dmz
```

salt.modules.firewalld.**remove_service_port**(*service, port*)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_port zone 80
```

salt.modules.firewalld.**remove_service_protocol**(*service, protocol*)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_protocol zone ssh
```

salt.modules.firewalld.**remove_source**(*zone, source, permanent=True*)

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

salt.modules.firewalld.**set_default_zone**(*zone*)

Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```

salt.modules.firewalld.**version**()

Return version from firewall-cmd

CLI Example:

```
salt '*' firewalld.version
```

21.9.129 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.freebsd_sysctl.`**`assign`**`(`*name, value*`)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.freebsd_sysctl.`**`get`**`(`*name*`)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.freebsd_sysctl.`**`persist`**`(`*name, value, config='/etc/sysctl.conf'*`)`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

`salt.modules.freebsd_sysctl.`**`show`**`(`*config_file=False*`)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

21.9.130 salt.modules.freebsd_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

maintainer George Mamalakis <mamalos@gmail.com>

maturity new

platform FreeBSD

`salt.modules.freebsd_update.`**`fetch`**`(`***kwargs*`)`

New in version 2016.3.4.

freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

kwargs: Parameters of freebsd-update command.

`salt.modules.freebsd_update.`**`ids`**`(`***kwargs*`)`

New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a "known good" index of the installed release.

kwargs: Parameters of freebsd-update command.

`salt.modules.freebsd_update.`**`install`**`(`*`**kwargs`*`)`

New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.

kwargs: Parameters of freebsd-update command.

`salt.modules.freebsd_update.`**`rollback`**`(`*`**kwargs`*`)`

New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.

kwargs: Parameters of freebsd-update command.

`salt.modules.freebsd_update.`**`update`**`(`*`**kwargs`*`)`

New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.

kwargs: Parameters of freebsd-update command.

`salt.modules.freebsd_update.`**`upgrade`**`(`*`**kwargs`*`)`

New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:

> yes | freebsd-upgrade -r VERSION

the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.

kwargs: Parameters of freebsd-update command.

21.9.131 salt.modules.freebsdjail

The jail module for FreeBSD

`salt.modules.freebsdjail.`**`fstab`**`(`*`jail`*`)`

Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

`salt.modules.freebsdjail.`**`get_enabled`**`()`

Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

`salt.modules.freebsdjail.`**`is_enabled`**`()`

See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

`salt.modules.freebsdjail.`**`restart`**`(`*jail=''*`)`
Restart the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.restart [<jail name>]
```

`salt.modules.freebsdjail.`**`show_config`**`(`*jail*`)`
Display specified jail's configuration

CLI Example:

```
salt '*' jail.show_config <jail name>
```

`salt.modules.freebsdjail.`**`start`**`(`*jail=''*`)`
Start the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.start [<jail name>]
```

`salt.modules.freebsdjail.`**`status`**`(`*jail*`)`
See if specified jail is currently running

CLI Example:

```
salt '*' jail.status <jail name>
```

`salt.modules.freebsdjail.`**`stop`**`(`*jail=''*`)`
Stop the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.stop [<jail name>]
```

`salt.modules.freebsdjail.`**`sysctl`**`()`
Dump all jail related kernel states (sysctl)

CLI Example:

```
salt '*' jail.sysctl
```

21.9.132 salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

`salt.modules.freebsdkmod.`**`available`**`()`
Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.freebsdkmod.`**`check_available`**`(`*mod*`)`
Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available vmm
```

`salt.modules.freebsdkmod.`**`is_loaded`**`(`*mod*`)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded vmm
```

`salt.modules.freebsdkmod.`**`load`**`(`*mod, persist=False*`)`

Load the specified kernel module

mod Name of the module to add

persist Write the module to sysrc kld_modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load bhyve
```

`salt.modules.freebsdkmod.`**`lsmod`**`()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.freebsdkmod.`**`mod_list`**`(`*only_persist=False*`)`

Return a list of the loaded module names

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.freebsdkmod.`**`remove`**`(`*mod, persist=False, comment=True*`)`

Remove the specified kernel module

mod Name of module to remove

persist Also remove module from /boot/loader.conf

comment If persist is set don't remove line from /boot/loader.conf but only comment it

CLI Example:

```
salt '*' kmod.remove vmm
```

21.9.133 salt.modules.freebsdpkg

Remote package support using `pkg_add(1)`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported `pkg_add(1)`, but checked for the existence of a pkgng local database and, if found, would provide some of pkgng's functionality. The rewrite of this module has removed all pkgng support, and moved it to the *pkgng* execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the `pkg` provider by setting the *`providers`* parameter in your Minion config file, in order to use pkgng.

```
providers:
  pkg: pkgng
```

More information on pkgng support can be found in the documentation for the *pkgng* module.

This module will respect the `PACKAGEROOT` and `PACKAGESITE` environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using *`config.get`* and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
freebsdpkg.PACKAGEROOT: ftp://ftp.freebsd.org/
freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-
↪stable/Latest/
```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

```
    salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
    salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
    salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
↪FreeBSD/ports/ia64/packages-9-stable/Latest/

.. note::

    These arguments can also be passed through in states:

    .. code-block:: yaml

        zsh:
          pkg.installed:
            - fromrepo: ftp://ftp2.freebsd.org/
```

`salt.modules.freebsdpkg.`**`file_dict`**`(`**packages*`)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.`**`file_list`**`(`**packages*`)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.`**`install`**`(`*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*`)`

Install package(s) using `pkg_add(1)`

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo or packageroot Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.

packagesite Specify the exact directory from which to install the remote package. Overrides the PACKAGESITE environment variable, if present.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↪deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.freebsdpkg.`**`latest_version`**`(`**names, **kwargs*`)`

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.freebsdpkg.`**`list_pkgs`**`(`*versions_as_list=False, with_origin=False, **kwargs*`)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.freebsdpkg.`**`refresh_db`**`()`

`pkg_add(1)` does not use a local database of available packages, so this function simply returns `True`. it exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.freebsdpkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Remove packages using `pkg_delete(1)`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.freebsdpkg.`**`version`**`(`**names*, ***kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.134 salt.modules.freebsdports

Install software from the FreeBSD `ports(7)` system

New in version 2014.1.0.

This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports state` to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

`salt.modules.freebsdports.`**`config`**`(`*name*, *reset=False*, ***kwargs*`)`

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use *`ports.showconfig`*.

name The port name, in `category/name` format

reset [False] If `True`, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

`salt.modules.freebsdports.`**`deinstall`**`(`*name*`)`

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

`salt.modules.freebsdports.`**`install`**`(`*name*, *clean=True*`)`

Install a port from the ports tree. Installs using `BATCH=yes` for non-interactive building. To set config options for a given port, use *`ports.config`*.

clean [True] If `True`, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

Note: It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

`salt.modules.freebsdports.`**`list_all`**`()`

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

Warning: Takes a while to run, and returns a **LOT** of output

`salt.modules.freebsdports.`**`rmconfig`**`(`*name*`)`

Clear the cached options for the specified port; run a `make rmconfig`

name The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

`salt.modules.freebsdports.`**`search`**`(`*name*`)`

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'
salt '*' ports.search nmap
```

Warning: Takes a while to run

`salt.modules.freebsdports.`**`showconfig`**`(`*name, default=False, dict_return=False*`)`

Show the configuration options for a given port.

default [False] Show the default options for a port (not necessarily the same as the current configuration)

dict_return [False] Instead of returning the output of `make showconfig`, return the data in an dictionary

CLI Example:

```
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True
```

`salt.modules.freebsdports.`**`update`**`(`*extract=False*`)`

Update the ports tree

extract [False] If `True`, runs a `portsnap extract` after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```
salt '*' ports.update
```

21.9.135 salt.modules.freebsdservice

The service module for FreeBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.freebsdservice.`**`available`**`(`*name, jail=None*`)`

Check that the given service is available.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.freebsdservice.`**`disable`**`(`*name, **kwargs*`)`

Disable the named service to start at boot

Arguments the same as for enable()

Changed in version 2016.3.4.

jail (optional keyword argument) the jail's id or name

chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.freebsdservice.`**`disabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.freebsdservice.`**`enable`**`(`*name*, ***kwargs*`)`

Enable the named service to start at boot

name service name

config [/etc/rc.conf] Config file for managing service. If config value is empty string, then /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.

Also service.config variable can be used to change default.

Changed in version 2016.3.4.

jail (optional keyword argument) the jail's id or name

chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.freebsdservice.`**`enabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise

name Service name

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.freebsdservice.`**`get_all`**`(`*jail=None*`)`

Return a list of all available services

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.freebsdservice.`**`get_disabled`**`(`*jail=None*`)`

Return what services are available but not enabled to start at boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.freebsdservice.`**`get_enabled`**`(`*jail=None*`)`

Return what services are set to run on boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.freebsdservice.`**`missing`**`(`*name*, *jail=None*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.freebsdservice.`**`reload_`**`(`*name*, *jail=None*`)`

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.freebsdservice.`**`restart`**`(`*name*, *jail=None*`)`

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.freebsdservice.`**`start`**`(`*name*, *jail=None*`)`

Start the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.freebsdservice.`**`status`**(*name*, *sig=None*, *jail=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2016.3.4.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (*`str`*) – The name of the service to check
- **`sig`** (*`str`*) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.freebsdservice.`**`stop`**(*name*, *jail=None*)

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

21.9.136 salt.modules.gem

Manage ruby gems.

`salt.modules.gem.`**`install`**(*gems*, *ruby=None*, *gem_bin=None*, *runas=None*, *version=None*, *rdoc=False*, *ri=False*, *pre_releases=False*, *proxy=None*, *source=None*)

Installs one or several gems.

Parameters

- **`gems`** – string The gems to install
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.
- **`version`** – string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **`rdoc`** – boolean : False Generate RDoc documentation for the gem(s). For rubygems > 3 this is interpreted as the –no-document arg and the ri option will then be ignored
- **`ri`** – boolean : False Generate RI documentation for the gem(s). For rubygems > 3 this is interpreted as the –no-document arg and the rdoc option will then be ignored

- **`pre_releases`** – boolean : False Include pre-releases in the available versions
- **`proxy`** – string : None Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname{[}:port]

source [None] Use the specified HTTP gem source server to download gem. Format: http://hostname{[}:port]

CLI Example:

```
salt '*' gem.install vagrant

salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

`salt.modules.gem.`**`list_`**(*prefix=", ruby=None, runas=None, gem_bin=None*)

List locally installed gems.

Parameters

- **`prefix`** – string : Only list gems when the name matches this prefix.
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

`salt.modules.gem.`**`list_upgrades`**(*ruby=None, runas=None, gem_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

gem_bin [None] Full path to `gem` binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

runas [None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.`**`sources_add`**(*source_uri, ruby=None, runas=None, gem_bin=None*)

Add a gem source.

Parameters

- **`source_uri`** – string The source URI to add.
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.`**`sources_list`**`(`*ruby=None*, *runas=None*, *gem_bin=None*`)`
List the configured gem sources.

Parameters

- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_list
```

`salt.modules.gem.`**`sources_remove`**`(`*source_uri*, *ruby=None*, *runas=None*, *gem_bin=None*`)`
Remove a gem source.

Parameters

- **`source_uri`** – string The source URI to remove.
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_remove http://rubygems.org/
```

`salt.modules.gem.`**`uninstall`**`(`*gems*, *ruby=None*, *runas=None*, *gem_bin=None*`)`
Uninstall one or several gems.

Parameters

- **`gems`** – string The gems to uninstall.
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.uninstall vagrant
```

`salt.modules.gem.`**`update`**`(`*gems*, *ruby=None*, *runas=None*, *gem_bin=None*`)`
Update one or several gems.

Parameters

- **`gems`** – string The gems to update.
- **`gem_bin`** – string : None Full path to `gem` binary to use.
- **`ruby`** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

- **runas** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update vagrant
```

`salt.modules.gem.`**`update_system`**(*version=”*, *ruby=None*, *runas=None*, *gem_bin=None*)

Update rubygems.

Parameters

- **version** – string : (newest) The version of rubygems to install.
- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update_system
```

`salt.modules.gem.`**`version`**(*ruby=None*, *runas=None*, *gem_bin=None*)

Print out the version of gem

Parameters

- **gem_bin** – string : None Full path to `gem` binary to use.
- **ruby** – string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** – string : None The user to run gem as.

CLI Example:

```
salt '*' gem.version
```

21.9.137 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.`**`avail_platforms`**()

Return which platforms are available

CLI Example:

```
salt myminion genesis.avail_platforms
```

`salt.modules.genesis.`**`bootstrap`**(*platform*, *root*, *img_format='dir'*, *fs_format='ext2'*, *fs_opts=None*, *arch=None*, *flavor=None*, *repo_url=None*, *static_qemu=None*, *img_size=None*, *mount_dir=None*, *pkg_cache=None*, *pkgs=None*, *exclude_pkgs=None*, *epel_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm'*)

Create an image for a specific platform.

Please note that this function *MUST* be run as root, as images that are created make files belonging to root.

platform Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root Local path to create the root of the image filesystem.

img_format Which format to create the image in. By default, just copies files into a directory on the local filesystem (`dir`). Future support will exist for `sparse`.

fs_format When using a non-`dir` `img_format`, which filesystem to format the image to. By default, `ext2`.

fs_opts When using a non-`dir` `img_format`, a dict of opts may be specified.

arch Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, `wheezy` on Debian.

repo_url Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)

static_qemu Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)

pkg_confs The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size If img_format is not `dir`, then the size of the image must be specified.

mount_dir If img_format is not `dir`, then the image must be mounted somewhere. If the `mount_dir` is not specified, then it will be created at `/opt/salt-genesis.<random_uuid>`. This directory will be unmounted and removed when the process is finished.

pkg_cache This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs A list of packages to be installed on this image. For RedHat, this will include `yum`, `centos-release` and `iputils` by default.

exclude_pkgs A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64 
↪flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

`salt.modules.genesis.`**`ldd_deps`**(*filename*, *ret=None*)

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash

`salt.modules.genesis.`**`mksls`**(*fmt*, *src*, *dst=None*)

Convert an installation file/script to an SLS file. Currently supports `kickstart`, `preseed`, and `autoyast`.

CLI Examples:

salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/dest.sls

New in version Beryllium.

`salt.modules.genesis.`**`pack`**`(`*name*, *root*, *path=None*, *pack_format='tar'*, *compress='bzip2'*`)`

Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

`salt.modules.genesis.`**`unpack`**`(`*name*, *dest=None*, *path=None*, *pack_format='tar'*, *compress='bz2'*`)`

Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

21.9.138 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

---

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.gentoo_service.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.gentoo_service.`**`disable`**`(`*name*, ***kwargs*`)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.`**`disabled`**`(`*name*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

`salt.modules.gentoo_service.`**`enable`**`(`*name*, ***kwargs*`)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.`**`enabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.`**`get_all`**`()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.gentoo_service.`**`get_disabled`**`()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.gentoo_service.`**`get_enabled`**`()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.gentoo_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.gentoo_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.gentoo_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.gentoo_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.gentoo_service.`**`status`**`(`*name, sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.gentoo_service.`**`stop`**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.gentoo_service.`**`zap`**(*name*)

Resets service state

CLI Example:

```
salt '*' service.zap <service name>
```

21.9.139 salt.modules.gentoolkitmod

Support for Gentoolkit

`salt.modules.gentoolkitmod.`**`eclean_dist`**(*destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude'*)

Clean obsolete portage sources

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with destructive=True

size_limit <size> Don't delete distfiles bigger than <size>. <size> is a size specification: "10M" is "ten megabytes", "200K" is "two hundreds kilobytes", etc. Units are: G, M, K and B.

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

fetch_restricted Protect fetch-restricted files. Only meaningful if used with destructive=True

exclude_file Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {<dist file>: <size>},
 'deprecated': {<package>: <dist file>},
 'saved': {<package>: <dist file>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

`salt.modules.gentoolkitmod.`**`eclean_pkg`**(*destructive=False, package_names=False, time_limit=0, exclude_file='/etc/eclean/packages.exclude'*)

Clean obsolete binary packages

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with destructive=True

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

exclude_file Path to exclusion file. Default is /etc/eclean/packages.exclude This is the same default eclean-pkg uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {<dist file>: <size>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

`salt.modules.gentoolkitmod.`**`glsa_check_list`**(*glsa_list*)

List the status of Gentoo Linux Security Advisories

glsa_list can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 'all' and 'affected'

Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
 'status': <glsa status>,
 'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

`salt.modules.gentoolkitmod.`**`revdep_rebuild`**(*lib=None*)

Fix up broken reverse dependencies

lib Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

21.9.140 salt.modules.git

Support for the Git SCM

`salt.modules.git.`**`add`**(*cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to git-add(1)

cwd The path to the git checkout

filename The location of the file/directory to add, relative to `cwd`

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `add` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

`salt.modules.git.`**`archive`**(*cwd, output, rev='HEAD', prefix=None, git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*)

Changed in version 2015.8.0: Returns `True` if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd The path to be archived

Note: `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

output The path of the archive to be created

overwrite [False] Unless set to `True`, Salt will over overwrite an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

rev [HEAD] The revision from which to create the archive

format Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the git-archive(1) manpage explanation of the `--format` argument (as well as the `CONFIGURATION` section of the manpage) for further information.

New in version 2015.8.0.

prefix Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

git_opts Any additional options to add to git command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

`salt.modules.git.`**`branch`**(*cwd*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-branch(1)

cwd The path to the git checkout

name Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts Any additional options to add to the command line, in a single string

---

Note: To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/
↪mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

`salt.modules.git.`**`checkout`**(*cwd*, *rev=None*, *force=False*, *opts="*, *git_opts="*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-checkout(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

rev The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

force [False] Force a checkout even if there might be overwritten changes

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

`salt.modules.git.`**`clone`**(*cwd*, *url=None*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*)

Interface to git-clone(1)

cwd Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

url The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

name Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 20515.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
↪git
```

`salt.modules.git.`**`commit`**(*cwd, message, opts='', git_opts='', user=None, password=None, filename=None, ignore_retcode=False, output_encoding=None*)

Interface to git-commit(1)

cwd The path to the git checkout

message Commit message

opts Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.
>
> The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

git_opts Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

`salt.modules.git.`**`config_get`**(*key*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

Get the value of a key in the git configuration file

key The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

cwd The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to `True`

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all [False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

`salt.modules.git.`**`config_get_regexp`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

key Regex on which key names will be matched

value_regex If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

cwd The path to the git checkout

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.`**`config_set`**(*key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

key The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

value The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

add [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

multivar Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

global [False] If `True`, set a global variable

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

`salt.modules.git.`**`config_unset`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

key The name of the configuration key to unset

value_regex Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

all [False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

global [False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

`salt.modules.git.`**`current_branch`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

`salt.modules.git.`**`describe`**(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.

cwd The path to the git checkout

rev [HEAD] The revision to describe

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.`**`diff`**(*cwd*, *item1=None*, *item2=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *no_index=False*, *cached=False*, *paths=None*, *output_encoding=None*)

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to git-diff(1)

cwd The path to the git checkout

item1 and item2 Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

no_index [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

Note: Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

cached [False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

Note: `item2` is ignored if this option is is set to `True`.

paths File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/
↪file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/
↪path/to/file2
```

`salt.modules.git.`**`discard_local_changes`**(*cwd, path='.', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2019.2.0.

Runs a `git checkout -- <path>` from the directory specified by `cwd`.

cwd The path to the git checkout

path path relative to cwd (defaults to `.`)

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

`salt.modules.git.`**`fetch`**(*cwd, remote=None, force=False, refspecs=None, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to git-fetch(1)

cwd The path to the git checkout

remote Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in git-fetch(1)).

New in version 2015.8.0.

force Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

refspecs Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

`salt.modules.git.init`(*cwd*, *bare=False*, *template=None*, *separate_git_dir=None*, *shared=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-init(1)

cwd The path to the directory to be initialized

bare [False] If `True`, init a bare repository

New in version 2015.8.0.

template Set this argument to specify an alternate template directory

New in version 2015.8.0.

separate_git_dir Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

`salt.modules.git.`**`is_worktree`**(*cwd*, *user=None*, *password=None*, *output_encoding=None*)

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

cwd path to the worktree to be removed

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

`salt.modules.git.`**`list_branches`**(*cwd*, *remote=False*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Return a list of branches

cwd The path to the git checkout

remote [False] If `True`, list remote branches. Otherwise, local branches will be listed.

> **Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.`**`list_tags`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Return a list of tags

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

`salt.modules.git.`**`list_worktrees`**`(`*cwd*, *stale=False*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*`)`

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to git-worktree(1) which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all [False] If `True`, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

stale [False] If `True`, return *only* worktrees whose gitdir is no longer present.

Note: Only one of `all` and `stale` can be set to `True`.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.`**`ls_remote`**(*cwd=None*, *remote='origin'*, *ref=None*, *opts="*, *git_opts="*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *output_encoding=None*, *saltenv='base'*)

Interface to git-ls-remote(1). Returns the upstream hash for a remote reference.

cwd The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

remote [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

ref The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts Any additional options to add to the command line, in a single string

New in version 2015.8.0.

git_opts Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='-
↪-tags'
```

`salt.modules.git.merge`(*cwd*, *rev=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

Interface to git-merge(1)

cwd The path to the git checkout

rev Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `merge` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

`salt.modules.git.`**`merge_base`**`(`*cwd, refs=None, octopus=False, is_ancestor=False, independent=False, fork_point=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*`)`

New in version 2015.8.0.

Interface to git-merge-base(1).

cwd The path to the git checkout

refs Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

all [False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

octopus [False] If `True`, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

Set `all` to `True` with this option to return all computed merge bases, otherwise only the "best" will be returned.

is_ancestor [False] If `True`, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

independent [False] If `True`, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

fork_point If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, `None` is returned.

Note: At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then `HEAD` is assumed.

---

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to git-merge-base(1) and are not yet supported in Salt.

---

git_opts Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886 octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886␣
↪independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
salt myminion git.merge_base /path/to/repo refs=mybranch fork_point=upstream/
↪master
```

`salt.modules.git.`**`merge_tree`**(*cwd*, *ref1*, *ref2*, *base=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd The path to the git checkout

ref1 First ref/commit to compare

ref2 Second ref/commit to compare

base The base tree to use for the 3-way-merge. If not provided, then *`git.merge_base`* will be invoked on `ref1` and `ref2` to determine the merge base to use.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

`salt.modules.git.`**`pull`**(*cwd*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*)

Interface to git-pull(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

`salt.modules.git.`**`push`**(*cwd*, *remote=None*, *ref=None*, *opts="*, *git_opts="*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*, ***kwargs*)

Interface to git-push(1)

cwd The path to the git checkout

remote Name of the remote to which the ref should being pushed

New in version 2015.8.0.

ref [master] Name of the ref to push

Note: Being a refspec, this argument can include a colon to define local and remote ref names.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.`**`rebase`**`(`*cwd, rev='master', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*`)`

Interface to git-rebase(1)

cwd The path to the git checkout

rev [master] The revision to rebase onto the current branch

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

`salt.modules.git.`**`remote_get`**(*cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None*)

Get the fetch and push URL for a specific remote

cwd The path to the git checkout

remote [origin] Name of the remote to query

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

`salt.modules.git.`**`remote_refs`**(*url*, *heads=False*, *tags=False*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *output_encoding=None*, *saltenv='base'*, ***kwargs*)

New in version 2015.8.0.

Return the remote refs for the specified URL by running `git ls-remote`.

url URL of the remote repository

filter Optionally provide a ref name to `git ls-remote`. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

heads [False] Restrict output to heads. Can be combined with `tags`.

tags [False] Restrict output to tags. Can be combined with `heads`.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
salt myminion git.remote_refs https://github.com/saltstack/salt.git filter=develop
```

`salt.modules.git.`**`remote_set`**(*cwd*, *url*, *remote='origin'*, *user=None*, *password=None*, *https_user=None*, *https_pass=None*, *push_url=None*, *push_https_user=None*, *push_https_pass=None*, *ignore_retcode=False*, *output_encoding=None*)

cwd The path to the git checkout

url Remote URL to set

remote [origin] Name of the remote to set

push_url If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

push_https_user Set HTTP Basic Auth user for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

push_https_pass Set HTTP Basic Auth password for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git␣
↪remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.git␣
↪remote=upstream push_url=git@github.com:user/repo.git
```

`salt.modules.git.`**`remotes`**(*cwd*, *user=None*, *password=None*, *redact_auth=True*, *ignore_retcode=False*, *output_encoding=None*)

Get fetch and push URLs for each remote in a git checkout

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

> **Warning:** Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

`salt.modules.git.`**`reset`**(*cwd*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-reset(1), returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

`salt.modules.git.`**`rev_parse`**(*cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2015.8.0.

Interface to git-rev-parse(1)

cwd The path to the git checkout

rev Revision to parse. See the SPECIFYING REVISIONS section of the git-rev-parse(1) manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the git-rev-parse(1) manpage.

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `rev-parse` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

`salt.modules.git.`**`revision`**(*cwd*, *rev='HEAD'*, *short=False*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd The path to the git checkout

rev [HEAD] The revision

short [False] If `True`, return an abbreviated SHA1 git hash

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.`**`rm_`**(*cwd*, *filename*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-rm(1)

cwd The path to the git checkout

filename The location of the file/directory to remove, relative to `cwd`

Note: To remove a directory, `-r` must be part of the `opts` parameter.

---

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

`salt.modules.git.`**`stash`**(*cwd*, *action='save'*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-stash(1), returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. `'save <stash comment>'`, `'apply stash@{2}'`, `'show'`, etc.). Omitting this argument will simply run `git stash`.

git_opts Any additional options to add to git command itself (not the `stash` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

`salt.modules.git.`**`status`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.status /path/to/repo
```

`salt.modules.git.`**`submodule`**(*cwd*, *command*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*, ***kwargs*)

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to git-submodule(1)

cwd The path to the submodule

command Submodule command to run, see *git-submodule(1) <git submodule>* for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `submodule` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

init [False] If `True`, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to update.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/
↪repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

`salt.modules.git.`**`symbolic_ref`**(*cwd, ref, value=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2015.8.0.

Interface to git-symbolic-ref(1)

cwd The path to the git checkout

ref Symbolic ref to read/modify

value If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `symbolic-refs` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

`salt.modules.git.`**`tag`**`(`*cwd, name, ref='HEAD', message=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*`)`

New in version 2018.3.4.

Interface to git-tag(1), adds and removes tags.

cwd The path to the main git checkout or a linked worktree

name Name of the tag

ref [HEAD] Which ref to tag (defaults to local clone's HEAD)

> **Note:** This argument is ignored when either `-d` or `--delete` is present in the `opts` passed to this function.

message Optional message to include with the tag. If provided, an annotated tag will be created.

opts Any additional options to add to the command line, in a single string

> **Note:** Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
# Create an non-annotated tag
salt myminion git.tag /path/to/repo v1.2
# Create an annotated tag
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
# Delete the tag
salt myminion git.tag /path/to/repo v1.2 opts='-d'
```

`salt.modules.git.`**`version`**(*versioninfo=False*)

New in version 2015.8.0.

Returns the version of Git installed on the minion

versioninfo [False] If `True`, return the version in a versioninfo list (e.g. `[2, 5, 0]`)

CLI Example:

```
salt myminion git.version
```

`salt.modules.git.`**`worktree_add`**(*cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*)

New in version 2015.8.0.

Interface to git-worktree(1), adds a worktree

cwd The path to the git checkout

worktree_path Path to the new worktree. Can be either absolute, or relative to `cwd`.

branch Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

ref Name of the ref on which to base the new worktree. If omitted, then `HEAD` is use, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

reset_branch [False] If `False`, then git-worktree(1) will fail to create the worktree if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new worktree.

force [False] By default, git-worktree(1) will not permit the same branch to be checked out in more than one worktree. Set this argument to `True` to override this.

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.
>
> All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

git_opts Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21␣
↪ref=v2.1.9.3
```

`salt.modules.git.`**`worktree_prune`**`(`*cwd, dry_run=False, verbose=True, expire=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*`)`

New in version 2015.8.0.

Interface to git-worktree(1), prunes stale worktree administrative data from the gitdir

cwd The path to the main git checkout or a linked worktree

dry_run [False] If `True`, then this function will report what would have been pruned, but no changes will be made.

verbose [True] Report all changes made. Set to `False` to suppress this output.

expire Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the git-config(1) manpage.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

git_opts Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.`**`worktree_rm`**(*cwd*, *user=None*, *output_encoding=None*)

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking *`git.is_worktree`*. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

Warning: There is no undoing this action. Be **VERY** careful before running this function.

cwd Path to the worktree to be removed

user Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

21.9.141 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

depends PyGithub python module

Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'github' key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

  # optional: some functions require a repo_name, which
  # can be set in the config file, or passed in at the CLI.
  repo_name: my_repo

  # optional: it can be dangerous to change the privacy of a repository
  # in an automated way. set this to True to allow privacy modifications
  allow_repo_privacy_changes: False
```

`salt.modules.github.`**`add_repo`**(*name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=None, gitignore_template=None, license_template=None, profile='github'*)

Create a new github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.

gitignore_template The desired language or platform for a .gitignore, e.g "Haskell".

license_template The desired LICENSE template to apply, e.g "mit" or "mozilla".

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`add_team`**(*name*, *description=None*, *repo_names=None*, *privacy=None*, *permission=None*, *profile='github'*)

Create a new Github team within an organization.

name The name of the team to be created.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be 'secret' or 'closed'.

permission The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`add_team_member`**(*name*, *team_name*, *profile='github'*)

Adds a team member to a team with team_name.

name The name of the team member to add.

team_name The name of the team of which to add the user.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`add_team_repo`**(*repo_name*, *team_name*, *profile='github'*, *permission=None*)

Adds a repository to a team with team_name.

repo_name The name of the repository to add.

team_name The name of the team of which to add the repository.

profile The name of the profile configuration to use. Defaults to `github`.

permission The permission for team members within the repository, can be 'pull', 'push' or 'admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`add_user`**`(`*name*, *profile='github'*`)`

Add a GitHub user.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

`salt.modules.github.`**`edit_repo`**`(`*name*, *description=None*, *homepage=None*, *private=None*, *has_issues=None*, *has_wiki=None*, *has_downloads=None*, *profile='github'*`)`

Updates an existing Github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`edit_team`**`(`*name*, *description=None*, *privacy=None*, *permission=None*, *profile='github'*`)`

Updates an existing Github team.

name The name of the team to be edited.

description The description of the team.

privacy The level of privacy for the team, can be 'secret' or 'closed'.

permission The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

`salt.modules.github.`**`get_issue`**`(`*issue_number*, *repo_name=None*, *profile='github'*, *output='min'*`)`

Return information about a single issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue to retrieve.

repo_name The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

`salt.modules.github.`**`get_issue_comments`**`(`*issue_number*, *repo_name=None*, *profile='github'*, *since=None*, *output='min'*`)`

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue for which to retrieve comments.

repo_name The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

since Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

`salt.modules.github.`**`get_issues`**`(`*repo_name=None*, *profile='github'*, *milestone=None*, *state='open'*, *assignee=None*, *creator=None*, *mentioned=None*, *labels=None*, *sort='created'*, *direction='desc'*, *since=None*, *output='min'*, *per_page=None*`)`

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

milestone The number of a GitHub milestone, or a string of either `*` or `none`.

If a number is passed, it should refer to a milestone by its number field. Use the `github.get_milestone` function to obtain a milestone's number.

If the string `*` is passed, issues with any milestone are accepted. If the string `none` is passed, issues without milestones are returned.

state Indicates the state of the issues to return. Can be either `open`, `closed`, or `all`. Default is `open`.

assignee Can be the name of a user. Pass in `none` (as a string) for issues with no assigned user or `*` for issues assigned to any user.

creator The user that created the issue.

mentioned A user that's mentioned in the issue.

labels A string of comma separated label names. For example, `bug,ui,@high`.

sort What to sort results by. Can be either `created`, `updated`, or `comments`. Default is `created`.

direction The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

`salt.modules.github.`**`get_milestone`**(*number=None, name=None, repo_name=None, profile='github', output='min'*)

Return information about a single milestone in a named repository.

New in version 2016.11.0.

number The number of the milestone to retrieve. If provided, this option will be favored over `name`.

name The name of the milestone to retrieve.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

`salt.modules.github.`**`get_milestones`**(*repo_name=None, profile='github', state='open', sort='due_on', direction='asc', output='min', per_page=None*)

Return information about milestones for a given repository.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

state The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

sort What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

direction The direction of the sort. Either `asc` or `desc`. Default is `asc`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

`salt.modules.github.`**`get_prs`**(*repo_name=None, profile='github', state='open', head=None, base=None, sort='created', direction='desc', output='min', per_page=None*)

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

repo_name The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

state Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.

head Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is `None`.

base Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.

sort What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.

direction The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

output The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

`salt.modules.github.`**`get_repo_info`**(*repo_name, profile='github', ignore_cache=False*)

Return information for a given repo.

New in version 2016.11.0.

repo_name The name of the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

`salt.modules.github.`**`get_repo_teams`**(*repo_name, profile='github'*)

Return teams belonging to a repository.

New in version 2017.7.0.

repo_name The name of the repository from which to retrieve teams.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

`salt.modules.github.`**`get_team`**(*name*, *profile='github'*)

Returns the team details if a team with the given name exists, or None otherwise.

name The team name for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

`salt.modules.github.`**`get_user`**(*name*, *profile='github'*, *user_details=False*)

Get a GitHub user by name.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

user_details Prints user information details. Defaults to `False`. If the user is already in the organization and user_details is set to False, the get_user function returns `True`. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

`salt.modules.github.`**`is_team_member`**(*name*, *team_name*, *profile='github'*)

Returns True if the github user is in the team with team_name, or False otherwise.

name The name of the user whose membership to check.

team_name The name of the team to check membership in.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`list_members_without_mfa`**(*profile='github'*, *ignore_cache=False*)

List all members (in lower case) without MFA turned on.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

`salt.modules.github.`**`list_private_repos`**(*profile='github'*)

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

`salt.modules.github.`**`list_public_repos`**(*profile='github'*)

List public repositories within the organization.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

`salt.modules.github.`**`list_repos`**(*profile='github'*)

List all repositories within the organization. Includes public and private repositories within the organization Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

`salt.modules.github.`**`list_team_members`**(*team_name*, *profile='github'*, *ignore_cache=False*)

Gets the names of team members in lower case.

team_name The name of the team from which to list members.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`list_team_repos`**(*team_name*, *profile='github'*, *ignore_cache=False*)

Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are always in lower case.

team_name The name of the team from which to list repos.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`list_teams`**(*profile='github', ignore_cache=False*)

Lists all teams with the organization.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

`salt.modules.github.`**`list_users`**(*profile='github', ignore_cache=False*)

List all users within the organization.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

`salt.modules.github.`**`remove_repo`**(*name, profile='github'*)

Remove a Github repository.

name The name of the repository to be removed.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

`salt.modules.github.`**`remove_team`**(*name, profile='github'*)

Remove a github team.

name The name of the team to be removed.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`remove_team_member`**(*name, team_name, profile='github'*)

Removes a team member from a team with team_name.

name The name of the team member to remove.

team_name The name of the team from which to remove the user.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**remove_team_repo**(*repo_name*, *team_name*, *profile='github'*)

Removes a repository from a team with team_name.

repo_name The name of the repository to remove.

team_name The name of the team of which to remove the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**remove_user**(*name*, *profile='github'*)

Remove a Github user by name.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_user github-handle
```

21.9.142 salt.modules.glance

Module for handling openstack glance calls.

optdepends

- glanceclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False   #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
```

(continues on next page)

(continued from previous page)

```
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' glance.image_list profile=openstack1
```

`salt.modules.glance.`**`image_create`**(*name, location=None, profile=None, visibility=None, container_format='bare', disk_format='raw', protected=None*)

Create an image (glance image-create)

CLI Example, old format:

```
salt '*' glance.image_create name=f16-jeos \
         disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```
salt '*' glance.image_create name=f16-jeos visibility=public \
         disk_format=qcow2 container_format=ovf
```

The parameter 'visibility' defaults to 'public' if not specified.

`salt.modules.glance.`**`image_delete`**(*id=None, name=None, profile=None*)

Delete an image (glance image-delete)

CLI Examples:

```
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

`salt.modules.glance.`**`image_list`**(*id=None, profile=None, name=None*)

Return a list of available images (glance image-list)

CLI Example:

```
salt '*' glance.image_list
```

`salt.modules.glance.`**`image_schema`**(*profile=None*)

Returns names and descriptions of the schema "image"'s properties for this profile's instance of glance

CLI Example:

```
salt '*' glance.image_schema
```

`salt.modules.glance.`**`image_show`**(*id=None, name=None, profile=None*)

Return details about a specific image (glance image-show)

CLI Example:

```
salt '*' glance.image_show
```

`salt.modules.glance.`**`image_update`**(*id=None, name=None, profile=None, **kwargs*)

Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility ('public' or 'private')

CLI Example:

```
salt '*' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_update name=f16-jeos
```

salt.modules.glance.**schema_get**(*name*, *profile=None*)

Known valid names of schemas are:

- image
- images
- member
- members

CLI Example:

```
salt '*' glance.schema_get name=f16-jeos
```

21.9.143 salt.modules.glanceng

Glance module for interacting with OpenStack Glance

New in version 2018.3.0.

:depends:shade

Example configuration

```
glance:
  cloud: default
```

```
glance:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
  identity_api_version: 3
```

salt.modules.glanceng.**compare_changes**(*obj*, ***kwargs*)
Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.glanceng.**get_openstack_cloud**(*auth=None*)
Return an openstack_cloud

salt.modules.glanceng.**get_operator_cloud**(*auth=None*)
Return an operator_cloud

salt.modules.glanceng.**image_create**(*auth=None*, ***kwargs*)
Create an image

CLI Example:

```
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw hw_
→scsi_model=virtio-scsi hw_disk_bus=scsi
```

`salt.modules.glanceng.`**`image_delete`**`(auth=None, **kwargs)`

Delete an image

CLI Example:

```
salt '*' glanceng.image_delete name=image1
salt '*' glanceng.image_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.glanceng.`**`image_get`**`(auth=None, **kwargs)`

Get a single image

CLI Example:

```
salt '*' glanceng.image_get name=image1
salt '*' glanceng.image_get name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.glanceng.`**`image_list`**`(auth=None, **kwargs)`

List images

CLI Example:

```
salt '*' glanceng.image_list
salt '*' glanceng.image_list
```

`salt.modules.glanceng.`**`image_search`**`(auth=None, **kwargs)`

Search for images

CLI Example:

```
salt '*' glanceng.image_search name=image1
salt '*' glanceng.image_search
```

`salt.modules.glanceng.`**`setup_clouds`**`(auth=None)`

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

`salt.modules.glanceng.`**`update_image_properties`**`(auth=None, **kwargs)`

Update properties for an image

CLI Example:

```
salt '*' glanceng.update_image_properties name=image1 hw_scsi_model=virtio-scsi⊠
↪hw_disk_bus=scsi
salt '*' glanceng.update_image_properties name=0e4febc2a5ab4f2c8f374b054162506d⊠
↪min_ram=1024
```

21.9.144 salt.modules.glusterfs

Manage a glusterfs pool

`salt.modules.glusterfs.`**`add_volume_bricks`**`(name, bricks)`

Add brick(s) to an existing volume

name Volume name

bricks List of bricks to add to the volume

CLI Example:

```
salt '*' glusterfs.add_volume_bricks <volume> <bricks>
```

salt.modules.glusterfs.**create_volume**(*name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False*)

Create a glusterfs volume

name Name of the gluster volume

bricks Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: '["<peer1>:<brick1>", "<peer2>:<brick2>"]'

stripe Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

replica Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

arbiter If true, specifies volume should use arbiter brick(s). Valid configuration limited to "replica 3 arbiter 1" per Gluster documentation. Every third brick in the brick list is used as an arbiter brick.

New in version 2019.2.0.

device_vg If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

transport Transport protocol to use, can be 'tcp', 'rdma' or 'tcp,rdma'

start Start the volume after creation

force Force volume creation, this works even if creating in root FS

CLI Examples:

```
salt host1 glusterfs.create newvolume host1:/brick

salt gluster1 glusterfs.create vol2 '["gluster1:/export/vol2/brick",
↪"gluster2:/export/vol2/brick"]' replica=2 start=True
```

salt.modules.glusterfs.**delete_volume**(*target, stop=True*)

Deletes a gluster volume

target Volume to delete

stop [True] If `True`, stop volume before delete

CLI Example:

```
salt '*' glusterfs.delete_volume <volume>
```

salt.modules.glusterfs.**disable_quota_volume**(*name*)

Disable quota on a glusterfs volume.

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.disable_quota_volume <volume>
```

salt.modules.glusterfs.**enable_quota_volume**(*name*)

Enable quota on a glusterfs volume.

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.enable_quota_volume <volume>
```

`salt.modules.glusterfs.`**`get_max_op_version`**`()`

New in version 2019.2.0.

Returns the glusterfs volume's max op-version value Requires Glusterfs version > 3.9

CLI Example: .. code-block:: bash

salt '*' glusterfs.get_max_op_version

`salt.modules.glusterfs.`**`get_op_version`**`(`*name*`)`

New in version 2019.2.0.

Returns the glusterfs volume op-version

name Name of the glusterfs volume

CLI Example:

```
salt '*' glusterfs.get_op_version <volume>
```

`salt.modules.glusterfs.`**`get_version`**`()`

New in version 2019.2.0.

Returns the version of glusterfs. CLI Example: .. code-block:: bash

salt '*' glusterfs.get_version

`salt.modules.glusterfs.`**`info`**`(`*name=None*`)`

New in version 2015.8.4.

Return gluster volume info.

name Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

`salt.modules.glusterfs.`**`list_quota_volume`**`(`*name*`)`

List quotas of glusterfs volume

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.list_quota_volume <volume>
```

`salt.modules.glusterfs.`**`list_volumes`**`()`

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

`salt.modules.glusterfs.`**`peer`**`(`*name*`)`

Add another node into the peer list.

name The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

$ gluster peer probe ftp2

GLUSTER CLI 3.4.4 return example (so we know what we are parsing): #if the "peer" is the local host: peer probe: success: on localhost not needed

#if the peer was just added: peer probe: success

#if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list

`salt.modules.glusterfs.`**`peer_status`**`()`

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

$ gluster peer status

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

Number of Peers: 2

Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)

Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)

`salt.modules.glusterfs.`**`set_op_version`**`(`*version*`)`

New in version 2019.2.0.

Set the glusterfs volume op-version

version Version to set the glusterfs volume op-version

CLI Example:

```
salt '*' glusterfs.set_op_version <volume>
```

`salt.modules.glusterfs.`**`set_quota_volume`**`(`*name, path, size, enable_quota=False*`)`

Set quota to glusterfs volume.

name Name of the gluster volume

path Folder path for restriction in volume ("/")

size Hard-limit size of the volume (MB/GB)

enable_quota Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

`salt.modules.glusterfs.`**`start_volume`**(*name*, *force=False*)

Start a gluster volume

name Volume name

force Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

`salt.modules.glusterfs.`**`status`**(*name*)

Check the status of a gluster volume.

name Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

`salt.modules.glusterfs.`**`stop_volume`**(*name*, *force=False*)

Stop a gluster volume

name Volume name

force Force stop the volume

New in version 2015.8.4.

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

`salt.modules.glusterfs.`**`unset_quota_volume`**(*name*, *path*)

Unset quota on glusterfs volume

name Name of the gluster volume

path Folder path for restriction in volume

CLI Example:

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```

21.9.145 salt.modules.gnomedesktop

GNOME implementations

`salt.modules.gnomedesktop.`**`get`**(*schema=None*, *key=None*, *user=None*, ***kwargs*)

Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-
↪activation-enabled
```

`salt.modules.gnomedesktop.`**`getClockFormat`**(***kwargs*)

Return the current clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

`salt.modules.gnomedesktop.`**`getClockShowDate`**`(`*`**kwargs`*`)`

Return the current setting, if the date is shown in the clock

CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

`salt.modules.gnomedesktop.`**`getIdleActivation`**`(`*`**kwargs`*`)`

Get whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

`salt.modules.gnomedesktop.`**`getIdleDelay`**`(`*`**kwargs`*`)`

Return the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

`salt.modules.gnomedesktop.`**`ping`**`(`*`**kwargs`*`)`

A test to ensure the GNOME module is loaded

CLI Example:

```
salt '*' gnome.ping user=<username>
```

`salt.modules.gnomedesktop.`**`setClockFormat`**`(`*`clockFormat, **kwargs`*`)`

Set the clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

`salt.modules.gnomedesktop.`**`setClockShowDate`**`(`*`kvalue, **kwargs`*`)`

Set whether the date is visible in the clock

CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

`salt.modules.gnomedesktop.`**`setIdleActivation`**`(`*`kvalue, **kwargs`*`)`

Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

`salt.modules.gnomedesktop.`**`setIdleDelay`**`(`*`delaySeconds, **kwargs`*`)`

Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

`salt.modules.gnomedesktop.`**`set_`**`(`*schema=None, key=None, user=None, value=None, **kwargs*`)`

Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-
↪activation-enabled value=False
```

21.9.146 salt.modules.google_chat

Module for sending messages to google chat.

New in version 2019.2.0.

To use this module you need to configure a webhook in the google chat room where you would like the message to be sent, see:

> https://developers.google.com/hangouts/chat/how-tos/webhooks

`salt.modules.google_chat.`**`send_message`**`(`*url, message*`)`

Send a message to the google chat room specified in the webhook url.

```
salt '*' google_chat.send_message "https://chat.googleapis.com/v1/spaces/example_
↪space/messages?key=example_key" "This is a test message"
```

21.9.147 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

Note: The `python-gnupg` library and `gpg` binary are required to be installed.

`salt.modules.gpg.`**`create_key`**`(`*key_type='RSA', key_length=1024, name_real='Autogenerated Key', name_comment='Generated by SaltStack', name_email=None, subkey_type=None, subkey_length=None, expire_date=None, use_passphrase=False, user=None, gnupghome=None*`)`

Create a key in the GPG keychain

Note: GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

key_type The type of the primary key to generate. It must be capable of signing. 'RSA' or 'DSA'.

key_length The length of the primary key in bits.

name_real The real name of the user identity which is represented by the key.

name_comment A comment to attach to the user id.

name_email An email address for the user.

subkey_type The type of the secondary key to generate.

subkey_length The length of the secondary key in bits.

expire_date The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

`salt.modules.gpg.`**`decrypt`**(*user=None*, *text=None*, *filename=None*, *output=None*, *use_passphrase=False*, *gnupghome=None*, *bare=False*)

Decrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

text The encrypted text to decrypt.

filename The encrypted filename to decrypt.

output The filename where the decrypted data will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'

salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True
```

`salt.modules.gpg.`**`delete_key`**(*keyid=None*, *fingerprint=None*, *delete_secret=False*, *user=None*, *gnupghome=None*)

Get a key from the GPG keychain

keyid The keyid of the key to be deleted.

fingerprint The fingerprint of the key to be deleted.

delete_secret Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E

salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
```

(continues on next page)

(continued from previous page)

```
salt '*' gpg.delete_key keyid=3FAD9F1E user=username

salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

`salt.modules.gpg.`**`encrypt`**(*user=None, recipients=None, text=None, filename=None, output=None, sign=None, use_passphrase=False, gnupghome=None, bare=False*)

Encrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

recipients The fingerprints for those recipient whom the data is being encrypted for.

text The text to encrypt.

filename The filename to encrypt.

output The filename where the signed file will be written, default is standard out.

sign Whether to sign, in addition to encrypt, the data. `True` to use default key or fingerprint to specify a different key to sign with.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.encrypt text='Hello there.  How are you?'

salt '*' gpg.encrypt filename='/path/to/important.file'

salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True
```

`salt.modules.gpg.`**`export_key`**(*keyids=None, secret=False, user=None, gnupghome=None*)

Export a key from the GPG keychain

keyids The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.

secret Export the secret key identified by the `keyids` information passed.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.export_key keyids=3FAD9F1E

salt '*' gpg.export_key keyids=3FAD9F1E secret=True

salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username
```

`salt.modules.gpg.`**`get_key`**(*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_key keyid=3FAD9F1E

salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

`salt.modules.gpg.`**`get_secret_key`**(*keyid=None, fingerprint=None, user=None, gnupghome=None*)
Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

`salt.modules.gpg.`**`import_key`**(*text=None, filename=None, user=None, gnupghome=None*)
Import a key from text or file

text The text containing to import.

filename The filename containing the key to import.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -----END
↪PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

`salt.modules.gpg.`**`list_keys`**(*user=None, gnupghome=None*)
List keys in GPG keychain

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.list_keys
```

`salt.modules.gpg.`**`list_secret_keys`**`(`*user=None, gnupghome=None*`)`

List secret keys in GPG keychain

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.list_secret_keys
```

`salt.modules.gpg.`**`receive_keys`**`(`*keyserver=None, keys=None, user=None, gnupghome=None*`)`

Receive key(s) from keyserver and add them to keychain

keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu

keys The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'

salt '*' gpg.receive_keys keys="['3FAD9F1E','3FBD9F2E']"

salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.`**`search_keys`**`(`*text, keyserver=None, user=None*`)`

Search keys from keyserver

text Text to search the keyserver for, e.g. email address, keyID or fingerprint.

keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.search_keys user@example.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
↪user=username
```

`salt.modules.gpg.`**`sign`**`(`*user=None, keyid=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None*`)`

Sign message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

keyid The keyid of the key to set the trust level for, defaults to first key in the secret keyring.

text The text to sign.

filename The filename to sign.

output The filename where the signed file will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.sign text='Hello there.  How are you?'

salt '*' gpg.sign filename='/path/to/important.file'

salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

`salt.modules.gpg.`**`trust_key`**(*keyid=None*, *fingerprint=None*, *trust_level=None*, *user=None*)

Set the trust level for a key in GPG keychain

keyid The keyid of the key to set the trust level for.

fingerprint The fingerprint of the key to set the trust level for.

trust_level The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192'
↪trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'
```

`salt.modules.gpg.`**`verify`**(*text=None*, *user=None*, *filename=None*, *gnupghome=None*, *signature=None*, *trustmodel=None*)

Verify a message or file

text The text to verify.

filename The filename to verify.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

signature Specify the filename of a detached signature.

New in version 2018.3.0.

trustmodel

Explicitly define the used trust model. One of:

- pgp
- classic
- tofu
- tofu+pgp
- direct

- always
- auto

New in version 2019.2.0.

CLI Example:

```
salt '*' gpg.verify text='Hello there.  How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```

21.9.148 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.

depends requests

configuration This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

For example:

```
grafana:
    grafana_url: http://grafana.localhost
    grafana_user: admin
    grafana_password: admin
    grafana_timeout: 3
```

`salt.modules.grafana4.`**`create_datasource`**`(`*orgname=None, profile='grafana', **kwargs*`)`

Create a new datasource in an organisation.

name Name of the data source.

type Type of the datasource ('graphite', 'influxdb' etc.).

access Use proxy or direct.

url The URL to the data source API.

user Optional - user to authenticate with the data source.

password Optional - password to authenticate with the data source.

database Optional - database to use with the data source.

basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser Optional - HTTP basic auth username.

basicAuthPassword Optional - HTTP basic auth password.

jsonData Optional - additional json data to post (eg. "timeInterval").

isDefault Optional - set data source as default.

withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

typeLogoUrl Optional - Logo to use for this datasource.

orgname Name of the organization in which the data source should be created.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

salt.modules.grafana4.**create_org**(*profile='grafana'*, ***kwargs*)

Create a new organization.

name Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

salt.modules.grafana4.**create_org_user**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Add user to the organization.

loginOrEmail Login or email of the user.

role

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname Name of the organization in which users are added.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=
↪<role>
```

salt.modules.grafana4.**create_update_dashboard**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Create or update a dashboard.

dashboard A dict that defines the dashboard to create/update.

overwrite Whether the dashboard should be overwritten if already existing.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True
↪orgname=<orgname>
```

salt.modules.grafana4.**create_user**(*profile='grafana'*, ***kwargs*)

Create a new user.

login Login of the new user.

password Password of the new user.

email Email of the new user.

name Optional - Full name of the new user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_user login=<login> password=<password> email=<email>
```

`salt.modules.grafana4.`**`delete_dashboard`**(*slug, orgname=None, profile='grafana'*)

Delete a dashboard.

slug Slug (name) of the dashboard.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

`salt.modules.grafana4.`**`delete_datasource`**(*datasourceid, orgname=None, profile='grafana'*)

Delete a datasource.

datasourceid Id of the datasource.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

`salt.modules.grafana4.`**`delete_org`**(*orgid, profile='grafana'*)

Delete an organization.

orgid Id of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

`salt.modules.grafana4.`**`delete_org_user`**(*userid, orgname=None, profile='grafana'*)

Remove user from the organization.

userid Id of the user.

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

`salt.modules.grafana4.`**`delete_user`**(*userid, profile='grafana'*)

Delete a user.

userid Id of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

`salt.modules.grafana4.`**`delete_user_org`**(*userid*, *orgid*, *profile='grafana'*)

Remove a user from an organization.

userid Id of the user.

orgid Id of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

`salt.modules.grafana4.`**`get_dashboard`**(*slug*, *orgname=None*, *profile='grafana'*)

Get a dashboard.

slug Slug (name) of the dashboard.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

`salt.modules.grafana4.`**`get_datasource`**(*name*, *orgname=None*, *profile='grafana'*)

Show a single datasource in an organisation.

name Name of the datasource.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

`salt.modules.grafana4.`**`get_datasources`**(*orgname=None*, *profile='grafana'*)

List all datasources in an organisation.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_datasources <orgname>
```

`salt.modules.grafana4.`**`get_org`**(*name*, *profile='grafana'*)

Show a single organization.

name Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org <name>
```

`salt.modules.grafana4.`**`get_org_address`**(*orgname=None, profile='grafana'*)

Get the organization address.

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_address <orgname>
```

`salt.modules.grafana4.`**`get_org_prefs`**(*orgname=None, profile='grafana'*)

Get the organization preferences.

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_prefs <orgname>
```

`salt.modules.grafana4.`**`get_org_users`**(*orgname=None, profile='grafana'*)

Get the list of users that belong to the organization.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_users <orgname>
```

`salt.modules.grafana4.`**`get_orgs`**(*profile='grafana'*)

List all organizations.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_orgs
```

`salt.modules.grafana4.`**`get_user`**(*login, profile='grafana'*)

Show a single user.

login Login of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user <login>
```

`salt.modules.grafana4.`**`get_user_data`**(*userid, profile='grafana'*)

Get user data.

userid Id of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_data <user_id>
```

`salt.modules.grafana4.`**`get_user_orgs`**(*userid*, *profile='grafana'*)

Get the list of organisations a user belong to.

userid Id of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_orgs <user_id>
```

`salt.modules.grafana4.`**`get_users`**(*profile='grafana'*)

List all users.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_users
```

`salt.modules.grafana4.`**`switch_org`**(*orgname*, *profile='grafana'*)

Switch the current organization.

name Name of the organization to switch to.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.switch_org <name>
```

`salt.modules.grafana4.`**`update_datasource`**(*datasourceid*, *orgname=None*, *profile='grafana'*, ***kwargs*)

Update a datasource.

datasourceid Id of the datasource.

name Name of the data source.

type Type of the datasource ('graphite', 'influxdb' etc.).

access Use proxy or direct.

url The URL to the data source API.

user Optional - user to authenticate with the data source.

password Optional - password to authenticate with the data source.

database Optional - database to use with the data source.

basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser Optional - HTTP basic auth username.

basicAuthPassword Optional - HTTP basic auth password.

jsonData Optional - additional json data to post (eg. "timeInterval").

isDefault Optional - set data source as default.

withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

typeLogoUrl Optional - Logo to use for this datasource.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_datasource <datasourceid>
```

`salt.modules.grafana4.`**`update_org`**(*orgid*, *profile='grafana'*, ***kwargs*)
Update an existing organization.

orgid Id of the organization.

name New name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org <org_id> name=<name>
```

`salt.modules.grafana4.`**`update_org_address`**(*orgname=None*, *profile='grafana'*, ***kwargs*)
Update the organization address.

orgname Name of the organization in which users are updated.

address1 Optional - address1 of the org.

address2 Optional - address2 of the org.

city Optional - city of the org.

zip_code Optional - zip_code of the org.

state Optional - state of the org.

country Optional - country of the org.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

`salt.modules.grafana4.`**`update_org_prefs`**(*orgname=None*, *profile='grafana'*, ***kwargs*)
Update the organization preferences.

orgname Name of the organization in which users are updated.

theme Selected theme for the org.

homeDashboardId Home dashboard for the org.

timezone Timezone for the org (one of: "browser", "utc", or "").

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

`salt.modules.grafana4.`**`update_org_user`**(*userid*, *orgname=None*, *profile='grafana'*, ***kwargs*)
Update user role in the organization.

userid Id of the user.

loginOrEmail Login or email of the user.

role

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail>␣
↪role=<role>
```

`salt.modules.grafana4.`**`update_user`**(*userid*, *profile='grafana'*, ***kwargs*)

Update an existing user.

userid Id of the user.

login Optional - Login of the user.

email Optional - Email of the user.

name Optional - Full name of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

`salt.modules.grafana4.`**`update_user_password`**(*userid*, *profile='grafana'*, ***kwargs*)

Update a user password.

userid Id of the user.

password New password of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

`salt.modules.grafana4.`**`update_user_permissions`**(*userid*, *profile='grafana'*, ***kwargs*)

Update a user password.

userid Id of the user.

isGrafanaAdmin Whether user is a Grafana admin.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
```

21.9.149 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

`salt.modules.grains.`**`append`**`(`*key*, *val*, *convert=False*, *delimiter=':'*`)`

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

key The grain key to be appended to

val The value to append to the grain key

convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.`**`delkey`**`(`*key*`)`

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

key The grain key from which to delete the value.

CLI Example:

```
salt '*' grains.delkey key
```

`salt.modules.grains.`**`delval`**`(`*key*, *destructive=False*`)`

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to `None`. To completely remove the grain, run `grains.delkey` or pass `destructive=True` to `grains.delval`.

key The grain key from which to delete the value.

destructive Delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.delval key
```

`salt.modules.grains.`**`equals`**`(`*key*, *value*`)`

Used to make sure the minion's grain key/value matches.

Returns `True` if matches otherwise `False`.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

`salt.modules.grains.`**`fetch`**`(`*key, default='', delimiter=':', ordered=True*`)`

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **`delimiter`** – Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **`ordered`** – Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.`**`filter_by`**`(`*lookup_dict, grain='os_family', merge=None, default='default', base=None*`)`

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

Parameters

- **`lookup_dict`** – A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from 'salt'
  salt '*' grains.filter_by '{salt*: got some salt, default: salt is⊠
  ↪not here}' id
  ```

- **`grain`** – The name of a grain to match with the current system's grains. For example, the value of the "os_family" grain for the current system could be used to pull values from the `lookup_dict` dictionary.

  Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **`merge`** – A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

- **`default`** – default lookup_dict's key used if the grain does not exists or if the grain value has no match on lookup_dict. If unspecified the value is "default".

  New in version 2014.1.0.

- **`base`** – A lookup_dict key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.

CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}, J: K}
↪' 'C'
# next one renders {A: {B: G}, D: J}
```

(continues on next page)

(continued from previous page)

```
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}
↪' 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

`salt.modules.grains.`**`get`**`(`*key, default=”, delimiter=’:’, ordered=True*`)`

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ”:” delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **`delimiter`** – Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **`ordered`** – Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.`**`get_or_set_hash`**`(`*`name, length=8, chars=’abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)’`*`)`

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don’t need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

> **Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.grains.`**`has_value`**`(`*key*`)`

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

`salt.modules.grains.`**`item`**`(`**args, **kwargs*`)`

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

`salt.modules.grains.`**`items`**`(`*sanitize=False*`)`

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

`salt.modules.grains.`**`ls`**`()`

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

`salt.modules.grains.`**`remove`**`(`*key, val, delimiter=':'*`)`

New in version 0.17.0.

Remove a value from a list in the grains config file

key The grain key to remove.

val The value to remove.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

`salt.modules.grains.`**`set`**(*key*, *val=''*, *force=False*, *destructive=False*, *delimiter=':'*)

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **`force`** – Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **`destructive`** – If an operation results in a key being removed, delete the key, too. Defaults to False.
- **`delimiter`** – Specify an alternate delimiter to use when traversing a nested dict, the default being **:**

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

`salt.modules.grains.`**`setval`**(*key*, *val*, *destructive=False*)

Set a grains value in the grains config file

key The grain key to be set.

val The value to set the grain key to.

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key "{'sub-key': 'val', 'sub-key2': 'val2'}"
```

`salt.modules.grains.`**`setvals`**(*grains*, *destructive=False*)

Set new grains values in the grains config file

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setvals "{'key1': 'val1', 'key2': 'val2'}"
```

21.9.150 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.groupadd.`**`add`**(*name*, *gid=None*, *system=False*, *root=None*)

Add the specified group

name Name of the new group

gid Use GID for the new group

system Create a system account

root Directory to chroot into

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.groupadd.`**`adduser`**(*name*, *username*, *root=None*)

Add a user in the group.

name Name of the group to modify

username Username to add to the group

root Directory to chroot into

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.groupadd.`**`chgid`**(*name*, *gid*, *root=None*)

Change the gid for a named group

name Name of the group to modify

gid Change the group ID to GID

root Directory to chroot into

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.groupadd.`**`delete`**(*name*, *root=None*)

Remove the named group

name Name group to delete

root Directory to chroot into

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.groupadd.`**`deluser`**(*name*, *username*, *root=None*)

Remove a user from the group.

name Name of the group to modify

username Username to delete from the group

root Directory to chroot into

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.groupadd.`**`getent`**`(`*refresh=False*, *root=None*`)`

Return info on all groups

refresh Force a refresh of group information

root Directory to chroot into

CLI Example:

```
salt '*' group.getent
```

`salt.modules.groupadd.`**`info`**`(`*name*, *root=None*`)`

Return information about a group

name Name of the group

root Directory to chroot into

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.groupadd.`**`members`**`(`*name*, *members_list*, *root=None*`)`

Replaces members of the group with a provided list.

name Name of the group to modify

members_list Username list to set into the group

root Directory to chroot into

CLI Example:

> salt '*' group.members foo 'user1,user2,user3,…'

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,…

21.9.151 salt.modules.grub_legacy

Support for GRUB Legacy

`salt.modules.grub_legacy.`**`conf`**`()`

Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

`salt.modules.grub_legacy.`**`version`**`()`

Return server version from grub –version

CLI Example:

```
salt '*' grub.version
```

21.9.152 salt.modules.guestfs

Interact with virtual machine images via libguestfs

depends

- libguestfs

`salt.modules.guestfs.`**`mount`**`(`*location*, *access='rw'*, *root=None*`)`

Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```

21.9.153 salt.modules.hadoop

Support for hadoop

maintainer Yann Jouanin <yann.jouanin@intelunix.fr>

maturity new

depends

platform linux

`salt.modules.hadoop.`**`dfs`**`(`*command=None*, **args*`)`

Execute a command on DFS

CLI Example:

```
salt '*' hadoop.dfs ls /
```

`salt.modules.hadoop.`**`dfs_absent`**`(`*path*`)`

Check if a file or directory is absent on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

`salt.modules.hadoop.`**`dfs_present`**`(`*path*`)`

Check if a file or directory is present on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

`salt.modules.hadoop.`**`dfsadmin_report`**`(`*arg=None*`)`

New in version 2019.2.0.

Reports basic filesystem information and statistics. Optional flags may be used to filter the list of displayed DataNodes.

arg [live] [dead] [decommissioning]

CLI Example:

```
salt '*' hadoop.dfsadmin -report
```

`salt.modules.hadoop.`**`namenode_format`**`(`*force=None*`)`

Format a name node

```
salt '*' hadoop.namenode_format force=True
```

`salt.modules.hadoop.`**`version`**`()`

Return version from hadoop version

CLI Example:

```
salt '*' hadoop.version
```

21.9.154 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

`salt.modules.haproxyconn.`**`disable_server`**`(`*name, backend, socket='/var/run/haproxy.sock'*`)`

Disable server in haproxy.

name Server to disable

backend haproxy backend, or all backends if "*" is supplied

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.disable_server db1.example.com mysql
```

`salt.modules.haproxyconn.`**`enable_server`**`(`*name, backend, socket='/var/run/haproxy.sock'*`)`

Enable Server in haproxy

name Server to enable

backend haproxy backend, or all backends if "*" is supplied

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.enable_server web1.example.com www
```

`salt.modules.haproxyconn.`**`get_backend`**`(`*backend, socket='/var/run/haproxy.sock'*`)`

Receive information about a specific backend.

backend haproxy backend

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.get_backend mysql
```

`salt.modules.haproxyconn.`**`get_sessions`**`(`*name, backend, socket='/var/run/haproxy.sock'*`)`

New in version 2016.11.0.

Get number of current sessions on server in backend (scur)

name Server name

backend haproxy backend

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.get_sessions web1.example.com www
```

`salt.modules.haproxyconn.`**`get_weight`**(*name*, *backend*, *socket='/var/run/haproxy.sock'*)

Get server weight

name Server name

backend haproxy backend

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.get_weight web1.example.com www
```

`salt.modules.haproxyconn.`**`list_backends`**(*servers=True*, *socket='/var/run/haproxy.sock'*)

List HaProxy Backends

socket haproxy stats socket, default `/var/run/haproxy.sock`

servers list backends with servers

CLI Example:

```
salt '*' haproxy.list_backends
```

`salt.modules.haproxyconn.`**`list_frontends`**(*socket='/var/run/haproxy.sock'*)

List HaProxy frontends

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.list_frontends
```

`salt.modules.haproxyconn.`**`list_servers`**(*backend*, *socket='/var/run/haproxy.sock'*, *objectify=False*)

List servers in haproxy backend.

backend haproxy backend

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.list_servers mysql
```

`salt.modules.haproxyconn.`**`set_state`**(*name*, *backend*, *state*, *socket='/var/run/haproxy.sock'*)

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

name Server name

backend haproxy backend

state A string of the state to set. Must be 'ready', 'drain', or 'maint'

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

`salt.modules.haproxyconn.`**`set_weight`**(*name*, *backend*, *weight=0*, *socket='/var/run/haproxy.sock'*)

Set server weight

name Server name

backend haproxy backend

weight Server Weight

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.set_weight web1.example.com www 13
```

`salt.modules.haproxyconn.`**`show_backends`**(*socket='/var/run/haproxy.sock'*)

Show HaProxy Backends

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.show_backends
```

`salt.modules.haproxyconn.`**`show_frontends`**(*socket='/var/run/haproxy.sock'*)

Show HaProxy frontends

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.show_frontends
```

`salt.modules.haproxyconn.`**`wait_state`**(*backend*, *server*, *value='up'*, *timeout=300*, *socket='/var/run/haproxy.sock'*)

Wait for a specific server state

backend haproxy backend

server targeted server

value state value

timeout timeout before giving up state value, default 5 min

socket haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.wait_state mysql server01 up 60
```

21.9.155 salt.modules.hashutil

A collection of hashing and encoding functions `salt.modules.hashutil.`**`base64_b64decode`**`(`*instr*`)`

Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

`salt.modules.hashutil.`**`base64_b64encode`**`(`*instr*`)`

Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

`salt.modules.hashutil.`**`base64_decodefile`**`(`*instr, outfile*`)`

Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/
↪binary_file'
```

`salt.modules.hashutil.`**`base64_decodestring`**`(`*instr*`)`

Decode a base64-encoded byte-like object using the "modern" Python interface

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

`salt.modules.hashutil.`**`base64_encodefile`**`(`*fname*`)`

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The *`file.decode`* state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

`salt.modules.hashutil.`**`base64_encodestring`**`(`*instr*`)`

Encode a byte-like object as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

`salt.modules.hashutil.`**`digest`**`(`*instr*, *checksum='md5'*`)`

Return a checksum digest for a string

instr A string

checksum [`md5`] The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.`**`digest_file`**`(`*infile*, *checksum='md5'*`)`

Return a checksum digest for a file

infile A file path

checksum [`md5`] The hashing algorithm to use to generate checksums. Wraps the *`hashutil.digest`* execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.`**`github_signature`**`(`*string*, *shared_secret*, *challenge_hmac*`)`

Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":....} ' 'shared secret'
↪'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

`salt.modules.hashutil.`**`hmac_compute`**`(`*string*, *shared_secret*`)`

New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:

```
salt '*' hashutil.hmac_compute 'get salted' 'shared secret'
```

`salt.modules.hashutil.`**`hmac_signature`**`(`*string*, *shared_secret*, *challenge_hmac*`)`

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'
↪'eBWf9bstXg+NiP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='
```

`salt.modules.hashutil.`**`md5_digest`**`(`*instr*`)`

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

`salt.modules.hashutil.`**`sha256_digest`**`(`*instr*`)`

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

`salt.modules.hashutil.`**`sha512_digest`**`(`*instr*`)`

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

21.9.156 salt.modules.heat module

Module for handling OpenStack Heat calls

New in version 2017.7.0.

depends

- heatclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False   #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
```

(continues on next page)

(continued from previous page)

```
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' heat.flavor_list profile=openstack1
```

`salt.modules.heat.`**`create_stack`**(*name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None*)

Create a stack (heat stack-create)

name Name of the new stack

template_file File of template

environment File of environment

parameters Parameter dict used to create the stack

poll Poll and report events until stack complete

rollback Enable rollback on create failure

timeout Stack creation timeout in minutes

profile Profile to build on

CLI Example:

```
salt '*' heat.create_stack name=mystack \
         template_file=salt://template.yaml \
         environment=salt://environment.yaml \
         parameters="{"image": "Debian 8", "flavor": "m1.small"}" \
         poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

`salt.modules.heat.`**`delete_stack`**(*name=None, poll=0, timeout=60, profile=None*)

Delete a stack (heat stack-delete)

name Name of the stack

poll Poll and report events until stack complete

timeout Stack creation timeout in minute

profile Profile to use

CLI Examples:

```
salt '*' heat.delete_stack name=mystack poll=5 \
         profile=openstack1
```

`salt.modules.heat.`**`list_stack`**(*profile=None*)

Return a list of available stack (heat stack-list)

profile Profile to use

CLI Example:

```
salt '*' heat.list_stack profile=openstack1
```

`salt.modules.heat.`**`show_stack`**(*name=None*, *profile=None*)
Return details about a specific stack (heat stack-show)

name Name of the stack

profile Profile to use

CLI Example:

```
salt '*' heat.show_stack name=mystack profile=openstack1
```

`salt.modules.heat.`**`template_stack`**(*name=None*, *profile=None*)
Return template a specific stack (heat stack-template)

name Name of the stack

profile Profile to use

CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

`salt.modules.heat.`**`update_stack`**(*name=None*, *template_file=None*, *environment=None*, *parameters=None*, *poll=0*, *rollback=False*, *timeout=60*, *profile=None*)
Update a stack (heat stack-template)

name Name of the stack

template_file File of template

environment File of environment

parameters Parameter dict used to update the stack

poll Poll and report events until stack complete

rollback Enable rollback on update failure

timeout Stack creation timeout in minutes

profile Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack \
         template_file=salt://template.yaml \
         environment=salt://environment.yaml \
         parameters="{"image": "Debian 8", "flavor": "m1.small"}" \
         poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

21.9.157 salt.modules.hg

Support for the Mercurial SCM

`salt.modules.hg.`**`archive`**(*cwd*, *output*, *rev='tip'*, *fmt=None*, *prefix=None*, *user=None*)
Export a tarball from the repository

cwd The path to the Mercurial repository

output The path to the archive tarball

rev: tip The revision to create an archive from

fmt: None Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

prefix [None] Prepend <prefix>/ to every filename in the archive

user [None] Run hg as a user other than what the minion runs as

If `prefix` is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

`salt.modules.hg.`**`clone`**(*cwd*, *repository*, *opts=None*, *user=None*, *identity=None*)

Clone a new repository

cwd The path to the Mercurial repository

repository The hg URI of the repository

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

`salt.modules.hg.`**`describe`**(*cwd*, *rev='tip'*, *user=None*)

Mimic git describe and return an identifier for the given revision

cwd The path to the Mercurial repository

rev: tip The path to the archive tarball

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.describe /path/to/repo
```

`salt.modules.hg.`**`pull`**(*cwd*, *opts=None*, *user=None*, *identity=None*, *repository=None*)

Perform a pull on the given repository

cwd The path to the Mercurial repository

repository [None] Perform pull from the repository different from .hg/hgrc:[paths]:default

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

`salt.modules.hg.`**`revision`**(*cwd*, *rev='tip'*, *short=False*, *user=None*)

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

cwd The path to the Mercurial repository

rev: **tip** The revision

short: **False** Return an abbreviated commit hash

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

`salt.modules.hg.`**`status`**(*cwd*, *opts=None*, *user=None*)

Show changed files of the given repository

cwd The path to the Mercurial repository

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.status /path/to/repo
```

`salt.modules.hg.`**`update`**(*cwd*, *rev*, *force=False*, *user=None*)

Update to a given revision

cwd The path to the Mercurial repository

rev The revision to update to

force [False] Force an update

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

21.9.158 salt.modules.hosts

Manage the information in the hosts file

`salt.modules.hosts.`**`add_host`**(*ip*, *alias*)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

`salt.modules.hosts.`**`get_alias`**(*ip*)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

`salt.modules.hosts.`**`get_ip`**`(`*host*`)`

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

`salt.modules.hosts.`**`has_pair`**`(`*ip, alias*`)`

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

`salt.modules.hosts.`**`list_hosts`**`()`

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

`salt.modules.hosts.`**`rm_host`**`(`*ip, alias*`)`

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

`salt.modules.hosts.`**`set_host`**`(`*ip, alias*`)`

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

21.9.159 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.`**`query`**`(`*url, **kwargs*`)`

New in version 2015.5.0.

Query a resource, and decode the return data

Passes through all the parameters described in the *`utils.http.query function`*:

`salt.utils.http.`**`query`**(*url, method='GET', params=None, data=None, data_file=None, header_dict=None, header_list=None, header_file=None, username=None, password=None, auth=None, decode=False, decode_type='auto', status=False, headers=False, text=False, cookies=None, cookie_jar=None, cookie_format='lwp', persist_session=False, session_cookie_jar=None, data_render=False, data_renderer=None, header_render=False, header_renderer=None, template_dict=None, test=False, test_url=None, node='minion', port=80, opts=None, backend=None, ca_bundle=None, verify_ssl=None, cert=None, text_out=None, headers_out=None, decode_out=None, stream=False, streaming_callback=None, header_callback=None, handle=False, agent='Salt/3000.3', hide_fields=None, raise_error=True, formdata=False, formdata_fieldname=None, formdata_filename=None, **kwargs*)

Query a resource, and decode the return data

raise_error [True] If `False`, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be `None`.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST             params=
↪'key1=val1&key2=val2'
salt '*' http.query http://somelink.com/ method=POST             data='<xml>
↪somecontent</xml>'
```

`salt.modules.http.`**`update_ca_bundle`**(*target=None, source=None, merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

`salt.modules.http.`**`wait_for_successful_query`**(*url, wait_for=300, **kwargs*)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160 request_
↪interval=1
```

21.9.160 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
ifttt:
  secret_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

`salt.modules.ifttt.`**`trigger_event`**(*event=None*, ***kwargs*)

Trigger a configured event in IFTTT.

Parameters **`event`** – The name of the event to trigger.

Returns A dictionary with status, text, and error if result was failure.

21.9.161 salt.modules.ilo

Manage HP ILO

depends hponcfg (SmartStart Scripting Toolkit Linux Edition)

`salt.modules.ilo.`**`change_password`**(*username*, *password*)

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

`salt.modules.ilo.`**`change_username`**(*old_username*, *new_username*)

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

`salt.modules.ilo.`**`configure_network`**(*ip*, *netmask*, *gateway*)

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

`salt.modules.ilo.`**`configure_snmp`**(*community*, *snmp_port=161*, *snmp_trapport=161*)

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

`salt.modules.ilo.`**`create_user`**(*name*, *password*, **privileges*)

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.

Supported privelges:

- ADMIN_PRIV Enables the user to administer user accounts.
- REMOTE_CONS_PRIV Enables the user to access the Remote Console functionality.
- RESET_SERVER_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL_MEDIA_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG_ILO_PRIV Enables the user to configure iLO settings.

`salt.modules.ilo.`**`delete_ssh_key`**`(`*username*`)`

Delete a users SSH key from the ILO

CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

`salt.modules.ilo.`**`delete_user`**`(`*username*`)`

Delete a user

CLI Example:

```
salt '*' ilo.delete_user damian
```

`salt.modules.ilo.`**`disable_dhcp`**`()`

Disable DHCP

CLI Example:

```
salt '*' ilo.disable_dhcp
```

`salt.modules.ilo.`**`disable_ssh`**`()`

Disable the SSH daemon

CLI Example:

```
salt '*' ilo.disable_ssh
```

`salt.modules.ilo.`**`enable_dhcp`**`()`

Enable DHCP

CLI Example:

```
salt '*' ilo.enable_dhcp
```

`salt.modules.ilo.`**`enable_ssh`**`()`

Enable the SSH daemon

CLI Example:

```
salt '*' ilo.enable_ssh
```

`salt.modules.ilo.`**`get_user`**`(`*username*`)`

Returns local user information, excluding the password

CLI Example:

```
salt '*' ilo.get_user damian
```

`salt.modules.ilo.`**`global_settings`**`()`

Show global settings

CLI Example:

```
salt '*' ilo.global_settings
```

`salt.modules.ilo.`**`list_users`**`()`

List all users

CLI Example:

```
salt '*' ilo.list_users
```

`salt.modules.ilo.`**`list_users_info`**`()`

List all users in detail

CLI Example:

```
salt '*' ilo.list_users_info
```

`salt.modules.ilo.`**`network`**`()`

Grab the current network settings

CLI Example:

```
salt '*' ilo.network
```

`salt.modules.ilo.`**`set_http_port`**`(`*port=80*`)`

Configure the port HTTP should listen on

CLI Example:

```
salt '*' ilo.set_http_port 8080
```

`salt.modules.ilo.`**`set_https_port`**`(`*port=443*`)`

Configure the port HTTPS should listen on

CLI Example:

```
salt '*' ilo.set_https_port 4334
```

`salt.modules.ilo.`**`set_ssh_key`**`(`*public_key*`)`

Configure SSH public keys for specific users

CLI Example:

```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-senstive) of the ILO username.

`salt.modules.ilo.`**`set_ssh_port`**`(`*port=22*`)`

Enable SSH on a user defined port

CLI Example:

```
salt '*' ilo.set_ssh_port 2222
```

21.9.162 salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

depends

- icinga2 server

`salt.modules.icinga2.`**`generate_cert`**`(`*domain*`)`

Generate an icinga2 client certificate and key.

Returns:: icinga2 pki new-cert –cn domain.tld –key /etc/icinga2/pki/domain.tld.key –cert /etc/icinga2/pki/domain.tld.crt

CLI Example:

```
salt '*' icinga2.generate_cert domain.tld
```

`salt.modules.icinga2.`**`generate_ticket`**`(`*domain*`)`

Generate and save an icinga2 ticket.

Returns:: icinga2 pki ticket –cn domain.tld

CLI Example:

```
salt '*' icinga2.generate_ticket domain.tld
```

`salt.modules.icinga2.`**`node_setup`**`(`*domain, master, ticket*`)`

Setup the icinga2 node.

Returns:: icinga2 node setup –ticket TICKET_ID –endpoint master.domain.tld –zone domain.tld –master_host master.domain.tld –trustedcert /etc/icinga2/pki/trusted-master.crt

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

`salt.modules.icinga2.`**`request_cert`**`(`*domain, master, ticket, port*`)`

Request CA cert from master icinga2 node.

Returns:: icinga2 pki request –host master.domain.tld –port 5665 –ticket TICKET_ID –key /etc/icinga2/pki/domain.tld.key –cert /etc/icinga2/pki/domain.tld.crt –trustedcert /etc/icinga2/pki/trusted-master.crt –ca /etc/icinga2/pki/ca.crt

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

`salt.modules.icinga2.`**`save_cert`**`(`*domain, master*`)`

Save the certificate for master icinga2 node.

Returns:: icinga2 pki save-cert –key /etc/icinga2/pki/domain.tld.key –cert /etc/icinga2/pki/domain.tld.crt –trustedcert /etc/icinga2/pki/trusted-master.crt –host master.domain.tld

CLI Example:

```
salt '*' icinga2.save_cert domain.tld master.domain.tld
```

21.9.163 salt.modules.incron

Work with incron

`salt.modules.incron.`**`list_tab`**`(`*user*`)`

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.`**`ls`**`(`*user*`)`

This function is an alias of `list_tab`.

> Return the contents of the specified user's incrontab
>
> CLI Example:
>
> ```
> salt '*' incron.list_tab root
> ```

`salt.modules.incron.`**`raw_incron`**`(`*user*`)`

Return the contents of the user's incrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

`salt.modules.incron.`**`raw_system_incron`**`()`

Return the contents of the system wide incrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

`salt.modules.incron.`**`rm`**`(`*user, path, mask, cmd*`)`

This function is an alias of `rm_job`.

> Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.
>
> CLI Example:
>
> ```
> salt '*' incron.rm_job root /path
> ```

`salt.modules.incron.`**`rm_job`**`(`*user, path, mask, cmd*`)`

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.`**`set_job`**`(`*user, path, mask, cmd*`)`

Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'
```

`salt.modules.incron.`**`write_incron_file`**`(`*user*, *path*`)`

Writes the contents of a file to a user's incrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

`salt.modules.incron.`**`write_incron_file_verbose`**`(`*user*, *path*`)`

Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

21.9.164 salt.modules.influxdbmod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

depends

- influxdb Python module (>= 3.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function influxdb_user='influxadmin' influxdb_
↪password='s3cr1t'
```

would override `user` and `password` while still using the defaults for `host` and `port`.

`salt.modules.influxdbmod.`**`alter_retention_policy`**`(`*database*, *name*, *duration*, *replication*, *default=False*, ***client_args*`)`

Modify an existing retention policy.

name Name of the retention policy to modify.

database Name of the database for which the retention policy was defined.

duration New duration of given retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

replication New replication of given retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

`salt.modules.influxdbmod.`**`continuous_query_exists`**`(`*database*, *name*, ***client_args*`)`

Check if continuous query with given name exists on the database.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to check.

CLI Example:

```
salt '*' influxdb.continuous_query_exists metrics default
```

`salt.modules.influxdbmod.`**`create_continuous_query`**`(`*database*, *name*, *query*, *resample_time=None*, *coverage_period=None*, ***client_args*`)`

Create a continuous query.

database Name of the database for which the continuous query will be created on.

name Name of the continuous query to create.

query The continuous query string.

resample_time [None] Duration between continuous query resampling.

coverage_period [None] Duration specifying time period per sample.

CLI Example:

```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.
↪a_month.:MEASUREMENT FROM mydb.a_week./.*/ GROUP BY time(5m), *'
```

`salt.modules.influxdbmod.`**`create_db`**`(`*name*, ***client_args*`)`

Create a database.

name Name of the database to create.

CLI Example:

```
salt '*' influxdb.create_db <name>
```

`salt.modules.influxdbmod.`**`create_retention_policy`**`(`*database*, *name*, *duration*, *replication*, *default=False*, ***client_args*`)`

Create a retention policy.

database Name of the database for which the retention policy will be created.

name Name of the new retention policy.

duration Duration of the new retention policy.

> Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

replication Replication factor of the retention policy.

> This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not the policy as default will be set as default.

CLI Example:

```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

`salt.modules.influxdbmod.`**`create_user`**`(`*name*, *passwd*, *admin=False*, ***client_args*`)`
Create a user.

name Name of the user to create.

passwd Password of the new user.

admin [False] Whether the user should have cluster administration privileges or not.

CLI Example:

```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

`salt.modules.influxdbmod.`**`db_exists`**`(`*name*, ***client_args*`)`
Checks if a database exists in InfluxDB.

name Name of the database to check.

CLI Example:

```
salt '*' influxdb.db_exists <name>
```

`salt.modules.influxdbmod.`**`drop_continuous_query`**`(`*database*, *name*, ***client_args*`)`
Drop a continuous query.

database Name of the database for which the continuous query will be drop from.

name Name of the continuous query to drop.

CLI Example:

```
salt '*' influxdb.drop_continuous_query mydb my_cq
```

`salt.modules.influxdbmod.`**`drop_db`**`(`*name*, ***client_args*`)`
Drop a database.

name Name of the database to drop.

CLI Example:

```
salt '*' influxdb.drop_db <name>
```

`salt.modules.influxdbmod.`**`drop_retention_policy`**`(`*database*, *name*, ***client_args*`)`
Drop a retention policy.

database Name of the database for which the retention policy will be dropped.

name Name of the retention policy to drop.

CLI Example:

```
salt '*' influxdb.drop_retention_policy mydb mypr
```

`salt.modules.influxdbmod.`**`get_continuous_query`**`(`*database*, *name*, ***client_args*`)`
Get an existing continuous query.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to get.

CLI Example:

```
salt '*' influxdb.get_continuous_query mydb cq_month
```

`salt.modules.influxdbmod.`**`get_retention_policy`**`(`*database*, *name*, ***client_args*`)`

Get an existing retention policy.

database Name of the database for which the retention policy was defined.

name Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

`salt.modules.influxdbmod.`**`grant_admin_privileges`**`(`*name*, ***client_args*`)`

Grant cluster administration privileges to a user.

name Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

`salt.modules.influxdbmod.`**`grant_privilege`**`(`*database*, *privilege*, *username*, ***client_args*`)`

Grant a privilege on a database to a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of 'read', 'write' or 'all'.

username Name of the user to grant the privilege to.

`salt.modules.influxdbmod.`**`list_dbs`**`(`***client_args*`)`

List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

`salt.modules.influxdbmod.`**`list_privileges`**`(`*name*, ***client_args*`)`

List privileges from a user.

name Name of the user from whom privileges will be listed.

CLI Example:

```
salt '*' influxdb.list_privileges <name>
```

`salt.modules.influxdbmod.`**`list_users`**`(`***client_args*`)`

List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

`salt.modules.influxdbmod.`**`query`**`(`*database*, *query*, ***client_args*`)`

Execute a query.

database Name of the database to query on.

query InfluxQL query string.

`salt.modules.influxdbmod.`**`remove_user`**`(`*name*, ***client_args*`)`

Remove a user.

name Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

`salt.modules.influxdbmod.`**`retention_policy_exists`**`(`*database*, *name*, ***client_args*`)`

Check if retention policy with given name exists.

database Name of the database for which the retention policy was defined.

name Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

`salt.modules.influxdbmod.`**`revoke_admin_privileges`**`(`*name*, ***client_args*`)`

Revoke cluster administration privileges from a user.

name Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

`salt.modules.influxdbmod.`**`revoke_privilege`**`(`*database*, *privilege*, *username*, ***client_args*`)`

Revoke a privilege on a database from a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of 'read', 'write' or 'all'.

username Name of the user to grant the privilege to.

`salt.modules.influxdbmod.`**`set_user_password`**`(`*name*, *passwd*, ***client_args*`)`

Change password of a user.

name Name of the user for whom to set the password.

passwd New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

`salt.modules.influxdbmod.`**`user_exists`**`(`*name*, ***client_args*`)`

Check if a user exists.

name Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

`salt.modules.influxdbmod.`**`user_info`**`(`*name*, ***client_args*`)`

Get information about given user.

name Name of the user for which to get information.

CLI Example:

```
salt '*' influxdb.user_info <name>
```

21.9.165 salt.modules.influxdb08mod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

depends

- influxdb Python module (>= 1.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

`salt.modules.influxdb08mod.`**`db_create`**(*name, user=None, password=None, host=None, port=None*)

Create a database

name Database name to create

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`db_exists`**(*name, user=None, password=None, host=None, port=None*)

Checks if a database exists in Influxdb

name Database name to create

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`db_list`**(*user=None, password=None, host=None, port=None*)

List all InfluxDB databases

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`db_remove`**(*name, user=None, password=None, host=None, port=None*)

Remove a database

name Database name to remove

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`login_test`**(*name, password, database=None, host=None, port=None*)

Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name The user to connect as

password The password of the user

database The database to try to log in to

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`query`**(*database, query, time_precision='s', chunked=False, user=None, password=None, host=None, port=None*)

Querying data

database The database to query

query Query to be executed

time_precision Time precision to use ('s', 'm', or 'u')

chunked Whether is chunked or not

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> <user>
↪<password> <host> <port>
```

`salt.modules.influxdb08mod.`**`retention_policy_add`**`(`*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*`)`

Add a retention policy.

database The database to operate on.

name Name of the policy to modify.

duration How long InfluxDB keeps the data.

replication How many copies of the data are stored in the cluster.

default Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

`salt.modules.influxdb08mod.`**`retention_policy_alter`**`(`*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*`)`

Modify an existing retention policy.

database The database to operate on.

name Name of the policy to modify.

duration How long InfluxDB keeps the data.

replication How many copies of the data are stored in the cluster.

default Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

`salt.modules.influxdb08mod.`**`retention_policy_exists`**`(`*database, name, user=None, password=None, host=None, port=None*`)`

Check if a retention policy exists.

database The database to operate on.

name Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_exists metrics default
```

salt.modules.influxdb08mod.**retention_policy_get**(*database, name, user=None, password=None, host=None, port=None*)

Get an existing retention policy.

database The database to operate on.

name Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_get metrics default
```

salt.modules.influxdb08mod.**user_chpass**(*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

name User name for whom to change the password

passwd New password

database The database on which to operate

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password>
↪<host> <port>
```

salt.modules.influxdb08mod.**user_create**(*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

name User name for the new user to create

passwd Password for the new user to create

database The database to create the user in

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user> <password>
↪<host> <port>
```

`salt.modules.influxdb08mod.`**`user_exists`**(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name User name

database The database to check for the user to exist

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`user_list`**(*database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

database The database to list the users from

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.`**`user_remove`**(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

name User name to remove

database The database to remove the user from

user User name for the new user to delete

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

21.9.166 salt.modules.infoblox

This module have been tested on infoblox API v1.2.1, other versions of the API are likly workable.

depends libinfoblox, https://github.com/steverweber/libinfoblox

libinfoblox can be installed using *pip install libinfoblox*

API documents can be found on your infoblox server at:

https://INFOBLOX/wapidoc

configuration The following configuration defaults can be defined (pillar or config files '/etc/salt/master.d/infoblox.conf'):

```
infoblox.config:
    api_sslverify: True
    api_url: 'https://INFOBLOX/wapi/v1.2.1'
    api_user: 'username'
    api_key: 'password'
```

Many of the functions accept *api_opts* to override the API config.

```
salt-call infoblox.get_host name=my.host.com              api_url:
↪'https://INFOBLOX/wapi/v1.2.1'             api_user=admin              
↪api_key=passs
```

salt.modules.infoblox.**create_a**(*data*, ***api_opts*)

Create A record.

This is a helper function to *create_object*. See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_a                          data =
            name: 'fastlinux.math.example.ca'
            ipv4addr: '127.0.0.1'
            view: External
```

salt.modules.infoblox.**create_cname**(*data*, ***api_opts*)

Create a cname record.

CLI Example:

```
salt-call infoblox.create_cname data={             "comment": "cname to example⤦
↪server",              "name": "example.example.com",              "zone":
↪"example.com",              "view": "Internal",              "canonical":
↪"example-ha-0.example.com"          }
```

`salt.modules.infoblox.create_host(data, **api_opts)`

Add host record

Avoid race conditions, use func:nextavailableip for ipv[4,6]addrs:

- func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default
- func:nextavailableip:10.0.0.0/8
- func:nextavailableip:10.0.0.0/8,external
- func:nextavailableip:10.0.0.3-10.0.0.10

See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_host             data =
        {'name': 'hostname.example.ca',
        'aliases': ['hostname.math.example.ca'],
    'extattrs': [{'Business Contact': {'value': 'example@example.ca'}},
        {'Pol8 Classification': {'value': 'Restricted'}},
        {'Primary OU': {'value': 'CS'}},
        {'Technical Contact': {'value': 'example@example.ca'}}],
    'ipv4addrs': [{'configure_for_dhcp': True,
        'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
        'mac': '00:50:56:84:6e:ae'}],
    'ipv6addrs': [], }
```

`salt.modules.infoblox.create_ipv4_range(data, **api_opts)`

Create a ipv4 range

This is a helper function to *create_object* See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_ipv4_range data={
    start_addr: '129.97.150.160',
    end_addr: '129.97.150.170'}
```

`salt.modules.infoblox.create_object(object_type, data, **api_opts)`

Create raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object object_type=record:host  data={}
```

`salt.modules.infoblox.delete_a(name=None, ipv4addr=None, allow_array=False, **api_opts)`

Delete A record

If the A record is used as a round robin you can set `allow_array=True` to delete all records for the hostname.

CLI Examples:

```
salt-call infoblox.delete_a name=abc.example.com
salt-call infoblox.delete_a ipv4addr=192.168.3.5
salt-call infoblox.delete_a name=acname.example.com allow_array=True
```

`salt.modules.infoblox.`**`delete_cname`**(*name=None*, *canonical=None*, ***api_opts*)

Delete CNAME. This is a helper call to delete_object.

If record is not found, return True

CLI Examples:

```
salt-call infoblox.delete_cname name=example.example.com
salt-call infoblox.delete_cname canonical=example-ha-0.example.com
```

`salt.modules.infoblox.`**`delete_host`**(*name=None*, *mac=None*, *ipv4addr=None*, ***api_opts*)

Delete host

CLI Example:

```
salt-call infoblox.delete_host name=example.domain.com
salt-call infoblox.delete_host ipv4addr=123.123.122.12
salt-call infoblox.delete_host ipv4addr=123.123.122.12 mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.`**`delete_ipv4_range`**(*start_addr=None*, *end_addr=None*, ***api_opts*)

Delete ip range.

CLI Example:

```
salt-call infoblox.delete_ipv4_range start_addr=123.123.122.12
```

`salt.modules.infoblox.`**`delete_object`**(*objref*, ***api_opts*)

Delete infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.delete_object objref=[ref_of_object]
```

`salt.modules.infoblox.`**`diff_objects`**(*obja*, *objb*)

Diff two complex infoblox objects. This is used from salt states to detect changes in objects.

Using `func:nextavailableip` will not cause a diff if the ipaddress is in range

`salt.modules.infoblox.`**`get_a`**(*name=None*, *ipv4addr=None*, *allow_array=True*, ***api_opts*)

Get A record

CLI Examples:

```
salt-call infoblox.get_a name=abc.example.com
salt-call infoblox.get_a ipv4addr=192.168.3.5
```

`salt.modules.infoblox.`**`get_cname`**(*name=None*, *canonical=None*, *return_fields=None*, ***api_opts*)

Get CNAME information.

CLI Examples:

```
salt-call infoblox.get_cname name=example.example.com
salt-call infoblox.get_cname canonical=example-ha-0.example.com
```

`salt.modules.infoblox.`**`get_host`**(*name=None*, *ipv4addr=None*, *mac=None*, *return_fields=None*, ***api_opts*)

Get host information

CLI Examples:

```
salt-call infoblox.get_host hostname.domain.ca
salt-call infoblox.get_host ipv4addr=123.123.122.12
salt-call infoblox.get_host mac=00:50:56:84:6e:ae
```

salt.modules.infoblox.**get_host_advanced**(*name=None*, *ipv4addr=None*, *mac=None*, ***api_opts*)

Get all host information

CLI Example:

```
salt-call infoblox.get_host_advanced hostname.domain.ca
```

salt.modules.infoblox.**get_host_domainname**(*name*, *domains=None*, ***api_opts*)

Get host domain name

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is returned.

If none are found the return is None

dots at end of names are ignored.

CLI Example:

```
salt-call uwl.get_host_domainname name=localhost.t.domain.com          ⊠
↪domains=['domain.com', 't.domain.com.']

# returns: t.domain.com
```

salt.modules.infoblox.**get_host_hostname**(*name*, *domains=None*, ***api_opts*)

Get hostname

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is truncated from the fqdn leaving the hostname.

If no matching domains are found the fqdn is returned.

dots at end of names are ignored.

CLI Examples:

```
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com      ⊠
↪domains="['domain.com', 't.domain.com']"
#returns: localhost.xxx

salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com
#returns: localhost
```

salt.modules.infoblox.**get_host_ipv4**(*name=None*, *mac=None*, *allow_array=False*, ***api_opts*)

Get ipv4 address from host record.

Use *allow_array* to return possible multiple values.

CLI Examples:

```
salt-call infoblox.get_host_ipv4 host=localhost.domain.com
salt-call infoblox.get_host_ipv4 mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.`**`get_host_ipv4addr_info`**(*ipv4addr=None, mac=None, discovered_data=None, return_fields=None, **api_opts*)

Get host ipv4addr information

CLI Examples:

```
salt-call infoblox.get_ipv4addr ipv4addr=123.123.122.12
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae return_fields=host return_
↪fields='mac,host,configure_for_dhcp,ipv4addr'
```

`salt.modules.infoblox.`**`get_host_ipv6addr_info`**(*ipv6addr=None, mac=None, discovered_data=None, return_fields=None, **api_opts*)

Get host ipv6addr information

CLI Example:

```
salt-call infoblox.get_host_ipv6addr_info
↪ipv6addr=2001:db8:85a3:8d3:1349:8a2e:370:7348
```

`salt.modules.infoblox.`**`get_host_mac`**(*name=None, allow_array=False, **api_opts*)

Get mac address from host record.

Use *allow_array* to return possible multiple values.

CLI Example:

```
salt-call infoblox.get_host_mac host=localhost.domain.com
```

`salt.modules.infoblox.`**`get_ipv4_range`**(*start_addr=None, end_addr=None, return_fields=None, **api_opts*)

Get ip range

CLI Example:

```
salt-call infoblox.get_ipv4_range start_addr=123.123.122.12
```

`salt.modules.infoblox.`**`get_network`**(*ipv4addr=None, network=None, return_fields=None, **api_opts*)

Get list of all networks. This is helpful when looking up subnets to use with func:nextavailableip

This call is offen slow and not cached!

some return_fields comment,network,network_view,ddns_domainname,disable,enable_ddns

CLI Example:

```
salt-call infoblox.get_network
```

`salt.modules.infoblox.`**`get_object`**(*objref, data=None, return_fields=None, max_results=None, ensure_none_or_one_result=False, **api_opts*)

Get raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.get_object objref=[_ref of object]
```

`salt.modules.infoblox.`**`is_ipaddr_in_ipfunc_range`**(*ipaddr, ipfunc*)

Return true if the ipaddress is in the range of the nextavailableip function

CLI Example:

```
salt-call infoblox.is_ipaddr_in_ipfunc_range          ipaddr="10.0.2.2" ipfunc=
↪"func:nextavailableip:10.0.0.0/8"
```

`salt.modules.infoblox.`**`update_cname`**`(`*name*, *data*, ***api_opts*`)`

Update CNAME. This is a helper call to update_object.

Find a CNAME `_ref` then call update_object with the record data.

CLI Example:

```
salt-call infoblox.update_cname name=example.example.com data="{
        'canonical':'example-ha-0.example.com',
        'use_ttl':true,
        'ttl':200,
        'comment':'Salt managed CNAME'}"
```

`salt.modules.infoblox.`**`update_host`**`(`*name*, *data*, ***api_opts*`)`

Update host record. This is a helper call to update_object.

Find a hosts `_ref` then call update_object with the record data.

CLI Example:

```
salt-call infoblox.update_host name=fqdn data={}
```

`salt.modules.infoblox.`**`update_object`**`(`*objref*, *data*, ***api_opts*`)`

Update raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object objref=[ref_of_object] data={}
```

21.9.167 salt.modules.ini_manage

Edit ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

(for example /etc/sysctl.conf)

`salt.modules.ini_manage.`**`get_ini`**`(`*file_name*, *separator='='*`)`

Retrieve whole structure from an ini file and return it as dictionary.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_ini',
       [path_to_ini_file])
```

CLI Example:

```
salt '*' ini.get_ini /path/to/ini
```

salt.modules.ini_manage.**get_option**(*file_name*, *section*, *option*, *separator='='*)

Get value of a key from a section in an ini file. Returns `None` if no matching key was found.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.**get_section**(*file_name*, *section*, *separator='='*)

Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
       [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

salt.modules.ini_manage.**remove_option**(*file_name*, *section*, *option*, *separator='='*)

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or `None` if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.**remove_section**(*file_name*, *section*, *separator='='*)

Remove a section in an ini file. Returns the removed section as dictionary, or `None` if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
       [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

`salt.modules.ini_manage.`**`set_option`**(*file_name, sections=None, separator='='*)

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name path of ini_file

sections [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options

separator [=] A character used to separate keys and values. Standard ini files use the "=" character.

New in version 2016.11.0.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
       ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

21.9.168 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

`class` `salt.modules.inspectlib.collector.`**`Inspector`**(*cachedir=None, piddir=None, pidfilename=None*)

`DEFAULT_MINION_CONFIG_PATH = '/etc/salt/minion'`

`IGNORE_FS_TYPES = ['autofs', 'cifs', 'nfs', 'nfs4']`

`IGNORE_MOUNTS = ['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']`

`IGNORE_PATHS = ['/tmp', '/var/tmp', '/lost+found', '/var/run', '/var/lib/rpm', '/.snap`

`MODE = ['configuration', 'payload', 'all']`

`build`(*format='qcow2', path='/tmp'*)

Build an image using Kiwi.

Parameters

- **`format`** –
- **`path`** –

Returns

`create_snapshot`()

Open new snapshot.

Returns

export(*description*, *local=False*, *path='/tmp'*, *format='qcow2'*)
Export description for Kiwi.

Parameters

- **local** –
- **path** –

Returns

request_snapshot(*mode*, *priority=19*, ***kwargs*)
Take a snapshot of the system.

reuse_snapshot()
Open an existing, latest snapshot.

Returns

snapshot(*mode*)
Take a snapshot of the system.

salt.modules.inspectlib.collector.**is_alive**(*pidfile*)
Check if PID is still alive.

salt.modules.inspectlib.collector.**main**(*dbfile*, *pidfile*, *mode*)
Main analyzer routine.

salt.modules.inspectlib.dbhandle module

class salt.modules.inspectlib.dbhandle.**DBHandle**(*path*)

class salt.modules.inspectlib.dbhandle.**DBHandleBase**(*path*)
Handle for the *volatile* database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

close()
Close the database connection.

flush(*table*)
Flush the table.

open(*new=False*)
Init the database, if required.

purge()
Purge whole database.

salt.modules.inspectlib.exceptions module

exception salt.modules.inspectlib.exceptions.**InspectorKiwiProcessorException**
Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.**InspectorQueryException**
Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.**InspectorSnapshotException**
Snapshot exception.

exception salt.modules.inspectlib.exceptions.**SIException**
System information exception.

salt.modules.inspectlib.query module

class `salt.modules.inspectlib.query.`**`Query`**(*scope*, *cachedir=None*)

Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

`SCOPES = ['changes', 'configuration', 'identity', 'system', 'software', 'services', 'p`

class `salt.modules.inspectlib.query.`**`SysInfo`**(*systype*)

System information.

Module contents

class `salt.modules.inspectlib.`**`EnvLoader`**(*cachedir=None*, *piddir=None*, *pidfilename=None*)

Load environment.

`DB_FILE = '_minion_collector.db'`

`DEFAULT_CACHE_PATH = '/var/cache/salt'`

`DEFAULT_PID_PATH = '/var/run'`

`PID_FILE = '_minion_collector.pid'`

21.9.169 salt.modules.inspectlib.entities module

class `salt.modules.inspectlib.entities.`**`AllowedDir`**

Allowed directories

class `salt.modules.inspectlib.entities.`**`IgnoredDir`**

Ignored directories

class `salt.modules.inspectlib.entities.`**`Package`**

Package.

class `salt.modules.inspectlib.entities.`**`PackageCfgFile`**

Config file, belongs to the package

class `salt.modules.inspectlib.entities.`**`PayloadFile`**

Payload file.

21.9.170 salt.modules.inspectlib.fsdb module

codeauthor Bo Maryniuk <bo@suse.de>

class `salt.modules.inspectlib.fsdb.`**`CsvDB`**(*path*)

File-based CSV database. This database is in-memory operating relatively small plain text csv files.

`close`()

Close the database.

Returns

`create_table_from_object`(*obj*)

Create a table from the object. NOTE: This method doesn't stores anything.

Parameters **`obj`** –

Returns

delete(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Delete object from the database.

Parameters

- **obj** –
- **matches** –
- **mt** –
- **lt** –
- **eq** –

Returns

flush(*table*)
Flush table.

Parameters **table** –

Returns

get(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Get objects from the table.

Parameters

- **table_name** –
- **matches** – Regexp.
- **mt** – More than.
- **lt** – Less than.
- **eq** – Equals.

Returns

is_closed()
Return if the database is closed.

Returns

list()
List all the databases on the given path.

Returns

list_tables()
Load existing tables and their descriptions.

Returns

new()
Create a new database and opens it.

Returns

open(*dbname=None*)
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

purge(*dbid*)
Purge the database.

Parameters **dbid** –

Returns

store(*obj*, *distinct=False*)

Store an object in the table.

Parameters

- **obj** – An object to store
- **distinct** – Store object only if there is none identical of such. If at least one field is different, store it.

Returns

update(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)

Update object(s) in the database.

Parameters

- **obj** –
- **matches** –
- **mt** –
- **lt** –
- **eq** –

Returns

class `salt.modules.inspectlib.fsdb.`**CsvDBEntity**

Serializable object for the table.

21.9.171 salt.modules.inspectlib.kiwiproc module

class `salt.modules.inspectlib.kiwiproc.`**KiwiExporter**(*grains*, *format*)

Exports system description as Kiwi configuration.

export(*name*)

Export to the Kiwi config.xml as text.

Returns

load(***descr*)

Load data by keys.

Parameters **data** –

Returns

21.9.172 salt.modules.inspector module

Module for full system inspection.

`salt.modules.inspector.`**build**(*format='qcow2'*, *path='/tmp/'*)

Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:

- **format**: Specifies output format: "qcow2" or "iso. Default: *qcow2*.
- **path**: Specifies output path where to store built image. Default: */tmp*.

CLI Example:

```
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

`salt.modules.inspector.`**`delete`**(*all=False*, **databases*)

Remove description snapshots from the system.

::parameter: all. Default: False. Remove all snapshots, if set to True.

CLI example:

```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

`salt.modules.inspector.`**`export`**(*local=False*, *path='/tmp'*, *format='qcow2'*)

Export an image description for Kiwi.

Parameters:

- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path: If *local=True*, then specifies the path where file with the Kiwi description is written.** Default: */tmp*.

CLI Example:

```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

`salt.modules.inspector.`**`inspect`**(*mode='all'*, *priority=19*, ***kwargs*)

Start node inspection and save the data to the database for further query.

Parameters:

- **mode**: Clarify inspection mode: configuration, payload, all (default)

  payload

    - **filter**: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

`salt.modules.inspector.`**`query`**(**args*, ***kwargs*)

Query the node for specific information.

Parameters:

- **scope**: Specify scope of the query.
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.

  - **Identity: Return user accounts information for this system.**

    accounts Can be either 'local', 'remote' or 'all' (equal to "local,remote"). Remote accounts cannot be resolved on all systems, but only those, which supports 'passwd -S -a'.

    disabled True (or False, default) to return only disabled accounts.

  - **payload: Payload scope parameters:**

    filter Include only results which path starts from the filter string.

    time Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)

    size Format size. Values: B, KB, MB, GB

    type Include payload type. Values (comma-separated): directory (or dir), link, file (default) Example (returns everything): type=directory,link,file

    owners Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id

    brief Return just a list of payload elements, if True. Default: False.

  - **all**: Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb␣
↪brief=False
```

`salt.modules.inspector.`**`snapshots`**`()`

List current description snapshots.

CLI Example:

```
salt myminion inspector.snapshots
```

21.9.173 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

`salt.modules.introspect.`**`enabled_service_owners`**`()`

Return which packages own each of the services that are currently enabled.

CLI Example:

salt myminion introspect.enabled_service_owners

`salt.modules.introspect.`**`running_service_owners`**`(`*exclude=('/dev', '/home', '/media', '/proc', '/run', '/sys/', '/tmp', '/var')*`)`

Determine which packages own the currently running services. By default, excludes files whose full path starts with `/dev`, `/home`, `/media`, `/proc`, `/run`, `/sys`, `/tmp` and `/var`. This can be overridden by passing in a new list to `exclude`.

CLI Example:

salt myminion introspect.running_service_owners

`salt.modules.introspect.`**`service_highstate`**`(`*requires=True*`)`

Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set `requires` to False.

CLI Example:

salt myminion introspect.service_highstate salt myminion introspect.service_highstate requires=False

21.9.174 salt.modules.iosconfig module

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module does not have external dependencies and can be used from any Proxy or regular Minion.

`salt.modules.iosconfig.`**`clean`**(*config=None*, *path=None*, *saltenv='base'*)

Return a clean version of the config, without any special signs (such as `!` as an individual line) or empty lines, but just lines with significant value in the configuration of the network device.

config The configuration sent as text. This argument is ignored when `path` is configured.

path Absolute or remote path from where to load the configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.clean path=salt://path/to/my/config.txt
salt '*' iosconfig.clean path=https://bit.ly/2mAdq7z
```

`salt.modules.iosconfig.`**`diff_text`**(*candidate_config=None*, *candidate_path=None*, *running_config=None*, *running_path=None*, *saltenv='base'*)

Return the diff, as text, between the candidate and the running config.

candidate_config The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

running_config The running configuration sent as text. This argument is ignored when `running_path` is set.

running_path Absolute or remote path from where to load the runing configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg running_
↪path=salt://path/to/running.cfg
```

`salt.modules.iosconfig.`**`diff_tree`**(*candidate_config=None*, *candidate_path=None*, *running_config=None*, *running_path=None*, *saltenv='base'*)

Return the diff, as Python dictionary, between the candidate and the running configuration.

candidate_config The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

running_config The running configuration sent as text. This argument is ignored when `running_path` is set.

running_path Absolute or remote path from where to load the runing configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg running_
↪path=salt://path/to/running.cfg
```

`salt.modules.iosconfig.`**`merge_diff`**(*initial_config=None*, *initial_path=None*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

Return the merge diff, as text, after merging the merge config into the initial config.

initial_config The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **base** Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_diff initial_path=salt://path/to/running.cfg merge_
↪path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`merge_text`**(*initial_config=None*, *initial_path=None*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

Return the merge result of the `initial_config` with the `merge_config`, as plain text.

initial_config The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **base** Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg merge_
↪path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`merge_tree`**(*initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base'*)

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

initial_config The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_tree initial_path=salt://path/to/running.cfg merge_
↪path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`tree`**(*config=None, path=None, with_tags=False, saltenv='base'*)

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

config The configuration sent as text. This argument is ignored when `path` is configured.

path Absolute or remote path from where to load the configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

with_tags: **`False`** Whether this function should return a detailed view, with tags.

saltenv: **`base`** Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

21.9.175 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module *pyghmi*.

depends Python module pyghmi. You can install pyghmi using pip:

```
pip install pyghmi
```

configuration The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
```

(continues on next page)

(continued from previous page)

```
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system
                        api_user=admin api_pass=pass
                        uid=1
```

`salt.modules.ipmi.`**`create_user`**(*uid*, *name*, *password*, *channel=14*, *callback=False*, *link_auth=True*, *ipmi_msg=True*, *privilege_level='administrator'*, ***kwargs*)

create/ensure a user is created with provided settings.

Parameters

- **privilege_level** – User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) * callback * user * operator * administrator * proprietary * no_access
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_
↪pass=nevertell
```

`salt.modules.ipmi.`**`fast_connect_test`**(***kwargs*)

Returns True if connection success. This uses an aggressive timeout value!

Parameters **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

`salt.modules.ipmi.`**`get_bootdev`**(***kwargs*)

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.`**`get_channel_access`**(*channel=14, read_mode='non_volatile', **kwargs*)
:param kwargs:api_host='127.0.0.1' api_user='admin' api_pass='example' api_port=623

Parameters

- **channel** – number [1:7]
- **read_mode** –
  - non_volatile = get non-volatile Channel Access
  - volatile = get present volatile (active) setting of Channel Access
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

A Python dict with the following keys/values:

```
{
    alerting:
    per_msg_auth:
    user_level_auth:
    access_mode:{ (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    privilege_level: { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary',
    }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

salt.modules.ipmi.**get_channel_info**(*channel=14*, ***kwargs*)

Get channel info

Parameters

- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data channel session supports

```
- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between
    single- and multi-session operation, as can occur with a
    serial/modem channel that supports connection mode auto-detect)
```

CLI Examples:

```
salt-call ipmi.get_channel_info
```

salt.modules.ipmi.**get_channel_max_user_count**(*channel=14*, ***kwargs*)

Get max users in channel

Parameters

- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns int – often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

salt.modules.ipmi.**get_health**(***kwargs*)

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

Parameters **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_power**(***kwargs*)

Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

Parameters **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_sensor_data**(***kwargs*)

Get sensor readings

Iterates sensor reading objects

Parameters **kwargs** –

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_user**(*uid, channel=14, **kwargs*)

Get user from uid and access on channel

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]

- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```
name: (str)
uid: (int)
channel: (int)
access:
    - callback (bool)
    - link_auth (bool)
    - ipmi_msg (bool)
    - privilege_level: (str)[callback, user, operatorm administrator,
                            proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user uid=2
```

`salt.modules.ipmi.`**`get_user_access`**(*uid*, *channel=14*, ***kwargs*)

Get user access

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```
channel_info:
    - max_user_count = maximum number of user IDs on this channel
    - enabled_users = count of User ID slots presently in use
    - users_with_fixed_names = count of user IDs with fixed names
access:
    - callback
    - link_auth
    - ipmi_msg
    - privilege_level: [reserved, callback, user, operator
                       administrator, proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user_access uid=2
```

`salt.modules.ipmi.`**`get_user_name`**`(`*uid*, *return_none_on_error=True*, ***kwargs*`)`

Get user name

Parameters

- **`uid`** – user number [1:16]
- **`return_none_on_error`** – return None on error
- **`kwargs`** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

`salt.modules.ipmi.`**`get_users`**`(`*channel=14*, ***kwargs*`)`

get list of users and access information

Parameters

- **`channel`** – number [1:7]
- **`kwargs`** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operatorm administrator, proprietary, no_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

`salt.modules.ipmi.`**`raw_command`**(*netfn*, *command*, *bridge_request=None*, *data=()*, *retry=True*, *delay_xmit=None*, ***kwargs*)

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- **`netfn`** – Net function number
- **`command`** – Command value
- **`bridge_request`** – The target slave address and channel number for the bridge request.
- **`data`** – Command data as a tuple or list
- **`kwargs`** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict – The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

`salt.modules.ipmi.`**`set_bootdev`**(*bootdev='default'*, *persist=False*, *uefiboot=False*, ***kwargs*)

Set boot device to use on next reboot

Parameters

- **`bootdev`** –
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting 'safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- **`persist`** – If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- **`uefiboot`** – If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no "don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **`kwargs`** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example

  - api_port=623
  - api_kg=None

Returns dict or True – If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

salt.modules.ipmi.**set_channel_access**(*channel=14, access_update_mode='non_volatile', alerting=False, per_msg_auth=False, user_level_auth=False, access_mode='always', privilege_update_mode='non_volatile', privilege_level='administrator', **kwargs*)

Set channel access

Parameters

- **`channel`** – number [1:7]
- **`access_update_mode`** –
  - 'dont_change' = don't set or change Channel Access
  - 'non_volatile' = set non-volatile Channel Access
  - 'volatile' = set volatile (active) setting of Channel Access
- **`alerting`** – PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)
- **`per_msg_auth`** – Per-message Authentication
  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **`user_level_auth`** – User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **`access_mode`** – Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.

    - shared = same as always available, but BIOS typically leaves the serial port available for software use.
- **`privilege_update_mode`** – Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
    - dont_change = don't set or change channel Privilege Level Limit
    - non_volatile = non-volatile Privilege Level Limit according
    - volatile = volatile setting of Privilege Level Limit
- **`privilege_level`** – Channel Privilege Level Limit
    - reserved = unused
    - callback
    - user
    - operator
    - administrator
    - proprietary = used by OEM
- **`kwargs`** –
    - api_host=127.0.0.1
    - api_user=admin
    - api_pass=example
    - api_port=623
    - api_kg=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

`salt.modules.ipmi.`**`set_identify`**(*on=True*, *duration=600*, ***kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **`on`** – Set to True to force on or False to force off
- **`duration`** – Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **`kwargs`** –
    - api_host=127.0.0.1
    - api_user=admin
    - api_pass=example
    - api_port=623
    - api_kg=None

CLI Examples:

```
salt-call ipmi.set_identify
```

`salt.modules.ipmi.`**`set_power`**(*state='power_on', wait=True, **kwargs*)

Request power state change

Parameters

- **`name`** –
  - power_on – system turn on
  - power_off – system turn off (without waiting for OS)
  - shutdown – request OS proper shutdown
  - reset – reset (without waiting for OS)
  - boot – If system is off, then 'on', else 'reset'
- **`ensure`** – If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **`kwargs`** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict – A dict describing the response retrieved

CLI Examples:

```
salt-call ipmi.set_power state=shutdown wait=True
```

`salt.modules.ipmi.`**`set_user_access`**(*uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs*)

Set user access

Parameters

- **`uid`** – user number [1:16]
- **`channel`** – number [1:7]
- **`callback`** – User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **`link_auth`** – User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for

the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

- **ipmi_msg** – User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege_level** – User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

`salt.modules.ipmi.`**`set_user_name`**(*uid*, *name*, ***kwargs*)

Set user name

Parameters

- **uid** – user number [1:16]
- **name** – username (limit of 16bytes)
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

`salt.modules.ipmi.`**`set_user_password`**(*uid*, *mode='set_password'*, *password=None*, ***kwargs*)
Set user password and (modes)

Parameters

- **uid** – id number of user. see: get_names_uid()['name']
- **mode** –
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** – max 16 char string (optional when mode is [disable or enable])
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns True on success when mode = test_password, return False on bad password

CLI Example:

```
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
                                 uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

`salt.modules.ipmi.`**`user_delete`**(*uid*, *channel=14*, ***kwargs*)
Delete user (helper)

Parameters

- **uid** – user number [1:16]
- **channel** – number [1:7]
- **kwargs** –
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.user_delete uid=2
```

21.9.176 salt.modules.ipset

Support for ipset

`salt.modules.ipset.`**`add`**(*setname=None, entry=None, family='ipv4', **kwargs*)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add setname 192.168.1.26

salt '*' ipset.add setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.`**`check`**(*set=None, entry=None, family='ipv4'*)

Check that an entry exists in the specified set.

set The ipset name

entry An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

family IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

`salt.modules.ipset.`**`check_set`**(*set=None, family='ipv4'*)

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set setname
```

`salt.modules.ipset.`**`delete`**(*set=None, entry=None, family='ipv4', **kwargs*)

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.`**`delete_set`**(*set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set

IPv6:
salt '*' ipset.delete_set custom_set family=ipv6
```

`salt.modules.ipset.`**`flush`**(*set=None, family='ipv4'*)

Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush

salt '*' ipset.flush set

IPv6:
salt '*' ipset.flush

salt '*' ipset.flush set
```

`salt.modules.ipset.`**`list_sets`**(*family='ipv4'*)

New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

`salt.modules.ipset.`**`long_range`**(*start, end*)

`salt.modules.ipset.`**`new_set`**(*set=None, set_type=None, family='ipv4', comment=False, **kwargs*)

New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

`salt.modules.ipset.`**`rename_set`**(*set=None, new_set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

`salt.modules.ipset.`**`test`**(*set=None, entry=None, family='ipv4', **kwargs*)

Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2

IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

`salt.modules.ipset.`**`version`**()

Return version from ipset –version

CLI Example:

```
salt '*' ipset.version
```

21.9.177 salt.modules.iptables

Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using `config.get`.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines

  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

  The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

`salt.modules.iptables.`**`append`**(*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`build_rule`**(*table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs*)

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either a short option ('I') or a long option (*–insert*). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with *-I* or *-D*), it may be specified as *position*. This will only be useful if *full* is True.

If *state* is passed, it will be ignored, use *connstate*. If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='!127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
```

`salt.modules.iptables.`**`check`**(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`check_chain`**(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6
```

`salt.modules.iptables.`**`delete`**(*table*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`delete_chain`**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.`**`flush`**(*table='filter'*, *chain=''*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT

IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

`salt.modules.iptables.`**`get_policy`**(*table='filter'*, *chain=None*, *family='ipv4'*)

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT

IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

`salt.modules.iptables.`**`get_rules`**(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules

IPv6:
salt '*' iptables.get_rules family=ipv6
```

`salt.modules.iptables.`**`get_saved_policy`**(*table='filter', chain=None, conf_file=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved

IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

`salt.modules.iptables.`**`get_saved_rules`**(*conf_file=None, family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules

IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

`salt.modules.iptables.`**`insert`**(*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`new_chain`**(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.`**`save`**(*filename=None, family='ipv4'*)
Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

`salt.modules.iptables.`**`set_policy`**(*table='filter', chain=None, policy=None, family='ipv4'*)
Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.`**`version`**(*family='ipv4'*)
Return version from iptables –version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

21.9.178 salt.modules.iwtools module

Support for Wireless Tools for Linux

`salt.modules.iwtools.`**`list_interfaces`**(*style=None*)
List all of the wireless interfaces

CLI Example:

salt minion iwtools.list_interfaces

`salt.modules.iwtools.`**`scan`**(*iface, style=None*)
List networks on a wireless interface

CLI Examples:

salt minion iwtools.scan wlp3s0 salt minion iwtools.scan wlp3s0 list

`salt.modules.iwtools.`**`set_mode`**(*iface, mode*)
List networks on a wireless interface

CLI Example:

salt minion iwtools.set_mode wlp3s0 Managed

21.9.179 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

`salt.modules.jboss7.`**`create_datasource`**(*jboss_config*, *name*, *datasource_properties*, *profile=None*)

Create datasource in running jboss instance

jboss_config Configuration dictionary with properties specified above.

name Datasource name

datasource_properties

A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↪", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↪"java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↪"secret", "min-pool-size": 3, "use-java-context": True}'
```

`salt.modules.jboss7.`**`create_simple_binding`**(*jboss_config*, *binding_name*, *value*, *profile=None*)

Create a simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

value Binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding \
        '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs",↩
↪\
        "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password":
↪"jbossadm"}' \
        my_binding_name my_binding_value
```

`salt.modules.jboss7.`**`deploy`**(*jboss_config, source_file*)

Deploy the application on the jboss instance from the local file system where minion is running.

jboss_config Configuration dictionary with properties specified above.

source_file Source file to deploy from

CLI Example:

```
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}' /opt/deploy_files/my_deploy
```

`salt.modules.jboss7.`**`list_deployments`**(*jboss_config*)

List all deployments on the jboss instance

jboss_config

Configuration dictionary with properties specified above.

CLI Example:

```
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user
↪": "jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.`**`read_datasource`**(*jboss_config, name, profile=None*)

Read datasource properties in the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile Profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.`**`read_simple_binding`**(*jboss_config, binding_name, profile=None*)

Read jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

profile The profile name (JBoss domain mode only)

CLI Example:

salt '*' jboss7.read_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_binding_name

`salt.modules.jboss7.`**`reload_`**(*jboss_config*, *host=None*)

Reload running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```
salt '*' jboss7.reload '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}'
```

`salt.modules.jboss7.`**`remove_datasource`**(*jboss_config*, *name*, *profile=None*)

Remove an existing datasource from the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

`salt.modules.jboss7.`**`status`**(*jboss_config*, *host=None*, *server_config=None*)

Get status of running jboss instance.

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

server_config The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}'
```

`salt.modules.jboss7.`**`stop_server`**(*jboss_config*, *host=None*)

Stop running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```
salt '*' jboss7.stop_server '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.`**`undeploy`**(*jboss_config*, *deployment*)

Undeploy the application from jboss instance

jboss_config Configuration dictionary with properties specified above.

deployment Deployment name to undeploy

CLI Example:

```
salt '*' jboss7.undeploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}' my_deployment
```

`salt.modules.jboss7.`**`update_datasource`**(*jboss_config*, *name*, *new_properties*, *profile=None*)

Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it does, it will be updated with the new value

jboss_config Configuration dictionary with properties specified above.

name Datasource name

new_properties

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↪", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↪"java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↪"secret", "min-pool-size": 3, "use-java-context": True}'
```

`salt.modules.jboss7.`**`update_simple_binding`**(*jboss_config*, *binding_name*, *value*, *profile=None*)

Update the simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be updated

value New binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_binding_name my_binding_value
```

21.9.180 salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

Note: Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

`salt.modules.jboss7_cli.`**`run_command`**(*jboss_config*, *command*, *fail_on_error=True*)

Execute a command against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

command Command to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_command
```

`salt.modules.jboss7_cli.`**`run_operation`**(*jboss_config, operation, fail_on_error=True, retries=1*)
Execute an operation against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

operation An operation to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

retries: Number of retries in case of "JBAS012144: Could not connect to remote" error.

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_operation
```

21.9.181 salt.modules.jenkinsmod module

Module for controlling Jenkins

depends python-jenkins

New in version 2016.3.0.

depends python-jenkins Python module (not to be confused with jenkins)

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.jenkinsmod.`**`build_job`**(*name=None, parameters=None*)
Initiate a build for the provided job.

Parameters

- **`name`** – The name of the job is check if it exists.
- **`parameters`** – Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

`salt.modules.jenkinsmod.`**`create_job`**(*name=None, config_xml=None, saltenv='base'*)
Return the configuration file.

Parameters

- **`name`** – The name of the job is check if it exists.
- **`config_xml`** – The configuration file to use to create the job.
- **`saltenv`** – The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname

salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

`salt.modules.jenkinsmod.`**`delete_job`**`(`*name=None*`)`

Return true is job is deleted successfully.

Parameters **`name`** – The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

`salt.modules.jenkinsmod.`**`disable_job`**`(`*name=None*`)`

Return true is job is disabled successfully.

Parameters **`name`** – The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

`salt.modules.jenkinsmod.`**`enable_job`**`(`*name=None*`)`

Return true is job is enabled successfully.

Parameters **`name`** – The name of the job to enable.

Returns Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

`salt.modules.jenkinsmod.`**`get_job_config`**`(`*name=None*`)`

Return the current job configuration for the provided job.

Parameters **`name`** – The name of the job to return the configuration for.

Returns The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

`salt.modules.jenkinsmod.`**`get_job_info`**`(`*name=None*`)`

Return information about the Jenkins job.

Parameters **`name`** – The name of the job is check if it exists.

Returns Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

`salt.modules.jenkinsmod.`**`get_jobs`**`()`

Return the currently configured jobs.

Returns The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```

`salt.modules.jenkinsmod.`**`get_version`**`()`

Return version of Jenkins

Returns The version of Jenkins

CLI Example:

```
salt '*' jenkins.get_version
```

`salt.modules.jenkinsmod.`**`job_exists`**`(`*name=None*`)`

Check whether the job exists in configured Jenkins jobs.

Parameters **`name`** – The name of the job is check if it exists.

Returns True if job exists, False if job does not exist.

CLI Example:

```
salt '*' jenkins.job_exists jobname
```

`salt.modules.jenkinsmod.`**`job_status`**`(`*name=None*`)`

Return the current status, enabled or disabled, of the job.

Parameters **`name`** – The name of the job to return status for

Returns Return true if enabled or false if disabled.

CLI Example:

```
salt '*' jenkins.job_status jobname
```

`salt.modules.jenkinsmod.`**`plugin_installed`**`(`*name*`)`

New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

Parameters **`name`** – The name of the parameter to confirm installation.

Returns True if plugin exists, False if plugin does not exist.

CLI Example:

```
salt '*' jenkins.plugin_installed pluginName
```

`salt.modules.jenkinsmod.`**`run`**`(`*script*`)`

New in version 2017.7.0.

Execute a script on the jenkins master

Parameters **`script`** – The script

CLI Example:

```
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'
```

`salt.modules.jenkinsmod.`**`update_job`**`(`*name=None, config_xml=None, saltenv='base'*`)`

Return the updated configuration file.

Parameters

- **`name`** – The name of the job is check if it exists.
- **`config_xml`** – The configuration file to use to create the job.
- **`saltenv`** – The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname

salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

21.9.182 salt.modules.jinja

Module for checking jinja maps and verifying the result of loading JSON/YAML files

New in version 3000.

`salt.modules.jinja.`**`import_json`**`(`*path*`)`

Loads JSON data from the specified path

CLI Example:

```
salt myminion jinja.import_JSON myformula/foo.json
```

`salt.modules.jinja.`**`import_yaml`**`(`*path*`)`

Loads YAML data from the specified path

CLI Example:

```
salt myminion jinja.import_yaml myformula/foo.yaml
```

`salt.modules.jinja.`**`load_map`**`(`*path, value*`)`

Loads the map at the specified path, and returns the specified value from that map.

CLI Example:

```
# Assuming the map is loaded in your formula SLS as follows:
#
# {% from "myformula/map.jinja" import myformula with context %}
#
# the following syntax can be used to load the map and check the
# results:
salt myminion jinja.load_map myformula/map.jinja myformula
```

21.9.183 salt.modules.jira_mod module

JIRA Execution module

New in version 2019.2.0.

Execution module to manipulate JIRA tickets via Salt.

This module requires the `jira` Python library to be installed.

Configuration example:

```
jira:
  server: https://jira.atlassian.org
  username: salt
  password: pass
```

`salt.modules.jira_mod.`**`add_comment`**(*issue_key, comment, visibility=None, is_internal=False, server=None, username=None, password=None*)

Add a comment to an existing ticket. Return `True` when it successfully added the comment.

issue_key The issue ID to add the comment to.

comment The body of the comment to be added.

visibility: `None` A dictionary having two keys:

- `type`: is `role` (or `group` if the JIRA server has configured comment visibility for groups).
- `value`: the name of the role (or group) to which viewing of this comment will be restricted.

is_internal: `False` Whether a comment has to be marked as `Internal` in Jira Service Desk.

CLI Example:

```
salt '*' jira.add_comment NE-123 'This is a comment'
```

`salt.modules.jira_mod.`**`assign_issue`**(*issue_key, assignee, server=None, username=None, password=None*)

Assign the issue to an existing user. Return `True` when the issue has been properly assigned.

issue_key The JIRA ID of the ticket to manipulate.

assignee The name of the user to assign the ticket to.

CLI Example:

salt '*' jira.assign_issue NET-123 example_user

`salt.modules.jira_mod.`**`create_issue`**(*project, summary, description, template_engine='jinja', context=None, defaults=None, saltenv='base', issuetype='Bug', priority='Normal', labels=None, assignee=None, server=None, username=None, password=None, **kwargs*)

Create a JIRA issue using the named settings. Return the JIRA ticket ID.

project The name of the project to attach the JIRA ticket to.

summary The summary (title) of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., `jinja`, `mako`, etc.) it will render the `summary` before creating the ticket.

description The full body description of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., `jinja`, `mako`, etc.) it will render the `description` before creating the ticket.

template_engine: `jinja` The name of the template engine to be used to render the values of the `summary` and `description` arguments. Default: `jinja`.

context: `None` The context to pass when rendering the `summary` and `description`. This argument is ignored when `template_engine` is set as `None`

defaults: `None` Default values to pass to the Salt rendering pipeline for the `summary` and `description` arguments. This argument is ignored when `template_engine` is set as `None`.

saltenv: `base` The Salt environment name (for the rendering system).

issuetype: `Bug` The type of the JIRA ticket. Default: `Bug`.

priority: `Normal` The priority of the JIRA ticket. Default: `Normal`.

labels: `None` A list of labels to add to the ticket.

assignee: `None` The name of the person to assign the ticket to.

CLI Examples:

```
salt '*' jira.create_issue NET 'Ticket title' 'Ticket description'
salt '*' jira.create_issue NET 'Issue on {{ opts.id }}' 'Error detected on {{
↪opts.id }}' template_engine=jinja
```

`salt.modules.jira_mod.`**`issue_closed`**(*issue_key, server=None, username=None, password=None*)

Check if the issue is closed.

issue_key The JIRA iD of the ticket to close.

Returns:

- `True`: the ticket exists and it is closed.
- `False`: the ticket exists and it has not been closed.
- `None`: the ticket does not exist.

CLI Example:

```
salt '*' jira.issue_closed NE-123
```

21.9.184 salt.modules.junos

Module to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to *`junos`* for information on connecting to junos proxy.

`salt.modules.junos.`**`cli`**(*command=None, **kwargs*)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

command (required) The command to execute on the Junos CLI

format [text] Format in which to get the CLI output (either `text` or `xml`)

dev_timeout [30] The NETCONF RPC timeout (in seconds)

dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use *`cp.push`*.

CLI Examples:

```
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show version' dev_timeout=40
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/user/cli_
↪output.txt
```

`salt.modules.junos.`**`commit`**`(`***kwargs*`)`

To commit the changes loaded in the candidate configuration.

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync [False] When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync [False] When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full When `True`, requires all the daemons to check and evaluate the new configuration.

detail When `True`, return commit detail

CLI Examples:

```
salt 'device_name' junos.commit comment='Commiting via saltstack' detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

`salt.modules.junos.`**`commit_check`**`()`

Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

`salt.modules.junos.`**`diff`**`(`***kwargs*`)`

Returns the difference between the candidate and the current configuration

id [0] The rollback ID value (0-49)

CLI Example:

```
salt 'device_name' junos.diff 3
```

`salt.modules.junos.`**`facts`**`()`

Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

`salt.modules.junos.`**`facts_refresh`**`()`

Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:

```
salt 'device_name' junos.facts_refresh
```

`salt.modules.junos.`**`file_copy`**(*src=None*, *dest=None*)

Copies the file from the local device to the junos device

src The source path where the file is kept.

dest The destination path on the where the file will be copied

CLI Example:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

`salt.modules.junos.`**`install_config`**(*path=None*, ***kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

path (required) Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

mode [exclusive] The mode in which the configuration is locked. Can be one of `private`, `dynamic`, `batch`, `exclusive`.

dev_timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

format Determines the format of the contents

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use *`cp.push`*.

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.install_config 'salt://production/network/routers/config.
↪set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf'
↪replace=True comment='Committed via SaltStack'
```

(continues on next page)

(continued from previous page)

```
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_
↪timeout=300 diffs_file='/salt/confs/old_config.conf' overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf' template_
↪vars='{"syslog_host": "10.180.222.7"}'
```

`salt.modules.junos.`**`install_os`**(*path=None*, ***kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

path (required) Path where the image file is present on the proxy minion

remote_path : If the value of path is a file path on the local (Salt host's) filesystem, then the image is copied from the local filesystem to the :remote_path: directory on the target Junos device. The default is `/var/tmp`. If the value of :path: or is a URL, then the value of :remote_path: is unused.

dev_timeout [30] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the "package add" RPC takes a significant amount of time. The default RPC timeout is 30 seconds. So this :timeout: value will be used in the context of the SW installation process. Defaults to 30 minutes (30*60=1800)

reboot [False] Whether to reboot after installation

no_copy [False] If `True` the software package will not be SCP'd to the device

bool validate: When `True` this method will perform a config validation against the new image

bool issu: When `True` allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

bool nssu: When `True` allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.

CLI Examples:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300
```

`salt.modules.junos.`**`load`**(*path=None*, ***kwargs*)

Loads the configuration from the file provided onto the device.

path (required) Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

format Determines the format of the contents

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.load 'salt://production/network/routers/config.set'

salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True

salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True

salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars='{
↪"syslog_host": "10.180.222.7"}'
```

`salt.modules.junos.`**`lock`**`()`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: When locking, it is important to remember to call *`junos.unlock`* once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```
salt 'device_name' junos.lock
```

`salt.modules.junos.`**`ping`**`(`*dest_ip=None*, ***kwargs*`)`

Send a ping RPC to a device

dest_ip The IP of the device to ping

dev_timeout [30] The NETCONF RPC timeout (in seconds)

rapid [False] When `True`, executes ping at 100pps instead of 1pps

ttl Maximum number of IP routers (IP hops) allowed between source and destination

routing_instance Name of the routing instance to use to send the ping

interface Interface used to send traffic

count [5] Number of packets to send

CLI Examples:

```
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

`salt.modules.junos.`**`rollback`**`(`***kwargs*`)`

Roll back the last committed configuration changes and commit

id [0] The rollback ID value (0-49)

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use *`cp.push`*.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

`salt.modules.junos.`**`rpc`**(*cmd=None*, *dest=None*, ***kwargs*)

This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.

cmd The RPC to be executed

dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use *`cp.push`*.

format [xml] The format in which the RPC reply is received from the device

dev_timeout [30] The NETCONF RPC timeout (in seconds)

filter Used with the `get-config` RPC to get specific configuration

terse [False] Amount of information you want

interface_name Name of the interface to query

CLI Example:

```
salt 'device' junos.rpc get_config /var/log/config.txt format=text filter='
↪<configuration><system/></configuration>'
salt 'device' junos.rpc get-interface-information /home/user/interface.xml
↪interface_name='lo0' terse=True
salt 'device' junos.rpc get-chassis-inventory
```

`salt.modules.junos.`**`set_hostname`**(*hostname=None*, ***kwargs*)

Set the device's hostname

hostname The name to be set

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment to the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

`salt.modules.junos.`**`shutdown`**(***kwargs*)

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

> **Note:** One of `shutdown` or `reboot` must be set to `True` or no action will be taken.

shutdown [False] Set this to `True` if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

reboot [False] If `True`, reboot instead of shutting down

at Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

in_min Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

`salt.modules.junos.`**`timeoutDecorator`**`(`*function*`)`

`salt.modules.junos.`**`unlock`**`()`

Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

`salt.modules.junos.`**`zeroize`**`()`

Resets the device to default factory settings

CLI Example:

```
salt 'device_name' junos.zeroize
```

21.9.185 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

`salt.modules.k8s.`**`create_namespace`**`(`*name*, *apiserver_url=None*`)`

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: .. code-block:: bash

> kubectl create namespaces namespace-name

CLI Example:

```
salt '*' k8s.create_namespace namespace_name

salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

`salt.modules.k8s.`**`create_secret`**`(`*namespace*, *name*, *sources*, *apiserver_url=None*, *force=False*, *update=False*, *saltenv='base'*`)`

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources

salt '*' k8s.create_secret namespace_name secret_name sources
http://kube-master.cluster.local
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
```

['/full/path/filename', "file:///full/path/filename", "salt://secret/storage/file.txt", "http://user:password@securesite.com/secret-file.json"]

Example of dictionaries:

```
```

{"nameit": '/full/path/fiename', name2: "salt://secret/storage/file.txt"}

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to "true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

`salt.modules.k8s.`**`delete_secret`**(*namespace, name, apiserver_url=None, force=True*)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name

salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.
↪local
```

`salt.modules.k8s.`**`get_labels`**(*node=None, apiserver_url=None*)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

`salt.modules.k8s.`**`get_namespaces`**(*namespace=", apiserver_url=None*)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:

```
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

`salt.modules.k8s.`**`get_secrets`**(*namespace, name=", apiserver_url=None, decode=False, brief=False*)

Get k8s namespaces

CLI Example:

```
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.
↪local
```

`salt.modules.k8s.`**`label_absent`**(*name, node=None, apiserver_url=None*)

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.
↪cluster.local
```

`salt.modules.k8s.`**`label_folder_absent`**(*name, node=None, apiserver_url=None*)

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.
↪cluster.local
```

`salt.modules.k8s.`**`label_present`**(*name, value, node=None, apiserver_url=None*)

New in version 2016.3.0.

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd

salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-
↪master.cluster.local
```

`salt.modules.k8s.`**`update_secret`**(*namespace, name, sources, apiserver_url=None, force=True, saltenv='base'*)

New in version 2016.3.0.

alias to k8s.create_secret with update=true

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url]↵
↪[force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
```

['/full/path/filename', "file:///full/path/filename", "salt://secret/storage/file.txt", "http://user:password@securesite.com/secret-file.json"]

Example of dictionaries:

```
```

{"nameit": '/full/path/fiename', name2: "salt://secret/storage/file.txt"}

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

21.9.186 salt.modules.kapacitor module

Kapacitor execution module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

New in version 2016.11.0.

Also protocol and SSL settings could be configured:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
```

New in version 2019.2.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

`salt.modules.kapacitor.`**`define_task`**(*name*, *tick_script*, *task_type='stream'*, *database=None*, *retention_policy='default'*, *dbrps=None*)

Define a task. Serves as both create/update.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a salt:// source.

task_type Task type. Defaults to 'stream'

dbrps A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrps.

New in version 2019.2.0.

database Which database to fetch data from.

retention_policy Which retention policy to fetch data from. Defaults to 'default'.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

salt.modules.kapacitor.**delete_task**(*name*)

Delete a kapacitor task.

name Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

salt.modules.kapacitor.**disable_task**(*name*)

Disable a kapacitor task.

name Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

salt.modules.kapacitor.**enable_task**(*name*)

Enable a kapacitor task.

name Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

salt.modules.kapacitor.**get_task**(*name*)

Get a dict of data on a task.

name Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

salt.modules.kapacitor.**version**()

Get the kapacitor version.

21.9.187 salt.modules.kerberos

Manage Kerberos KDC

configuration In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

`salt.modules.kerberos.`**`create_keytab`**(*name*, *keytab*, *enctypes=None*)

Create keytab

CLI Example:

```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.
↪example.com.keytab
```

`salt.modules.kerberos.`**`create_principal`**(*name*, *enctypes=None*)

Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

`salt.modules.kerberos.`**`delete_principal`**(*name*)

Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

`salt.modules.kerberos.`**`get_policy`**(*name*)

Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

`salt.modules.kerberos.`**`get_principal`**(*name*)

Get princial details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

`salt.modules.kerberos.`**`get_privs`**()

Current privileges

CLI Example:

```
salt 'kdc.example.com' kerberos.get_privs
```

`salt.modules.kerberos.`**`list_policies`**()

List policies

CLI Example:

```
salt 'kdc.example.com' kerberos.list_policies
```

`salt.modules.kerberos.`**`list_principals`**()

Get all principals

CLI Example:

```
salt 'kde.example.com' kerberos.list_principals
```

21.9.188 salt.modules.kernelpkg_linux_apt

Manage Linux kernel packages on APT-based systems

`salt.modules.kernelpkg_linux_apt.`**`active`**`()`

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_apt.`**`cleanup`**`(`*keep_latest=True*`)`

Remove all unused kernel packages from the system.

keep_latest [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

`salt.modules.kernelpkg_linux_apt.`**`latest_available`**`()`

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

`salt.modules.kernelpkg_linux_apt.`**`latest_installed`**`()`

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

`salt.modules.kernelpkg_linux_apt.`**`list_installed`**`()`

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

`salt.modules.kernelpkg_linux_apt.`**`needs_reboot`**`()`

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_apt.`**`remove`**`(`*release*`)`

Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by *`list_installed()`*, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

`salt.modules.kernelpkg_linux_apt.`**`upgrade`**`(`*reboot=False*, *at_time=None*`)`

Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.

at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See *`reboot()`* for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

`salt.modules.kernelpkg_linux_apt.`**`upgrade_available`**`()`

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

21.9.189 salt.modules.kernelpkg_linux_yum

Manage Linux kernel packages on YUM-based systems

`salt.modules.kernelpkg_linux_yum.`**`active`**`()`

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_yum.`**`cleanup`**`(`*keep_latest=True*`)`

Remove all unused kernel packages from the system.

keep_latest [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

`salt.modules.kernelpkg_linux_yum.`**`latest_available`**`()`

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

`salt.modules.kernelpkg_linux_yum.`**`latest_installed`**`()`

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

`salt.modules.kernelpkg_linux_yum.`**`list_installed`**`()`

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

`salt.modules.kernelpkg_linux_yum.`**`needs_reboot`**`()`

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_yum.`**`remove`**`(`*release*`)`

Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 3.10.0-327.el7
```

`salt.modules.kernelpkg_linux_yum.`**`upgrade`**`(`*reboot=False, at_time=None*`)`

Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.

at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_yum.**upgrade_available**()

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

21.9.190 salt.modules.key

Functions to view the minion's public key information

salt.modules.key.**finger**(*hash_type=None*)

Return the minion's public key fingerprint

hash_type The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger
```

salt.modules.key.**finger_master**(*hash_type=None*)

Return the fingerprint of the master's public key on the minion.

hash_type The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

21.9.191 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.**get_sys**()

Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.**get_x**()

Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.**set_sys**(*layout*)

Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

`salt.modules.keyboard.`**`set_x`**`(`*layout*`)`

Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

21.9.192 salt.modules.keystone

Module for handling openstack keystone calls.

optdepends

- keystoneclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

OR (for token based authentication)

```
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

`salt.modules.keystone.`**`api_version`**`(`*profile=None*, ***connection_args*`)`

Returns the API version derived from endpoint's response.

CLI Example:

```
salt '*' keystone.api_version
```

`salt.modules.keystone.auth(profile=None, **connection_args)`

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```
salt '*' keystone.auth
```

`salt.modules.keystone.ec2_credentials_create(user_id=None, name=None, tenant_id=None, tenant=None, profile=None, **connection_args)`

Create EC2-compatible credentials for user per tenant

CLI Examples:

```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create         user_
↪id=c965f79c4f864eaaa9c3b41904e67082         tenant_
↪id=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_delete(user_id=None, name=None, access_key=None, profile=None, **connection_args)`

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete         860f8c2c38ca4fab989f9bc56a061a64
↪access_key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin         access_
↪key=5f66d2f24f604b8bb9cd28886106f442
```

`salt.modules.keystone.ec2_credentials_get(user_id=None, name=None, access=None, profile=None, **connection_args)`

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082
↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
↪access=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_list(user_id=None, name=None, profile=None, **connection_args)`

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack
```

`salt.modules.keystone.endpoint_create(service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)`

Create an endpoint for an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
↪'http://adminurl/url' region

salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public
↪' region='RegionOne'
```

`salt.modules.keystone.`**`endpoint_delete`**(*service*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Delete endpoints of an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]

salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```

`salt.modules.keystone.`**`endpoint_get`**(*service*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```
salt 'v2' keystone.endpoint_get nova [region=RegionOne]

salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]
```

`salt.modules.keystone.`**`endpoint_list`**(*profile=None*, ***connection_args*)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```
salt '*' keystone.endpoint_list
```

`salt.modules.keystone.`**`project_create`**(*name*, *domain*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.

New in version 2016.11.0.

name The project name, which must be unique within the owning domain.

domain The domain name.

description The project description.

enabled Enables or disables the project.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

`salt.modules.keystone.`**`project_delete`**(*project_id=None*, *name=None*, *profile=None*, ***connection_args*)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

`salt.modules.keystone.`**`project_get`**(*project_id=None, name=None, profile=None, **connection_args*)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

`salt.modules.keystone.`**`project_list`**(*profile=None, **connection_args*)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

`salt.modules.keystone.`**`project_update`**(*project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args*)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name, which must be unique within the owning domain.

description The project description.

enabled Enables or disables the project.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin␣
↪email=admin@domain.com
```

salt.modules.keystone.**role_create**(*name*, *profile=None*, ***connection_args*)
Create a named role.

CLI Example:

```
salt '*' keystone.role_create admin
```

salt.modules.keystone.**role_delete**(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)
Delete a role (keystone role-delete)

CLI Examples:

```
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

salt.modules.keystone.**role_get**(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)
Return a specific roles (keystone role-get)

CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

salt.modules.keystone.**role_list**(*profile=None*, ***connection_args*)
Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

salt.modules.keystone.**service_create**(*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)
Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

salt.modules.keystone.**service_delete**(*service_id=None*, *name=None*, *profile=None*, ***connection_args*)
Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

salt.modules.keystone.**service_get**(*service_id=None*, *name=None*, *profile=None*, ***connection_args*)
Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

`salt.modules.keystone.`**`service_list`**(*profile=None*, ***connection_args*)
Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

`salt.modules.keystone.`**`tenant_create`**(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)
Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

`salt.modules.keystone.`**`tenant_delete`**(*tenant_id=None*, *name=None*, *profile=None*, ***connection_args*)
Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

`salt.modules.keystone.`**`tenant_get`**(*tenant_id=None*, *name=None*, *profile=None*, ***connection_args*)
Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

`salt.modules.keystone.`**`tenant_list`**(*profile=None*, ***connection_args*)
Return a list of available tenants (keystone tenants-list)

CLI Example:

```
salt '*' keystone.tenant_list
```

`salt.modules.keystone.`**`tenant_update`**(*tenant_id=None*, *name=None*, *description=None*, *enabled=None*, *profile=None*, ***connection_args*)
Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:

```
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin␣
↪email=admin@domain.com
```

`salt.modules.keystone.`**`token_get`**(*profile=None*, ***connection_args*)
Return the configured tokens (keystone token-get)

CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

`salt.modules.keystone.`**`user_create`**(*name*, *password*, *email*, *tenant_id=None*, *enabled=True*, *profile=None*, *project_id=None*, *description=None*, ***connection_args*)

Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.
↪org         tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True
```

`salt.modules.keystone.`**`user_delete`**(*user_id=None*, *name=None*, *profile=None*, ***connection_args*)

Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

`salt.modules.keystone.`**`user_get`**(*user_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

`salt.modules.keystone.`**`user_list`**(*profile=None*, ***connection_args*)

Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

`salt.modules.keystone.`**`user_password_update`**(*user_id=None*, *name=None*, *password=None*, *profile=None*, ***connection_args*)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
↪password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082
↪password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

`salt.modules.keystone.`**`user_role_add`**(*user_id=None*, *user=None*, *tenant_id=None*, *tenant=None*, *role_id=None*, *role=None*, *profile=None*, *project_id=None*, *project_name=None*, ***connection_args*)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↪id=7167a092ece84bae8cead4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

`salt.modules.keystone.`**`user_role_list`**(*user_id=None, tenant_id=None, user_name=None, tenant_name=None, profile=None, project_id=None, project_name=None, **connection_args*)

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↪id=7167a092ece84bae8cead4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

`salt.modules.keystone.`**`user_role_remove`**(*user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args*)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654␣
↪tenant_id=7167a092ece84bae8cead4bf9d15bb3b role_
↪id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

`salt.modules.keystone.`**`user_update`**(*user_id=None, name=None, email=None, enabled=None, tenant=None, profile=None, project=None, description=None, **connection_args*)

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082␣
↪name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname␣
↪email=newemail@domain.com
```

`salt.modules.keystone.`**`user_verify_password`**(*user_id=None, name=None, password=None, profile=None, **connection_args*)

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082␣
↪password=foobar
```

21.9.193 salt.modules.keystoneng

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.

:depends:shade

Example configuration

```
keystone:
  cloud: default
```

```
keystone:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
  identity_api_version: 3
```

`salt.modules.keystoneng.`**`compare_changes`**(*obj*, ***kwargs*)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

`salt.modules.keystoneng.`**`domain_create`**(*auth=None*, ***kwargs*)

Create a domain

CLI Example:

```
salt '*' keystoneng.domain_create name=domain1
```

`salt.modules.keystoneng.`**`domain_delete`**(*auth=None*, ***kwargs*)

Delete a domain

CLI Example:

```
salt '*' keystoneng.domain_delete name=domain1
salt '*' keystoneng.domain_delete name=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.`**`domain_get`**(*auth=None*, ***kwargs*)

Get a single domain

CLI Example:

```
salt '*' keystoneng.domain_get name=domain1
salt '*' keystoneng.domain_get name=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.`**`domain_list`**(*auth=None*, ***kwargs*)

List domains

CLI Example:

```
salt '*' keystoneng.domain_list
```

`salt.modules.keystoneng.`**`domain_search`**(*auth=None*, ***kwargs*)

Search domains

CLI Example:

```
salt '*' keystoneng.domain_search
salt '*' keystoneng.domain_search name=domain1
```

`salt.modules.keystoneng.`**`domain_update`**(*auth=None*, ***kwargs*)

Update a domain

CLI Example:

```
salt '*' keystoneng.domain_update name=domain1 new_name=newdomain
salt '*' keystoneng.domain_update name=domain1 enabled=True description='new␣
↪description'
```

salt.modules.keystoneng.**endpoint_create**(*auth=None*, ***kwargs*)
Create an endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_create interface=admin service=glance url=https://
↪example.org:9292
salt '*' keystoneng.endpoint_create interface=public service=glance␣
↪region=RegionOne url=https://example.org:9292
salt '*' keystoneng.endpoint_create interface=admin service=glance url=https://
↪example.org:9292 enabled=True
```

salt.modules.keystoneng.**endpoint_delete**(*auth=None*, ***kwargs*)
Delete an endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_delete id=3bee4bd8c2b040ee966adfda1f0bfca9
```

salt.modules.keystoneng.**endpoint_get**(*auth=None*, ***kwargs*)
Get a single endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_get id=02cffaa173b2460f98e40eda3748dae5
```

salt.modules.keystoneng.**endpoint_list**(*auth=None*, ***kwargs*)
List endpoints

CLI Example:

```
salt '*' keystoneng.endpoint_list
```

salt.modules.keystoneng.**endpoint_search**(*auth=None*, ***kwargs*)
Search endpoints

CLI Example:

```
salt '*' keystoneng.endpoint_search
salt '*' keystoneng.endpoint_search id=02cffaa173b2460f98e40eda3748dae5
```

salt.modules.keystoneng.**endpoint_update**(*auth=None*, ***kwargs*)
Update an endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717␣
↪interface=public enabled=False
salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717␣
↪region=newregion
salt '*' keystoneng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717␣
↪service_name_or_id=glance url=https://example.org:9292
```

salt.modules.keystoneng.**get_entity**(*ent_type*, ***kwargs*)
Attempt to query Keystone for more information about an entity

`salt.modules.keystoneng.`**`get_openstack_cloud`**(*auth=None*)
Return an openstack_cloud

`salt.modules.keystoneng.`**`get_operator_cloud`**(*auth=None*)
Return an operator_cloud

`salt.modules.keystoneng.`**`group_create`**(*auth=None*, ***kwargs*)
Create a group

CLI Example:

```
salt '*' keystoneng.group_create name=group1
salt '*' keystoneng.group_create name=group2 domain=domain1 description='my group2
↪'
```

`salt.modules.keystoneng.`**`group_delete`**(*auth=None*, ***kwargs*)
Delete a group

CLI Example:

```
salt '*' keystoneng.group_delete name=group1
salt '*' keystoneng.group_delete name=group2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.group_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.keystoneng.`**`group_get`**(*auth=None*, ***kwargs*)
Get a single group

CLI Example:

```
salt '*' keystoneng.group_get name=group1
salt '*' keystoneng.group_get name=group2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.group_get name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.keystoneng.`**`group_list`**(*auth=None*, ***kwargs*)
List groups

CLI Example:

```
salt '*' keystoneng.group_list
salt '*' keystoneng.group_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.`**`group_search`**(*auth=None*, ***kwargs*)
Search for groups

CLI Example:

```
salt '*' keystoneng.group_search name=group1
salt '*' keystoneng.group_search domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.`**`group_update`**(*auth=None*, ***kwargs*)
Update a group

CLI Example:

```
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e new_name=newgroupname
salt '*' keystoneng.group_create name=0e4febc2a5ab4f2c8f374b054162506d new_
↪name=newgroupname
```

salt.modules.keystoneng.**project_create**(*auth=None*, ***kwargs*)

Create a project

CLI Example:

```
salt '*' keystoneng.project_create name=project1
salt '*' keystoneng.project_create name=project2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.project_create name=project3 enabled=False description='my⊠
↪project3'
```

salt.modules.keystoneng.**project_delete**(*auth=None*, ***kwargs*)

Delete a project

CLI Example:

```
salt '*' keystoneng.project_delete name=project1
salt '*' keystoneng.project_delete name=project2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.project_delete name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.**project_get**(*auth=None*, ***kwargs*)

Get a single project

CLI Example:

```
salt '*' keystoneng.project_get name=project1
salt '*' keystoneng.project_get name=project2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.project_get name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.**project_list**(*auth=None*, ***kwargs*)

List projects

CLI Example:

```
salt '*' keystoneng.project_list
salt '*' keystoneng.project_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**project_search**(*auth=None*, ***kwargs*)

Search projects

CLI Example:

```
salt '*' keystoneng.project_search
salt '*' keystoneng.project_search name=project1
salt '*' keystoneng.project_search domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**project_update**(*auth=None*, ***kwargs*)

Update a project

CLI Example:

```
salt '*' keystoneng.project_update name=project1 new_name=newproject
salt '*' keystoneng.project_update name=project2 enabled=False description='new⊠
↪description'
```

salt.modules.keystoneng.**role_assignment_list**(*auth=None*, ***kwargs*)

List role assignments

CLI Example:

```
salt '*' keystoneng.role_assignment_list
```

`salt.modules.keystoneng.role_create(auth=None, **kwargs)`

Create a role

CLI Example:

```
salt '*' keystoneng.role_create name=role1
salt '*' keystoneng.role_create name=role1 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.role_delete(auth=None, **kwargs)`

Delete a role

CLI Example:

```
salt '*' keystoneng.role_delete name=role1 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.role_delete name=1eb6edd5525e4ac39af571adee673559
```

`salt.modules.keystoneng.role_get(auth=None, **kwargs)`

Get a single role

CLI Example:

```
salt '*' keystoneng.role_get name=role1
salt '*' keystoneng.role_get name=role1 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.role_get name=1eb6edd5525e4ac39af571adee673559
```

`salt.modules.keystoneng.role_grant(auth=None, **kwargs)`

Grant a role in a project/domain to a user/group

CLI Example:

```
salt '*' keystoneng.role_grant name=role1 user=user1 project=project1
salt '*' keystoneng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d group=user1
↪project=project1 domain=domain1
salt '*' keystoneng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d
↪group=19573afd5e4241d8b65c42215bae9704 project=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.keystoneng.role_list(auth=None, **kwargs)`

List roles

CLI Example:

```
salt '*' keystoneng.role_list
salt '*' keystoneng.role_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

`salt.modules.keystoneng.role_revoke(auth=None, **kwargs)`

Grant a role in a project/domain to a user/group

CLI Example:

```
salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d group=user1
↪project=project1 domain=domain1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
↪group=19573afd5e4241d8b65c42215bae9704 project=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.keystoneng.**role_search**(*auth=None*, ***kwargs*)

Search roles

CLI Example:

```
salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
salt '*' keystoneng.role_search domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**role_update**(*auth=None*, ***kwargs*)

Update a role

CLI Example:

```
salt '*' keystoneng.role_update name=role1 new_name=newrole
salt '*' keystoneng.role_update name=1eb6edd5525e4ac39af571adee673559 new_
↪name=newrole
```

salt.modules.keystoneng.**service_create**(*auth=None*, ***kwargs*)

Create a service

CLI Example:

```
salt '*' keystoneng.service_create name=glance type=image
salt '*' keystoneng.service_create name=glance type=image description="Image"
```

salt.modules.keystoneng.**service_delete**(*auth=None*, ***kwargs*)

Delete a service

CLI Example:

```
salt '*' keystoneng.service_delete name=glance
salt '*' keystoneng.service_delete name=39cc1327cdf744ab815331554430e8ec
```

salt.modules.keystoneng.**service_get**(*auth=None*, ***kwargs*)

Get a single service

CLI Example:

```
salt '*' keystoneng.service_get name=glance
salt '*' keystoneng.service_get name=75a5804638944b3ab54f7fbfcec2305a
```

salt.modules.keystoneng.**service_list**(*auth=None*, ***kwargs*)

List services

CLI Example:

```
salt '*' keystoneng.service_list
```

salt.modules.keystoneng.**service_search**(*auth=None*, ***kwargs*)

Search services

CLI Example:

```
salt '*' keystoneng.service_search
salt '*' keystoneng.service_search name=glance
salt '*' keystoneng.service_search name=135f0403f8e544dc9008c6739ecda860
```

salt.modules.keystoneng.**service_update**(*auth=None*, ***kwargs*)

Update a service

CLI Example:

```
salt '*' keystoneng.service_update name=cinder type=volumev2
salt '*' keystoneng.service_update name=cinder description='new description'
salt '*' keystoneng.service_update name=ab4d35e269f147b3ae2d849f77f5c88f
↪enabled=False
```

salt.modules.keystoneng.**setup_clouds**(*auth=None*)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.keystoneng.**user_create**(*auth=None*, ***kwargs*)

Create a user

CLI Example:

```
salt '*' keystoneng.user_create name=user1
salt '*' keystoneng.user_create name=user2 password=1234 enabled=False
salt '*' keystoneng.user_create name=user3 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**user_delete**(*auth=None*, ***kwargs*)

Delete a user

CLI Example:

```
salt '*' keystoneng.user_delete name=user1
salt '*' keystoneng.user_delete name=user2 domain_
↪id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.user_delete name=a42cbbfa1e894e839fd0f584d22e321f
```

salt.modules.keystoneng.**user_get**(*auth=None*, ***kwargs*)

Get a single user

CLI Example:

```
salt '*' keystoneng.user_get name=user1
salt '*' keystoneng.user_get name=user1 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.user_get name=02cffaa173b2460f98e40eda3748dae5
```

salt.modules.keystoneng.**user_list**(*auth=None*, ***kwargs*)

List users

CLI Example:

```
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**user_search**(*auth=None*, ***kwargs*)

List users

CLI Example:

```
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.**user_update**(*auth=None*, ***kwargs*)

Update a user

CLI Example:

```
salt '*' keystoneng.user_update name=user1 enabled=False description='new␣
↪description'
salt '*' keystoneng.user_update name=user1 new_name=newuser
```

21.9.194 salt.modules.keystore

Module to interact with keystores

`salt.modules.keystore.`**`add`**(*name*, *keystore*, *passphrase*, *certificate*, *private_key=None*)

Adds certificates to an existing keystore or creates a new one if necesssary.

Parameters

- **name** – alias for the certificate
- **keystore** – The path to the keystore file to query
- **passphrase** – The passphrase to use to decode the keystore
- **certificate** – The PEM public certificate to add to keystore. Can be a string for file.
- **private_key** – (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

```
salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----BEGIN␣
↪CERTIFICATE-----SIb...BM=-----END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert private_key=/
↪tmp/512.key
```

`salt.modules.keystore.`**`list`**(*keystore*, *passphrase*, *alias=None*, *return_cert=False*)

Lists certificates in a keytool managed keystore.

Parameters

- **keystore** – The path to the keystore file to query
- **passphrase** – The passphrase to use to decode the keystore
- **alias** – (Optional) If found, displays details on only this key
- **return_certs** – (Optional) Also return certificate PEM.

Warning: There are security implications for using return_cert to return decrypted certificates.

CLI Example:

```
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit␣
↪debian:verisign_-_g5.pem
```

`salt.modules.keystore.`**`remove`**(*name*, *keystore*, *passphrase*)

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False

Parameters

- **name** – alias for the certificate
- **keystore** – The path to the keystore file to query

- **passphrase** – The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

21.9.195 salt.modules.kmod

Module to manage Linux kernel modules

`salt.modules.kmod.`**`available`**`()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.kmod.`**`check_available`**`(`*mod*`)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

`salt.modules.kmod.`**`is_loaded`**`(`*mod*`)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

`salt.modules.kmod.`**`load`**`(`*mod, persist=False*`)`

Load the specified kernel module

mod Name of module to add

persist Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

`salt.modules.kmod.`**`lsmod`**`()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.kmod.`**`mod_list`**`(`*only_persist=False*`)`

Return a list of the loaded module names

only_persist Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.kmod.`**`remove`**`(`*mod, persist=False, comment=True*`)`

Remove the specified kernel module

mod Name of module to remove

persist Also remove module from /etc/modules

comment If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

21.9.196 salt.modules.kubernetesmod

Module for handling kubernetes calls.

optdepends

- kubernetes Python client

configuration The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.kubeconfig: '/path/to/kubeconfig'
kubernetes.kubeconfig-data: '<base64 encoded kubeconfig content'
kubernetes.context: 'context'
```

These settings can be overridden by adding *context and 'kubeconfig* or *kubeconfig_data* parameters when calling a function.

The data format for *kubernetes.kubeconfig-data* value is the content of *kubeconfig* base64 encoded in one line.

Only *kubeconfig* or *kubeconfig-data* should be provided. In case both are provided *kubeconfig* entry is preferred.

```
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

Changed in version 2019.2.0.

Warning: Configuration options changed in 2019.2.0. The following configuration options have been removed:

- kubernetes.user
- kubernetes.password
- kubernetes.api_url
- kubernetes.certificate-authority-data/file
- kubernetes.client-certificate-data/file
- kubernetes.client-key-data/file

Please use now:

- kubernetes.kubeconfig or kubernetes.kubeconfig-data
- kubernetes.context

`salt.modules.kubernetesmod.`**`configmaps`**`(`*namespace='default', **kwargs*`)`

Return a list of kubernetes configmaps defined in the namespace

CLI Examples:

```
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

`salt.modules.kubernetesmod.`**`create_configmap`**(*name, namespace, data, source=None, template=None, saltenv='base', **kwargs*)

Creates the kubernetes configmap as defined by the user.

CLI Examples:

```
salt 'minion1' kubernetes.create_configmap             settings default '{
↪"example.conf": "# example file"}'

salt 'minion2' kubernetes.create_configmap             name=settings⊠
↪namespace=default data='{"example.conf": "# example file"}'
```

`salt.modules.kubernetesmod.`**`create_deployment`**(*name, namespace, metadata, spec, source, template, saltenv, **kwargs*)

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetesmod.`**`create_namespace`**(*name, **kwargs*)

Creates a namespace with the specified name.

CLI Example: salt '*' kubernetes.create_namespace salt salt '*' kubernetes.create_namespace name=salt

`salt.modules.kubernetesmod.`**`create_pod`**(*name, namespace, metadata, spec, source, template, saltenv, **kwargs*)

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetesmod.`**`create_secret`**(*name, namespace='default', data=None, source=None, template=None, saltenv='base', **kwargs*)

Creates the kubernetes secret as defined by the user.

CLI Examples:

```
salt 'minion1' kubernetes.create_secret             passwords default '{"db":
↪"letmein"}'

salt 'minion2' kubernetes.create_secret             name=passwords⊠
↪namespace=default data='{"db": "letmein"}'
```

`salt.modules.kubernetesmod.`**`create_service`**(*name, namespace, metadata, spec, source, template, saltenv, **kwargs*)

Creates the kubernetes service as defined by the user.

`salt.modules.kubernetesmod.`**`delete_configmap`**(*name, namespace='default', **kwargs*)

Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

`salt.modules.kubernetesmod.`**`delete_deployment`**(*name, namespace='default', **kwargs*)

Deletes the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.`**`delete_namespace`**`(`*name*, ***kwargs*`)`

Deletes the kubernetes namespace defined by name

CLI Examples:

```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

`salt.modules.kubernetesmod.`**`delete_pod`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Deletes the kubernetes pod defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default
```

`salt.modules.kubernetesmod.`**`delete_secret`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Deletes the kubernetes secret defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

`salt.modules.kubernetesmod.`**`delete_service`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Deletes the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.`**`deployments`**`(`*namespace='default'*, ***kwargs*`)`

Return a list of kubernetes deployments defined in the namespace

CLI Examples:

```
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

`salt.modules.kubernetesmod.`**`namespaces`**`(`***kwargs*`)`

Return the names of the available namespaces

CLI Examples:

```
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces kubeconfig=/etc/salt/k8s/kubeconfig
↪context=minikube
```

`salt.modules.kubernetesmod.`**`node`**`(`*name*, ***kwargs*`)`

Return the details of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node name='minikube'
```

`salt.modules.kubernetesmod.`**`node_add_label`**`(`*node_name*, *label_name*, *label_value*, ***kwargs*`)`

Set the value of the label identified by *label_name* to *label_value* on the node identified by the name *node_name*. Creates the lable if not present.

CLI Examples:

```
salt '*' kubernetes.node_add_label node_name="minikube"            label_name=
↪"foo" label_value="bar"
```

`salt.modules.kubernetesmod.`**`node_labels`**`(`*name*, ***kwargs*`)`

Return the labels of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node_labels name="minikube"
```

`salt.modules.kubernetesmod.`**`node_remove_label`**`(`*node_name*, *label_name*, ***kwargs*`)`

Removes the label identified by *label_name* from the node identified by the name *node_name*.

CLI Examples:

```
salt '*' kubernetes.node_remove_label node_name="minikube"            label_name=
↪"foo"
```

`salt.modules.kubernetesmod.`**`nodes`**`(`***kwargs*`)`

Return the names of the nodes composing the kubernetes cluster

CLI Examples:

```
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

`salt.modules.kubernetesmod.`**`ping`**`(`***kwargs*`)`

Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: salt '*' kubernetes.ping

`salt.modules.kubernetesmod.`**`pods`**`(`*namespace='default'*, ***kwargs*`)`

Return a list of kubernetes pods defined in the namespace

CLI Examples:

```
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

`salt.modules.kubernetesmod.`**`replace_configmap`**`(`*name*, *data*, *source=None*, *template=None*, *saltenv='base'*, *namespace='default'*, ***kwargs*`)`

Replaces an existing configmap with a new one defined by name and namespace with the specified data.

CLI Examples:

```
salt 'minion1' kubernetes.replace_configmap             settings default '{
↪"example.conf": "# example file"}'

salt 'minion2' kubernetes.replace_configmap             name=settings
↪namespace=default data='{"example.conf": "# example file"}'
```

`salt.modules.kubernetesmod.`**`replace_deployment`**`(`*name*, *metadata*, *spec*, *source*, *template*, *saltenv*, *namespace='default'*, ***kwargs*`)`

Replaces an existing deployment with a new one defined by name and namespace, having the specificed metadata and spec.

`salt.modules.kubernetesmod.`**`replace_secret`**`(`*name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs*`)`

Replaces an existing secret with a new one defined by name and namespace, having the specificed data.

CLI Examples:

```
salt 'minion1' kubernetes.replace_secret            name=passwords data='{"db":
↪"letmein"}'

salt 'minion2' kubernetes.replace_secret            name=passwords␣
↪namespace=saltstack data='{"db": "passw0rd"}'
```

`salt.modules.kubernetesmod.`**`replace_service`**`(`*name, metadata, spec, source, template, old_service, saltenv, namespace='default', **kwargs*`)`

Replaces an existing service with a new one defined by name and namespace, having the specificed metadata and spec.

`salt.modules.kubernetesmod.`**`secrets`**`(`*namespace='default', **kwargs*`)`

Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

`salt.modules.kubernetesmod.`**`services`**`(`*namespace='default', **kwargs*`)`

Return a list of kubernetes services defined in the namespace

CLI Examples:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

`salt.modules.kubernetesmod.`**`show_configmap`**`(`*name, namespace='default', **kwargs*`)`

Return the kubernetes configmap defined by name and namespace.

CLI Examples:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

`salt.modules.kubernetesmod.`**`show_deployment`**`(`*name, namespace='default', **kwargs*`)`

Return the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.`**`show_namespace`**`(`*name, **kwargs*`)`

Return information for a given namespace defined by the specified name

CLI Examples:

```
salt '*' kubernetes.show_namespace kube-system
```

`salt.modules.kubernetesmod.`**`show_pod`**`(`*name, namespace='default', **kwargs*`)`

Return POD information for a given pod name defined in the namespace

CLI Examples:

```
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default
```

`salt.modules.kubernetesmod.`**`show_secret`**`(`*name*, *namespace='default'*, *decode=False*, ***kwargs*`)`

Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Examples:

```
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True
```

`salt.modules.kubernetesmod.`**`show_service`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Return the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default
```

21.9.197 salt.modules.launchctl_service

Module for the management of MacOS systems that use launchd/launchctl

---

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

---

depends

- plistlib Python module

`salt.modules.launchctl_service.`**`available`**`(`*job_label*`)`

Check that the given service is available.

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.launchctl_service.`**`disabled`**`(`*job_label*, *runas=None*`)`

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service label>
```

`salt.modules.launchctl_service.`**`enabled`**`(`*job_label*, *runas=None*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service label>
```

`salt.modules.launchctl_service.`**`get_all`**`()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.launchctl_service.`**`missing`**(*job_label*)

The inverse of service.available Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.launchctl_service.`**`restart`**(*job_label*, *runas=None*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

`salt.modules.launchctl_service.`**`start`**(*job_label*, *runas=None*)

Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

`salt.modules.launchctl_service.`**`status`**(*name*, *runas=None*)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (*`str`*) – The name of the service to check
- **`runas`** (*`str`*) – User to run launchctl commands

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.launchctl_service.`**`stop`**(*job_label*, *runas=None*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

21.9.198 salt.modules.layman

Support for Layman

`salt.modules.layman.`**`add`**`(`*overlay*`)`

Add the given overlay from the cached remote list to your locally installed overlays. Specify 'ALL' to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

`salt.modules.layman.`**`delete`**`(`*overlay*`)`

Remove the given overlay from the your locally installed overlays. Specify 'ALL' to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```

`salt.modules.layman.`**`list_all`**`()`

List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:

```
salt '*' layman.list_all
```

`salt.modules.layman.`**`list_local`**`()`

List the locally installed overlays.

Return a list of installed overlays:

CLI Example:

```
salt '*' layman.list_local
```

`salt.modules.layman.`**`sync`**`(`*overlay='ALL'*`)`

Update the specified overlay. Use 'ALL' to synchronize all overlays. This is the default if no overlay is specified.

overlay Name of the overlay to sync. (Defaults to 'ALL')

CLI Example:

```
salt '*' layman.sync
```

21.9.199 salt.modules.ldap3

Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the *`ldapmod`* execution module.

depends

- `ldap` Python module

`exception` `salt.modules.ldap3.`**`LDAPError`**`(`*message, cause=None*`)`

Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

Variables **`cause`** – backend exception object, if applicable

`salt.modules.ldap3.`**`add`**(*connect_spec*, *dn*, *attributes*)

Add an entry to an LDAP database.

Parameters

- **`connect_spec`** – See the documentation for the `connect_spec` parameter for *`connect()`*.
- **`dn`** – Distinguished name of the entry.
- **`attributes`** – Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.add "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret',
    },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

`salt.modules.ldap3.`**`change`**(*connect_spec*, *dn*, *before*, *after*)

Modify an entry in an LDAP database.

This does the same thing as *`modify()`*, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

Parameters

- **`connect_spec`** – See the documentation for the `connect_spec` parameter for *`connect()`*.
- **`dn`** – Distinguished name of the entry.
- **`before`** – The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **`after`** – The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.change "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
```

(continues on next page)

(continued from previous page)

```
        'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
before="{'example_value': 'before_val'}"
after="{'example_value': 'after_val'}"
```

`salt.modules.ldap3.`**`connect`**`(`*connect_spec=None*`)`

Connect and optionally bind to an LDAP server.

Parameters **`connect_spec`** – This can be an LDAP connection object returned by a previous call to *`connect()`* (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- **`'backend'`** Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only `'ldap'` is supported at the moment.
- **`'url'`** Optional; defaults to `'ldapi:///'`. URL to the LDAP server.
- **`'bind'`** Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:
  - **`'method'`** Optional; defaults to `None`. The authentication method to use. Valid values include but are not necessarily limited to `'simple'`, `'sasl'`, and `None`. If `None`, an anonymous connection is made. Available methods depend on the chosen backend.
  - **`'mechanism'`** Optional; defaults to `'EXTERNAL'`. The SASL mechanism to use. Ignored unless the method is `'sasl'`. Available methods depend on the chosen backend and the server's capabilities.
  - **`'credentials'`** Optional; defaults to `None`. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is `'sasl'`.

    For the `'ldap'` backend, this is a dictionary. If `None`, an empty dict is used. Keys:

    - **`'args'`** Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
    - **`'kwargs'`** Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
  - **`'dn'`** Optional; defaults to an empty string. The distinguished name to bind.
  - **`'password'`** Optional; defaults to an empty string. Password for binding. Ignored if the method is `'sasl'`.
- **`'tls'`** Optional; defaults to `None`. A backend-specific object containing settings to override default TLS behavior.

  For the `'ldap'` backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If `None`, an empty dict is used. Possible keys:

  - **`'starttls'`** If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
  - **`'cacertdir'`** Set the path of the directory containing CA certificates.
  - **`'cacertfile'`** Set the pathname of the CA certificate file.

  - **'certfile'** Set the pathname of the certificate file.
  - **'cipher_suite'** Set the allowed cipher suite.
  - **'crlcheck'** Set the CRL evaluation strategy. Valid values are `'none'`, `'peer'`, and `'all'`.
  - **'crlfile'** Set the pathname of the CRL file.
  - **'dhfile'** Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
  - **'keyfile'** Set the pathname of the certificate key file.
  - **'newctx'** If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
  - **'protocol_min'** Set the minimum protocol version.
  - **'random_file'** Set the pathname of the random file when `/dev/random` and `/dev/urandom` are not available.
  - **'require_cert'** Set the certificate validation policy. Valid values are `'never'`, `'hard'`, `'demand'`, `'allow'`, and `'try'`.

- **'opts'** Optional; defaults to `None`. A backend-specific object containing options for the backend.

  For the `'ldap'` backend, this is a dictionary of OpenLDAP options to set. If `None`, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the `'LDAP_OPT_'` prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest `with` statements.

CLI example:

```
salt '*' ldap3.connect "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret'}
}"
```

`salt.modules.ldap3.`**`delete`**(*connect_spec*, *dn*)

Delete an entry from an LDAP database.

Parameters

- **connect_spec** – See the documentation for the `connect_spec` parameter for *`connect()`*.
- **dn** – Distinguished name of the entry.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.delete "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

`salt.modules.ldap3.`**`modify`**(*connect_spec, dn, directives*)

Modify an entry in an LDAP database.

Parameters

- **`connect_spec`** – See the documentation for the `connect_spec` parameter for *`connect()`*.
- **`dn`** – Distinguished name of the entry.
- **`directives`** – Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form `(op, attr, vals)`, where:
  - `op` identifies the modification operation to perform. One of:
    - `'add'` to add one or more values to the attribute
    - `'delete'` to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    - `'replace'` to replace all of the attribute's values with zero or more new values
  - `attr` names the attribute to modify
  - `vals` is an iterable of values to add or delete

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.modify "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
directives="('add', 'example', ['example_val'])"
```

`salt.modules.ldap3.`**`search`**(*connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0*)

Search an LDAP database.

Parameters

- **`connect_spec`** – See the documentation for the `connect_spec` parameter for *`connect()`*.
- **`base`** – Distinguished name of the entry at which to start the search.
- **`scope`** – One of the following:
  - **`'subtree'`** Search the base and all of its descendants.
  - **`'base'`** Search only the base itself.
  - **`'onelevel'`** Search only the base's immediate children.
- **`filterstr`** – String representation of the filter to apply in the search.

- **`attrlist`** – Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- **`attrsonly`** – If non-zero, don't return any attribute values.

Returns a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI example:

```
salt '*' ldap3.search "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret',
    },
}" "base='dc=example,dc=com'"
```

21.9.200 salt.modules.ldapmod

Salt interface to LDAP commands

depends

- ldap Python module

configuration In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

Warning: At the moment this module only recommends connection to LDAP services listening on `localhost`. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

`salt.modules.ldapmod.`**`search`**(*filter*, *dn=None*, *scope=None*, *attrs=None*, ***kwargs*)

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1,
            'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
                         {'saltKeyValue': ['ntpserver=ntp.acme.local',
                                           'foo=myfoo'],
                          'saltState': ['foo', 'bar']}]],
            'time': {'human': '1.2ms', 'raw': '0.00123'}}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb
scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

21.9.201 salt.modules.libcloud_compute module

Apache Libcloud Compute Management

Connection module for Apache Libcloud Compute management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html

Clouds include Amazon EC2, Azure, Google GCE, VMware, OpenStack Nova

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple cloud providers

```
libcloud_compute:
    profile_test1:
      driver: google
      key: service-account@googlecloud.net
      secret: /path/to.key.json
    profile_test2:
      driver: arm
      key: 12345
      secret: mysecret
```

depends apache-libcloud

`salt.modules.libcloud_compute.`**`attach_volume`**`(`*node_id, volume_id, profile, device=None, **libcloud_kwargs*`)`

Attaches volume to node.

Parameters

- **node_id** (str) – Node ID to target
- **volume_id** (str) – Volume ID from which to attach
- **profile** (str) – The profile key
- **device** (str) – Where the device is exposed, e.g. '/dev/sdb'
- **libcloud_kwargs** (dict) – Extra arguments for the driver's attach_volume method

CLI Example:

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

`salt.modules.libcloud_compute.`**`copy_image`**(*source_region, image_id, name, profile, description=None, **libcloud_kwargs*)

Copies an image from a source region to the current region.

Parameters

- **`source_region`** (`str`) – Region to copy the node from.
- **`image_id`** (`str`) – Image to copy.
- **`name`** (`str`) – name for new image.
- **`profile`** (`str`) – The profile key
- **`description`** – description for new image.
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's copy_image method

CLI Example:

```
salt myminion libcloud_compute.copy_image us-east1 image1 'new image' profile1
```

`salt.modules.libcloud_compute.`**`create_image`**(*node_id, name, profile, description=None, **libcloud_kwargs*)

Create an image from a node

Parameters

- **`node_id`** (`str`) – Node to run the task on.
- **`name`** (`str`) – name for new image.
- **`profile`** (`str`) – The profile key
- **`description`** (`description`) – description for new image.
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's create_image method

CLI Example:

```
salt myminion libcloud_compute.create_image server1 my_image profile1
salt myminion libcloud_compute.create_image server1 my_image profile1 description=
↪'test image'
```

`salt.modules.libcloud_compute.`**`create_key_pair`**(*name, profile, **libcloud_kwargs*)

Create a single key pair by name

Parameters

- **`name`** (`str`) – Name of the key pair to create.
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's create_key_pair method

CLI Example:

```
salt myminion libcloud_compute.create_key_pair pair1 profile1
```

`salt.modules.libcloud_compute.`**`create_volume`**(*size, name, profile, location_id=None, **libcloud_kwargs*)

Create a storage volume

Parameters

- **size** (int) – Size of volume in gigabytes (required)
- **name** (str) – Name of the volume to be created
- **location_id** (str) – Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.create_volume 1000 vol1 profile1
```

`salt.modules.libcloud_compute.`**`create_volume_snapshot`**`(`*volume_id, profile, name=None, **libcloud_kwargs*`)`

Create a storage volume snapshot

Parameters

- **volume_id** (str) – Volume ID from which to create the new snapshot.
- **profile** (str) – The profile key
- **name** (str) – Name of the snapshot to be created (optional)
- **libcloud_kwargs** (dict) – Extra arguments for the driver's create_volume_snapshot method

CLI Example:

```
salt myminion libcloud_compute.create_volume_snapshot vol1 profile1
```

`salt.modules.libcloud_compute.`**`delete_image`**`(`*image_id, profile, **libcloud_kwargs*`)`

Delete an image of a node

Parameters

- **image_id** (str) – Image to delete
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's delete_image method

CLI Example:

```
salt myminion libcloud_compute.delete_image image1 profile1
```

`salt.modules.libcloud_compute.`**`delete_key_pair`**`(`*name, profile, **libcloud_kwargs*`)`

Delete a key pair

Parameters

- **name** (str) – Key pair name.
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:

```
salt myminion libcloud_compute.delete_key_pair pair1 profile1
```

`salt.modules.libcloud_compute.`**`destroy_node`**`(`*node_id, profile, **libcloud_kwargs*`)`

Destroy a node in the cloud

Parameters

- **node_id** (`str`) – Unique ID of the node to destroy
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's destroy_node method

CLI Example:

```
salt myminion libcloud_compute.destry_node as-2346 profile1
```

`salt.modules.libcloud_compute.`**`destroy_volume`**(*volume_id*, *profile*, ***libcloud_kwargs*)

Destroy a volume.

Parameters

- **volume_id** (`str`) – Volume ID from which to destroy
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's destroy_volume method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume vol1 profile1
```

`salt.modules.libcloud_compute.`**`destroy_volume_snapshot`**(*volume_id*, *snapshot_id*, *profile*, ***libcloud_kwargs*)

Destroy a volume snapshot.

Parameters

- **volume_id** (`str`) – Volume ID from which the snapshot belongs
- **snapshot_id** (`str`) – Volume Snapshot ID from which to destroy
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's destroy_volume_snapshot method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1
```

`salt.modules.libcloud_compute.`**`detach_volume`**(*volume_id*, *profile*, ***libcloud_kwargs*)

Detaches a volume from a node.

Parameters

- **volume_id** (`str`) – Volume ID from which to detach
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's detach_volume method

CLI Example:

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

`salt.modules.libcloud_compute.`**`extra`**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (`str`) – Driver's method name
- **profile** (`str`) – The profile key

- **libcloud_kwargs** (dict) – Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_compute.extra ex_get_permissions google container_name=my_
↪container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_compute.**get_image**(*image_id*, *profile*, ***libcloud_kwargs*)

Get an image of a node

Parameters

- **image_id** (str) – Image to fetch
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's delete_image method

CLI Example:

```
salt myminion libcloud_compute.get_image image1 profile1
```

salt.modules.libcloud_compute.**get_key_pair**(*name*, *profile*, ***libcloud_kwargs*)

Get a single key pair by name

Parameters

- **name** (str) – Name of the key pair to retrieve.
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's get_key_pair method

CLI Example:

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

salt.modules.libcloud_compute.**import_key_pair**(*name*, *key*, *profile*, *key_type=None*, ***libcloud_kwargs*)

Import a new public key from string or a file path

Parameters

- **name** (str) – Key pair name.
- **key** (str or path str) – Public key material, the string or a path to a file
- **profile** (str) – The profile key
- **key_type** (str) – The key pair type, either *FILE* or *STRING*. Will detect if not provided and assume that if the string is a path to an existing path it is a FILE, else STRING.
- **libcloud_kwargs** (dict) – Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123 profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

salt.modules.libcloud_compute.**list_images**(*profile*, *location_id=None*, ***libcloud_kwargs*)

Return a list of images for this cloud

Parameters

- **profile** (str) – The profile key

- **location_id** (`str`) – The location key, from list_locations
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_images method

CLI Example:

```
salt myminion libcloud_compute.list_images profile1
```

`salt.modules.libcloud_compute.`**list_key_pairs**(*profile*, ***libcloud_kwargs*)

List all the available key pair objects.

Parameters

- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_key_pairs method

CLI Example:

```
salt myminion libcloud_compute.list_key_pairs profile1
```

`salt.modules.libcloud_compute.`**list_locations**(*profile*, ***libcloud_kwargs*)

Return a list of locations for this cloud

Parameters

- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_locations method

CLI Example:

```
salt myminion libcloud_compute.list_locations profile1
```

`salt.modules.libcloud_compute.`**list_nodes**(*profile*, ***libcloud_kwargs*)

Return a list of nodes

Parameters

- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_nodes method

CLI Example:

```
salt myminion libcloud_compute.list_nodes profile1
```

`salt.modules.libcloud_compute.`**list_sizes**(*profile*, *location_id=None*, ***libcloud_kwargs*)

Return a list of node sizes

Parameters

- **profile** (`str`) – The profile key
- **location_id** (`str`) – The location key, from list_locations
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_sizes method

CLI Example:

```
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1
```

`salt.modules.libcloud_compute.`**list_volume_snapshots**(*volume_id*, *profile*, ***libcloud_kwargs*)

Return a list of storage volumes snapshots for this cloud

Parameters

- **volume_id** (str) – The volume identifier
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's list_volume_snapshots method

CLI Example:

```
salt myminion libcloud_compute.list_volume_snapshots vol1 profile1
```

`salt.modules.libcloud_compute.`**`list_volumes`**(*profile*, ***libcloud_kwargs*)

Return a list of storage volumes for this cloud

Parameters

- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.list_volumes profile1
```

`salt.modules.libcloud_compute.`**`reboot_node`**(*node_id*, *profile*, ***libcloud_kwargs*)

Reboot a node in the cloud

Parameters

- **node_id** (str) – Unique ID of the node to reboot
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's reboot_node method

CLI Example:

```
salt myminion libcloud_compute.reboot_node as-2346 profile1
```

21.9.202 salt.modules.libcloud_dns module

Apache Libcloud DNS Management

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

configuration This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
    profile_test1:
      driver: cloudflare
      key: 12345
      secret: mysecret
    profile_test2:
      driver: godaddy
      key: 12345
      secret: mysecret
      shopper_id: 12345
```

depends apache-libcloud

`salt.modules.libcloud_dns.`**`create_record`**(*name*, *zone_id*, *type*, *data*, *profile*)

Create a new record.

Parameters

- **name** (`str`) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.
- **zone_id** (`str`) – Zone where the requested record is created.
- **type** (`str`) – DNS record type (A, AAAA, …).
- **data** (`str`) – Data for the record (depends on the record type).
- **profile** (`str`) – The profile key

CLI Example:

```
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1
```

`salt.modules.libcloud_dns.`**`create_zone`**(*domain*, *profile*, *type='master'*, *ttl=None*)

Create a new zone.

Parameters

- **domain** (`str`) – Zone domain name (e.g. example.com)
- **profile** (`str`) – The profile key
- **type** (`str`) – Zone type (master / slave).
- **ttl** (`int`) – TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.create_zone google.com profile1
```

`salt.modules.libcloud_dns.`**`delete_record`**(*zone_id*, *record_id*, *profile*)

Delete a record.

Parameters

- **zone_id** (`str`) – Zone to delete.
- **record_id** (`str`) – Record to delete.
- **profile** (`str`) – The profile key

Return type `bool`

CLI Example:

```
salt myminion libcloud_dns.delete_record google.com www profile1
```

`salt.modules.libcloud_dns.`**`delete_zone`**(*zone_id*, *profile*)

Delete a zone.

Parameters

- **zone_id** (`str`) – Zone to delete.
- **profile** (`str`) – The profile key

Return type `bool`

CLI Example:

```
salt myminion libcloud_dns.delete_zone google.com profile1
```

`salt.modules.libcloud_dns.`**`extra`**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (`str`) – Driver's method name

- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's delete_container method

CLI Example:

```
salt myminion libcloud_dns.extra ex_get_permissions google container_name=my_
↪container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_dns.**get_bind_data**(*zone_id*, *profile*)

Export Zone to the BIND compatible format.

Parameters

- **zone_id** (str) – Zone to export.
- **profile** (str) – The profile key

Returns Zone data in BIND compatible format.

Return type str

CLI Example:

```
salt myminion libcloud_dns.get_bind_data google.com profile1
```

salt.modules.libcloud_dns.**get_record**(*zone_id*, *record_id*, *profile*)

Get record information for the given zone_id on the given profile

Parameters

- **zone_id** (str) – Zone to export.
- **record_id** (str) – Record to delete.
- **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.get_record google.com www profile1
```

salt.modules.libcloud_dns.**get_zone**(*zone_id*, *profile*)

Get zone information for the given zone_id on the given profile

Parameters

- **zone_id** (str) – Zone to export.
- **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.get_zone google.com profile1
```

salt.modules.libcloud_dns.**list_record_types**(*profile*)

List available record types for the given profile, e.g. A, AAAA

Parameters **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.list_record_types profile1
```

salt.modules.libcloud_dns.**list_records**(*zone_id*, *profile*, *type=None*)

List records for the given zone_id on the given profile

Parameters

- **zone_id** (str) – Zone to export.
- **profile** (str) – The profile key

- **type** (str) – The record type, e.g. A, NS

CLI Example:

```
salt myminion libcloud_dns.list_records google.com profile1
```

`salt.modules.libcloud_dns.`**`list_zones`**(*profile*)

List zones for the given profile

Parameters **profile** (str) – The profile key

CLI Example:

```
salt myminion libcloud_dns.list_zones profile1
```

`salt.modules.libcloud_dns.`**`update_zone`**(*zone_id, domain, profile, type='master', ttl=None*)

Update an existing zone.

Parameters

- **zone_id** (str) – Zone ID to update.
- **domain** (str) – Zone domain name (e.g. example.com)
- **profile** (str) – The profile key
- **type** (str) – Zone type (master / slave).
- **ttl** (int) – TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave
```

21.9.203 salt.modules.libcloud_loadbalancer

Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```
libcloud_loadbalancer:
    profile_test1:
      driver: gce
      key: GOOG0123456789ABCXYZ
      secret: mysecret
    profile_test2:
      driver: alb
      key: 12345
      secret: mysecret
```

depends apache-libcloud

`salt.modules.libcloud_loadbalancer.`**`balancer_attach_member`**(*balancer_id, ip, port, profile, extra=None, **libcloud_kwargs*)

Add a new member to the load balancer

Parameters

- **balancer_id** (str) – id of a load balancer you want to fetch
- **ip** (str) – IP address for the new member
- **port** (int) – Port for the new member
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's balancer_attach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4 80␣
↪profile1
```

salt.modules.libcloud_loadbalancer.**balancer_detach_member**(*balancer_id*, *member_id*, *profile*, ***libcloud_kwargs*)

Add a new member to the load balancer

Parameters

- **balancer_id** (str) – id of a load balancer you want to fetch
- **ip** (str) – IP address for the new member
- **port** (int) – Port for the new member
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's balancer_detach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_detach_member balancer123 member123␣
↪profile1
```

salt.modules.libcloud_loadbalancer.**create_balancer**(*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, ***libcloud_kwargs*)

Create a new load balancer instance

Parameters

- **name** (str) – Name of the new load balancer (required)
- **port** (str) – Port the load balancer should listen on, defaults to 80
- **protocol** (str) – Loadbalancer protocol, defaults to http.
- **algorithm** (str) – Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's create_balancer method

Returns The details of the new balancer

CLI Example:

```
salt myminion libcloud_storage.create_balancer my_balancer 80 http profile1
```

salt.modules.libcloud_loadbalancer.**destroy_balancer**(*balancer_id*, *profile*, ***libcloud_kwargs*)

Destroy a load balancer

Parameters

- **balancer_id** (str) – LoadBalancer ID which should be used
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's destroy_balancer method

Returns True if the destroy was successful, otherwise False.

Return type bool

CLI Example:

```
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1
```

salt.modules.libcloud_loadbalancer.**extra**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (str) – Driver's method name
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_loadbalancer.extra ex_get_permissions google container_
↪name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_loadbalancer.**get_balancer**(*balancer_id*, *profile*, ***libcloud_kwargs*)

Get the details for a load balancer by ID

Parameters

- **balancer_id** (str) – id of a load balancer you want to fetch
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's get_balancer method

Returns the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer balancer123 profile1
```

salt.modules.libcloud_loadbalancer.**get_balancer_by_name**(*name*, *profile*, ***libcloud_kwargs*)

Get the details for a load balancer by name

Parameters

- **name** (str) – Name of a load balancer you want to fetch
- **profile** (str) – The profile key
- **libcloud_kwargs** (dict) – Extra arguments for the driver's list_balancers method

Returns the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer_by_name my_balancer profile1
```

`salt.modules.libcloud_loadbalancer.`**`list_balancer_members`**(*balancer_id*, *profile*, ***libcloud_kwargs*)

List the members of a load balancer

Parameters

- **`balancer_id`** (`str`) – id of a load balancer you want to fetch
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's list_balancer_members method

CLI Example:

```
salt myminion libcloud_storage.list_balancer_members balancer123 profile1
```

`salt.modules.libcloud_loadbalancer.`**`list_balancers`**(*profile*, ***libcloud_kwargs*)

Return a list of load balancers.

Parameters

- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's list_balancers method

CLI Example:

```
salt myminion libcloud_storage.list_balancers profile1
```

`salt.modules.libcloud_loadbalancer.`**`list_protocols`**(*profile*, ***libcloud_kwargs*)

Return a list of supported protocols.

Parameters

- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's list_protocols method

Returns a list of supported protocols

Return type `list` of `str`

CLI Example:

```
salt myminion libcloud_storage.list_protocols profile1
```

`salt.modules.libcloud_loadbalancer.`**`list_supported_algorithms`**(*profile*, ***libcloud_kwargs*)

Get the supported algorithms for a profile

Parameters

- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's list_supported_algorithms method

Returns The supported algorithms

CLI Example:

```
salt myminion libcloud_storage.list_supported_algorithms profile1
```

21.9.204 salt.modules.libcloud_storage

Apache Libcloud Storage Management

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
    profile_test1:
      driver: google_storage
      key: GOOG0123456789ABCXYZ
      secret: mysecret
    profile_test2:
      driver: s3
      key: 12345
      secret: mysecret
```

depends apache-libcloud

`salt.modules.libcloud_storage.`**`create_container`**(*container_name*, *profile*, ***libcloud_kwargs*)

Create a container in the cloud

Parameters

- **`container_name`** (`str`) – Container name
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's create_container method

CLI Example:

```
salt myminion libcloud_storage.create_container MyFolder profile1
```

`salt.modules.libcloud_storage.`**`delete_container`**(*container_name*, *profile*, ***libcloud_kwargs*)

Delete an object container in the cloud

Parameters

- **`container_name`** (`str`) – Container name
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's delete_container method

Returns True if an object container has been successfully deleted, False otherwise.

Return type `bool`

CLI Example:

```
salt myminion libcloud_storage.delete_container MyFolder profile1
```

`salt.modules.libcloud_storage.`**`delete_object`**(*container_name*, *object_name*, *profile*, ***libcloud_kwargs*)

Delete an object in the cloud

Parameters

- **`container_name`** (`str`) – Container name

- **`object_name`** (`str`) – Object name
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's delete_object method

Returns True if an object has been successfully deleted, False otherwise.

Return type `bool`

CLI Example:

```
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

`salt.modules.libcloud_storage.`**`download_object`**(*container_name, object_name, destination_path, profile, overwrite_existing=False, delete_on_failure=True, **libcloud_kwargs*)

Download an object to the specified destination path.

Parameters

- **`container_name`** (`str`) – Container name
- **`object_name`** (`str`) – Object name
- **`destination_path`** (`str`) – Full path to a file or a directory where the incoming file will be saved.
- **`profile`** (`str`) – The profile key
- **`overwrite_existing`** (`bool`) – True to overwrite an existing file, defaults to False.
- **`delete_on_failure`** (`bool`) – True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's download_object method

Returns True if an object has been successfully downloaded, False otherwise.

Return type `bool`

CLI Example:

```
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.jpg
↪profile1
```

`salt.modules.libcloud_storage.`**`extra`**(*method, profile, **libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **`method`** (`str`) – Driver's method name
- **`profile`** (`str`) – The profile key
- **`libcloud_kwargs`** (`dict`) – Extra arguments for the driver's delete_container method

CLI Example:

```
salt myminion libcloud_storage.extra ex_get_permissions google container_name=my_
↪container object_name=me.jpg --out=yaml
```

`salt.modules.libcloud_storage.`**`get_container`**(*container_name, profile, **libcloud_kwargs*)

List container details for the given container_name on the given profile

Parameters

- **container_name** (`str`) – Container name
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's get_container method

CLI Example:

```
salt myminion libcloud_storage.get_container MyFolder profile1
```

`salt.modules.libcloud_storage.`**`get_container_object`**`(`*container_name*, *object_name*, *profile*, ***libcloud_kwargs*`)`

Get the details for a container object (file or object in the cloud)

Parameters

- **container_name** (`str`) – Container name
- **object_name** (`str`) – Object name
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's get_container_object method

CLI Example:

```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz profile1
```

`salt.modules.libcloud_storage.`**`list_container_objects`**`(`*container_name*, *profile*, ***libcloud_kwargs*`)`

List container objects (e.g. files) for the given container_id on the given profile

Parameters

- **container_name** (`str`) – Container name
- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_container_objects method

CLI Example:

```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

`salt.modules.libcloud_storage.`**`list_containers`**`(`*profile*, ***libcloud_kwargs*`)`

Return a list of containers.

Parameters

- **profile** (`str`) – The profile key
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's list_containers method

CLI Example:

```
salt myminion libcloud_storage.list_containers profile1
```

`salt.modules.libcloud_storage.`**`upload_object`**`(`*file_path*, *container_name*, *object_name*, *profile*, *extra=None*, *verify_hash=True*, *headers=None*, ***libcloud_kwargs*`)`

Upload an object currently located on a disk.

Parameters

- **file_path** (`str`) – Path to the object on disk.
- **container_name** (`str`) – Destination container.
- **object_name** (`str`) – Object name.
- **profile** (`str`) – The profile key
- **verify_hash** (`bool`) – Verify hash
- **extra** (`dict`) – Extra attributes (driver specific). (optional)
- **headers** (`dict`) – (optional) Additional request headers, such as CORS headers. For example: headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}
- **libcloud_kwargs** (`dict`) – Extra arguments for the driver's upload_object method

Returns The object name in the cloud

Return type `str`

CLI Example:

```
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me.jpg␣
↪profile1
```

21.9.205 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

`salt.modules.linux_acl.`**`delfacl`**`(`*acl_type, acl_name='', *args, **kwargs*`)`

Remove specific FACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

`salt.modules.linux_acl.`**`getfacl`**`(`**args, **kwargs*`)`

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

`salt.modules.linux_acl.`**`modfacl`**`(`*acl_type, acl_name='', perms='', *args, **kwargs*`)`

Add or modify a FACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
```

(continues on next page)

(continued from previous page)

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen raise_err=True
```

salt.modules.linux_acl.**version**()

Return facl version from getfacl –version

CLI Example:

```
salt '*' acl.version
```

salt.modules.linux_acl.**wipefacls**(**args*, ***kwargs*)

Remove all FACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

21.9.206 salt.modules.linux_ip module

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.**down**(*iface*, *iface_type=None*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.linux_ip.**get_interface**(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.linux_ip.**get_routes**(*iface=None*)

Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

salt.modules.linux_ip.**up**(*iface*, *iface_type=None*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

21.9.207 salt.modules.linux_lvm

Support for Linux LVM2

`salt.modules.linux_lvm.`**`fullversion`**`()`

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

`salt.modules.linux_lvm.`**`lvcreate`**`(`*lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinvolume=False, thinpool=False, force=False, **kwargs*`)`

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name     vg_name size=10G
salt '*' lvm.lvcreate new_volume_name     vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot        vg_name snapshot=volume_name size=3G
```

New in version to_complete.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name   vg_name               size=20G
↪thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
↪thinvolume=True
```

`salt.modules.linux_lvm.`**`lvdisplay`**`(`*lvname='', quiet=False*`)`

Return information about the logical volume(s)

lvname logical device name

quiet if the logical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

`salt.modules.linux_lvm.`**`lvremove`**`(`*lvname, vgname*`)`

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

`salt.modules.linux_lvm.`**`lvresize`**`(`*size=None, lvpath=None, extents=None*`)`

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

`salt.modules.linux_lvm.`**`pvcreate`**`(`*devices, override=True, **kwargs*`)`

Set a physical device to be used as an LVM physical volume

override Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

`salt.modules.linux_lvm.`**`pvdisplay`**`(`*pvname=”, real=False, quiet=False*`)`

Return information about the physical volume(s)

pvname physical device name

real dereference any symlinks and report the real device

New in version 2015.8.7.

quiet if the physical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

`salt.modules.linux_lvm.`**`pvremove`**`(`*devices, override=True*`)`

Remove a physical device being used as an LVM physical volume

override Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.`**`version`**`()`

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

`salt.modules.linux_lvm.`**`vgcreate`**`(`*vgname, devices, **kwargs*`)`

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

`salt.modules.linux_lvm.`**`vgdisplay`**`(`*vgname=”, quiet=False*`)`

Return information about the volume group(s)

vgname volume group name

quiet if the volume group is not present, do not show any error

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

`salt.modules.linux_lvm.`**`vgextend`**`(`*vgname, devices*`)`

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

`salt.modules.linux_lvm.`**`vgremove`**`(`*vgname*`)`

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

21.9.208 salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.`**`assign`**`(`*name*, *value*`)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.`**`default_config`**`()`

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

`salt.modules.linux_sysctl.`**`get`**`(`*name*`)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

`salt.modules.linux_sysctl.`**`persist`**`(`*name*, *value*, *config=None*`)`

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using *`sysctl.default_config`*.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.`**`show`**`(`*config_file=False*`)`

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

21.9.209 salt.modules.localemod

Module for managing locales on POSIX-like systems.

`salt.modules.localemod.`**`avail`**`(`*locale*`)`

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

`salt.modules.localemod.`**`gen_locale`**(*locale*, ***kwargs*)

Generate a locale. Options:

New in version 2014.7.0.

Parameters **`locale`** – Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8'    # Debian/Gentoo only
```

`salt.modules.localemod.`**`get_locale`**()

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

`salt.modules.localemod.`**`list_avail`**()

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

`salt.modules.localemod.`**`set_locale`**(*locale*)

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

21.9.210 salt.modules.locate

Module for using the locate utilities

`salt.modules.locate.`**`locate`**(*pattern*, *database=''*, *limit=0*, ***kwargs*)

Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

`salt.modules.locate.`**`stats`**`()`

Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

`salt.modules.locate.`**`updatedb`**`()`

Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

`salt.modules.locate.`**`version`**`()`

Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

21.9.211 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

`salt.modules.logadm.`**`list_conf`**`(`*conf_file='/etc/logadm.conf', log_file=None, include_unset=False*`)`

Show parsed configuration

New in version 2018.3.0.

conf_file [string] path to logadm.conf, defaults to /etc/logadm.conf
log_file [string] optional show only one log file
include_unset [boolean] include unset flags in output
CLI Example:

```
salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False
```

`salt.modules.logadm.`**`remove`**`(`*name, conf_file='/etc/logadm.conf'*`)`

Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

`salt.modules.logadm.`**`rotate`**`(`*name, pattern=None, conf_file='/etc/logadm.conf', **kwargs*`)`

Set up pattern for logging.
name [string] alias for entryname
pattern [string] alias for log_file
conf_file [string] optional path to alternative configuration file
kwargs [boolean|string|int] optional additional flags and parameters

---

Note: `name` and `pattern` were kept for backwards compatibility reasons.

`name` is an alias for the `entryname` argument, `pattern` is an alias for `log_file`. These aliases will only be used if the `entryname` and `log_file` arguments are not passed.

For a full list of arguments see ``logadm.show_args``.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
salt '*' logadm.rotate myapplog log_file='/var/log/myapp/*.log' count=4 owner=myappd mode='0700'
```

`salt.modules.logadm.`**`show_args`**`()`

Show which arguments map to which flags and options.

New in version 2018.3.0.

CLI Example:

```
salt '*' logadm.show_args
```

`salt.modules.logadm.`**`show_conf`**`(`*conf_file='/etc/logadm.conf', name=None*`)`

Show configuration

conf_file [string] path to logadm.conf, defaults to /etc/logadm.conf

name [string] optional show only a single entry

CLI Example:

```
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
```

21.9.212 salt.modules.logmod module

On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}
  {%- do salt.log.info(var) -%}
{%- endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

`salt.modules.logmod.`**`critical`**`(`*message*`)`

Log message at level CRITICAL.

`salt.modules.logmod.`**`debug`**`(`*message*`)`

Log message at level DEBUG.

`salt.modules.logmod.`**`error`**`(`*message*`)`

Log message at level ERROR.

`salt.modules.logmod.`**`exception`**`(`*message*`)`

Log message at level EXCEPTION.

`salt.modules.logmod.`**`info`**(*message*)

Log message at level INFO.

`salt.modules.logmod.`**`warning`**(*message*)

Log message at level WARNING.

21.9.213 salt.modules.logrotate

Module for managing logrotate.

`salt.modules.logrotate.`**`get`**(*key, value=None, conf_file='/etc/logrotate.conf'*)

Get the value for a specific configuration line.

Parameters

- **`key`** (*`str`*) – The command or stanza block to configure.
- **`value`** (*`str`*) – The command value or command of the block specified by the key parameter.
- **`conf_file`** (*`str`*) – The logrotate configuration file.

Returns The value for a specific configuration line.

Return type bool|int|str

CLI Example:

```
salt '*' logrotate.get rotate

salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

`salt.modules.logrotate.`**`set_`**(*key, value, setting=None, conf_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line.

Parameters

- **`key`** (*`str`*) – The command or block to configure.
- **`value`** (*`str`*) – The command value or command of the block specified by the key parameter.
- **`setting`** (*`str`*) – The command value for the command specified by the value parameter.
- **`conf_file`** (*`str`*) – The logrotate configuration file.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.`**`show_conf`**`(`*conf_file='/etc/logrotate.conf'*`)`

Show parsed configuration

Parameters **`conf_file`** (*`str`*) – The logrotate configuration file.

Returns The parsed configuration.

Return type dict

CLI Example:

```
salt '*' logrotate.show_conf
```

21.9.214 salt.modules.lvs

Support for LVS (Linux Virtual Server)

`salt.modules.lvs.`**`add_server`**`(`*protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1, **kwargs*`)`

Add a real server to a virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.`**`add_service`**`(`*protocol=None, service_address=None, scheduler='wlc'*`)`

Add a virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.`**`check_server`**`(`*protocol=None, service_address=None, server_address=None, **kwargs*`)`

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.`**`check_service`**`(`*protocol=None, service_address=None, **kwargs*`)`

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

`salt.modules.lvs.`**`clear`**`()`

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

`salt.modules.lvs.`**`delete_server`**`(`*protocol=None*, *service_address=None*, *server_address=None*`)`

Delete the realserver from the virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.`**`delete_service`**`(`*protocol=None*, *service_address=None*`)`

Delete the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

`salt.modules.lvs.`**`edit_server`**`(`*protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method=None*, *weight=None*, ***kwargs*`)`

Edit a real server to a virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.`**`edit_service`**`(`*protocol=None*, *service_address=None*, *scheduler=None*`)`

Edit the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.`**`get_rules`**`()`

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

`salt.modules.lvs.`**`list_`**`(`*protocol=None*, *service_address=None*`)`

List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

`salt.modules.lvs.`**`zero`**(*protocol=None*, *service_address=None*)

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

21.9.215 salt.modules.lxc

Control Linux Containers via Salt

depends lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

`salt.modules.lxc.`**`add_veth`**(*name*, *interface_name*, *bridge=None*, *path=None*)

Add a veth to a container. Note : this function doesn't update the container config, just add the interface at runtime
name Name of the container
interface_name Name of the interface in the container
bridge Name of the bridge to attach the interface to (facultative)
CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

`salt.modules.lxc.`**`apply_network_profile`**(*name*, *network_profile*, *nic_opts=None*, *path=None*)

New in version 2015.5.0.

Apply a network profile to a container
network_profile profile name or default values (dict)
nic_opts values to override in defaults (dict) indexed by nic card names
path path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
      nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
salt 'minion' lxc.apply_network_profile web1 \
      "{'eth0': {'mac': 'xx:xx:xx:xx:xx:yy'}}"
      nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
      "{eth0: {disable: true}}"
```

`salt.modules.lxc.`**`attachable`**(*name*, *path=None*)

Return True if the named container can be attached to via the lxc-attach command
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

`salt.modules.lxc.`**`bootstrap`**(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *path=None*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)

Install and configure salt in a container.

config Minion configuration options. By default, the `master` option is set to the target host's master.

approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `True`

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

pub_key Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

priv_key Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url url, content or filepath to the salt bootstrap script

bootstrap_args salt bootstrap script arguments

bootstrap_shell shell to execute the script into

install Whether to attempt a full installation of salt-minion if needed.

force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
        [approve_key=(True|False)] [install=(True|False)]
```

`salt.modules.lxc.`**`clone`**(*name*, *orig*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container as a clone of another container

name Name of the container

orig Name of the original container to be cloned

profile Profile to use in container cloning (see *`lxc.get_container_profile`*). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

Container Cloning Arguments

snapshot Use Copy On Write snapshots (LVM)

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

network_profile Network profile to use for container

New in version 2015.8.0.

nic_opts give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

`salt.modules.lxc.`**`cloud_init`**(*name*, *vm_=None*, ***kwargs*)

Thin wrapper to lxc.init to be used from the saltcloud lxc driver

name Name of the container may be None and then guessed from saltcloud mapping

vm_ saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

`salt.modules.lxc.`**`cloud_init_interface`**(*name*, *vm_=None*, ***kwargs*)

Interface between salt.cloud.lxc driver and lxc.init `vm_` is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

> **Warning:** BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name name of the lxc container to create

pub_key public key to preseed the minion with. Can be the keycontent or a filepath

priv_key private key to preseed the minion with. Can be the keycontent or a filepath

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

profile *profile* selection

network_profile *network profile* selection

nic_opts per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
            'gateway': None, (default)
            'link': 'br0', (default)
            'gateway': None, (default)
            'netmask': '', (default)
            'ip': '22.1.4.25'}}
```

unconditional_install given to lxc.bootstrap (see relative doc)

force_install given to lxc.bootstrap (see relative doc)

config any extra argument for the salt minion config

dnsservers list of DNS servers to set inside the container

dns_via_dhcp do not set the dns servers, let them be set by the dhcp.

autostart autostart the container at boot time

password administrative password for the container

bootstrap_delay delay before launching bootstrap script at Container init

> **Warning:** Legacy but still supported options:
>
> **from_container** which container we use as a template when running lxc.clone
>
> **image** which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container
>
> **backing** which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, brtfs
>
> **fstype** When using a blockdevice level backing store, which filesystem to use on

size When using a blockdevice level backing store, which size for the filesystem to use on

snapshot Use snapshot when cloning the container source

vgname if using LVM: vgname

lvname if using LVM: lvname

thinpool: if using LVM: thinpool

ip ip for the primary nic

mac mac address for the primary nic

netmask netmask for the primary nic (24) = `vm_.get('netmask', '24')`

bridge bridge for the primary nic (lxcbr0)

gateway network gateway for the container

additional_ips additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: '', mac: '', netmask:''} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

```
- {'mac': '00:16:3e:01:29:40',
   'gateway': None, (default)
   'link': 'br0', (default)
   'netmask': '', (default)
   'ip': '22.1.4.25'}
```

users administrative users for the container default: [root] and [root, ubuntu] on ubuntu

default_nic name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.`**`copy_to`**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container
name Container name
source File to be copied to the container
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
dest Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.
overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.
makedirs : False
Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.
CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.`**`create`**(*name*, *config=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container.

name Name of the container

config The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).

profile Profile to use in container creation (see *`lxc.get_container_profile`*). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

network_profile Network profile to use for container

New in version 2015.5.0.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the *`lxc.templates`* function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the *`lxc.images`* function.

options Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{"dist": "centos", "release": "6", "arch": "amd64"}'
```

For available template options, refer to the lxc template scripts which are ususally located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

fstype Filesystem type to use on LVM logical volume

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

vgname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

thinpool Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

nic_opts give extra opts overriding network profile values

path parent path for the container creation (default: /var/lib/lxc)

zfsroot Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)

New in version 2015.8.0.

`salt.modules.lxc.`**`destroy`**(*name*, *stop=False*, *path=None*)

Destroy the named container.

Warning: Destroys all data associated with the container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop [False] If `True`, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.`**`edit_conf`**`(`*conf_file, out_format='simple', read_only=False, lxc_config=None, **kwargs*`)`

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

out_format: Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

read_only: return only the edited configuration without applying it to the underlying lxc configuration file

lxc_config: List of dict containning lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatchs, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in `simple` format, meaning an unordered dict (which may not represent the actual file order). Passing in an `out_format` of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
    out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
    out_format=commented \
    lxc_config="[{'lxc.network.name': 'eth0', \
                  'lxc.network.ipv4': '1.2.3.4'},
                 {'lxc.network.name': 'eth2', \
                  'lxc.network.ipv4': '1.2.3.5',\
                  'lxc.network.gateway': '1.2.3.1'}]"
```

`salt.modules.lxc.`**`exists`**`(`*name, path=None*`)`

Returns whether the named container exists.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

`salt.modules.lxc.`**`freeze`**`(`*name, **kwargs*`)`

Freeze the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

start [False] If `True` and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

`salt.modules.lxc.`**`get_container_profile`**`(`*name=None*, ***kwargs*`)`

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using *`config.get`*. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
  ubuntu:
    template: ubuntu
    backing: lvm
    vgname: lxc
    size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to *`lxc.create`*) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

`salt.modules.lxc.`**`get_network_profile`**`(`*name=None*, ***kwargs*`)`

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using *`config.get`*. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use network profiles.

> **Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.`**`get_parameter`**(*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.`**`get_pid`**(*name*, *path=None*)

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

`salt.modules.lxc.`**`get_root_path`**(*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.`**`images`**(*dist=None*)

New in version 2015.5.0.

List the available images for LXC's `download` template.

dist [None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.`**`info`**(*name*, *path=None*)

Returns information about a container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

`salt.modules.lxc.`**`init`**(*name*, *config=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *cpu=None*, *autostart=True*, *password=None*, *password_encrypted=None*, *users=None*, *dnsservers=None*, *searchdomains=None*, *bridge=None*, *gateway=None*, *pub_key=None*, *priv_key=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*, *bootstrap_url=None*, ***kwargs*)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name Name of the container

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

cpus Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares

autostart autostart container on reboot

memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

network_profile Network profile to use for the container

New in version 2015.5.0.

nic_opts Extra options for network interfaces, will override

`{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}`

or

`{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}`

users Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

password Set the initial password for the users defined in the `users` parameter

password_encrypted [False] Set to `True` to denote a password hash instead of a plaintext password

New in version 2015.5.0.

profile A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

start Start the newly-created container

dnsservers list of dns servers to set in the container, default [] (no setting)

seed Seed the container with the minion config. Default: `True`

install If salt-minion is not already installed, install it. Default: `True`

config Optional config parameters. By default, the id is set to the name of the container.

master salt master (default to minion's master)

master_port salt master port (default to minion's master port)

pub_key Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

priv_key Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

approve_key If explicit preseeding is not used; Attempt to request key approval from the master. Default: `True`

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

clone_from Original from which to use a clone operation to create the container. Default: `None`

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url See lxc.bootstrap

bootstrap_shell See lxc.bootstrap

bootstrap_args See lxc.bootstrap

force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
        [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
        [nic=nic_profile] [profile=lxc_profile] \
        [nic_opts=nic_opts] [start=(True|False)] \
        [seed=(True|False)] [install=(True|False)] \
        [config=minion_config] [approve_key=(True|False) \
        [clone_from=original] [autostart=True] \
        [priv_key=/path_or_content] [pub_key=/path_or_content] \
        [bridge=lxcbr0] [gateway=10.0.3.1] \
        [dnsservers[dns1,dns2]] \
        [users=[foo]] [password='secret'] \
        [password_encrypted=(True|False)]
```

`salt.modules.lxc.`**`list_`**(*extra=False*, *limit=None*, *path=None*)

List containers classified by state

extra Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *`lxc.info`*.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

`salt.modules.lxc.`**`ls_`**(*active=None*, *cache=True*, *path=None*)

Return a list of the containers available on the minion

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

active If `True`, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

`salt.modules.lxc.`**`read_conf`**(*conf_file*, *out_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

out_format: set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

`salt.modules.lxc.`**`reboot`**(*name*, *path=None*)

Reboot a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

`salt.modules.lxc.`**`reconfigure`**(*name*, *cpu=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *bridge=None*, *gateway=None*, *autostart=None*, *utsname=None*, *rootfs=None*, *path=None*, ***kwargs*)

Reconfigure a container.

This only applies to a few property

name Name of the container.

utsname utsname of the container.

New in version 2016.3.0.

rootfs rootfs of the container.

New in version 2016.3.0.

cpu Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares.

autostart autostart container on reboot

memory cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

nic Network interfaces profile (defined in config or pillar).

nic_opts Extra options for network interfaces, will override

`{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}`

or

`{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}`

path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{'eth1': {'mac':
↪'00:16:3e:dd:ee:44'}}" memory=4
```

`salt.modules.lxc.`**`restart`**(*name*, *path=None*, *lxc_config=None*, *force=False*)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name The name of the container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

force [False] If `True`, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

`salt.modules.lxc.`**`retcode`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy*, *https_proxy*, *no_proxy'*)

New in version 2015.5.0.

Run `cmd.retcode` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

`salt.modules.lxc.`**`run`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy*, *https_proxy*, *no_proxy'*)

New in version 2015.8.0.

Run `cmd.run` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *lxc.run_stderr* or *lxc.run_all*.

name Name of the container in which to run the command
cmd Command to run
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.
chroot_fallback if the container is not running, try to run the command using chroot default: false
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

`salt.modules.lxc.`**`run_all`**`(`*name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy'*`)`

New in version 2015.5.0.

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist.

name Name of the container in which to run the command
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

cmd Command to run
no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

`salt.modules.lxc.`**`run_stderr`**(*name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.5.0.

Run *`cmd.run_stderr`* within a container

> **Warning:** Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed if the command being run does not exist.

name Name of the container in which to run the command

cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

`salt.modules.lxc.`**`run_stdout`**(*name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.5.0.

Run *`cmd.run_stdout`* within a container

> **Warning:** Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *`lxc.run_stderr`* or *`lxc.run_all`*.

name Name of the container in which to run the command

cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.lxc.`**`running_systemd`**`(`*name*, *cache=True*, *path=None*`)`

Determine if systemD is running

path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

`salt.modules.lxc.`**`search_lxc_bridge`**`()`

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

`salt.modules.lxc.`**`search_lxc_bridges`**`()`

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

`salt.modules.lxc.`**`set_dns`**`(`*name*, *dnsservers=None*, *searchdomains=None*, *path=None*`)`

Changed in version 2015.5.0: The `dnsservers` and `searchdomains` parameters can now be passed as a comma-separated list.

Update /etc/resolv.confo

path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

`salt.modules.lxc.`**`set_parameter`**`(`*name*, *parameter*, *value*, *path=None*`)`

Set the value of a cgroup parameter for a container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

`salt.modules.lxc.`**`set_password`**(*name, users, password, encrypted=True, path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

users Comma-separated list (or python list) of users to change password

password Password to set for the specified user(s)

encrypted [True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↪0fXtJOPcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCBOqgbfdKQSFnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

`salt.modules.lxc.`**`start`**(*name, **kwargs*)

Start the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

`salt.modules.lxc.`**`state`**(*name, path=None*)

Returns the state of a container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

`salt.modules.lxc.`**`stop`**(*name, kill=False, path=None, use_vt=None*)

Stop the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

kill: False Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to `False`

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

`salt.modules.lxc.`**`systemd_running_state`**`(`*name*, *path=None*`)`

Get the operational state of a systemd based container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

`salt.modules.lxc.`**`templates`**`()`

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

`salt.modules.lxc.`**`test_bare_started_state`**`(`*name*, *path=None*`)`

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

`salt.modules.lxc.`**`test_sd_started_state`**`(`*name*, *path=None*`)`

Test if a systemd container is fully started

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

`salt.modules.lxc.`**`unfreeze`**`(`*name*, *path=None*, *use_vt=None*`)`

Unfreeze the named container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

`salt.modules.lxc.`**`update_lxc_conf`**`(`*name*, *lxc_conf*, *lxc_conf_unset*, *path=None*`)`

Edit LXC configuration options

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \
        lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
        lxc_conf_unset="['lxc.utsname']"
```

`salt.modules.lxc.`**`version`**`()`

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

`salt.modules.lxc.`**`wait_started`**`(`*name, path=None, timeout=300*`)`

Check that the system has fully inited

This is actually very important for systemD based containers

see https://github.com/saltstack/salt/issues/23847

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

`salt.modules.lxc.`**`write_conf`**`(`*conf_file, conf*`)`

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
    {'lxc.utsname': '$CONTAINER_NAME'},
    '# This is a commented line\n',
    '\n',
    {'lxc.mount': '$CONTAINER_FSTAB'},
    {'lxc.rootfs': {'comment': 'This is another test',
                    'value': 'This is another test'}},
    '\n',
    {'lxc.network.type': 'veth'},
    {'lxc.network.flags': 'up'},
    {'lxc.network.link': 'br0'},
    {'lxc.network.mac': '$CONTAINER_MACADDR'},
    {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
    {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
    out_format=commented
```

21.9.216 salt.modules.lxd

Module for managing the LXD daemon and its containers.

New in version 2019.2.0.

LXD(1) is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

Note:

- pylxd(2) version >=2.2.5 is required to let this work, currently only available via pip.

  To install on Ubuntu:

  $ apt-get install libssl-dev python-pip $ pip install -U pylxd

- you need lxd installed on the minion for the init() and version() methods.
- for the config_get() and config_get() methods you need to have lxd-client installed.

---

maintainer René Jochum <rene@jochums.at>

maturity new

depends python-pylxd

platform Linux

`salt.modules.lxd.`**`authenticate`**(*remote_addr*, *password*, *cert*, *key*, *verify_cert=True*)

Authenticate with a remote LXDaemon.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443

password : The password of the remote.

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.
↪crt ~/.config/lxc/client.key false
```

See the requests-docs for the SSL stuff.

`salt.modules.lxd.`**`config_get`**(*key*)

Get an LXD daemon config option

key : The key of the config value to retrieve

CLI Examples:

```
salt '*' lxd.config_get core.https_address
```

`salt.modules.lxd.`**`config_set`**(*key*, *value*)

Set an LXD daemon config option

CLI Examples:

To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:

```
salt '*' lxd.config_set core.https_address [::]:8443
```

To set the server trust password:

```
salt '*' lxd.config_set core.trust_password blah
```

salt.modules.lxd.**container_config_delete**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a container config value

name : Name of the container

config_key : The config key to delete

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.**container_config_get**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a container config value

name : Name of the container

config_key : The config key to retrieve

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.**container_config_set**(*name*, *config_key*, *config_value*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Set a container config value

name : Name of the container

config_key : The config key to set

config_value : The config value to set

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.**container_create**(*name*, *source*, *profiles=None*, *config=None*, *devices=None*, *architecture='x86_64'*, *ephemeral=False*, *wait=True*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Create a container

name : The name of the container

source :
  Can be either a string containing an image alias: "xenial/amd64"
  or an dict with type "image" with alias:

    {"type": "image", "alias": "xenial/amd64"}
  or image with "fingerprint":

    {"type": "image", "fingerprint": "SHA-256"}
  or image with "properties":

    {"type": "image",

      "properties": { "os": "ubuntu", "release": "14.04", "architecture": "x86_64"}}
  or none: {"type": "none"}
  or copy:

    {"type": "copy", "source": "my-old-container"}

profiles [['default']] List of profiles to apply on this container

config : A config dict or None (None = unset).
  Can also be a list:

    [{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]

devices : A device dict or None (None = unset).

architecture ['x86_64']
  Can be one of the following:

- unknown
- i686
- x86_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

ephemeral [False] Destroy this container after stop?

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

_raw [False] Return the raw pyxld object or a dict?

CLI Examples:

```
salt '*' lxd.container_create test xenial/amd64
```

See also the rest-api-docs.

`salt.modules.lxd.`**`container_delete`**`(`*name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Delete a container

name : Name of the container to delete

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_device_add`**`(`*name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs*`)`

Add a container device

name : Name of the container

device_name : The device name to add

device_type : Type of the device

** **kwargs** : Additional device args

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_device_delete`**`(`*name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Delete a container device

name : Name of the container

device_name : The device name to delete

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_device_get`**`(`*name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Get a container device

name : Name of the container

device_name : The device name to retrieve

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_execute`**`(`*name, cmd, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Execute a command list on a container.

name : Name of the container

cmd : Command to be executed (as a list)

Example : '["ls", "-l"]'

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_execute <container name> '["ls", "-l"]'
```

`salt.modules.lxd.`**`container_file_get`**`(`*name, src, dst, overwrite=False, mode=None, uid=None, gid=None, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Get a file from a container

name : Name of the container

src : The source file or directory

dst : The destination file or directory

mode : Set file mode to octal number

uid : Set file uid (owner)

gid : Set file gid (group)

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_file_put`**`(`*name, src, dst, recursive=False, overwrite=False, mode=None, uid=None, gid=None, saltenv='base', remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Put a file into a container

name : Name of the container

src : The source file or directory

dst : The destination file or directory

recursive : Decent into src directory

overwrite : Replace destination if it exists

mode : Set file mode to octal number

uid : Set file uid (owner)

gid : Set file gid (group)

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_file_put <container name> /var/tmp/foo /var/tmp/
```

salt.modules.lxd.**container_freeze**(*name, remote_addr=None, cert=None, key=None, verify_cert=True*)

Freeze a container

name : Name of the container to freeze

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

salt.modules.lxd.**container_get**(*name=None, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False*)

Gets a container from the LXD

name : The name of the container to get.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

_raw : Return the pylxd object, this is internal and by states in use.

salt.modules.lxd.**container_list**(*list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True*)

Lists containers

list_names [False] Only return a list of names when True

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

Full dict with all available informations:

```
salt '*' lxd.container_list
```

For a list of names:

```
salt '*' lxd.container_list true
```

See also container-attributes.

`salt.modules.lxd.`**`container_migrate`**(*name*, *stop_and_start=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *src_remote_addr=None*, *src_cert=None*, *src_key=None*, *src_verify_cert=None*)

Migrate a container.

If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.modules.lxd.authenticate` to authenticate your cert(s).

name : Name of the container to migrate

stop_and_start : Stop the container on the source and start it on dest

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~
↪/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/client.crt ~
↪/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_addr=https://
↪srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/client.key verify_
↪cert=False src_remote_addr=https://srv01:8443
```

`salt.modules.lxd.`**`container_rename`**(*name*, *newname*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Rename a container

name : Name of the container to Rename

newname : The new name of the contianer

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_restart`**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Restart a container

name : Name of the container to restart

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_start`**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Start a container

name : Name of the container to start

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_state`**(*name=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get container state

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_stop`**(*name*, *timeout=30*, *force=True*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Stop a container

name : Name of the container to stop

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`container_unfreeze`**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Unfreeze a container

name : Name of the container to unfreeze

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

`salt.modules.lxd.`**`image_alias_add`**(*image*, *alias*, *description=''*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Create an alias on the given image

image : An image alias, a fingerprint or a image object

alias : The alias to add

description : Description of the alias

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

`salt.modules.lxd.`**`image_alias_delete`**(*image*, *alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete an alias (this is currently not restricted to the image)

image : An image alias, a fingerprint or a image object

alias : The alias to delete

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

`salt.modules.lxd.`**`image_copy_lxd`**(*source, src_remote_addr, src_cert, src_key, src_verify_cert, remote_addr, cert, key, verify_cert=True, aliases=None, public=None, auto_update=None, _raw=False*)

Copy an image from another LXD instance

source : An alias or a fingerprint of the source.

src_remote_addr : An URL to the source remote daemon

Examples: https://mysourceserver.lan:8443

src_cert : PEM Formatted SSL Certificate for the source

Examples: ~/.config/lxc/client.crt

src_key : PEM Formatted SSL Key for the source

Examples: ~/.config/lxc/client.key

src_verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

remote_addr : Address of the destination daemon

Examples: https://mydestserver.lan:8443

cert : PEM Formatted SSL Certificate for the destination

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key for the destination

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [None] Make this image public available, None = copy source

auto_update [None] Wherever to auto-update from the original source, None = copy source

_raw [False] Return the raw pylxd object or a dict of the destination image?

CLI Examples:

```
$ salt '*' lxd.image_copy_lxd xenial/amd64 https://srv01:8443 ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false https://srv02:8443 ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false aliases="['xenial/amd64']"
```

`salt.modules.lxd.`**`image_delete`**(*image, remote_addr=None, cert=None, key=None, verify_cert=True*)

Delete an image by an alias or fingerprint

name : The alias or fingerprint of the image to delete, can be a obj for the states.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_delete xenial/amd64

`salt.modules.lxd.`**`image_from_file`**(*filename, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, saltenv='base', _raw=False*)

Create an image from a file

filename : The filename of the rootfs

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [False] Make this image public available

saltenv [base] The saltenv to use for salt:// copies

_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=["busybox-amd64"]

`salt.modules.lxd.`**`image_from_simplestreams`**(*server*, *alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *aliases=None*, *public=False*, *auto_update=False*, *_raw=False*)

Create an image from simplestreams

server : Simplestreams server URI

alias : The alias of the image to retrieve

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [False] Make this image public available

auto_update [False] Should LXD auto update that image?

_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/releases" "trusty/amd64" aliases='["t", "trusty/amd64"]' auto_update=True

`salt.modules.lxd.`**`image_from_url`**(*url*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *aliases=None*, *public=False*, *auto_update=False*, *_raw=False*)

Create an image from an url

url : The URL from where to download the image

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

aliases [[]] List of aliases to append to the copied image

public [False] Make this image public available

auto_update [False] Should LXD auto update that image?

_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_from_url https://dl.stgraber.org/lxd aliases='["busybox-amd64"]'

`salt.modules.lxd.`**`image_get`**(*fingerprint*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Get an image by its fingerprint

fingerprint : The fingerprint of the image to retrieve

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

_raw [False] Return the raw pylxd object or a dict of it?

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_get <fingerprint>

`salt.modules.lxd.`**`image_get_by_alias`**(*alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Get an image by an alias

alias : The alias of the image to retrieve

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

_raw [False] Return the raw pylxd object or a dict of it?

CLI Examples:

..code-block:: bash

$ salt '*' lxd.image_get_by_alias xenial/amd64

`salt.modules.lxd.`**`image_list`**(*list_aliases=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Lists all images from the LXD.

list_aliases :

Return a dict with the fingerprint as key and a list of aliases as value instead.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.image_list true --out=json
$ salt '*' lxd.image_list --out=json
```

`salt.modules.lxd.`**`init`**(*storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None*)

Calls lxd init –auto – opts
storage_backend : Storage backend to use (zfs or dir, default: dir)
trust_password : Password required to add new clients
network_address [None] Address to bind LXD to (default: none)
network_port [None] Port to bind LXD to (Default: 8443)
storage_create_device [None] Setup device based storage using this DEVICE
storage_create_loop [None] Setup loop based storage with this SIZE in GB
storage_pool [None] Storage pool to use or create
CLI Examples:

To listen on all IPv4/IPv6 Addresses:

```
salt '*' lxd.init dir PaSsW0rD [::]
```

To not listen on Network:

```
salt '*' lxd.init
```

`salt.modules.lxd.`**`normalize_input_values`**(*config, devices*)

normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

```
salt '*' lxd.normalize_input_values config={} devices={}
```

`salt.modules.lxd.`**`profile_config_delete`**(*name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True*)

Delete a profile config item.
name : The name of the profile to delete the config item.
config_key : The config key for the value to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.
CLI Example:

```
$ salt '*' lxd.profile_config_delete autostart boot.autostart.delay
```

salt.modules.lxd.**profile_config_get**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a profile config item.

name : The name of the profile to get the config item from.

config_key : The key for the item to retrieve.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_config_get autostart boot.autostart
```

salt.modules.lxd.**profile_config_set**(*name*, *config_key*, *config_value*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Set a profile config item.

name : The name of the profile to set the config item to.

config_key : The items key.

config_value : Its items value.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_config_set autostart boot.autostart 0
```

salt.modules.lxd.**profile_create**(*name*, *config=None*, *devices=None*, *description=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Creates a profile.

name : The name of the profile to get.

config : A config dict or None (None = unset).

Can also be a list:

[{'**key**': '**boot.autostart**', '**value**': **1**}, {'key': 'security.privileged', 'value': '1'}]

devices : A device dict or None (None = unset).

description : A description string or None (None = unset).

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
$ salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.
↪autostart.delay: 2, boot.autostart.priority: 1}"
$ salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type: 'disk',
↪ source: '/home/shared', path: '/home/shared'}}"
```

See the lxd-docs for the details about the config and devices dicts.

`salt.modules.lxd.`**`profile_delete`**`(`*name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Deletes a profile.

name : The name of the profile to delete.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_delete shared_mounts
```

`salt.modules.lxd.`**`profile_device_delete`**`(`*name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Delete a profile device.

name : The name of the profile to delete the device.

device_name : The name of the device to delete.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_device_delete autostart eth1
```

`salt.modules.lxd.`**`profile_device_get`**`(`*name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True*`)`

Get a profile device.

name : The name of the profile to get the device from.

device_name : The name of the device to retrieve.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_device_get default eth0
```

`salt.modules.lxd.`**`profile_device_set`**(*name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs*)

Set a profile device.

name : The name of the profile to set the device to.

device_name : The name of the device to set.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Example:

```
$ salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged parent=lxdbr0
```

`salt.modules.lxd.`**`profile_get`**(*name, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False*)

Gets a profile from the LXD

name : The name of the profile to get.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

_raw : Return the pylxd object, this is internal and by states in use.

CLI Examples:

```
$ salt '*' lxd.profile_get autostart
```

`salt.modules.lxd.`**`profile_list`**(*list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True*)

Lists all profiles from the LXD.

list_names :

Return a list of names instead of full blown dicts.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

`salt.modules.lxd.`**`pylxd_client_get`**(*remote_addr=None, cert=None, key=None, verify_cert=True*)

Get an pyxld client, this is not ment to be runned over the CLI.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normaly uses self-signed certificates.

See the requests-docs for the SSL stuff.

`salt.modules.lxd.`**`pylxd_save_object`**(*obj*)

Saves an object (profile/image/container) and translate its execpetion on failure

obj : The object to save

This is an internal method, no CLI Example.

`salt.modules.lxd.`**`pylxd_version`**()

Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

`salt.modules.lxd.`**`snapshots_all`**(*container, remote_addr=None, cert=None, key=None, verify_cert=True*)

Get all snapshots for a container

container : The name of the container to get.

remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key

verify_cert [True] Verify the ssl certificate. Default: True

CLI Examples:

```
$ salt '*' lxd.snapshots_all test-container
```

`salt.modules.lxd.`**`snapshots_create`**(*container, name=None, remote_addr=None, cert=None, key=None, verify_cert=True*)

Create a snapshot for a container

container : The name of the container to get.

name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
$ salt '*' lxd.snapshots_create test-container test-snapshot
```

`salt.modules.lxd.`**`snapshots_delete`**(*container*, *name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a snapshot for a container
container : The name of the container to get.
name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
$ salt '*' lxd.snapshots_delete test-container test-snapshot
```

`salt.modules.lxd.`**`snapshots_get`**(*container*, *name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get information about snapshot for a container
container : The name of the container to get.
name : The name of the snapshot.
remote_addr : An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Verify the ssl certificate. Default: True
CLI Examples:

```
$ salt '*' lxd.snapshots_get test-container test-snapshot
```

`salt.modules.lxd.`**`sync_config_devices`**(*obj*, *newconfig*, *newdevices*, *test=False*)

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.
obj : The object to sync with / or just test with.
newconfig: The new config to check with the obj.
newdevices: The new devices to check with the obj.
test: Wherever to not change anything and give "Would change" message.

`salt.modules.lxd.`**`version`**()

Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

21.9.217 salt.modules.mac_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

`salt.modules.mac_assistive.`**`enable`**`(`*app_id*, *enabled=True*`)`

Enable or disable an existing assistive access application.

app_id The bundle ID or command to set assistive access status.

enabled Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

`salt.modules.mac_assistive.`**`enabled`**`(`*app_id*`)`

Check if a bundle ID or command is listed in assistive access and enabled.

app_id The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`install`**`(`*app_id*, *enable=True*`)`

Install a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to install for assistive access.

enabled Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`installed`**`(`*app_id*`)`

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`remove`**`(`*app_id*`)`

Remove a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

21.9.218 salt.modules.mac_brew_pkg

Homebrew for macOS

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.mac_brew_pkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew_pkg.`**`info_installed`**`(`**names*`)`

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names The names of the packages for which to return information.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.mac_brew_pkg.`**`install`**`(`*name=None*, *pkgs=None*, *taps=None*, *options=None*, ***kwargs*`)`

Install the passed package(s) with `brew install`

name The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

taps Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
```

options Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
↪options='["--with-fpm"]'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew_pkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew_pkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew_pkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_brew_pkg.`**`refresh_db`**()

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.mac_brew_pkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Removes packages with `brew uninstall`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.`**`upgrade`**`(`*refresh=True*`)`

Upgrade outdated, unpinned brews.

refresh Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_brew_pkg.`**`upgrade_available`**`(`*pkg*`)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_brew_pkg.`**`version`**`(`**names, **kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

21.9.219 salt.modules.macdefaults

Set defaults on Mac OS

`salt.modules.macdefaults.`**`delete`**`(`*domain, key, user=None*`)`

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType

salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

domain The name of the domain to delete from

key The key of the given domain to delete

user The user to delete the defaults with

`salt.modules.macdefaults.`**`read`**`(`*domain, key, user=None*`)`

Write a default to the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType

salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

domain The name of the domain to read from

key The key of the given domain to read from

user The user to write the defaults to `salt.modules.macdefaults.`**`write`**(*domain, key, value, type='string', user=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server

salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain The name of the domain to write to
key The key of the given domain to write to
value The value to write to the given key
type The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
user The user to write the defaults to

21.9.220 salt.modules.mac_desktop module

macOS implementations of various commands in the "desktop" interface

`salt.modules.mac_desktop.`**`get_output_volume`**()

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

`salt.modules.mac_desktop.`**`lock`**()

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

`salt.modules.mac_desktop.`**`say`**(**words*)

Say some words.
words The words to execute the say command with.
CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

`salt.modules.mac_desktop.`**`screensaver`**()

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

`salt.modules.mac_desktop.`**`set_output_volume`**(*volume*)

Set the volume of sound.
volume The level of volume. Can range from 0 to 100.
CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

21.9.221 salt.modules.mac_group

Manage groups on Mac OS 10.7+

`salt.modules.mac_group.`**`add`**(*name*, *gid=None*, ***kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.mac_group.`**`adduser`**(*group*, *name*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.mac_group.`**`chgid`**(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.mac_group.`**`delete`**(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.mac_group.`**`deluser`**(*group*, *name*)

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.mac_group.`**`getent`**(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.mac_group.`**`info`**(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.mac_group.`**`members`**(*name*, *members_list*)

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:
salt '*' group.members foo 'user1,user2,user3,...'
Replaces a membership list for a local group 'foo'.

21.9.222 salt.modules.mac_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.**get_default_keychain**(*user=None, domain='user'*)
Get the default keychain
user The user to check the default keychain of
domain The domain to use valid values are user|system|common|dynamic, the default is user
CLI Example:

```
salt '*' keychain.get_default_keychain
```

salt.modules.mac_keychain.**get_friendly_name**(*cert, password*)
Get the friendly name of the given certificate
cert The certificate to install
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

salt.modules.mac_keychain.**get_hash**(*name, password=None*)
Returns the hash of a certificate in the keychain.
name The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.
password The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs
CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.**install**(*cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None*)
Install a certificate
cert The certificate to install
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
allow_any Allow any application to access the imported certificate without warning
keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.`**`list_certs`**`(`*keychain='/Library/Keychains/System.keychain'*`)`

List all of the installed certificates

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:

```
salt '*' keychain.list_certs
```

`salt.modules.mac_keychain.`**`set_default_keychain`**`(`*keychain, domain='user', user=None*`)`

Set the default keychain

keychain The location of the keychain to set as default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

`salt.modules.mac_keychain.`**`uninstall`**`(`*cert_name, keychain='/Library/Keychains/System.keychain', keychain_password=None*`)`

Uninstall a certificate from a keychain

cert_name The name of the certificate to remove

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.`**`unlock_keychain`**`(`*keychain, password*`)`

Unlock the given keychain with the password

keychain The keychain to unlock

password The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

21.9.223 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

`salt.modules.macpackage.`**`get_mpkg_ids`**`(`*mpkg*`)`

Attempt to get the package IDs from a mounted .mpkg file

Parameters **`mpkg`** (`str`) – The location of the mounted mpkg file

Returns List of package IDs

Return type list

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

`salt.modules.macpackage.`**`get_pkg_id`**`(`*pkg*`)`

Attempt to get the package ID from a .pkg file

Parameters **`pkg`** (*`str`*) – The location of the pkg file

Returns List of all of the package IDs

Return type list

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

`salt.modules.macpackage.`**`install`**`(`*pkg, target='LocalSystem', store=False, allow_untrusted=False*`)`

Install a pkg file

Parameters

- **`pkg`** (*`str`*) – The package to install
- **`target`** (*`str`*) – The target in which to install the package to
- **`store`** (*`bool`*) – Should the package be installed as if it was from the store?
- **`allow_untrusted`** (*`bool`*) – Allow the installation of untrusted packages?

Returns A dictionary containing the results of the installation

Return type dict

CLI Example:

```
salt '*' macpackage.install test.pkg
```

`salt.modules.macpackage.`**`install_app`**`(`*app, target='/Applications/'*`)`

Install an app file by moving it into the specified Applications directory

Parameters

- **`app`** (*`str`*) – The location of the .app file
- **`target`** (*`str`*) – The target in which to install the package to Default is "/Applications/"

Returns The results of the rsync command

Return type str

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

`salt.modules.macpackage.`**`installed_pkgs`**`()`

Return the list of installed packages on the machine

Returns List of installed packages

Return type list

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

`salt.modules.macpackage.`**`mount`**`(`*dmg*`)`

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters **`dmg`** (*`str`*) – The location of the dmg file to mount

Returns

Tuple containing the results of the command along with the mount point

Return type tuple

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

`salt.modules.macpackage.`**`uninstall_app`**`(`*app*`)`

Uninstall an app file by removing it from the Applications directory

Parameters **`app`** (*`str`*) – The location of the .app file

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

`salt.modules.macpackage.`**`unmount`**`(`*mountpoint*`)`

Attempt to unmount a dmg file from a temporary location

Parameters **`mountpoint`** (*`str`*) – The location of the mount point

Returns The results of the hdutil detach command

Return type str

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

21.9.224 salt.modules.mac_pkgutil module

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

`salt.modules.mac_pkgutil.`**`forget`**`(`*package_id*`)`

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

Warning: DO NOT use this command to fix broken package design

Parameters **`package_id`** (*`str`*) – The name of the package to forget

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`install`**`(`*source, package_id*`)`

Install a .pkg from an URI or an absolute path.

Parameters

- **`source`** (*`str`*) – The path to a package.
- **`package_id`** (*`str`*) – The package ID

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.
↪apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`is_installed`**`(`*package_id*`)`

Returns whether a given package id is installed.

Returns True if installed, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`list_`**`()`

List the installed packages.

Returns A list of installed packages

Return type list

CLI Example:

```
salt '*' pkgutil.list
```

21.9.225 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, *refresh=True* is the default for all operations that need an up-to-date copy of available ports. Consider *refresh=False* when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where *salt mac-machine pkg./something/* won't want to return. Use

salt-run jobs.active

on the master to check for potentially long-running calls to *port*.

Finally, ports database updates are always handled with *port selfupdate* as opposed to *port sync*. This makes sense in the MacPorts user commmunity but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words *salt mac-machine pkg.refresh_db* is more like *apt-get update; apt-get upgrade dpkg apt-get* than simply *apt-get update*.

`salt.modules.mac_portspkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`install`**`(`*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*`)`

Install the passed package(s) with `port install`

name The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↪osxkeychain+doc+pcre'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_portspkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation

Options:

refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_portspkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

Options:

refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_portspkg.`**`refresh_db`**`()`

Update ports with `port selfupdate`

CLI Example:

```
salt mac pkg.refresh_db
```

`salt.modules.mac_portspkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Removes packages with `port uninstall`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_portspkg.`**`upgrade`**`(`*refresh=True*`)`

Run a full upgrade using MacPorts 'port upgrade outdated'

Options:

refresh Update ports with `port selfupdate`

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_portspkg.`**`upgrade_available`**`(`*pkg*, *refresh=True*`)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_portspkg.`**`version`**`(`**names*, ***kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

21.9.226 salt.modules.mac_power module

Module for editing power settings on macOS

New in version 2016.3.0.

`salt.modules.mac_power.`**`get_computer_sleep`**`()`

Display the amount of idle time until the computer sleeps.

Returns A string representing the sleep settings for the computer

Return type str

CLI Example:

..code-block:: bash

salt '*' power.get_computer_sleep

`salt.modules.mac_power.`**`get_display_sleep`**`()`

Display the amount of idle time until the display sleeps.

Returns A string representing the sleep settings for the displey

Return type str

CLI Example:

..code-block:: bash

salt '*' power.get_display_sleep

`salt.modules.mac_power.`**`get_harddisk_sleep`**`()`

Display the amount of idle time until the hard disk sleeps.

Returns A string representing the sleep settings for the hard disk

Return type str

CLI Example:

..code-block:: bash

salt '*' power.get_harddisk_sleep

`salt.modules.mac_power.`**`get_restart_freeze`**`()`

Displays whether 'restart on freeze' is on or off if supported

Returns A string value representing the "restart on freeze" settings

Return type string

CLI Example:

```
salt '*' power.get_restart_freeze
```

`salt.modules.mac_power.`**`get_restart_power_failure`**`()`

Displays whether 'restart on power failure' is on or off if supported

Returns A string value representing the "restart on power failure" settings

Return type string

CLI Example:

```
salt '*' power.get_restart_power_failure
```

`salt.modules.mac_power.`**`get_sleep`**`()`

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk

Return type dict

CLI Example:

```
salt '*' power.get_sleep
```

`salt.modules.mac_power.`**`get_sleep_on_power_button`**`()`

Displays whether 'allow power button to sleep computer' is on or off if supported

Returns A string value representing the "allow power button to sleep computer" settings

Return type string

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

`salt.modules.mac_power.`**`get_wake_on_modem`**`()`

Displays whether 'wake on modem' is on or off if supported

Returns A string value representing the "wake on modem" settings

Return type str

CLI Example:

```
salt '*' power.get_wake_on_modem
```

`salt.modules.mac_power.`**`get_wake_on_network`**`()`

Displays whether 'wake on network' is on or off if supported

Returns A string value representing the "wake on network" settings

Return type string

CLI Example:

```
salt '*' power.get_wake_on_network
```

`salt.modules.mac_power.`**`set_computer_sleep`**`(`*minutes*`)`

Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.

Parameters **`minutes`** – Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

`salt.modules.mac_power.`**`set_display_sleep`**`(`*minutes*`)`

Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.

Parameters **`minutes`** – Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

`salt.modules.mac_power.`**`set_harddisk_sleep`**`(`*minutes*`)`

Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.

Parameters **`minutes`** – Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

`salt.modules.mac_power.`**`set_restart_freeze`**`(`*enabled*`)`

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters **enabled** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.**set_restart_power_failure**(*enabled*)

Set whether or not the computer will automatically restart after a power failure.

Parameters **enabled** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.**set_sleep**(*minutes*)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters **minutes** – Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.**set_sleep_on_power_button**(*enabled*)

Set whether or not the power button can sleep the computer.

Parameters **enabled** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.**set_wake_on_modem**(*enabled*)

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters **enabled** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.**set_wake_on_network**(*enabled*)

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters **enabled** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_wake_on_network True
```

21.9.227 salt.modules.mac_service module

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

Note: As of the 2019.2.0 release, if a service is located in a `LaunchAgent` path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

`salt.modules.mac_service.`**`available`**(*name*)

Check that the given service is available.

Parameters **`name`** (*`str`*) – The name of the service

Returns True if the service is available, otherwise False

Return type bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.mac_service.`**`disable`**(*name*, *runas=None*)

Disable a launchd service. Raises an error if the service fails to be disabled

Parameters

- **`name`** (*`str`*) – Service label, file name, or full path
- **`runas`** (*`str`*) – User to run launchctl commands

Returns `True` if successful or if the service is already disabled

Return type bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

`salt.modules.mac_service.`**`disabled`**(*name*, *runas=None*, *domain='system'*)

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **`name`** (*`str`*) – The name to look up
- **`runas`** (*`str`*) – User to run launchctl commands
- **`domain`** (*`str`*) – domain to check for disabled services. Default is system.

Returns True if the specified service is NOT enabled, otherwise False

Return type bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

`salt.modules.mac_service.`**`enable`**(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) – Service label, file name, or full path
- **runas** (*str*) – User to run launchctl commands

Returns `True` if successful or if the service is already enabled

Return type bool

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

`salt.modules.mac_service.`**`enabled`**(*name*, *runas=None*)

Check if the specified service is enabled

Parameters

- **name** (*str*) – The name of the service to look up
- **runas** (*str*) – User to run launchctl commands

Returns True if the specified service enabled, otherwise False

Return type bool

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

`salt.modules.mac_service.`**`get_all`**(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters **runas** (*str*) – User to run launchctl commands

Returns A list of all the services available or enabled

Return type list

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.mac_service.`**`get_enabled`**(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters **runas** (*str*) – User to run launchctl commands

Returns A list of all the services enabled on the system

Return type list

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.mac_service.`**`launchctl`**(*sub_cmd*, **args*, ***kwargs*)

Run a launchctl command and raise an error if it fails

Parameters

- **sub_cmd** (*str*) – Sub command supplied to launchctl
- **args** (*tuple*) – Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) – Dictionary containing arguments to pass to `cmd.run_all`
- **return_stdout** (*bool*) – A keyword argument. If true return the stdout of the launchctl command

Returns `True` if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

Return type bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

`salt.modules.mac_service.`**`list_`**(*name=None*, *runas=None*)

Run launchctl list and return the output

Parameters

- **`name`** (*`str`*) – The name of the service to list
- **`runas`** (*`str`*) – User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

`salt.modules.mac_service.`**`missing`**(*name*)

The inverse of service.available Check that the given service is not available.

Parameters **`name`** (*`str`*) – The name of the service

Returns True if the service is not available, otherwise False

Return type bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.mac_service.`**`restart`**(*name*, *runas=None*)

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **`name`** (*`str`*) – Service label, file name, or full path
- **`runas`** (*`str`*) – User to run launchctl commands

Returns `True` if successful

Return type bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

`salt.modules.mac_service.`**`show`**(*name*)

Show properties of a launchctl service

Parameters **`name`** (*`str`*) – Service label, file name, or full path

Returns The service information if the service is found

Return type dict

CLI Example:

```
salt '*' service.show org.cups.cupsd  # service label
salt '*' service.show org.cups.cupsd.plist  # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist  # full
↪path
```

`salt.modules.mac_service.`**`start`**(*name*, *runas=None*)

Start a launchd service. Raises an error if the service fails to start

---

Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **`name`** (*`str`*) – Service label, file name, or full path
- **`runas`** (*`str`*) – User to run launchctl commands

Returns `True` if successful or if the service is already running

Return type bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

`salt.modules.mac_service.`**`status`**`(`*name*, *sig=None*, *runas=None*`)`

Return the status for a service.

Parameters

- **`name`** (*`str`*) – Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **`sig`** (*`str`*) – Find the service with status.pid instead. Note that `name` must still be provided.
- **`runas`** (*`str`*) – User to run launchctl commands

Returns The PID for the service if it is running, or 'loaded' if the service should not always have a PID, or otherwise an empty string

Return type str

CLI Example:

```
salt '*' service.status cups
```

`salt.modules.mac_service.`**`stop`**`(`*name*, *runas=None*`)`

Stop a launchd service. Raises an error if the service fails to stop

---

Note: Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

Parameters

- **`name`** (*`str`*) – Service label, file name, or full path
- **`runas`** (*`str`*) – User to run launchctl commands

Returns `True` if successful or if the service is already stopped

Return type bool

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

21.9.228 salt.modules.mac_shadow module

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

`salt.modules.mac_shadow.`**`del_password`**`(`*name*`)`

Deletes the account password

Parameters **`name`** (*str*) – The user name of the account

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.mac_shadow.`**`get_account_created`**`(`*name*`)`

Get the date/time the account was created

Parameters **`name`** (*str*) – The username of the account

Returns The date/time the account was created (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

`salt.modules.mac_shadow.`**`get_change`**`(`*name*`)`

Gets the date on which the password expires

Parameters **`name`** (*str*) – The name of the user account

Returns The date the password will expire

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

`salt.modules.mac_shadow.`**`get_expire`**`(`*name*`)`

Gets the date on which the account expires

Parameters **`name`** (*str*) – The name of the user account

Returns The date the account expires

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

`salt.modules.mac_shadow.`**`get_last_change`**`(`*name*`)`

Get the date/time the account was changed

Parameters **`name`** (*str*) – The username of the account

Returns The date/time the account was modified (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

`salt.modules.mac_shadow.`**`get_login_failed_count`**`(`*name*`)`

Get the the number of failed login attempts

Parameters **`name`** (*str*) – The username of the account

Returns The number of failed login attempts

Return type int

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

`salt.modules.mac_shadow.`**`get_login_failed_last`**`(`*name*`)`

Get the date/time of the last failed login attempt

Parameters **name** (*str*) – The username of the account

Returns The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

`salt.modules.mac_shadow.`**`get_maxdays`**`(`*name*`)`

Get the maximum age of the password

Parameters **name** (*str*) – The username of the account

Returns The maximum age of the password in days

Return type int

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

`salt.modules.mac_shadow.`**`info`**`(`*name*`)`

Return information for the specified user

Parameters **name** (*str*) – The username

Returns A dictionary containing the user's shadow information

Return type dict

CLI Example:

```
salt '*' shadow.info admin
```

`salt.modules.mac_shadow.`**`set_change`**`(`*name, date*`)`

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- **name** (*str*) – The name of the user account
- **date** (*date*) – The date the password will expire. Must be in mm/dd/yyyy format.

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

`salt.modules.mac_shadow.`**`set_expire`**`(`*name, date*`)`

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- **name** (*str*) – The name of the user account

- **date** (*datetime*) – The date the account will expire. Format must be mm/dd/yyyy.

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

salt.modules.mac_shadow.**set_inactdays**(*name*, *days*)

Set the number if inactive days before the account is locked. Not available in macOS

Parameters

- **name** (*str*) – The user name
- **days** (*int*) – The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

salt.modules.mac_shadow.**set_maxdays**(*name*, *days*)

Set the maximum age of the password in days

Parameters

- **name** (*str*) – The username of the account
- **days** (*int*) – The maximum age of the account in days

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.**set_mindays**(*name*, *days*)

Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (*str*) – The user name
- **days** (*int*) – The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

salt.modules.mac_shadow.**set_password**(*name*, *password*)

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name** (*str*) – The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) – The plaintext password to set

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

`salt.modules.mac_shadow.`**`set_warndays`**`(`*name*, *days*`)`

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters

- **name** (*str*) – The user name
- **days** (*int*) – The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

21.9.229 salt.modules.mac_softwareupdate module

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.`**`download`**`(`*name*`)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters **name** (*str*) – The update to download.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.`**`download_all`**`(`*recommended=False*, *restart=True*`)`

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended** (*bool*) – If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) – Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.

Return type list

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.`**`get_catalog`**`()`

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns The catalog being used for update lookups

Return type str

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

`salt.modules.mac_softwareupdate.`**`ignore`**`(`*name*`)`

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters **`name`** – The name of the update to add to the ignore list.

Ptype str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

`salt.modules.mac_softwareupdate.`**`list_available`**`(`*recommended=False, restart=False*`)`

List all available updates.

Parameters

- **`recommended`** (*`bool`*) – Show only recommended updates.
- **`restart`** (*`bool`*) – Show only updates that require a restart.

Returns Returns a dictionary containing the updates

Return type dict

CLI Example:

```
salt '*' softwareupdate.list_available
```

`salt.modules.mac_softwareupdate.`**`list_downloads`**`()`

Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded

Return type list

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

`salt.modules.mac_softwareupdate.`**`list_ignored`**`()`

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns The list of ignored updates

Return type list

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

`salt.modules.mac_softwareupdate.`**`reset_catalog`**`()`

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

`salt.modules.mac_softwareupdate.`**`reset_ignored`**`()`

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns True if the list was reset, Otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

salt.modules.mac_softwareupdate.**schedule_enable**(*enable*)

Enable/disable automatic update scheduling.

Parameters **enable** – True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

Type bool str

Returns True if scheduling is enabled, False if disabled

Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

salt.modules.mac_softwareupdate.**schedule_enabled**()

Check the status of automatic update scheduling.

Returns True if scheduling is enabled, False if disabled

Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

salt.modules.mac_softwareupdate.**set_catalog**(*url*)

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters **url** (*str*) – The url to the update catalog

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

salt.modules.mac_softwareupdate.**update**(*name*)

Install a named update.

Parameters **name** (*str*) – The name of the of the update to install.

Returns True if successfully updated, otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

salt.modules.mac_softwareupdate.**update_all**(*recommended=False*, *restart=True*)

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **recommended** (*bool*) – If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) – Set this to False if you do not want to install updates that require a restart. Default is True

Returns A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

Return type dict

CLI Example:

```
salt '*' softwareupdate.update_all
```

`salt.modules.mac_softwareupdate.`**`update_available`**`(`*name*`)`

Check whether or not an update is available with a given name.

Parameters **`name`** (*`str`*) – The name of the update to look for

Returns True if available, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

21.9.230 salt.modules.mac_sysctl module

Module for viewing and modifying sysctl parameters

`salt.modules.mac_sysctl.`**`assign`**`(`*name*, *value*`)`

Assign a single sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.mac_sysctl.`**`get`**`(`*name*`)`

Return a single sysctl parameter for this minion

name The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.mac_sysctl.`**`persist`**`(`*name*, *value*, *config='/etc/sysctl.conf'*, *apply_change=False*`)`

Assign and persist a simple sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

config The location of the sysctl configuration file.

apply_change Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

`salt.modules.mac_sysctl.`**`show`**`(`*config_file=False*`)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

21.9.231 salt.modules.mac_system module

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

> **Warning:** Using this module will enable `atrun` on the system if it is disabled.

salt.modules.mac_system.**get_boot_arch**()

Get the kernel architecture setting from `com.apple.Boot.plist`

Returns A string value representing the boot architecture setting

Return type str

CLI Example:

```
salt '*' system.get_boot_arch
```

salt.modules.mac_system.**get_computer_name**()

Gets the computer name

Returns The computer name

Return type str

CLI Example:

```
salt '*' system.get_computer_name
```

salt.modules.mac_system.**get_disable_keyboard_on_lock**()

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns True if disable keyboard on lock is on, False if off

Return type bool

CLI Example:

..code-block:: bash

salt '*' system.get_disable_keyboard_on_lock

salt.modules.mac_system.**get_remote_events**()

Displays whether remote apple events are on or off.

Returns True if remote apple events are on, False if off

Return type bool

CLI Example:

```
salt '*' system.get_remote_events
```

salt.modules.mac_system.**get_remote_login**()

Displays whether remote login (SSH) is on or off.

Returns True if remote login is on, False if off

Return type bool

CLI Example:

```
salt '*' system.get_remote_login
```

salt.modules.mac_system.**get_restart_delay**()

Get the number of seconds after which the computer will start up after a power failure.

Returns A string value representing the number of seconds the system will delay restart after power loss

Return type str

CLI Example:

```
salt '*' system.get_restart_delay
```

`salt.modules.mac_system.`**`get_startup_disk`**`()`

Displays the current startup disk

Returns The current startup disk

Return type str

CLI Example:

```
salt '*' system.get_startup_disk
```

`salt.modules.mac_system.`**`get_subnet_name`**`()`

Gets the local subnet name

Returns The local subnet name

Return type str

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.`**`halt`**`(`*at_time=None*`)`

Halt a running system

Parameters **at_time** (*str*) – Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.`**`list_startup_disks`**`()`

List all valid startup disks on the system.

Returns A list of valid startup disks

Return type list

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.`**`restart`**`(`*at_time=None*`)`

Restart the system

Parameters **at_time** (*str*) – Any valid *at* expression. For example, some valid at expressions could be:

- noon

  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

`salt.modules.mac_system.`**`set_boot_arch`**(*arch='default'*)

Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error `changes to kernel architecture failed to save!`, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters **`arch`** (*`str`*) – A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

  - i386
  - x86_64
  - default

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

`salt.modules.mac_system.`**`set_computer_name`**(*name*)

Set the computer name

Parameters **`name`** (*`str`*) – The new computer name

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

`salt.modules.mac_system.`**`set_disable_keyboard_on_lock`**(*enable*)

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters **`enable`** (*`bool`*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

`salt.modules.mac_system.`**`set_remote_events`**`(`*enable*`)`

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters **enable** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_events On
```

`salt.modules.mac_system.`**`set_remote_login`**`(`*enable*`)`

Set the remote login (SSH) to either on or off.

Parameters **enable** (*bool*) – True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_login True
```

`salt.modules.mac_system.`**`set_restart_delay`**`(`*seconds*`)`

Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:

```
Error, IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html

Parameters **seconds** (*int*) – The number of seconds. Must be a multiple of 30

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_restart_delay 180
```

`salt.modules.mac_system.`**`set_startup_disk`**`(`*path*`)`

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters **path** (*str*) – The valid startup disk path

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

`salt.modules.mac_system.`**`set_subnet_name`**`(`*name*`)`

Set the local subnet name

Parameters **name** (*str*) – The new local subnet name

Note: Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type bool

CLI Example:

```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

`salt.modules.mac_system.`**`shutdown`**`(`*at_time=None*`)`

Shutdown the system

Parameters **`at_time`** (*str*) – Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

`salt.modules.mac_system.`**`sleep`**`(`*at_time=None*`)`

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters **`at_time`** (*str*) – Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

21.9.232 salt.modules.mac_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

`salt.modules.mac_timezone.`**`get_date`**`()`

Displays the current date

Returns the system date

Return type str

CLI Example:

```
salt '*' timezone.get_date
```

`salt.modules.mac_timezone.`**`get_hwclock`**`()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.mac_timezone.`**`get_offset`**`()`

Displays the current time zone offset

Returns The current time zone offset

Return type str

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.mac_timezone.`**`get_time`**`()`

Get the current system time.

Returns The current time in 24 hour format

Return type str

CLI Example:

```
salt '*' timezone.get_time
```

`salt.modules.mac_timezone.`**`get_time_server`**`()`

Display the currently set network time server.

Returns the network time server

Return type str

CLI Example:

```
salt '*' timezone.get_time_server
```

`salt.modules.mac_timezone.`**`get_using_network_time`**`()`

Display whether network time is on or off

Returns True if network time is on, False if off

Return type bool

CLI Example:

```
salt '*' timezone.get_using_network_time
```

`salt.modules.mac_timezone.`**`get_zone`**`()`

Displays the current time zone

Returns The current time zone

Return type str

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.mac_timezone.`**`get_zonecode`**`()`

Displays the current time zone abbreviated code

Returns The current time zone code

Return type str

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.mac_timezone.`**`list_zones`**`()`

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

Returns a list of time zones

Return type list

CLI Example:

```
salt '*' timezone.list_zones
```

`salt.modules.mac_timezone.`**`set_date`**`(`*date*`)`

Set the current month, day, and year

Parameters **`date`** (*`str`*) – The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns True if successful, False if not

Return type bool

Raises SaltInvocationError on Invalid Date format

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

`salt.modules.mac_timezone.`**`set_hwclock`**`(`*clock*`)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.mac_timezone.`**`set_time`**`(`*time*`)`

Sets the current time. Must be in 24 hour format.

Parameters **`time`** (*`str`*) – The time to set in 24 hour format. The value must be double quoted. ie: '"17:46"'

Returns True if successful, False if not

Return type bool

Raises SaltInvocationError on Invalid Time format

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time '"17:34"'
```

`salt.modules.mac_timezone.`**`set_time_server`**(*time_server='time.apple.com'*)

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters **`time_server`** – IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'

Type str

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

`salt.modules.mac_timezone.`**`set_using_network_time`**(*enable*)

Set whether network time is on or off.

Parameters **`enable`** – True to enable, False to disable. Can also use 'on' or 'off'

Type str bool

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

`salt.modules.mac_timezone.`**`set_zone`**(*time_zone*)

Set the local time zone. Use `timezone.list_zones` to list valid time_zone arguments

Parameters **`time_zone`** (*`str`*) – The time zone to apply

Returns True if successful, False if not

Return type bool

Raises SaltInvocationError on Invalid Timezone

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

`salt.modules.mac_timezone.`**`zone_compare`**(*time_zone*)

Compares the given timezone name with the system timezone name.

Returns True if they are the same, False if not

Return type bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

21.9.233 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

`salt.modules.mac_user.`**`add`**(*name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.mac_user.`**`chfullname`**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

`salt.modules.mac_user.`**`chgid`**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.mac_user.`**`chgroups`**(*name*, *groups*, *append=False*)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

`salt.modules.mac_user.`**`chhome`**(*name*, *home*, ***kwargs*)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

`salt.modules.mac_user.`**`chshell`**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.mac_user.`**`chuid`**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.mac_user.`**`delete`**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.mac_user.`**`disable_auto_login`**()

New in version 2016.3.0.

Disables auto login on the machine

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' user.disable_auto_login
```

`salt.modules.mac_user.`**`enable_auto_login`**`(`*name, password*`)`

New in version 2016.3.0.

Configures the machine to auto login with the specified user

Parameters

- **name** (*str*) – The user account use for auto login
- **password** (*str*) – The password to user for auto login

  New in version 2017.7.3.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

`salt.modules.mac_user.`**`get_auto_login`**`()`

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False

Return type str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

`salt.modules.mac_user.`**`getent`**`(`*refresh=False*`)`

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.mac_user.`**`info`**`(`*name*`)`

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.mac_user.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.mac_user.`**`list_users`**`()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.mac_user.`**`primary_group`**`(`*name*`)`

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.mac_user.`**`rename`**`(`*name*, *new_name*`)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

21.9.234 salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

`salt.modules.mac_xattr.`**`clear`**`(`*path*`)`

Causes the all attributes on the file/directory to be removed

Parameters **`path`** (*`str`*) – The file(s) to get attributes from

Returns True if successful, otherwise False

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.`**`delete`**`(`*path*, *attribute*`)`

Removes the given attribute from the file

Parameters

- **`path`** (*`str`*) – The file(s) to get attributes from
- **`attribute`** (*`str`*) – The attribute name to be deleted from the file/directory

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.`**`list_`**`(`*path*, ***kwargs*`)`

List all of the extended attributes on the given file/directory

Parameters

- **`path`** (*`str`*) – The file(s) to get attributes from

- **hex** (*bool*) – Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file

Return type dict

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.`**`read`**`(`*path, attribute, **kwargs*`)`

Read the given attributes on the given file/directory

Parameters

- **path** (*str*) – The file to get attributes from
- **attribute** (*str*) – The attribute to read
- **hex** (*bool*) – Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute

Return type str

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.`**`write`**`(`*path, attribute, value, **kwargs*`)`

Causes the given attribute name to be assigned the given value

Parameters

- **path** (*str*) – The file(s) to get attributes from
- **attribute** (*str*) – The attribute name to be written to the file/directory
- **value** (*str*) – The value to assign to the given attribute
- **hex** (*bool*) – Set the values with forced hexadecimal values

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

21.9.235 salt.modules.makeconf

Support for modifying make.conf under Gentoo

`salt.modules.makeconf.`**`append_cflags`**`(`*value*`)`

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

`salt.modules.makeconf.`**`append_cxxflags`**`(`*value*`)`

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

`salt.modules.makeconf.`**`append_emerge_default_opts`**`(`*value*`)`

Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.`**`append_features`**`(`*value*`)`

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

`salt.modules.makeconf.`**`append_gentoo_mirrors`**`(`*value*`)`

Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.`**`append_makeopts`**`(`*value*`)`

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

salt.modules.makeconf.**append_var**(*var*, *value*)
Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**cflags_contains**(*value*)
Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

salt.modules.makeconf.**chost_contains**(*value*)
Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**cxxflags_contains**(*value*)
Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

salt.modules.makeconf.**emerge_default_opts_contains**(*value*)
Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

salt.modules.makeconf.**features_contains**(*value*)
Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

`salt.modules.makeconf.`**`gentoo_mirrors_contains`**`(`*value*`)`

Verify if GENTOO_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.`**`get_cflags`**`()`

Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

`salt.modules.makeconf.`**`get_chost`**`()`

Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

`salt.modules.makeconf.`**`get_cxxflags`**`()`

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

`salt.modules.makeconf.`**`get_emerge_default_opts`**`()`

Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

`salt.modules.makeconf.`**`get_features`**`()`

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

`salt.modules.makeconf.`**`get_gentoo_mirrors`**`()`

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

salt.modules.makeconf.**get_makeopts**()

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

salt.modules.makeconf.**get_sync**()

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

salt.modules.makeconf.**get_var**(*var*)

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

salt.modules.makeconf.**makeopts_contains**(*value*)

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

salt.modules.makeconf.**remove_var**(*var*)

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

salt.modules.makeconf.**set_cflags**(*value*)

Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_chost**(*value*)

Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**set_cxxflags**(*value*)

Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_emerge_default_opts**(*value*)

Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**set_gentoo_mirrors**(*value*)

Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**set_makeopts**(*value*)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

salt.modules.makeconf.**set_sync**(*value*)

Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

salt.modules.makeconf.**set_var**(*var, value*)

Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**sync_contains**(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

salt.modules.makeconf.**trim_cflags**(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

salt.modules.makeconf.**trim_cxxflags**(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

`salt.modules.makeconf.`**`trim_emerge_default_opts`**`(`*value*`)`

Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.`**`trim_features`**`(`*value*`)`

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

`salt.modules.makeconf.`**`trim_gentoo_mirrors`**`(`*value*`)`

Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.`**`trim_makeopts`**`(`*value*`)`

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

`salt.modules.makeconf.`**`trim_var`**`(`*var, value*`)`

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.`**`var_contains`**(*var*, *value*)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

21.9.236 salt.modules.mandrill

Mandrill

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.

`salt.modules.mandrill.`**`send`**(*message*, *asynchronous=False*, *ip_pool=None*, *send_at=None*, *api_url=None*, *api_version=None*, *api_key=None*, ***kwargs*)

Send out the email using the details from the `message` argument.

message The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

asynchronous: `False` Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

ip_pool The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

send_at When this message should be sent as a UTC timestamp in `YYYY-MM-DD HH:MM:SS` format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

Note: Fur further details please consult the API documentation.

CLI Example:

```
$ salt '*' mandrill.send message="{'subject': 'Hi', 'from_email': 'test@example.
↪com', 'to': [{'email': 'recv@example.com', 'type': 'to'}]}"
```

`message` structure example (as YAML for readability):

```
message:
    text: |
        This is the body of the email.
        This is the second line.
```

(continues on next page)

(continued from previous page)

```
    subject: Email subject
    from_name: Test At Example Dot Com
    from_email: test@example.com
    to:
      - email: recv@example.com
        type: to
        name: Recv At Example Dot Com
      - email: cc@example.com
        type: cc
        name: CC At Example Dot Com
    important: true
    track_clicks: true
    track_opens: true
    attachments:
      - type: text/x-yaml
        name: yaml_file.yml
        content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl
```

Output example:

```
minion:
    ----------
    comment:
    out:
        |_
          ----------
          _id:
              c4353540a3c123eca112bbdd704ab6
          email:
              recv@example.com
          reject_reason:
              None
          status:
              sent
    result:
        True
```

21.9.237 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.marathon.`**`app`**`(`*`id`*`)`

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

`salt.modules.marathon.`**`apps`**`()`

Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

salt.modules.marathon.**has_app**(*id*)

Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

salt.modules.marathon.**info**()

Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

salt.modules.marathon.**restart_app**(*id*, *restart=False*, *force=True*)

Restart the current server configuration for the specified app.

Parameters

- **restart** – Restart the app
- **force** – Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.**rm_app**(*id*)

Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.**update_app**(*id*, *config*)

Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

21.9.238 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.**compound**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given compound target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

`salt.modules.match.`**`data`**(*tgt*)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

`salt.modules.match.`**`filter_by`**(*lookup*, *tgt_type='compound'*, *minion_id=None*, *default='default'*)

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

`salt.modules.match.`**`glob`**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given glob target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

`salt.modules.match.`**`grain`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`grain_pcre`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`ipcidr`**(*tgt*)

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal
```

`salt.modules.match.`**`list_`**(*tgt, minion_id=None*)

Return True if the minion ID matches the given list target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.`**`pcre`**(*tgt, minion_id=None*)

Return True if the minion ID matches the given pcre target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.`**`pillar`**(*tgt, delimiter=':'*)

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter=
↪'|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`pillar_pcre`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`search_by`**(*lookup*, *tgt_type='compound'*, *minion_id=None*)

Search a dictionary of target strings for matching targets

This is the inverse of *`match.filter_by`* and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

21.9.239 salt.modules.mattermost module

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

`salt.modules.mattermost.`**`post_message`**(*message*, *channel=None*, *username=None*, *api_url=None*, *hook=None*)

Send a message to a Mattermost channel.

Parameters

- **channel** – The channel name, either will work.
- **username** – The username of the poster.
- **message** – The message to send to the Mattermost channel.
- **api_url** – The Mattermost api url, if not specified in the configuration.
- **hook** – The Mattermost hook, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

21.9.240 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm_raid.`**`add`**`(`*name*, *device*`)`

Add new device to RAID array.

CLI Example:

```
salt '*' raid.add /dev/md0 /dev/sda1
```

`salt.modules.mdadm_raid.`**`assemble`**`(`*name*, *devices*, *test_mode=False*, ***kwargs*`)`

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name The name of the array to assemble.

devices The list of devices comprising the array to assemble.

kwargs Optional arguments to be passed to mdadm.

returns

- **test_mode=True:** Prints out the full command.
- **test_mode=False (Default):** Executes command on the host(s) and prints out the mdadm output.

For more info, read the `mdadm` manpage.

`salt.modules.mdadm_raid.`**`create`**`(`*name*, *level*, *devices*, *metadata='default'*, *test_mode=False*, ***kwargs*`)`

Create a RAID device.

Changed in version 2014.7.0.

Warning: Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde
↪']" test_mode=True
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

name The name of the array to create.
level The RAID level to use when creating the raid.
devices A list of devices used to build the array.
metadata Version of metadata to use when creating the array.
kwargs Optional arguments to be passed to mdadm.
returns
  test_mode=True: Prints out the full command.
  test_mode=False (Default): Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the `mdadm(8)` manpage

`salt.modules.mdadm_raid.`**`destroy`**`(`*device*`)`
Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

`salt.modules.mdadm_raid.`**`detail`**`(`*device='/dev/md0'*`)`
Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

`salt.modules.mdadm_raid.`**`examine`**`(`*device, quiet=False*`)`
Show detail for a specified RAID component device
device Device to examine, that is part of the RAID
quiet If the device is not part of the RAID, do not show any error
CLI Example:

```
salt '*' raid.examine '/dev/sda1'
```

`salt.modules.mdadm_raid.`**`list_`**`()`
List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

`salt.modules.mdadm_raid.`**`save_config`**`()`
Save RAID configuration to config file.

Same as: mdadm –detail –scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

`salt.modules.mdadm_raid.`**`stop`**`()`

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

21.9.241 salt.modules.mdata

Module for managaging metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform smartos

`salt.modules.mdata.`**`delete_`**`(`**keyname*`)`

Delete metadata
prop [string] name of property
CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

`salt.modules.mdata.`**`get_`**`(`**keyname*`)`

Get metadata
keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

`salt.modules.mdata.`**`list_`**`()`

List available metadata

CLI Example:

```
salt '*' mdata.list
```

`salt.modules.mdata.`**`put_`**`(`*keyname, val*`)`

Put metadata
prop [string] name of property
val [string] value to set
CLI Example:

```
salt '*' mdata.list
```

21.9.242 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

`salt.modules.memcached.`**`add`**`(`*key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0*`)`

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

`salt.modules.memcached.`**`decrement`**`(`*key, delta=1, host='127.0.0.1', port=11211*`)`

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

`salt.modules.memcached.`**`delete`**`(`*key, host='127.0.0.1', port=11211, time=0*`)`

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

`salt.modules.memcached.`**`get`**`(`*key, host='127.0.0.1', port=11211*`)`

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

`salt.modules.memcached.`**`increment`**`(`*key, delta=1, host='127.0.0.1', port=11211*`)`

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

`salt.modules.memcached.`**`replace`**`(`*key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0*`)`

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of *`memcached.add`*

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

`salt.modules.memcached.`**`set_`**`(`*key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0*`)`

Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

`salt.modules.memcached.`**`status`**(*host='127.0.0.1'*, *port=11211*)

Get memcached status

CLI Example:

```
salt '*' memcached.status
```

21.9.243 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

`salt.modules.mine.`**`delete`**(*fun*)

Remove specific function contents of minion.

Parameters **fun** (*str*) – The name of the function.

Return type bool

Returns True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

`salt.modules.mine.`**`flush`**()

Remove all mine contents of minion.

Return type bool

Returns True on success

CLI Example:

```
salt '*' mine.flush
```

`salt.modules.mine.`**`get`**(*tgt*, *fun*, *tgt_type='glob'*, *exclude_minion=False*)

Get data from the mine.

Parameters

- **tgt** (*str*) – Target whose mine data to get.
- **fun** (*str or list*) – Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt_type** (*str*) – Default `glob`. Target type to use with `tgt`. See *Targeting Minions* for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude_minion** (*bool*) – Excludes the current minion from the result set.

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *`Mine Runner module`* instead; it can be invoked from a Pillar SLS file using the *`saltutil.runner`* module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

`salt.modules.mine.`**`get_docker`**(*interfaces=None*, *cidrs=None*, *with_container_id=False*)

Changed in version 2017.7.8,2018.3.3: When *`docker.update_mine`* is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: *`docker.update_mine`* now defaults to `False`

Get all mine data for *`docker.ps`* and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

with_container_id Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24",
↪ "172.17.42.0/24"]'
```

`salt.modules.mine.`**`send`**(*name*, **args*, ***kwargs*)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

Parameters **`name`** (*`str`*) – Name of the function to add to the mine.

The following pameters are extracted from kwargs if present:

Parameters

- **`mine_function`** (*`str`*) – The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.
- **`allow_tgt`** (*`str`*) – Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **`allow_tgt_type`** (*`str`*) – Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

Return type bool

Returns Whether executing the function and storing the information was succesful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See *Targeting Minions* for more information about targeting.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0 allow_tgt=
↪'G@grain:value' allow_tgt_type=compound
```

`salt.modules.mine.`**`update`**(*clear=False*, *mine_functions=None*)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option *mine_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

Parameters

- **`clear`** (*`bool`*) – Default: `False` Specifies whether updating will clear the existing values (`True`), or whether it will update them (`False`).
- **`mine_functions`** (*`dict`*) – Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltstack.com/en/latest/topics/mine/index.html#mine-functions

  This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under *mine_functions* in the minion/master config or pillar. A potential use would be together with the *scheduler*, for example:

  ```
  schedule:
    lldp_mine_update:
      function: mine.update
      kwargs:
          mine_functions:
            net.lldp: []
      hours: 12
  ```

  In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip_addrs* would continue to be updated as specified in *mine_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

`salt.modules.mine.`**`valid`**`()`

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

21.9.244 salt.modules.minion module

Module to provide information about minions

`salt.modules.minion.`**`kill`**`(`*timeout=15*`)`

Kill the salt minion.

timeout int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI example:

```
>$ salt minion[12] minion.kill
minion1:
    ----------
    killed:
        7874
    retcode:
        0
minion2:
    ----------
    killed:
        29071
    retcode:
        0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: `0` is success, anything else is a failure.

salt.modules.minion.**list_**()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as *salt-key -L*

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.**restart**()

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the `argv` of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from `argv` then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
>$ salt minion[12] minion.restart
minion1:
    ----------
    comment:
        - Restart using process argv:
        -     /home/omniture/install/bin/salt-minion
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
    killed:
        10070
    restart:
        ----------
        stderr:
        stdout:
    retcode:
        0
minion2:
    ----------
    comment:
        - Using configuration minion_restart_command:
        -     /home/omniture/install/bin/salt-minion
```

(continues on next page)

(continued from previous page)

```
        -     --not-an-option
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
        - Restart failed
    killed:
        10896
    restart:
        ----------
        stderr:
            Usage: salt-minion

            salt-minion: error: no such option: --not-an-option
        stdout:
    retcode:
        64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

21.9.245 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.`**`get_str`**`(`*length=20*`)`

New in version 2014.7.0.

Returns a random string of the specified length.
length [20] Any valid number of bytes.
CLI Example:

```
salt '*' random.get_str 128
```

`salt.modules.mod_random.`**`hash`**`(`*value, algorithm='sha512'*`)`

New in version 2014.7.0.

Encodes a value with the specified encoder.
value The value to be hashed.
algorithm [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.
CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.`**`rand_int`**`(`*start=1, end=10, seed=None*`)`

Returns a random integer number between the start and end number.
start [1] Any valid integer number
end [10] Any valid integer number
seed : Optional hashable object
Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```

`salt.modules.mod_random.`**`seed`**(*range=10*, *hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

hash: **None** Any hashable object.

range: **10** Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

`salt.modules.mod_random.`**`shadow_hash`**(*crypt_salt=None*, *password=None*, *algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.

crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm [sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5alT' 'MyP@asswd' md5
```

`salt.modules.mod_random.`**`str_encode`**(*value*, *encoder='base64'*)

New in version 2014.7.0.

value The value to be encoded.

encoder [base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

21.9.246 salt.modules.modjk

Control Modjk via the Apache Tomcat "Status" worker (http://tomcat.apache.org/connectors-doc/reference/status.html)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or *pillar*.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

`salt.modules.modjk.`**`bulk_activate`**(*workers, lbn, profile='default'*)

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.`**`bulk_disable`**(*workers, lbn, profile='default'*)

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.`**`bulk_recover`**(*workers, lbn, profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.`**`bulk_stop`**(*workers, lbn, profile='default'*)

Stop all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.`**`dump_config`**(*profile='default'*)

Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

`salt.modules.modjk.`**`get_running`**(*profile='default'*)

Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

`salt.modules.modjk.`**`lb_edit`**(*lbn*, *settings*, *profile='default'*)

Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}"
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}" other-profile
```

`salt.modules.modjk.`**`list_configured_members`**(*lbn*, *profile='default'*)

Return a list of member workers from the configuration files

CLI Examples:

```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

`salt.modules.modjk.`**`recover_all`**(*lbn*, *profile='default'*)

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

`salt.modules.modjk.`**`reset_stats`**(*lbn*, *profile='default'*)

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

`salt.modules.modjk.`**`version`**(*profile='default'*)

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

`salt.modules.modjk.`**`worker_activate`**(*worker*, *lbn*, *profile='default'*)

Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.`**`worker_disable`**(*worker*, *lbn*, *profile='default'*)

Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

`salt.modules.modjk.`**`worker_edit`**(*worker, lbn, settings, profile='default'*)

Edit the worker settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}" other-
↪profile
```

`salt.modules.modjk.`**`worker_recover`**(*worker, lbn, profile='default'*)

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

`salt.modules.modjk.`**`worker_status`**(*worker, profile='default'*)

Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

`salt.modules.modjk.`**`worker_stop`**(*worker, lbn, profile='default'*)

Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.`**`workers`**(*profile='default'*)

Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

21.9.247 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

`salt.modules.mongodb.`**`db_exists`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a database exists in MongoDB

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.`**`db_list`**(*user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

List all MongoDB databases

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

`salt.modules.mongodb.`**`db_remove`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Remove a MongoDB database

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.`**`find`**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Find an object or list of objects in a collection

CLI Example:

```
salt '*' mongodb.find mycollection '[{"foo": "FOO", "bar": "BAR"}]' <user>
↪<password> <host> <port> <database>
```

`salt.modules.mongodb.`**`insert`**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.insert '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM
↪"}]' mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.`**`remove`**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.remove mycollection '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ
↪", "bar": "BAM"}]' <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.`**`update_one`**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Update an object into a collection http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one

New in version 2016.11.0.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection
↪<user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_create**(*name*, *passwd*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*, *roles=None*)

Create a MongoDB user

CLI Example:

```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password>
↪ <host> <port> <database>
```

salt.modules.mongodb.**user_exists**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Checks if a user exists in MongoDB

CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_find**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get single user from MongoDB

CLI Example:

```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
↪<authdb>
```

salt.modules.mongodb.**user_grant_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Grant one or many roles to a MongoDB user

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db": "dbname" }
↪, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**user_list**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

List users of a MongoDB database

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Remove a MongoDB user

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_revoke_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Revoke one or many roles to a MongoDB user

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db": "dbname"
↪}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**user_roles_exists**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a user of a MongoDB database has specified roles

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '[{"role": "readWrite", "db": "dbname"
↪}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**version**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get MongoDB instance version

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

21.9.248 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.**configtest**()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

salt.modules.monit.**id_**(*reset=False*)

New in version 2016.3.0.

Return monit unique id.
reset [False] Reset current id and generate a new id when it's True.
CLI Example:

```
salt '*' monit.id [reset=True]
```

salt.modules.monit.**monitor**(*name*)

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

salt.modules.monit.**reload_**()

New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

salt.modules.monit.restart(*name*)

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

salt.modules.monit.start(*name*)

CLI Example:

```
salt '*' monit.start <service name>
```

salt.modules.monit.status(*svc_name=''*)

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

salt.modules.monit.stop(*name*)

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

salt.modules.monit.summary(*svc_name=''*)

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

salt.modules.monit.unmonitor(*name*)

Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

salt.modules.monit.validate()

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

salt.modules.monit.version()

New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

21.9.249 salt.modules.moosefs

Module for gathering and managing information about MooseFS

`salt.modules.moosefs.`**`dirinfo`**`(`*path, opts=None*`)`

Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n][h|H]]
```

`salt.modules.moosefs.`**`fileinfo`**`(`*path*`)`

Return information on a file located on the Moose

CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

`salt.modules.moosefs.`**`getgoal`**`(`*path, opts=None*`)`

Return goal(s) for a file or directory

CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n][h|H][r]]
```

`salt.modules.moosefs.`**`mounts`**`()`

Return a list of current MooseFS mounts

CLI Example:

```
salt '*' moosefs.mounts
```

21.9.250 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.`**`active`**`(`*extended=False*`)`

List the active mounts.

CLI Example:

```
salt '*' mount.active
```

`salt.modules.mount.`**`automaster`**`(`*config='/etc/auto_salt'*`)`

List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

`salt.modules.mount.`**`delete_mount_cache`**`(`*real_name*`)`

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.delete_mount_cache /mnt/share
```

`salt.modules.mount.`**`filesystems`**`(`*config='/etc/filesystems'*`)`

New in version 2018.3.3.

List the contents of the filesystems

CLI Example:

```
salt '*' mount.filesystems
```

`salt.modules.mount.`**`fstab`**`(`*config='/etc/fstab'*`)`

Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

`salt.modules.mount.`**`is_fuse_exec`**`(`*cmd*`)`

Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

`salt.modules.mount.`**`is_mounted`**`(`*name*`)`

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

`salt.modules.mount.`**`mount`**`(`*name, device, mkmnt=False, fstype='', opts='defaults', user=None, util='mount'*`)`

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.`**`read_mount_cache`**`(`*name*`)`

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.read_mount_cache /mnt/share
```

`salt.modules.mount.`**`remount`**`(`*name, device, mkmnt=False, fstype='', opts='defaults', user=None*`)`

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.`**`rm_automaster`**`(`*name, device, config='/etc/auto_salt'*`)`

Remove the mount point from the auto_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_filesystems`**`(`*name, device, config='/etc/filesystems'*`)`

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:

```
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_fstab`**`(`*name, device, config='/etc/fstab'*`)`

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_vfstab`**`(`*name, device, config='/etc/vfstab'*`)`

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

`salt.modules.mount.`**`set_automaster`**`(`*name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs*`)`

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.`**`set_filesystems`**`(`*name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs*`)`

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- **`name`** – The name of the mount point where the device is mounted.

- **device** – The device that is being mounted.
- **vfstype** – The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** – Additional options used when mounting the device.
- **mount** – Mount if not mounted, default True.
- **config** – Configuration file, default /etc/filesystems.
- **match** – File systems type to match on, default auto

CLI Example:

```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.**set_fstab**(*name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', not_change=False, **kwargs*)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_vfstab**(*name, device, fstype, opts='-', device_fsck='-', pass_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', not_change=False, **kwargs*)

..verionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.**swapoff**(*name*)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.**swapon**(*name, priority=None*)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.**swaps**()

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

`salt.modules.mount.`**`umount`**(*name*, *device=None*, *user=None*, *util='mount'*)

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

`salt.modules.mount.`**`vfstab`**(*config='/etc/vfstab'*)

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

`salt.modules.mount.`**`write_mount_cache`**(*real_name*, *device*, *mkmnt*, *fstype*, *mount_opts*)

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- **`real_name`** – The real name of the mount point where the device is mounted.
- **`device`** – The device that is being mounted.
- **`mkmnt`** – Whether or not the mount point should be created.
- **`fstype`** – The file system that is used.
- **`mount_opts`** – Additional options used when mounting the device.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,nosuid
```

21.9.251 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port:   1433
mssql.user:   'sysdba'
```

(continues on next page)

(continued from previous page)

```
mssql.password:   'Some preferable complex password'
mssql.database: ''
```

The default for the port is '1433' and for the database is " (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

`salt.modules.mssql.`**`db_create`**(*database*, *containment='NONE'*, *new_database_options=None*, ***kwargs*)

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

CLI Example:

```
salt minion mssql.db_create DB_NAME
```

`salt.modules.mssql.`**`db_exists`**(*database_name*, ***kwargs*)

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

`salt.modules.mssql.`**`db_list`**(***kwargs*)

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

`salt.modules.mssql.`**`db_remove`**(*database_name*, ***kwargs*)

Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

`salt.modules.mssql.`**`login_create`**(*login*, *new_login_password=None*, *new_login_domain="*, *new_login_roles=None*, *new_login_options=None*, ***kwargs*)

Creates a new login. Does not update password of existing logins. For Windows authentication, provide `new_login_domain`. For SQL Server authentication, prvide `new_login_password`. Since hashed passwords are *varbinary* values, if the `new_login_password` is 'int / long', it will be considered to be HASHED.

new_login_roles a list of SERVER roles

new_login_options a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_
↪password=PASSWORD]
```

`salt.modules.mssql.`**`login_exists`**(*login*, *domain="*, ***kwargs*)

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

`salt.modules.mssql.`**`login_remove`**(*login*, ***kwargs*)

Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

`salt.modules.mssql.`**`role_create`**(*role*, *owner=None*, *grants=None*, ***kwargs*)

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants='["SELECT",
↪"INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

`salt.modules.mssql.`**`role_exists`**(*role*, ***kwargs*)

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

`salt.modules.mssql.`**`role_list`**(***kwargs*)

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

`salt.modules.mssql.`**`role_remove`**(*role*, ***kwargs*)

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

`salt.modules.mssql.`**`tsql_query`**(*query*, ***kwargs*)

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

`salt.modules.mssql.`**`user_create`**(*username*, *login=None*, *domain=''*, *database=None*, *roles=None*, *options=None*, ***kwargs*)

Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME
```

`salt.modules.mssql.`**`user_exists`**(*username*, *domain=''*, *database=None*, ***kwargs*)

Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

`salt.modules.mssql.`**`user_list`**`(`*`**kwargs`*`)`

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

`salt.modules.mssql.`**`user_remove`**`(`*`username, **kwargs`*`)`

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

`salt.modules.mssql.`**`version`**`(`*`**kwargs`*`)`

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

21.9.252 salt.modules.msteams module

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

`salt.modules.msteams.`**`post_card`**`(`*`message, hook_url=None, title=None, theme_color=None`*`)`

Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel. :param hook_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title for the posted card :param theme_color: Optional hex color highlight for the posted card :return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

21.9.253 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.`**`list_plugins`**`()`

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

`salt.modules.munin.`**`run`**`(`*`plugins`*`)`

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

`salt.modules.munin.`**`run_all`**`()`

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

21.9.254 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- MySQLdb Python module

Note: On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

---

configuration In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined `here`. Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.`**`alter_db`**`(`*name, character_set=None, collate=None, **connection_args*`)`

Modify database using `ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s;` query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.`**`db_check`**`(`*name, table=None, **connection_args*`)`

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.`**`db_create`**(*name*, *character_set=None*, *collate=None*, ***connection_args*)

Adds a databases to the MySQL server.

name The name of the database to manage

character_set The character set, if left empty the MySQL default will be used

collate The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

`salt.modules.mysql.`**`db_exists`**(*name*, ***connection_args*)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

`salt.modules.mysql.`**`db_get`**(*name*, ***connection_args*)

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

`salt.modules.mysql.`**`db_list`**(***connection_args*)

Return a list of databases of a MySQL server using the output from the `SHOW DATABASES` query.

CLI Example:

```
salt '*' mysql.db_list
```

`salt.modules.mysql.`**`db_optimize`**(*name*, *table=None*, ***connection_args*)

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

`salt.modules.mysql.`**`db_remove`**(*name*, ***connection_args*)

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

`salt.modules.mysql.`**`db_repair`**(*name*, *table=None*, ***connection_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

`salt.modules.mysql.`**`db_tables`**(*name*, ***connection_args*)

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

`salt.modules.mysql.`**`file_query`**`(`*database, file_name, **connection_args*`)`

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database
    database to run script inside

file_name
    File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

`salt.modules.mysql.`**`free_slave`**`(`***connection_args*`)`

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

`salt.modules.mysql.`**`get_master_status`**`(`***connection_args*`)`

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

`salt.modules.mysql.`**`get_slave_status`**`(`***connection_args*`)`

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                   'Exec_Master_Log_Pos': 107,
                   'Last_Errno': 0,
                   'Last_Error': '',
                   'Last_IO_Errno': 0,
                   'Last_IO_Error': '',
                   'Last_SQL_Errno': 0,
                   'Last_SQL_Error': '',
                   'Master_Host': 'comet.scion-eng.com',
                   'Master_Log_File': 'mysql-bin.000021',
                   'Master_Port': 3306,
