Add an item or items to a queue

`salt.queues.pgjsonb_queue.`**`list_items`**`(`*queue*`)`
List contents of a queue

`salt.queues.pgjsonb_queue.`**`list_length`**`(`*queue*`)`
Provide the number of items in a queue

`salt.queues.pgjsonb_queue.`**`list_queues`**`()`
Return a list of Salt Queues on the Salt Master

`salt.queues.pgjsonb_queue.`**`pop`**`(`*queue, quantity=1, is_runner=False*`)`
Pop one or more or all items from the queue return them.

21.14.2 salt.queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the *sqlite_queue_dir* which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting *sqlite_queue_dir* to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

`salt.queues.sqlite_queue.`**`delete`**`(`*queue, items*`)`
Delete an item or items from a queue

`salt.queues.sqlite_queue.`**`insert`**`(`*queue, items*`)`
Add an item or items to a queue

`salt.queues.sqlite_queue.`**`list_items`**`(`*queue*`)`
List contents of a queue

`salt.queues.sqlite_queue.`**`list_length`**`(`*queue*`)`
Provide the number of items in a queue

`salt.queues.sqlite_queue.`**`list_queues`**`()`
Return a list of Salt Queues on the Salt Master

`salt.queues.sqlite_queue.`**`pop`**`(`*queue, quantity=1, is_runner=False*`)`
Pop one or more or all items from the queue return them.

21.15 roster modules

`ansible`	Read in an Ansible inventory file or script
`cache`	The `cache` roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.
`cloud`	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
`clustershell`	This roster resolves hostname in a pdsh/clustershell style.
`flat`	Read in the roster from a flat file using the renderer system

Continued on next page

Table 15 – continued from previous page

range	This roster resolves targets from a range server.
scan	Scan a netmask or ipaddr for open ssh ports
sshconfig	Parses roster entries out of Host directives from SSH config
terraform	Dynamic roster from terraform current state

21.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
↪port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
↪ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh -N all test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh -N desktop test.ping
home:
    True
[~]# salt-ssh -N computers test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
    True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
```

(continues on next page)

(continued from previous page)

```
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 22
      },
      "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 23
      }
    }
  }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
        True
```

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

`salt.roster.ansible.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the ansible inventory_file Default: /etc/salt/roster

21.15.2 salt.roster.cache

The `cache` roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster_order per config key default order changed to industry-wide best practices CIDR range selection

Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

-
  ```
  roster_order:
      host: id          # use the minion id as hostname
  ```

You can define lists of parameters as well, the first result from the list will become the value.

Selecting a host

```
# default
roster_order:
    host:
      - ipv6-private  # IPv6 addresses in private ranges
      - ipv6-global   # IPv6 addresses in global ranges
      - ipv4-private  # IPv4 addresses in private ranges
      - ipv4-public   # IPv4 addresses in public ranges
      - ipv4-local    # loopback addresses
```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local    # Both IPv6 and IPv4 addresses in that range
    - 2000::/3                       # CIDR networks, both IPv4 and IPv6 are supported
```

Using cached data

Several cached libraries can be selected using the `library: `` prefix, followed by the library key. This can be referenced using the same ``:` syntax as e.g. *`pillar.get`*. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4                # Lookup this grain
    - mine: network.ip_addrs         # Mine data lookup works the same

  password: sdb://vault/ssh_pass     # Salt SDB URLs are also supported

  user:
    - pillar: ssh:auth:user          # Lookup this pillar key
    - sdb://osenv/USER               # Lookup this env var through sdb

  priv:
    - pillar:                        # Lists are also supported
        - salt:ssh:private_key
        - ssh:auth:private_key
```

`salt.roster.cache.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

21.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at /etc/salt/cloud. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.`**`extract_ipv4`**(*roster_order*, *ipv4*)
Extract the preferred IP address from the ipv4 grain

`salt.roster.cloud.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

depends clustershell, https://github.com/cea-hpc/clustershell

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets

21.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

`salt.roster.flat.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.6 salt.roster.range module

This roster resolves targets from a range server.

depends seco.range, https://github.com/ytoolshed/range

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

`salt.roster.range.`**`target_glob`**(*tgt*, *hosts*)

`salt.roster.range.`**`target_range`**(*tgt*, *hosts*)

`salt.roster.range.`**`targets`**(*tgt*, *tgt_type='range'*, ***kwargs*)
Return the targets from a range query

21.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

class `salt.roster.scan.`**`RosterMatcher`**(*tgt*, *tgt_type*)
Matcher for the roster data structure

`targets`()
Return ip addrs based on netmask, sitting in the "glob" spot because it is the default

`salt.roster.scan.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

class `salt.roster.sshconfig.`**`RosterMatcher`**(*raw*, *tgt*, *tgt_type*)
Matcher for the roster data structure

`get_data`(*minion*)
Return the configured ip

`ret_glob_minions`()
Return minions that match via glob

`targets`()
Execute the correct tgt_type routine and return

`salt.roster.sshconfig.`**`parse_ssh_config`**(*lines*)
Parses lines from the SSH config to create roster targets.

Parameters **`lines`** – Individual lines from the ssh config file
Returns Dictionary of targets in similar style to the flat roster

`salt.roster.sshconfig.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.9 salt.roster.terraform

Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the Terraform Salt provider.

It exposes all salt_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

Basic Example

Given a simple salt-ssh tree with a Saltfile:

```
salt-ssh:
  config_dir: etc/salt
  max_procs: 30
  wipe_ssh: True
```

and `etc/salt/master`:

```
root_dir: .
  file_roots:
    base:
      - srv/salt
  pillar_roots:
    base:
      - srv/pillar
  roster: terraform
```

In the same folder as your `Saltfile`, create terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a `salt_host` resource:

```
resource "salt_host" "dbminion" {
  salt_id = "dbserver"
  host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
  user = "root"
  passwd = "linux"
}
```

You can use the count attribute to create multiple roster entries with a single definition. Please refer to the Terraform Salt provider for more detailed examples.

`salt.roster.terraform.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Returns the roster from the terraform state file, checks opts for location, but defaults to terraform.tfstate

21.16 runner modules

asam	Novell ASAM Runner
auth	Authentication runner for creating, deleting, and managing eauth tokens.
bgp	BGP Finder
cache	Return cached data from minions
cloud	The Salt Cloud Runner
ddns	Dynamic DNS Runner
digicertapi	Support for Digicert.
doc	A runner module to collect and display the inline documentation from the various module types
drac	Manage Dell DRAC from the Master
error	Error generator to enable integration testing of salt runner error handling
event	Module for sending events using the runner system.
f5	Runner to provide F5 Load Balancer functionality
fileserver	Directly manage the Salt fileserver plugins
git_pillar	Runner module to directly manage the git external pillar

Continued on next page

Table 16 – continued from previous page

http	Module for making various web calls.
jobs	A convenience system to manage jobs, both active and already run
launchd	Manage launchd plist files
lxc	Control Linux Containers via Salt
manage	General management functions for salt, tools like seeing what hosts are up and what hosts are down
mattermost	Module for sending messages to Mattermost
mine	A runner to access data from the salt mine
nacl	This module helps include encrypted passwords in pillars, grains and salt state files.
net	NET Finder
network	Network tools to run from the Master
pagerduty	Runner Module for Firing Events via PagerDuty
pillar	Functions to interact with the pillar compiler on the master
pkg	Package helper functions using `salt.modules.pkg`
queue	General management and processing of queues.
reactor	A convenience system to manage reactors
salt	This runner makes Salt's execution modules available on the salt master.
saltutil	The Saltutil runner is used to sync custom types to the Master.
sdb	Runner for setting and querying data via the sdb API on the master
smartos_vmadm	Runner for SmartOS minions control vmadm
spacewalk	Spacewalk Runner
ssh	A Runner module interface on top of the salt-ssh Python API.
state	Execute orchestration functions
survey	A general map/reduce style salt runner for aggregating results returned by several different minions.
test	This runner is used only for test purposes and servers no production purpose
thin	The thin runner is used to manage the salt thin systems.
vault	**maintainer** SaltStack
venafiapi	Support for Venafi
virt	Control virtual machines via Salt
vistara	Vistara Runner
winrepo	Runner to manage Windows software repo

21.16.1 salt.runners.asam

Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

codeauthor Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

Note: Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.`**`add_platform`**(*name*, *platform_set*, *server_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.`**`list_platform_sets`**(*server_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.`**`list_platforms`**(*server_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.`**`remove_platform`**(*name*, *server_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

21.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.`**`del_token`**(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.`**`mk_token`**`(`*`**load`*`)`

Create an eauth token using provided credentials

Non-root users may specify an expiration date – if allowed via the *`token_expire_user_override`* setting – by passing an additional `token_expire` param. This overrides the *`token_expire`* setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)
```

21.16.3 salt.runners.bgp

BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

Configuration

- Minion (proxy) config

  The `bgp.neighbors` function must be appened in the list of `mine_functions`:

  ```
  mine_functions:
    bgp.neighbors: []
  ```

  Which instructs Salt to cache the data returned by the `neighbors` function from the *`NAPALM BGP module`*.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- Master config

  By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

  tgt: `*` From what minions will collect the mine data. Default: `*` (collect mine data from all minions)

  tgt_type: `glob` Minion matching expression form. Default: `glob`.

  return_fields What fields to return in the output. It can display all the fields from the `neighbors` function from the *`NAPALM BGP module`*.

  Some fields cannot be removed:

  - `as_number`: the AS number of the neighbor

- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.
- `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the *`net runner`*, so the user needs to enable the mines as specified in the documentation.
- `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the *`net runner`*, so the user needs to enable the mines as specified in the documentation.

display: **`True`** Display on the screen or return structured object? Default: `True` (return on the CLI).

outputter: **`table`** Specify the outputter name when displaying on the CLI. Default: *`table`*.

Configuration example:

```
runners:
  bgp:
    tgt: 'edge*'
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

`salt.runners.bgp.`**`neighbors`**`(`**asns, **kwargs*`)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

asns A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

device Filter by device name (minion ID).

ip Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

network Search neighbors within a certain IP network.

title Custom title.

display: **`True`** Display on the screen or return structured object? Default: `True` (return on the CLI).

outputter: **`table`** Specify the outputter name when displaying on the CLI. Default: *`table`*.

In addition, any field from the output of the `neighbors` function from the *`NAPALM BGP module`* can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
----------------------------------------------------------------------------------
↪------------------------------------------------------------------------------
|    Device     | AS Number |         Neighbor Address         | State|#Active/

21.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.`**`clear_all`**(*tgt=None, tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.`**`clear_git_lock`**(*role, remote=None, **kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

Note: Running *`cache.clear_all`* will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a `role` of `gitfs` is equivalent to running `salt-run fileserver.clear_lock backend=git`.

---

role Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

type [update,checkout,mountpoint] The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: `mountpoint` lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.`**`clear_grains`**(*tgt=None, tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.`**`clear_mine`**(*tgt=None, tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.`**`clear_mine_func`**(*tgt=None, tgt_type='glob', clear_mine_func_flag=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.`**`clear_pillar`**(*tgt=None*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.`**`cloud`**(*tgt*, *provider=None*)

Return cloud cache data for target.

Note: Only works with glob matching

tgt Glob Target to match minion ids

provider Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.`**`fetch`**(*bank*, *key*, *cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.`**`flush`**(*bank*, *key=None*, *cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.`**`grains`**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

tgt Target to match minion ids.

> Changed in version 2017.7.5,2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt `Sodium` release.

tgt_type The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

`salt.runners.cache.`**`list_`**(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.`**`mine`**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.`**`pillar`**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions if tgt is set. If tgt is not set will return cached pillars for all minions.

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.`**`store`**(*bank*, *key*, *data*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

21.16.5 salt.runners.cloud

The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.`**`action`**(*func=None*, *cloudmap=None*, *instances=None*, *provider=None*, *instance=None*, *opts=None*, ***kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

`salt.runners.cloud.`**`create`**(*provider*, *instances*, *opts=None*, ***kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance \
    image=ami-1624987f size='t1.micro' ssh_username=ec2-user \
    securitygroup=default delvol_on_destroy=True
```

`salt.runners.cloud.`**`destroy`**(*instances*, *opts=None*)
Destroy the named vm(s)

`salt.runners.cloud.`**`full_query`**(*query_type='list_nodes_full'*)
List all available cloud provider data

`salt.runners.cloud.`**`list_images`**(*provider='all'*)
List cloud provider images for the given providers

`salt.runners.cloud.`**`list_locations`**(*provider='all'*)
List cloud provider sizes for the given providers

`salt.runners.cloud.`**`list_sizes`**(*provider='all'*)
List cloud provider sizes for the given providers

`salt.runners.cloud.`**`map_run`**(*path=None*, *opts=None*, ***kwargs*)
Execute a salt cloud map file

`salt.runners.cloud.`**`profile`**(*prof=None*, *instances=None*, *opts=None*, ***kwargs*)
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

`salt.runners.cloud.`**`query`**(*query_type='list_nodes'*)
List cloud provider data for all providers

`salt.runners.cloud.`**`select_query`**(*query_type='list_nodes_select'*)
List selected nodes

21.16.6 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

codeauthor Nitin Madhok <nmadhok@clemson.edu>

`salt.runners.ddns.`**`add_host`**(*zone*, *name*, *ttl*, *ip*, *keyname*, *keyfile*, *nameserver*, *timeout*, *port=53*, *keyalgorithm='hmac-md5'*)
Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.`**`create`**(*zone*, *name*, *ttl*, *rdtype*, *data*, *keyname*, *keyfile*, *nameserver*, *timeout*, *port=53*, *keyalgorithm='hmac-md5'*)
Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.`**`delete`**`(`*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*`)`

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↪0.0.1 5 A
```

`salt.runners.ddns.`**`delete_host`**`(`*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*`)`

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↪keyring 10.0.0.1 5
```

`salt.runners.ddns.`**`update`**`(`*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*`)`

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

Note: If `replace` is set to True, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

21.16.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall (jphall@saltstack.com).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the `Account` item in the left sidebar, and select `Account Access`. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key:␣
↪ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABC
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key:
↪ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABC
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.`**`del_cached_domain`**(*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com,domain2.example.com
```

`salt.runners.digicertapi.`**`gen_csr`**(*minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None*)

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.`**`gen_key`**(*minion_id, dns_name=None, password=None, key_len=2048*)

Generate and return a private_key. If a `dns_name` is passed in, the private_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.`**`get_certificate`**(*order_id=None, certificate_id=None, minion_id=None, cert_format='pem_all', filename=None*)

Retrieve a certificate by order_id or certificate_id and write it to stdout or a filename.

A list of permissible cert_formats is here: https://www.digicert.com/services/v2/documentation/appendix-certificate-formats

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs_csr, and needs_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the `filename` argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

`salt.runners.digicertapi.`**`get_org_details`**(*organization_id*)

Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

`salt.runners.digicertapi.`**`list_domain_cache`**()

List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

`salt.runners.digicertapi.`**`list_domains`**(*container_id=None*)

List domains that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id.

CLI Example:

```
salt-run digicert.list_domains
```

`salt.runners.digicertapi.`**`list_orders`**(*status=None*)

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

`salt.runners.digicertapi.`**`list_organizations`**(*container_id=None, include_validation=True*)

List organizations that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

`salt.runners.digicertapi.`**`list_requests`**(*status=None*)

List certificate requests made to CertCentral. You can filter by status: `pending`, `approved`, `rejected`

CLI Example:

```
salt-run digicert.list_requests pending
```

`salt.runners.digicertapi.`**`order_certificate`**(*minion_id, common_name, organization_id, validity_years, cert_key_passphrase=None, signature_hash=None, key_len=2048, dns_names=None, organization_units=None, server_platform=None, custom_expiration_date=None, comments=None, disable_renewal_notifications=False, product_type_hint=None, renewal_of_order_id=None*)

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10           3
↪signature_hash=sha256           dns_names=['this.domain.com', 'that.domain.com
↪']           organization_units='My Domain Org Unit'           comments=
↪'Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing *renewal_of_order_id*. Previous order details can be retrieved with digicertapi.list_orders.

`salt.runners.digicertapi.`**`show_csrs`**`()`

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

`salt.runners.digicertapi.`**`show_organization`**`(`*domain*`)`

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

`salt.runners.digicertapi.`**`show_rsa`**`(`*minion_id, dns_name*`)`

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

21.16.8 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.`**`execution`**`()`

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.`**`runner`**`()`

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.`**`wheel`**`()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

21.16.9 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

```
drac:
  username: admin
  password: secret
```

`salt.runners.drac.`**`poweroff`**(*hostname, timeout=20, username=None, password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

`salt.runners.drac.`**`poweron`**(*hostname, timeout=20, username=None, password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

`salt.runners.drac.`**`pxe`**(*hostname, timeout=20, username=None, password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.`**`reboot`**(*hostname, timeout=20, username=None, password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.`**`version`**(*hostname, timeout=20, username=None, password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

21.16.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.`**`error`**(*name=None, message=''*)

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

21.16.11 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.`**`send`**(*tag, data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

Parameters

- **`tag`** – the tag to send with the event
- **`data`** – an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
        foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
        baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

21.16.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com:
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

class `salt.runners.f5.`**`F5Mgmt`**(*lb, username, password*)

`add_pool_member`(*name, port, pool_name*)
Add a node to a pool

`check_member_pool`(*member, pool_name*)
Check a pool member exists in a specific pool

`check_pool`(*name*)
Check to see if a pool exists

`check_virtualserver`(*name*)
Check to see if a virtual server exists

`create_pool`(*name, method='ROUND_ROBIN'*)
Create a pool on the F5 load balancer

`create_vs`(*name, ip, port, protocol, profile, pool_name*)
Create a virtual server

`lbmethods`()
List all the load balancer methods

`salt.runners.f5.`**`add_pool_member`**(*lb, name, port, pool_name*)
Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

`salt.runners.f5.`**`check_member_pool`**(*lb, member, pool_name*)
Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

`salt.runners.f5.`**`check_pool`**(*lb, name*)
Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

`salt.runners.f5.`**`check_virtualserver`**(*lb, name*)
Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

`salt.runners.f5.`**`create_pool`**(*lb*, *name*, *method='ROUND_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

`salt.runners.f5.`**`create_vs`**(*lb*, *name*, *ip*, *port*, *protocol*, *profile*, *pool_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

21.16.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.`**`clear_cache`**(*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*`git`*, *`hg`*, *`svn`*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

backend Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.`**`clear_file_list_cache`**(*saltenv=None*, *backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

saltenv By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
```

(continues on next page)

(continued from previous page)

```
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See this GitHub issue for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = []  # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.`**`clear_lock`**(*backend=None, remote=None*)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, *hg*, *svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend Only clear the update lock for the specified backend(s).

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.`**`dir_list`**`(`*saltenv='base', backend=None*`)`

Return a list of directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.`**`empty_dir_list`**`(`*saltenv='base', backend=None*`)`

New in version 2015.5.0.

Return a list of empty directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as *git* and *hg*) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.`**`envs`**`(`*backend=None, sources=False*`)`

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.`**`file_list`**`(`*saltenv='base', backend=None*`)`

Return a list of files from the salt fileserver

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.`**`lock`**`(`*backend=None, remote=None*`)`

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git*, *hg*, *svn*).

Note: This will only operate on enabled backends (those configured in *fileserver_backend*).

---

backend Only set the update lock for the specified backend(s).

remote If not None, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.`**`symlink_list`**`(`*saltenv='base', backend=None*`)`

Return a list of symlinked files and dirs

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.`**`update`**`(`*backend=None*`)`

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend Narrow fileserver backends to a subset of the enabled ones.

> Changed in version 2015.5.0: If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.
>
> Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots', 'git']"`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

21.16.14 salt.runners.git_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.`**`update`**`(`*branch=None*, *repo=None*`)`

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *git_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git_pillar remotes. The return data has also changed to a dictionary. The values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given git_pillar remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Fetch one or all configured git_pillar remotes.

Note: This will *not* fast-forward the git_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git_pillar repos roughly every 60 seconds (or whatever *`loop_interval`* is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using *`saltutil.refresh_pillar`* and then use *`pillar.item`* to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

21.16.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.`**`query`**(*url*, *output=True*, ***kwargs*)

Query a resource, and decode the return data

Passes through all the parameters described in the *`utils.http.query function`*:

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST             params=
↪'key1=val1&key2=val2'
salt-run http.query http://somelink.com/ method=POST             data='<xml>
↪somecontent</xml>'
```

`salt.runners.http.`**`update_ca_bundle`**(*target=None*, *source=None*, *merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

21.16.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

`salt.runners.jobs.`**`active`**(*display_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

`salt.runners.jobs.`**`exit_success`**(*jid*, *ext_source=None*)

Check if a job has been executed and exit successfully

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.exit_success 20160520145827701627
```

salt.runners.jobs.**last_run**(*ext_source=None*, *outputter=None*, *metadata=None*, *function=None*, *target=None*, *display_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{'foo': 'bar'}"
```

salt.runners.jobs.**list_job**(*jid*, *ext_source=None*, *display_progress=False*)

List a specific job given by its jid

ext_source If provided, specifies which external job cache to use.

display_progress [False] If `True`, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

salt.runners.jobs.**list_jobs**(*ext_source=None*, *outputter=None*, *search_metadata=None*, *search_function=None*, *search_target=None*, *start_time=None*, *end_time=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source If provided, specifies which external job cache to use.

FILTER OPTIONS

Note: If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

search_metadata Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}'
```

search_function Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function='["test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

search_target Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target='["db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

start_time Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

end_time Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↪metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18
↪22:00'
```

`salt.runners.jobs.`**`list_jobs_filter`**(*count, filter_find_job=True, ext_source=None, outputter=None, display_progress=False*)

List all detectable jobs and associated functions

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

`salt.runners.jobs.`**`lookup_jid`**(*jid, ext_source=None, returned=True, missing=False, display_progress=False*)

Return the printout from a previously executed job

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

returned [True] If `True`, include the minions that did return from the command.

New in version 2015.8.0.

missing [False] If `True`, include the minions that did *not* return from the command.

display_progress [False] If `True`, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

`salt.runners.jobs.`**`print_job`**(*jid, ext_source=None*)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

21.16.17 salt.runners.launchd

Manage launchd plist files

`salt.runners.launchd.`**`write_launchd_plist`**(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

21.16.18 salt.runners.lxc

Control Linux Containers via Salt

depends lxc execution module

`salt.runners.lxc.`**`cloud_init`**`(`*names, host=None, quiet=False, **kwargs*`)`

Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion to start the container on. Required.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead

`salt.runners.lxc.`**`find_guest`**`(`*name, quiet=False, path=None*`)`

Returns the host for a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

`salt.runners.lxc.`**`find_guests`**`(`*names, path=None*`)`

Return a dict of hosts and named guests

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

`salt.runners.lxc.`**`freeze`**`(`*name, quiet=False, path=None*`)`

Freeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

`salt.runners.lxc.`**`info`**`(`*name, quiet=False, path=None*`)`

Returns information about a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

`salt.runners.lxc.`**`init`**`(`*names, host=None, saltcloud_mode=False, quiet=False, **kwargs*`)`

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
        [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
        [template=lxc_template_name] [clone=original name] \
        [profile=lxc_profile] [network_proflile=network_profile] \
        [nic=network_profile] [nic_opts=nic_opts] \
        [start=(true|false)] [seed=(true|false)] \
        [install=(true|false)] [config=minion_config] \
        [snapshot=(true|false)]
```

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion on which to initialize the container **(required)**

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation

cpuset cgroups cpuset.

cpushare cgroups cpu shares.

memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

template Name of LXC template on which to base this container

clone Clone this container from an existing container

profile A LXC profile (defined in config or pillar).

network_profile Network profile to use for the container

New in version 2015.5.2.

nic Deprecated since version 2015.5.0: Use `network_profile` instead

nic_opts Extra options for network interfaces. E.g.:

`{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}`

start Start the newly created container.

seed Seed the container with the minion config and autosign its key. Default: true

install If salt-minion is not already installed, install it. Default: true

config Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.`**`list_`**(*host=None*, *quiet=False*, *path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.`**`purge`**(*name*, *delete_key=True*, *quiet=False*, *path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.`**`start`**(*name*, *quiet=False*, *path=None*)

Start the named container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.`**`stop`**(*name*, *quiet=False*, *path=None*)

Stop the named container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.`**`unfreeze`**`(`*name, quiet=False, path=None*`)`

Unfreeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

21.16.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.`**`alived`**`(`*subset=None, show_ip=False, show_ipv4=None*`)`

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.`**`allowed`**`(`*subset=None, show_ip=False, show_ipv4=None*`)`

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

`salt.runners.manage.`**`bootstrap`**`(`*version='develop', script=None, hosts='', script_args='', roster='flat', ssh_user=None, ssh_password=None, ssh_priv_key=None, tmp_dir='/tmp/.bootstrap', http_backend='tornado'*`)`

Bootstrap minions with salt-bootstrap

version [develop] Git tag of version to install

script [https://bootstrap.saltstack.com] URL containing the script to execute

hosts Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

script_args Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

roster [flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt's Roster Documentation*.

A full list of roster types, see the *builtin roster modules* documentation.

New in version 2016.11.0.

ssh_user If `user` isn't found in the `roster`, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the roster `user` value if it is already defined.

New in version 2016.11.0.

ssh_password If `passwd` isn't found in the `roster`, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

ssh_privkey If `priv` isn't found in the `roster`, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

tmp_dir [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

http_backend [tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'          script=
↪'https://bootstrap.saltstack.com/develop'
```

`salt.runners.manage.`**`bootstrap_psexec`**(*hosts='', master=None, version=None, arch='win32', installer_url=None, username=None, password=None*)

Bootstrap Windows minions via PsExec.

hosts Comma separated list of hosts to deploy the Windows Salt minion.

master Address of the Salt master passed as an argument to the installer.

version Point release of installer to download. Defaults to the most recent.

arch Architecture of installer to download. Defaults to win32.

installer_url URL of minion installer executable. Defaults to the latest version from https://repo.saltstack.com/windows/

username Optional user name for login on remote computer.

password Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↪'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↪exampledomain/salt-installer.exe'
```

`salt.runners.manage.`**`down`**(*removekeys=False, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

`salt.runners.manage.`**`joined`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.`**`key_regen`**`()`

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The key_regen routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a salt-key -A command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.`**`list_not_state`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.`**`list_state`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.list_state
```

`salt.runners.manage.`**`not_alived`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`
New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_alived
```

`salt.runners.manage.`**`not_allowed`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`
New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_allowed
```

`salt.runners.manage.`**`not_joined`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`
New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_joined
```

`salt.runners.manage.`**`not_present`**`(`*subset=None*, *show_ip=False*, *show_ipv4=None*`)`
New in version 2015.5.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_present
```

`salt.runners.manage.`**`not_reaped`**(*subset=None*, *show_ip=False*, *show_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.`**`present`**(*subset=None*, *show_ip=False*, *show_ipv4=None*)

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.`**`reaped`**(*subset=None*, *show_ip=False*, *show_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.`**`safe_accept`**(*target*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

`salt.runners.manage.`**`status`**(*output=True*, *tgt='*'*, *tgt_type='glob'*, *timeout=None*, *gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.`**`up`**`(`*tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None*`)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.`**`versions`**`()`

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

21.16.20 salt.runners.mattermost

Note for 2017.7 releases!

Due to the salt.runners.config module not being available in this release series, importing the salt.runners.config module from the master branch is required to make this module work.

Ref: Mattermost runner failing to retrieve config values due to unavailable config runner #43479

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

`salt.runners.mattermost.`**`post_event`**`(`*event, channel=None, username=None, api_url=None, hook=None*`)`

Send an event to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param event: The event to send to the Mattermost channel. :param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

`salt.runners.mattermost.`**`post_message`**`(`*message, channel=None, username=None, api_url=None, hook=None*`)`

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel. :param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

21.16.21 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.`**`get`**`(`*tgt, fun, tgt_type='glob'*`)`

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.`**`update`**`(`*tgt, tgt_type='glob', clear=False, mine_functions=None*`)`

New in version 2017.7.0.

Update the mine data on a certain group of minions.

tgt Which minions to target for the execution.

tgt_type: **`glob`** The type of `tgt`.

clear: **`False`** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: `False` (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

21.16.22 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have *pillar_opts=True*:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
    # also `box_type` default changed from secretbox to sealedbox.
    box_type: sealedbox                     (default)
    sk_file: /etc/salt/pki/master/nacl      (default)
    pk_file: /etc/salt/pki/master/nacl.pub  (default)
    sk: None
    pk: None
```

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↪pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk_file* and *pk_file* use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-run nacl.keygen
local:
    ----------
    pk:
        /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
    sk:
        SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-run nacl.dec data=
↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/+cYsk6m5WhGdk58='
↪        sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    sk_file: /etc/salt/pki/master/nacl
    pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public key
nacl.config:
    pk: '/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
    user: root
    password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hlbWj0llUA+uaVyvou3vJ4=')|json}}
    cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}}
    cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

`salt.runners.nacl.`**`dec`**(*data*, ***kwargs*)

Alias to *{box_type}_decrypt*

box_type: secretbox, sealedbox(default)

`salt.runners.nacl.`**`dec_file`**(*name*, *out=None*, ***kwargs*)

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox             sk_
↪file=/etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.`**`enc`**(*data*, ***kwargs*)

Alias to *{box_type}_encrypt*

box_type: secretbox, sealedbox(default)

`salt.runners.nacl.`**`enc_file`**(*name*, *out=None*, ***kwargs*)

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox             sk_file=/
↪etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.`**`keygen`**(*sk_file=None*, *pk_file=None*, ***kwargs*)

Use libnacl to generate a keypair.

If no *sk_file* is defined return a keypair.

If only the *sk_file* is defined *pk_file* will use the same name with a postfix *.pub*.

When the *sk_file* is already existing, but *pk_file* is not. The *pk_file* will be generated using the *sk_file*.

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
↪master/nacl.pub
salt-run nacl.keygen
```

`salt.runners.nacl.`**`sealedbox_decrypt`**(*data*, ***kwargs*)

Decrypt data using a secret key that was encrypted using a public key with *nacl.sealedbox_encrypt*.

CLI Examples:

```
salt-run nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/
↪master/nacl
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.`**`sealedbox_encrypt`**(*data*, ***kwargs*)
Encrypt data using a public key generated from *nacl.keygen*. The encryptd data can be decrypted using *nacl.sealedbox_decrypt* only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
```

`salt.runners.nacl.`**`secretbox_decrypt`**(*data*, ***kwargs*)
Decrypt data that was encrypted using *nacl.secretbox_encrypt* using the secret key that was generated from *nacl.keygen*.

CLI Examples:

```
salt-run nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/
↪master/nacl
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.`**`secretbox_encrypt`**(*data*, ***kwargs*)
Encrypt data using a secret key generated from *nacl.keygen*. The same secret key can be used to decrypt the data using *nacl.secretbox_decrypt*.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

21.16.23 salt.runners.net

NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

Configuration

- Minion (proxy) config

  To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

  ```
  mine_functions:
    net.ipaddrs: []
    net.lldp: []
    net.mac: []
    net.arp: []
    net.interfaces: []
  ```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

  By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

  target: `*` From what minions will collect the mine data. Default: `*` (collect from all minions).

  expr_form: `glob` Minion matching expression form. Default: `glob`.

  ignore_interfaces A list of interfaces name to ignore. By default will consider all interfaces.

  display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

  outputter: `table` Specify the outputter name when displaying on the CLI. Default: `table`.

  Configuration example:

```
runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml
```

`salt.runners.net.find`(*addr*, *best=True*, *display=True*)

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

best: `True` Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
↪returned
_________________________________________________________________________________
↪______________________________________
```

(continues on next page)

(continued from previous page)

_____________________________________________________________________________
```

salt.runners.net.**findarp**(*device=None, interface=None, mac=None, ip=None, display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

ip Search using a specific IP Address.

display: **`True`** Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```
ARP Entries for MAC 8C:60:0F:78:EC:41
________________________________________________________________________________
|    Device    |      Interface      |        MAC        |       IP      |  Age  |

| edge01.bjm01 | irb.171 [ae0.171] | 8C:60:0F:78:EC:41 | 172.172.17.19 | 956.0 |
________________________________________________________________________________
```

salt.runners.net.**findmac**(*device=None, mac=None, interface=None, vlan=None, display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

vlan Search using a VLAN ID.

display: **`True`** Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

```
MAC Address(es)
__________________________________________________________________________________
↪___________
```

(continues on next page)

(continued from previous page)

```

↪   0.0    |
----------------------------------------------------------------------------------
↪___________
```

salt.runners.net.**interfaces**(*device=None*, *interface=None*, *title=None*, *pattern=None*, *ipnet=None*, *best=True*, *display=True*)

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddrs

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return interfaces that contain a certain pattern in their description.

ipnet Return interfaces whose IP networks associated include this IP network.

best: `True` When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

display: **True** Display on the screen or return structured object? Default: `True` (return on the CLI).

title Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
----------------------------------------------------------------------------------
↪_______________________________
|    Device     | Interface | Interface Description |  UP  | Enabled | Speed☒
↪[Mbps] | MAC Address | IP Addresses |

```

salt.runners.net.**lldp**(*device=None*, *interface=None*, *title=None*, *pattern=None*, *chassis=None*, *display=True*)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

chassis Search using a specific Chassis ID.

display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

title Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details

salt.runners.net.**multi_find**(**patterns*, ***kwargs*)

Execute multiple search tasks. This function is based on the *find* function. Depending on the search items, some information might overlap.

Optional arguments:

best: `True` Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: `True` Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

21.16.24 salt.runners.network

Network tools to run from the Master

`salt.runners.network.`**`wol`**(*mac, bcast='255.255.255.255', destport=9*)

Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

`salt.runners.network.`**`wollist`**(*maclist, bcast='255.255.255.255', destport=9*)

Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wollist '/path/to/maclist'
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
```

`salt.runners.network.`**`wolmatch`**(*tgt, tgt_type='glob', bcast='255.255.255.255', destport=9*)

Send a "Magic Packet" to wake up Minions that are matched in the grains cache

CLI Example:

```
salt-run network.wolmatch minion_id
salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.255.255⊠
↪destport=7
```

21.16.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master config.

For example:

```
my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

`salt.runners.pagerduty.`**`create_event`**(*service_key=None*, *description=None*, *details=None*, *incident_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>          ⏎
↪profile=my-pagerduty-account
```

The following parameters are required:
service_key This key can be found by using pagerduty.list_services.
description This is a short description of the event.
details This can be a more detailed description of the event.
profile This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.`**`list_escalation_policies`**(*profile=None*, *api_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies my-pagerduty-account

`salt.runners.pagerduty.`**`list_incidents`**(*profile=None*, *api_key=None*)

List incidents belonging to this account

CLI Example:

salt-run pagerduty.list_incidents my-pagerduty-account

`salt.runners.pagerduty.`**`list_maintenance_windows`**(*profile=None*, *api_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

salt-run pagerduty.list_windows my-pagerduty-account salt-run pagerduty.list_maintenance_windows my-pagerduty-account

`salt.runners.pagerduty.`**`list_policies`**(*profile=None*, *api_key=None*)

List escalation policies belonging to this account

CLI Example:

salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies my-pagerduty-account

`salt.runners.pagerduty.`**`list_schedules`**(*profile=None*, *api_key=None*)

List schedules belonging to this account

CLI Example:

salt-run pagerduty.list_schedules my-pagerduty-account

`salt.runners.pagerduty.`**`list_services`**(*profile=None*, *api_key=None*)

List services belonging to this account

CLI Example:

salt-run pagerduty.list_services my-pagerduty-account

`salt.runners.pagerduty.`**`list_users`**(*profile=None*, *api_key=None*)

List users belonging to this account

CLI Example:

salt-run pagerduty.list_users my-pagerduty-account

`salt.runners.pagerduty.`**`list_windows`**(*profile=None*, *api_key=None*)

List maintenance windows belonging to this account

CLI Example:

salt-run pagerduty.list_windows my-pagerduty-account salt-run pagerduty.list_maintenance_windows my-pagerduty-account

21.16.26 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.`**`show_pillar`**(*minion='*'*, ***kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `*`. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar_source_merging_strategy.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.`**`show_top`**(*minion=None*, *saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

21.16.27 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.`**`list_upgrades`**(*jid*, *style='group'*, *outputter='nested'*, *ext_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

21.16.28 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: `pgjsonb`).

Once the queue is setup, the *runner_queue* will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

Note: only the queue is required, this defaults to using pgjsonb

---

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process_runner task was executed.

`salt.runners.queue.`**`delete`**(*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue "['item1', 'item2', 'item3']"
```

`salt.runners.queue.`**`insert`**(*queue, items, backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue "['item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue "['item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.`**`insert_runner`**(*fun, args=None, kwargs=None, queue=None, backend=None*)

Insert a reference to a runner into the queue so that it can be run later.

fun The runner function that is going to be run

args list or comma-seperated string of args to send to fun

kwargs dictionary of keyword arguments to send to fun

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo
↪": "bar"}}'
```

`salt.runners.queue.`**`list_items`**(*queue, backend='sqlite'*)

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.`**`list_length`**(*queue*, *backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.`**`list_queues`**(*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.`**`pop`**(*queue*, *quantity=1*, *backend='sqlite'*, *is_runner=False*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.`**`process_queue`**(*queue*, *quantity=1*, *backend='sqlite'*, *is_runner=False*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

`salt.runners.queue.`**`process_runner`**(*quantity=1*, *queue=None*, *backend=None*)

Process queued runners

quantity number of runners to process

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

21.16.29 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

engines:

- reactor

`salt.runners.reactor.`**`add`**`(`*event, reactors, saltenv='base', test=None*`)`

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↪'
```

`salt.runners.reactor.`**`delete`**`(`*event, saltenv='base', test=None*`)`

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.`**`list_`**`(`*saltenv='base', test=None*`)`

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

21.16.30 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.`**`cmd`**`(`*fun, *args, **kwargs*`)`

Changed in version 2018.3.0: Added `with_pillar` argument

Execute `fun` with the given `args` and `kwargs`. Parameter `fun` should be the string *name* of the execution module to call.

Note: Execution modules will be loaded *every time* this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using *`salt-run saltutil.sync_modules`*, otherwise they will not be available.

---

with_pillar [False] If `True`, pillar data will be compiled for the master

> **Note:** To target the master in the pillar top file, keep in mind that the default `id` for the master is `<hostname>_master`. This can be overridden by setting an `id` configuration parameter in the master config file.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.`**`execute`**(*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', jid='', kwarg=None, **kwargs*)

New in version 2017.7.0.

Execute `fun` on all minions matched by `tgt` and `tgt_type`. Parameter `fun` is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
    collect_bgp_stats:
        function: salt.execute
        args:
            - edge-routers
            - bgp.neighbors
        kwargs:
            tgt_type: nodegroup
        days: 1
        returner: redis
```

21.16.31 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the *saltutil module* for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.`**`sync_all`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync all custom types

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'], 'grains
↪': []}
```

`salt.runners.saltutil.`**`sync_cache`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

`salt.runners.saltutil.`**`sync_clouds`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

`salt.runners.saltutil.`**`sync_eauth_tokens`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_eauth_tokens
```

`salt.runners.saltutil.`**`sync_engines`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync engines from `salt://_engines` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

`salt.runners.saltutil.`**`sync_executors`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 3000.

Sync executor modules from `salt://_executors` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_executors
```

`salt.runners.saltutil.`**`sync_fileserver`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

New in version 2018.3.0.

Sync fileserver modules from `salt://_fileserver` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_fileserver
```

`salt.runners.saltutil.`**`sync_grains`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync grains modules from `salt://_grains` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_grains
```

`salt.runners.saltutil.`**`sync_modules`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync execution modules from `salt://_modules` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_modules
```

`salt.runners.saltutil.`**`sync_output`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync output modules from `salt://_output` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_output
```

`salt.runners.saltutil.`**`sync_pillar`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync pillar modules from `salt://_pillar` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_pillar
```

`salt.runners.saltutil.`**`sync_proxymodules`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync proxy modules from `salt://_proxy` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_proxymodules
```

`salt.runners.saltutil.`**`sync_queues`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync queue modules from `salt://_queues` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

`salt.runners.saltutil.`**`sync_renderers`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync renderer modules from from `salt://_renderers` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

`salt.runners.saltutil.`**`sync_returners`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync returner modules from `salt://_returners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

`salt.runners.saltutil.`**`sync_roster`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 2017.7.0.

Sync roster modules from `salt://_roster` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

`salt.runners.saltutil.`**`sync_runners`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync runners from `salt://_runners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

`salt.runners.saltutil.`**`sync_sdb`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync sdb modules from `salt://_sdb` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.`**`sync_serializers`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2019.2.0.

Sync serializer modules from `salt://_serializers` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.`**`sync_states`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync state modules from `salt://_states` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.`**`sync_thorium`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

saltenv: **`base`** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist comma-seperated list of modules to sync

extmod_blacklist comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_thorium
```

`salt.runners.saltutil.`**`sync_tops`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master_tops modules from `salt://_tops` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.`**`sync_utils`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.`**`sync_wheel`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync wheel modules from `salt://_wheel` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

21.16.32 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.`**`delete`**`(`*uri*`)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt-run sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.`**`get`**`(`*uri*`)`

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt-run sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.`**`get_or_set_hash`**(*uri*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.`**`set_`**(*uri*, *value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt-run sdb.set sdb://mymemcached/foo bar
```

21.16.33 salt.runners.smartos_vmadm

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.`**`get`**(*search*, *one=True*)

Return information for vms

search [string] filter vms, see the execution module.

one [boolean] return only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.`**`is_running`**(*search*)

Return true if vm is running

search [string] filter vms, see the execution module.

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

Note: If multiple vms are matched, the result will be true of ALL vms are running

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

`salt.runners.smartos_vmadm.`**`list_vms`**(*search=None*, *verbose=False*)

List all vms

search [string] filter vms, see the execution module

verbose [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

`salt.runners.smartos_vmadm.`**`nodes`**(*verbose=False*)

List all compute nodes

verbose [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

`salt.runners.smartos_vmadm.`**`reboot`**(*search*, *one=True*, *force=False*)

Reboot one or more vms

search [string] filter vms, see the execution module.

one [boolean] reboot only one vm

force [boolean] force reboot, faster but no graceful shutdown

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.`**`start`**(*search*, *one=True*)

Start one or more vms

search [string] filter vms, see the execution module.

one [boolean] start only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.`**`stop`**(*search*, *one=True*)

Stop one or more vms

search [string] filter vms, see the execution module.

one [boolean] stop only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

21.16.34 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

codeauthor Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>

maintainer Benedikt Werner <1benediktwerner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

Note: Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

`salt.runners.spacewalk.`**`addGroupsToKey`**(*server, activation_key, groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,
↪group2]'
```

`salt.runners.spacewalk.`**`api`**(*server, command, *args, **kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
↪Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
↪"MyGroup", "Description"]'
```

State Example:

```
create_group:
  salt.runner:
    - name: spacewalk.api
    - server: spacewalk01.domain.com
    - command: systemgroup.create
    - arguments:
      - MyGroup
      - Description
```

`salt.runners.spacewalk.`**`deleteAllActivationKeys`**`(`*server*`)`

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.`**`deleteAllGroups`**`(`*server*`)`

Delete all server groups from Spacewalk

`salt.runners.spacewalk.`**`deleteAllSystems`**`(`*server*`)`

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

`salt.runners.spacewalk.`**`unregister`**`(`*name, server_url*`)`

Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

21.16.35 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.`**`cmd`**`(`*tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None*`)`

New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the *`SSHClient.cmd`* method.

21.16.36 salt.runners.state

Execute orchestration functions

`salt.runners.state.`**`event`**`(`*tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='master'*`)`

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **`tagmatch`** – the event is written to stdout for each tag that matches this glob or regular expression.
- **`count`** – this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **`quiet`** – do not print to stdout; just block
- **`sock_dir`** – path to the Salt master's event socket file.
- **`pretty`** – Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **`node`** – Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\
    salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \\
    salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\
    salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\
    salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
    echo $data | jq --color-output .
done
```

See also:

See https://github.com/saltstack/salt/blob/master/tests/eventlisten.sh for an example of usage within a shell script.

`salt.runners.state.`**`orchestrate`**(*mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None, pillar_enc=None, orchestration_jid=None*)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *`Docs for the master-side state module`*

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

`salt.runners.state.`**`orchestrate_high`**(*data*, *test=None*, *queue=False*, *pillar=None*, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
            require: [{salt: stage_one}],
        }]},
    }'
```

`salt.runners.state.`**`orchestrate_show_sls`**(*mods*, *saltenv='base'*, *test=None*, *queue=False*, *pillar=None*, *pillarenv=None*, *pillar_enc=None*)

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to it's minion id.

See also:

The state.show_sls module function

CLI Example: .. code-block:: bash
salt-run state.orch_show_sls my-orch-formula.my-orch-state 'pillar={ nodegroup: ng1 }'

`salt.runners.state.`**`orchestrate_single`**(*fun*, *name*, *test=None*, *queue=False*, *pillar=None*, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

`salt.runners.state.`**`pause`**(*jid*, *state_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.`**`resume`**(*jid*, *state_id=None*)

Remove a pause from a jid, allowing it to continue

`salt.runners.state.`**`rm_pause`**(*jid*, *state_id=None*)

This function is an alias of `resume`.

Remove a pause from a jid, allowing it to continue

`salt.runners.state.`**`set_pause`**(*jid*, *state_id=None*, *duration=None*)

This function is an alias of `pause`.

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.`**`soft_kill`**(*jid*, *state_id=None*)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

21.16.37 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *"some of these things are not like the others..."* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.`**`diff`**(**args*, ***kwargs*)

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences – namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
             <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.`**`hash`**(**args*, ***kwargs*)

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
          <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

21.16.38 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.`**`arg`**`(`**args, **kwargs*`)`
Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

`salt.runners.test.`**`get_opts`**`()`
New in version 2018.3.0.

Return the configuration options of the master.

CLI Example:

```
salt-run test.get_opts
```

`salt.runners.test.`**`metasyntactic`**`(`*locality='us'*`)`
Return common metasyntactic variables for the given locality

`salt.runners.test.`**`raw_arg`**`(`**args, **kwargs*`)`
Output the given args and kwargs

`salt.runners.test.`**`sleep`**`(`*s_time=10*`)`
Sleep t seconds, then return True

`salt.runners.test.`**`stdout_print`**`()`
Print 'foo' and return 'bar'

`salt.runners.test.`**`stream`**`()`
Return True

21.16.39 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.`**`generate`**`(`*extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3', absonly=True, compress='gzip'*`)`
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.`**`generate_min`**`(`*extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3'*`)`
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

21.16.40 salt.runners.vault

maintainer SaltStack

maturity new

platform all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

`salt.runners.vault.`**`generate_token`**`(`*minion_id*, *signature*, *impersonated_by_master=False*`)`

Generate a Vault token for minion minion_id

minion_id The id of the minion that requests a token

signature Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see impersonated_by_master).

impersonated_by_master If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

`salt.runners.vault.`**`show_policies`**`(`*minion_id*`)`

Show the Vault policies that are applied to tokens for the given minion

minion_id The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

`salt.runners.vault.`**`unseal`**`()`

Unseal Vault server

This function uses the 'keys' from the 'vault' configuration to unseal vault server

vault:

keys:

- n63/TbrQuL3xaIW7ZZpuXj/tIfnK1/MbVxO4vT3wYD2A
- S9OwCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
- F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
- 1cYtvjKJNDVam9c7HNqJUfINk4PYyAXIpjkpN/sIuzPv
- 3pPK5X6vGtwLhNOFv1U2elahECz3HpRUfNXJFYLw6lid

CLI Examples:

```
salt-run vault.unseal
```

21.16.41 salt.runners.venafiapi

Support for Venafi

depends

- vcert Python module

configuration In order to connect to Venafi services you need to specify it in Salt master configuration. Example for Venafi Cloud (using env variables):

venafi: api_key: "sdb://osenv/CLOUDAPIKEY"

Example for Venafi Platform (using env variables):

venafi: base_url: "https://tpp.example.com/" tpp_user: admin tpp_password: "sdb://osenv/TPP_PASSWORD" trust_bundle: "/opt/venafi/bundle.pem"

`salt.runners.venafiapi.`**`del_cached_domain`**`(`*domains*`)`

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com,domain2.example.com
```

`salt.runners.venafiapi.`**`list_domain_cache`**`()`

List domains that have been cached

CLI Example:

```
salt-run venafi.list_domain_cache
```

`salt.runners.venafiapi.`**`renew`**`(`*minion_id, dns_name=None, zone=None, country=None, state=None, loc=None, org=None, org_unit=None, key_password=None, csr_path=None, pkey_path=None*`)`

Request a new certificate

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.`**`request`**`(`*minion_id, dns_name=None, zone=None, country=None, state=None, loc=None, org=None, org_unit=None, key_password=None, csr_path=None, pkey_path=None*`)`

Request a new certificate

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.`**`show_cert`**`(`*dns_name*`)`

Show issued certificate for domain

CLI Example:

```
salt-run venafi.show_cert example.com
```

21.16.42 salt.runners.virt

Control virtual machines via Salt

`salt.runners.virt.`**`force_off`**`(`*name*`)`

Force power down the named virtual machine

`salt.runners.virt.`**`host_info`**`(`*host=None*`)`

Return information about the host connected to this master `salt.runners.virt.`**`init`**(*name*, *cpu*, *mem*, *image*, *hypervisor='kvm'*, *host=None*, *seed=True*, *nic='default'*, *install=True*, *start=True*, *disk='default'*, *saltenv='base'*, *enable_vnc=False*, *seed_cmd='seed.apply'*, *enable_qcow=False*)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

name The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

cpu The number of cpus to allocate to this new virtual machine.

mem The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

image The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

hypervisor The hypervisor to use for the new virtual machine. Default is *kvm*.

host The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

seed Set to *False* to prevent Salt from seeding the new virtual machine.

nic The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.

install Set to False to prevent Salt from installing a minion on the new VM before it spins up.

disk The disk profile to use

saltenv The Salt environment to use

enable_vnc Whether a VNC screen is attached to resulting VM. Default is *False*.

seed_cmd If seed is *True*, use this execution module function to seed new VM. Default is *seed.apply*.

enable_qcow Clone disk image as a copy-on-write qcow2 image, using downloaded *image* as backing file.

`salt.runners.virt.`**`list`**(*host=None*, *quiet=False*, *hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

`salt.runners.virt.`**`migrate`**(*name*, *target=''*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

`salt.runners.virt.`**`next_host`**()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most "available" next host.

`salt.runners.virt.`**`pause`**(*name*)

Pause the named VM

`salt.runners.virt.`**`purge`**(*name*, *delete_key=True*)

Destroy the named VM

`salt.runners.virt.`**`query`**(*host=None*, *quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

`salt.runners.virt.`**`reset`**(*name*)

Force power down and restart an existing VM

`salt.runners.virt.`**`resume`**(*name*)

Resume a paused VM

`salt.runners.virt.`**`start`**(*name*)

Start a named virtual machine

`salt.runners.virt.`**`vm_info`**(*name*, *quiet=False*)

Return the information on the named VM

21.16.43 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (http://www.vistarait.com/) REST API

codeauthor Brad Thurber <brad.thurber@gmail.com>

To use this runner, the Vistara client_id and Vistara oauth2 client_key and client_secret must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

`salt.runners.vistara.`**`delete_device`**(*name*, *safety_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, delete_device will only perform the delete if a single host is returned. Set safety_on=False to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

21.16.44 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.`**`genrepo`**(*opts=None*, *fire_event=True*)

Generate winrepo_cachefile based on sls files in the winrepo_dir

opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

fire_event [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.`**`update_git_repos`**(*opts=None*, *clean=False*, *masterless=False*)

Checkout git repos containing Windows Software Package Definitions

opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

clean [False] Clean repo cachedirs which are not configured under *`winrepo_remotes`*.

> **Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

21.17 sdb modules

cache	cache Module
confidant	An SDB module for getting credentials from confidant.
consul	Consul sdb Module
couchdb	CouchDB sdb Module
env	Environment sdb Module
etcd_db	etcd Database Module
keyring_db	Keyring Database Module
memcached	Memcached sdb Module
redis_sdb	Redis SDB module
rest	Generic REST API SDB Module
sqlite3	SQLite sdb Module
tism	tISM - the Immutable Secrets Manager SDB Module
vault	Vault SDB Module
yaml	Pull sdb values from a YAML file

21.17.1 salt.sdb.cache module

cache Module

maintainer SaltStack

maturity New

platform all

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-conf/
↪saltmaster
```

`salt.sdb.cache.`**`delete`**(*key*, *service=None*, *profile=None*)

Get a value from the cache service

`salt.sdb.cache.`**`get`**(*key*, *service=None*, *profile=None*)

Get a value from the cache service

`salt.sdb.cache.`**`set_`**(*key*, *value*, *service=None*, *profile=None*)

Set a key/value pair in the cache service

21.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

depends confidant-common, confidant-client

Module Documentation

`salt.sdb.confidant.`**`get`**(*key*, *profile=None*)

Read pillar data from Confidant via its API.

CLI Example:

salt myminion sdb.get 'sdb://confidant/credentials'

Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can't be trusted.

21.17.3 salt.sdb.consul module

Consul sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to Consul using an `sdb://` URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
myconsul:
  driver: consul
  host: 127.0.0.1
  port: 8500
  token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  scheme: http
  consistency: default
  dc: dev
  verify: True
```

The `driver` refers to the Consul module, all other options are optional. For option details see: https://python-consul.readthedocs.io/en/latest/#consul

`salt.sdb.consul.`**`get`**`(`*key*, *profile=None*`)`

`salt.sdb.consul.`**`get_conn`**`(`*profile*`)`
Return a client object for accessing consul

`salt.sdb.consul.`**`set_`**`(`*key*, *value*, *profile=None*`)`

21.17.4 salt.sdb.couchdb

CouchDB sdb Module

maintainer SaltStack

maturity New

depends python2-couchdb

platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's *sdb* system to allow for inserts and retrevals using the *sdb://* prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an *sdb://* URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

`salt.sdb.couchdb.`**`get`**`(`*key, profile=None*`)`
Get a value from couchdb by id

`salt.sdb.couchdb.`**`set_`**`(`*key, value, profile=None*`)`
Set a key/value pair in couchdb

21.17.5 salt.sdb.env module

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:
  driver: env
```

WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif  %}
```

The above example will return success.

The `env` sdb module can also be used with salt cloud. Assuming you have exported the environment variable named `compute` (and have `osenv` defined). The example below will look for the salt cloud config key `compute_name` in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

`salt.sdb.env.`**`get`**(*key*, *profile=None*)
Get a value

`salt.sdb.env.`**`set_`**(*key*, *value*, *profile=None*)
Set a key/value pair

21.17.6 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack

maturity New

depends python-etcd

platform all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/python-etcd`.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 2379
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.`**`delete`**(*key*, *service=None*, *profile=None*)
Get a value from the etcd service

`salt.sdb.etcd_db.`**`get`**(*key*, *service=None*, *profile=None*)
Get a value from the etcd service

`salt.sdb.etcd_db.`**`set_`**(*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in the etcd service

21.17.7 salt.sdb.keyring_db

Keyring Database Module

maintainer SaltStack

maturity New

depends keyring

platform all

This module allows access to the keyring package using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/keyring`.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

https://pypi.python.org/pypi/keyring

New in version 2014.1.4.

`salt.sdb.keyring_db.`**`get`**`(`*key*, *service=None*, *profile=None*`)`
Get a value from a keyring service

`salt.sdb.keyring_db.`**`set_`**`(`*key*, *value*, *service=None*, *profile=None*`)`
Set a key/value pair in a keyring service

21.17.8 salt.sdb.memcached

Memcached sdb Module

maintainer SaltStack

maturity New

depends python-memcached

platform all

This module allows access to memcached using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/python-memcached`.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  memcached.host: localhost
  memcached.port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

`salt.sdb.memcached.`**`get`**`(`*key, profile=None*`)`
Get a value from memcached

`salt.sdb.memcached.`**`set_`**`(`*key, value, profile=None*`)`
Set a key/value pair in memcached

21.17.9 salt.sdb.redis_sdb module

Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an `sdb://` URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
sdb_redis:
  driver: redis
  host: 127.0.0.1
  port: 6379
  password: pass
  db: 1
```

The `driver` refers to the Redis module, all other options are optional. For option details see: https://redis-py.readthedocs.io/en/latest/.

`salt.sdb.redis_sdb.`**`delete`**`(`*key, profile=None*`)`
Delete a key from the Redis SDB.

`salt.sdb.redis_sdb.`**`get`**`(`*key, profile=None*`)`
Get a value from the Redis SDB.

`salt.sdb.redis_sdb.`**`set_`**`(`*key, value, profile=None*`)`
Set a value into the Redis SDB.

21.17.10 salt.sdb.rest module

Generic REST API SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
    backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
    params:
      user: myuser
```

`salt.sdb.rest.`**`get`**(*key*, *service=None*, *profile=None*)
  Get a value from the REST interface

`salt.sdb.rest.`**`query`**(*key*, *value=None*, *service=None*, *profile=None*)
  Get a value from the REST interface

`salt.sdb.rest.`**`set_`**(*key*, *value*, *service=None*, *profile=None*)
  Set a key/value pair in the REST interface

21.17.11 salt.sdb.sqlite3

SQLite sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to sqlite3 using an `sdb://` URI

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the sqlite3 module, `database` refers to the sqlite3 database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

```
myadvanced
  driver: sqlite3
  database: /tmp/sdb-advanced.sqlite
create_statements:
  - "CREATE TABLE advanced (a text, b text, c blob, d blob)"
  - "CREATE INDEX myidx ON advanced (a)"
get_query: "SELECT d FROM advanced WHERE a=:key"
set_query: "INSERT OR REPLACE INTO advanced (a, d) VALUES (:key, :value)"
```

`salt.sdb.sqlite3.`**`get`**(*key*, *profile=None*)
: Get a value from sqlite3

`salt.sdb.sqlite3.`**`set_`**(*key*, *value*, *profile=None*)
: Set a key/value pair in sqlite3

21.17.12 salt.sdb.tism module

tISM - the Immutable Secrets Manager SDB Module

maintainer tISM

maturity New

platform all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>

sdb://tism/
↪hQEMAzJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwAOqlRiNp0F7IpiiVRF+h+sW5Mb4ffB1TElMzQ+/
↪G5ptd6CjmgBfBsuGeajWmvLEi4lC6/
↪9v1rYGjjLeOCCcN4Dl5AHlxUUaSrxB8akTDvSAnPvGhtRTZqDlltl5UEHsyYXM8RaeCrBw5Or1yvC9Ctx2saVp3xmALQvyhzkU
↪H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use sdb in a runner or pillar you must also place a profile in the master configuration.

```
tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
↪eyJhZG1pbiI6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWdtdmw4Iiwia2V5cyI6WyJBTEwiXX0.
↪RtAhG6Uorf5xnSf4Ya_GwJnoHkCsql4r1_hiOeDSLzo
```

(continues on next page)

(continued from previous page)

```
```

`salt.sdb.tism.`**`get`**(*key*, *service=None*, *profile=None*)
Get a decrypted secret from the tISMd API

21.17.13 salt.sdb.vault module

Vault SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```
myvault:
  driver: vault
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords/mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

`salt.sdb.vault.`**`get`**(*key*, *profile=None*)
Get a value from the vault service

`salt.sdb.vault.`**`set_`**(*key*, *value*, *profile=None*)
Set a key/value pair in the vault service

21.17.14 salt.sdb.yaml module

Pull sdb values from a YAML file

maintainer SaltStack

maturity New

platform all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
  gpg: true
```

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the *GPG renderer*.

`salt.sdb.yaml.`**`get`**`(`*key*, *profile=None*`)`

Get a value from the dictionary

`salt.sdb.yaml.`**`set_`**`(`**args*, ***kwargs*`)`

Setting a value is not supported; edit the YAML files directly

21.18 serializer modules

configparser	salt.serializers.configparser
json	salt.serializers.json
msgpack	salt.serializers.msgpack
python	salt.serializers.python
toml	salt.serializers.toml
yaml	salt.serializers.yaml
yamlex	salt.serializers.yamlex

21.18.1 salt.serializers.configparser module

salt.serializers.configparser

New in version 2016.3.0.

Implements a configparser serializer.

`salt.serializers.configparser.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **`stream_or_string`** – stream or string to deserialize.
- **`options`** – options given to lower configparser module.

`salt.serializers.configparser.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to a configparser formatted string or file.

Parameters

- **`obj`** – the data structure to serialize
- **`options`** – options given to lower configparser module.

21.18.2 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **`stream_or_string`** – stream or string to deserialize.
- **`options`** – options given to lower json/simplejson module.

`salt.serializers.json.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to JSON.

Parameters

- **`obj`** – the data structure to serialize
- **`options`** – options given to lower json/simplejson module.

21.18.3 salt.serializers.msgpack

salt.serializers.msgpack

Implements MsgPack serializer.

`salt.serializers.msgpack.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** – stream or string to deserialize.
- **`options`** – options given to lower msgpack module.

`salt.serializers.msgpack.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to MsgPack.

Parameters

- **`obj`** – the data structure to serialize
- **`options`** – options given to lower msgpack module.

21.18.4 salt.serializers.python module

salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to a Python string representation (via pprint.format)

Parameters
- **`obj`** – the data structure to serialize
- **`options`** – options given to pprint.format

21.18.5 salt.serializers.toml

salt.serializers.toml

Implements TOML serializer.

It's just a wrapper around pytoml module.

`salt.serializers.toml.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize from TOML into Python data structure.

Parameters
- **`stream_or_string`** – toml stream or string to deserialize.
- **`options`** – options given to lower pytoml module.

`salt.serializers.toml.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to TOML.

Parameters
- **`obj`** – the data structure to serialize.
- **`options`** – options given to lower pytoml module.

21.18.6 salt.serializers.yaml

salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

`salt.serializers.yaml.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize any string of stream like object into a Python data structure.

Parameters
- **`stream_or_string`** – stream or string to deserialize.
- **`options`** – options given to lower yaml module.

`salt.serializers.yaml.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to YAML.

Parameters
- **`obj`** – the data structure to serialize
- **`options`** – options given to lower yaml module.

21.18.7 salt.serializers.yamlex

salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - …

For example, the file *states.sls* has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an OrderedDict

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex *__repr__* and *__str__* objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yml_obj = yaml.deserialize(str(obj))
assert yml_obj == obj
```

yamlex implements also custom tags:

!aggregate

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

!reset

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.`**`deserialize`**`(`*stream_or_string, **options*`)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** – stream or string to deserialize.
- **`options`** – options given to lower yaml module.

`salt.serializers.yamlex.`**`serialize`**`(`*obj, **options*`)`

Serialize Python data to YAML.

Parameters

- **`obj`** – the data structure to serialize
- **`options`** – options given to lower yaml module.

21.19 state modules

acme	ACME / Let's Encrypt certificate management state
alias	Configuration of email aliases
alternatives	Configuration of the alternatives system
ansiblegate	Execution of Ansible modules from within states
apache	Apache state
apache_conf	Manage Apache Confs
apache_module	Manage Apache Modules
apache_site	Manage Apache Sites
aptpkg	Package management operations specific to APT- and DEB-based systems
archive	Extract an archive
artifactory	This state downloads artifacts from artifactory.
at	Configuration disposable regularly scheduled tasks for at.
augeas	Configuration management using Augeas
aws_sqs	Manage SQS Queues
azurearm_compute	Azure (ARM) Compute State Module
azurearm_network	Azure (ARM) Network State Module
azurearm_resource	Azure (ARM) Resource State Module
beacon	Management of the Salt beacons
bigip	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
blockdev	Management of Block Devices
boto3_elasticache	Manage Elasticache with boto3
boto3_elasticsearch	Manage Elasticsearch Service
boto3_route53	Manage Route53 records with Boto 3
boto_apigateway	Manage Apigateway Rest APIs
boto_asg	Manage Autoscale Groups
boto_cfn	Connection module for Amazon Cloud Formation
boto_cloudfront	Manage CloudFront distributions
boto_cloudtrail	Manage CloudTrail Objects
boto_cloudwatch_alarm	Manage Cloudwatch alarms

Continued on next page

Table 19 – continued from previous page

`boto_cloudwatch_event`	Manage CloudTrail Objects
`boto_cognitoidentity`	Manage CognitoIdentity Functions
`boto_datapipeline`	Manage Data Pipelines
`boto_dynamodb`	Manage DynamoDB Tables
`boto_ec2`	Manage EC2
`boto_elasticache`	Manage Elasticache
`boto_elasticsearch_domain`	Manage Elasticsearch Domains
`boto_elb`	Manage ELBs
`boto_elbv2`	Manage AWS Application Load Balancer
`boto_iam`	Manage IAM objects
`boto_iam_role`	Manage IAM roles
`boto_iot`	Manage IoT Objects
`boto_kinesis`	Manage Kinesis Streams
`boto_kms`	Manage KMS keys, key policies and grants.
`boto_lambda`	Manage Lambda Functions
`boto_lc`	Manage Launch Configurations
`boto_rds`	Manage RDSs
`boto_route53`	Manage Route53 records
`boto_s3_bucket`	Manage S3 Buckets
`boto_secgroup`	Manage Security Groups
`boto_sns`	Manage SNS Topics
`boto_sqs`	Manage SQS Queues
`boto_vpc`	Manage VPCs
`bower`	Installation of Bower Packages
`cabal`	Installation of Cabal Packages
`ceph`	Manage ceph with salt.
`chef`	Execute Chef client runs
`chocolatey`	Manage Chocolatey package installs ..
`chronos_job`	Configure Chronos jobs via a salt proxy.
`cimc`	A state module to manage Cisco UCS chassis devices.
`cisconso`	State module for Cisco NSO Proxy minions
`cloud`	Using states instead of maps to deploy clouds
`cmd`	Execution of arbitrary commands
`composer`	Installation of Composer Packages
`cron`	Management of cron, the Unix command scheduler
`csf`	CSF Ip tables management
`cyg`	Installation of Cygwin packages.
`ddns`	Dynamic DNS updates
`debconfmod`	Management of debconf selections
`dellchassis`	Manage chassis via Salt Proxies.
`disk`	Disk monitoring state
`docker_container`	Management of Docker containers
`docker_image`	Management of Docker images
`docker_network`	Management of Docker networks
`docker_volume`	Management of Docker volumes
`drac`	Management of Dell DRAC
`elasticsearch`	State module to manage Elasticsearch.
`elasticsearch_index`	State module to manage Elasticsearch indices
`elasticsearch_index_template`	State module to manage Elasticsearch index templates

Continued on next page

Table 19 – continued from previous page

`environ`	Support for getting and setting the environment variables of the current salt process.
`eselect`	Management of Gentoo configuration using eselect
`etcd_mod`	Manage etcd Keys
`ethtool`	Configuration of network device
`esxi`	Manage VMware ESXi Hosts.
`event`	Send events through Salt's event system during state runs
`file`	Operations on regular files, special files, directories, and symlinks
`firewall`	State to check firewall configurations
`firewalld`	Management of firewalld
`gem`	Installation of Ruby modules packaged as gems
`git`	States to manage git repositories and git configuration
`github`	Github User State Module
`glance`	Managing Images in OpenStack Glance
`glance_image`	Management of OpenStack Glance Images
`glusterfs`	Manage GlusterFS pool.
`gnomedesktop`	Configuration of the GNOME desktop
`gpg`	Management of the GPG keychains
`grafana`	Manage Grafana Dashboards
`grafana4_dashboard`	Manage Grafana v4.0 Dashboards
`grafana4_datasource`	Manage Grafana v4.0 data sources
`grafana4_org`	Manage Grafana v4.0 orgs
`grafana4_user`	Manage Grafana v4.0 users
`grafana_dashboard`	Manage Grafana v2.0 Dashboards
`grafana_datasource`	Manage Grafana v2.0 data sources
`grains`	Manage grains on the minion
`group`	Management of user groups
`heat`	Management of Heat
`hg`	Interaction with Mercurial repositories
`host`	Management of addresses and names in hosts file
`http`	HTTP monitoring states
`icinga2`	Icinga2 state
`ifttt`	Trigger an event in IFTTT
`incron`	Management of incron, the inotify cron
`influxdb08_database`	Management of Influxdb 0.8 databases
`influxdb08_user`	Management of InfluxDB 0.8 users
`influxdb_continuous_query`	Management of Influxdb continuous queries
`influxdb_database`	Management of Influxdb databases
`influxdb_retention_policy`	Management of Influxdb retention policies
`influxdb_user`	Management of InfluxDB users
`infoblox_a`	Infoblox A record managment.
`infoblox_cname`	Infoblox CNAME managment.
`infoblox_host_record`	Infoblox host record managment.
`infoblox_range`	Infoblox host record managment.
`ini_manage`	Manage ini files
`ipmi`	Manage IPMI devices over LAN
`ipset`	Management of ipsets
`iptables`	Management of iptables

Continued on next page

Table 19 – continued from previous page

`jboss7`	Manage JBoss 7 Application Server via CLI interface
`jenkins`	Management of Jenkins
`junos`	State modules to interact with Junos devices.
`kapacitor`	Kapacitor state module.
`kernelpkg`	Manage kernel packages and active kernel version
`keyboard`	Management of keyboard layouts
`keystone`	Management of Keystone users
`keystone_domain`	Management of OpenStack Keystone Domains
`keystone_endpoint`	Management of OpenStack Keystone Endpoints
`keystone_group`	Management of OpenStack Keystone Groups
`keystone_project`	Management of OpenStack Keystone Projects
`keystone_role`	Management of OpenStack Keystone Roles
`keystone_role_grant`	Management of OpenStack Keystone Role Grants
`keystone_service`	Management of OpenStack Keystone Services
`keystone_user`	Management of OpenStack Keystone Users
`keystore`	State management of a java keystore
`kmod`	Loading and unloading of kernel modules
`kubernetes`	Manage kubernetes resources as salt states
`layman`	Management of Gentoo Overlays using layman
`ldap`	Manage entries in an LDAP database
`libcloud_dns`	Manage DNS records and zones using libcloud
`libcloud_loadbalancer`	Apache Libcloud Load Balancer State
`libcloud_storage`	Apache Libcloud Storage State
`linux_acl`	Linux File Access Control Lists
`locale`	Management of languages/locales
`logadm`	Management of logs using Solaris logadm.
`logrotate`	Module for managing logrotate.
`loop`	Loop state
`lvm`	Management of Linux logical volumes
`lvs_server`	Management of LVS (Linux Virtual Server) Real Server
`lvs_service`	Management of LVS (Linux Virtual Server) Service
`lxc`	Manage Linux Containers
`mac_assistive`	Allows you to manage assistive access on macOS minions with 10.9+
`macdefaults`	Writing/reading defaults from a macOS minion
`mac_keychain`	Installing of certificates to the keychain
`macpackage`	Installing of mac pkg files
`mac_xattr`	Allows you to manage extended attributes on files or directories
`makeconf`	Management of Gentoo make.conf
`marathon_app`	Configure Marathon apps via a salt proxy.
`mdadm_raid`	Managing software RAID with mdadm
`memcached`	States for Management of Memcached Keys
`modjk`	State to control Apache modjk
`modjk_worker`	Manage modjk workers
`module`	Execution of Salt modules from within states
`mongodb_database`	Management of MongoDB Databases
`mongodb_user`	Management of MongoDB Users
`monit`	Monit state
`mount`	Mounting of filesystems

Continued on next page

Table 19 – continued from previous page

msteams	Send a message card to Microsoft Teams
mysql_database	Management of MySQL databases (schemas)
mysql_grants	Management of MySQL grants (user permissions)
mysql_query	Execution of MySQL queries
mysql_user	Management of MySQL users
netacl	Network ACL
netconfig	Network Config
netntp	Network NTP
netsnmp	Network SNMP
netusers	Network Users
network	Configuration of network interfaces
net_napalm_yang	NAPALM YANG state
neutron_network	Management of OpenStack Neutron Networks
neutron_secgroup	Management of OpenStack Neutron Security Groups
neutron_secgroup_rule	Management of OpenStack Neutron Security Group Rules
neutron_subnet	Management of OpenStack Neutron Subnets
nfs_export	Management of NFS exports
nftables	Management of nftables
npm	Installation of NPM Packages
ntp	Management of NTP servers
nxos	State module for Cisco NX OS Switches Proxy minions
openstack_config	Manage OpenStack configuration file settings.
openvswitch_bridge	Management of Open vSwitch bridges.
openvswitch_port	Management of Open vSwitch ports.
opsgenie	Create/Close an alert in OpsGenie
pagerduty	Create an Event in PagerDuty
pagerduty_escalation_policy	Manage PagerDuty escalation policies.
pagerduty_schedule	Manage PagerDuty schedules.
pagerduty_service	Manage PagerDuty services
pagerduty_user	Manage PagerDuty users.
panos	A state module to manage Palo Alto network devices.
pcs	Management of Pacemaker/Corosync clusters with PCS
pecl	Installation of PHP Extensions Using pecl
pdbedit	Manage accounts in Samba's passdb using pdbedit
pip_state	Installation of Python Packages Using pip
pkg	Installation of packages using OS package managers such as yum or apt-get
pkgbuild	The pkgbuild state is the front of Salt package building backend.
pkgng	Manage package remote repo using FreeBSD pkgng
pkgrepo	Management of APT/DNF/YUM/Zypper package repos
portage_config	Management of Portage package configuration on Gentoo
ports	Manage software from FreeBSD ports
postgres_cluster	Management of PostgreSQL clusters
postgres_database	Management of PostgreSQL databases
postgres_extension	Management of PostgreSQL extensions
postgres_group	Management of PostgreSQL groups (roles)

Continued on next page

Table 19 – continued from previous page

`postgres_initdb`	Initialization of PostgreSQL data directory
`postgres_language`	Management of PostgreSQL languages
`postgres_privileges`	Management of PostgreSQL Privileges
`postgres_schema`	Management of PostgreSQL schemas
`postgres_tablespace`	Management of PostgreSQL tablespace
`postgres_user`	Management of PostgreSQL users (roles)
`powerpath`	Powerpath configuration support
`probes`	Network Probes
`process`	Process Management
`proxy`	Allows you to manage proxy settings on minions
`pushover`	Send a message to PushOver
`pyenv`	Managing python installations with pyenv
`pyrax_queues`	Manage Rackspace Queues
`quota`	Management of POSIX Quotas
`rabbitmq_cluster`	Manage RabbitMQ Clusters
`rabbitmq_plugin`	Manage RabbitMQ Plugins
`rabbitmq_policy`	Manage RabbitMQ Policies
`rabbitmq_upstream`	Manage RabbitMQ Upstreams
`rabbitmq_user`	Manage RabbitMQ Users
`rabbitmq_vhost`	Manage RabbitMQ Virtual Hosts
`rbac_solaris`	Management of Solaris RBAC
`rbenv`	Managing Ruby installations with rbenv
`rdp`	Manage RDP Service on Windows servers
`redismod`	Management of Redis server
`reg`	Manage the Windows registry
`rsync`	State to synchronize files and directories with rsync.
`rvm`	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
`salt_proxy`	Salt proxy state
`saltmod`	Control the Salt command interface
`saltutil`	Saltutil State
`schedule`	Management of the Salt scheduler
`selinux`	Management of SELinux rules
`serverdensity_device`	Monitor Server with Server Density
`service`	Starting or restarting of services and daemons
`slack`	Send a message to Slack
`smartos`	Management of SmartOS Standalone Compute Nodes
`smtp`	Sending Messages via SMTP
`snapper`	Managing implicit state and baselines using snapshots
`solrcloud`	States for solrcloud alias and collection configuration
`splunk`	Splunk User State Module
`splunk_search`	Splunk Search State Module
`sqlite3`	Management of SQLite3 databases
`ssh_auth`	Control of entries in SSH authorized_key files
`ssh_known_hosts`	Control of SSH known_hosts entries
`stateconf`	Stateconf System
`status`	Minion status monitoring
`statuspage`	StatusPage
`supervisord`	Interaction with the Supervisor daemon
`svn`	Manage SVN repositories

Continued on next page

Table 19 – continued from previous page

`sysctl`	Configuration of the kernel using sysctl
`syslog_ng`	State module for syslog_ng
`sysrc`	State to work with sysrc
`telemetry_alert`	Manage Telemetry alert configurations
`test`	Test States
`testinframod`	
`timezone`	Management of timezones
`tls`	Enforce state for SSL/TLS
`tomcat`	Manage Apache Tomcat web applications
`trafficserver`	Control Apache Traffic Server
`tuned`	Interface to Red Hat tuned-adm module
`uptime`	Monitor Web Server with Uptime
`user`	Management of user accounts
`vagrant`	Manage Vagrant VMs
`vault`	States for managing Hashicorp Vault.
`vbox_guest`	VirtualBox Guest Additions installer state
`victorops`	Create an Event in VictorOps
`virt`	Manage virt
`virtualenv_mod`	Setup of Python virtualenv sandboxes.
`webutil`	Support for htpasswd module.
`win_certutil`	Installing of certificates to the Windows Certificate Manager
`win_dacl`	Windows Object Access Control Lists
`win_dism`	Installing of Windows features using DISM
`win_dns_client`	Module for configuring DNS Client on Windows systems
`win_firewall`	State for configuring Windows Firewall
`win_iis`	Microsoft IIS site management
`win_lgpo`	Manage Windows Local Group Policy
`win_license`	Installation and activation of windows licenses
`win_network`	Configuration of network interfaces on Windows hosts
`win_path`	Manage the Windows System PATH
`win_pki`	Microsoft certificate management via the Pki PowerShell module.
`win_powercfg`	This module allows you to control the power settings of a windows minion via powercfg.
`win_servermanager`	Manage Windows features via the ServerManager powershell module.
`win_smtp_server`	Module for managing IIS SMTP server configuration on Windows servers.
`win_snmp`	Module for managing SNMP service settings on Windows servers.
`win_system`	Management of Windows system information
`win_wua`	Installation of Windows Updates using the Windows Update Agent
`win_wusa`	Microsoft Updates (KB) Management
`winrepo`	Manage Windows Package Repository
`x509`	Manage X509 Certificates
`xml`	XML Manager
`xmpp`	Sending Messages over XMPP

Table 19 – continued from previous page

zabbix_action	New in version 2017.7.
zabbix_host	Management of Zabbix hosts.
zabbix_hostgroup	Management of Zabbix host groups.
zabbix_mediatype	Management of Zabbix mediatypes.
zabbix_template	New in version 2017.7.
zabbix_user	Management of Zabbix users.
zabbix_usergroup	Management of Zabbix user groups.
zabbix_valuemap	New in version 2017.7.
zcbuildout	Management of zc.buildout
zenoss	State to manage monitoring in Zenoss.
zk_concurrency	Control concurrency of steps within state execution using zookeeper
zfs	States for managing zfs datasets
zone	Management of Solaris Zones
zookeeper	**depends** kazoo
zpool	States for managing zpools

21.19.1 salt.states.acme module

ACME / Let's Encrypt certificate management state

See also the module documentation

```
reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab
```

`salt.states.acme.`**`cert`**(*name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **`name`** – Common Name of the certificate (DNS name of certificate)
- **`aliases`** – subjectAltNames (Additional DNS names on certificate)
- **`email`** – e-mail address for interaction with ACME provider

- **webroot** – True or a full path to webroot. Otherwise use standalone mode
- **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** – True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** – RSA key bits
- **server** – API endpoint to talk to
- **owner** – owner of the private key file
- **group** – group of the private key file
- **mode** – mode of the private key file
- **certname** – Name of the certificate to save
- **preferred_challenges** – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** – The address the server listens to during tls-sni-01 challenge.
- **http_01_port** – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** – The address the server listens to during http-01 challenge.
- **dns_plugin** – Name of a DNS plugin to use (currently only 'cloudflare')
- **dns_plugin_credentials** – Path to the credentials file if required by the specified DNS plugin

21.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

`salt.states.alias.`**`absent`**(*name*)

Ensure that the named alias is absent

name The alias to remove

`salt.states.alias.`**`present`**(*name, target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

name The local user/address to assign an alias to

target The forwarding address

21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

`salt.states.alternatives.`**`auto`**`(`*name*`)`

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>
name is the master name for this link group (e.g. pager)

`salt.states.alternatives.`**`install`**`(`*name, link, path, priority*`)`

Install new alternative for defined <name>
name is the master name for this link group (e.g. pager)
link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)
path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)
priority is an integer; options with higher numbers have higher priority in automatic mode.

`salt.states.alternatives.`**`remove`**`(`*name, path*`)`

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.`**`set_`**`(`*name, path*`)`

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

```
foo:
  alternatives.set:
    - path: /usr/bin/foo-2.0
```

21.19.4 salt.states.ansiblegate

Execution of Ansible modules from within states

With *ansible.call* these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
      - name: emacs
      - state: installed
```

class `salt.states.ansiblegate.`**`AnsibleState`**

Ansible state caller.

`get_args`(*argset*)

Get args and kwargs from the argset.

Parameters **`argset`** –

Returns

`salt.states.ansiblegate.`**`playbooks`**(*name*, *rundir=None*, *git_repo=None*, *git_kwargs=None*, *ansible_kwargs=None*)

Run Ansible Playbooks

Parameters

- **`name`** – path to playbook. This can be relative to rundir or the git repo
- **`rundir`** – location to run ansible-playbook from.
- **`git_repo`** – git repository to clone for ansible playbooks. This is cloned using the *git.latest* state, and is cloned to the *rundir* if specified, otherwise it is clone to the *cache_dir*
- **`git_kwargs`** – extra kwargs to pass to *git.latest* state module besides the *name* and *target*
- **`ansible_kwargs`** – extra kwargs to pass to *ansible.playbooks* execution module besides the *name* and *target*

Returns Ansible playbook output.

```
run nginx install:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gituser/playbook.git
    - git_kwargs:
        rev: master
```

21.19.5 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
```

(continues on next page)

(continued from previous page)

```
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
            AllowOverride: All
```

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. <Directory /path/to/dir>).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as <Else>, it still needs keyword `this` with empty string (or "" if nicer output is required - without space).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
        - this: '*:80'
        - ServerName:
          - website.com
        - DocumentRoot: /var/www/vhosts/website.com
        - Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
            AllowOverride: All
        - Directory:
          - this: /var/www/vhosts/website.com/private
          - Order: Deny,Allow
          - Deny from: all
          - Allow from:
            - 127.0.0.1
            - 192.168.100.0/24
          - If:
```

(continues on next page)

(continued from previous page)

```
                this: some condition
                do: something
            - Else:
                this:
                do: something else
            - Else:
                this: ""
                do: another thing
```

salt.states.apache.**configfile**(*name*, *config*)

21.19.6 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.**disabled**(*name*)
Ensure an Apache conf is disabled.
name Name of the Apache conf

salt.states.apache_conf.**enabled**(*name*)
Ensure an Apache conf is enabled.
name Name of the Apache conf

21.19.7 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

salt.states.apache_module.**disabled**(*name*)
Ensure an Apache module is disabled.

New in version 2016.3.0.
name Name of the Apache module

`salt.states.apache_module.`**`enabled`**`(`*name*`)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

name Name of the Apache module

21.19.8 salt.states.apache_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default

Disable default site:
  apache_site.disabled:
    - name: default
```

`salt.states.apache_site.`**`disabled`**`(`*name*`)`

Ensure an Apache site is disabled.

name Name of the Apache site

`salt.states.apache_site.`**`enabled`**`(`*name*`)`

Ensure an Apache site is enabled.

name Name of the Apache site

21.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.`**`held`**`(`*name*`)`

Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

21.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.`**`extracted`**`(`*name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_files_list_verify=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, clean_parent=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs*`)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

Important: ZIP Archive Handling

Note: this information applies to 2016.11.0 and later.

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's zipfile module to extract ZIP files.

2. *archive.cmd_unzip*, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of *archive.cmd_unzip* when CLI options are specified (via the `options` argument), and will otherwise prefer the *archive.unzip* function. Use of *archive.cmd_unzip* can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of *archive.unzip*. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by *archive.cmd_unzip*) - When the `options` argument is used, *archive.cmd_unzip* is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an upstream bug in Python, permissions are not preserved when the zipfile module is used to extract an archive. As of the 2016.11.0 release, *archive.unzip* (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

---

name Directory into which the archive should be extracted

source Archive to be extracted

Note: This argument uses the same syntax as its counterpart in the *file.managed* state.

source_hash Hash of source file, or file with list of hash-to-file mappings

Note: This argument uses the same syntax as its counterpart in the *file.managed* state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
```

(continues on next page)

(continued from previous page)

```
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the `source` URI. When managing a file with a `source` of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

source_hash_update [False] Set this to `True` if archive should be extracted if source_hash has changed and there is a difference between the archive and the local files. This would extract regardless of the `if_missing` parameter.

Note that this is only checked if the `source` value has not changed. If it has (e.g. to increment a version number in the path) then the archive will not be extracted even if the hash has changed.

Note: Setting this to `True` along with `keep_source` set to `False` will result the `source` re-download to do a archive file list check. If it's not desirable please consider the `skip_files_list_verify` argument.

New in version 2016.3.0.

skip_files_list_verify [False] Set this to `True` if archive should be extracted if source_hash has changed but only checksums of the archive will be checked to determine if the extraction is required.

Note: The current limitation of this logic is that you have to set minions `hash_type` config option to the same one that you're going to pass via `source_hash` argument.

New in version 3000.

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

keep_source [True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

keep [True] Same as `keep_source`, kept for backward-compatibility.

Note: If both `keep_source` and `keep` are used, `keep` will be ignored.

---

password **For ZIP archives only**. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added *`archive.is_encrypted`* function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

options **For tar and zip archives only**. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native tarfile/zipfile support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar`/`unzip` implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the xz CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f`/`--file` should *not* be used here.

---

list_options **For tar archives only**. This state uses *`archive.list`* to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, *`archive.list`* "just works". Archives compressed using gzip, bzip2, and xz/lzma (with the help of the xz CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to *`archive.list`*.

This argument will be passed through to *`archive.list`* as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

force [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option *very* carefully.

New in version 2016.11.0.

overwrite [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

New in version 2016.11.1.

clean_parent [False] If `True`, and the archive is extracted, delete the parent directory (i.e. the directory into which the archive is extracted), and then re-create that directory before extracting. Note that `clean` and `clean_parent` are mutually exclusive.

New in version 3000.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running *`archive.list`* on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running *`archive.list`* on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if if is present.

trim_output [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip [False] Set to `True` for zip files to force usage of the *`archive.cmd_unzip`* function to extract.

New in version 2016.11.0.

extract_perms [True] **For ZIP archives only.** When using *archive.unzip* to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running *archive.list* on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the `name` argument.

New in version 2016.11.0.

archive_format One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples

1. tar with lmza (i.e. xz) compression:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo
```

3. tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True
```

21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.`**`downloaded`**(*name, artifact, target_dir='/tmp', target_file=None, use_literal_group_id=False*)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:

- artifactory_url: URL of the artifactory instance
- repository: Repository in artifactory
- artifact_id: Artifact ID
- group_id: Group ID
- packaging: Packaging
- classifier: Classifier .. versionadded:: 2015.8.0
- **version: Version** One of the following: - Version to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- username: Artifactory username .. versionadded:: 2015.8.0
- password: Artifactory password .. versionadded:: 2015.8.0

target_dir Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

target_file Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
  artifactory.downloaded:
   - artifact:
       artifactory_url: http://artifactory.intranet.example.com/artifactory
       repository: 'libs-release-local'
       artifact_id: 'module'
       group_id: 'com.company.module'
       packaging: 'jar'
       classifier: 'sources'
       version: '1.0'
   - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
  artifactory.downloaded:
   - artifact:
        artifactory_url: http://artifactory.intranet.example.com/artifactory
        repository: 'libs-release-local'
        artifact_id: 'module'
        group_id: 'com.company.module'
        packaging: 'jar'
        classifier: 'sources'
        version: '1.0'
   - target_dir: /opt/jboss7/modules/com/company/lib
```

21.19.12 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.`**`absent`**(*name*, *jobid=None*, ***kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

jobid: **string|int** Specific jobid to remove

tag [string] Job's tag

runas [string] Runs user-specified jobs

kwargs Addition kwargs can be provided to filter jobs. See output of *at.jobcheck* for more.

```
example1:
  at.absent:
```

Warning: this will remove all jobs!

```
example2:
  at.absent:
    - year: 13
```

```
example3:
  at.absent:
    - tag: rose
```

```
example4:
  at.absent:
    - tag: rose
    - day: 13
    - hour: 16
```

```
example5:
  at.absent:
    - jobid: 4
```

`salt.states.at.`**`mod_watch`**(*name*, ***kwargs*)

The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

name The name of the atjob

`salt.states.at.`**`present`**(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

Changed in version 2017.7.0.

Add a job to queue.

job [string] Command to run.

timespec [string] The 'timespec' follows the format documented in the at(1) manpage.

tag [string] Make a tag for the job.

user [string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:
  at.present:
```

(continues on next page)

(continued from previous page)

```
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

`salt.states.at.`**`watch`**(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

New in version 2017.7.0.

Add an at job if trigger by watch
job [string] Command to run.
timespec [string] The 'timespec' follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
      - file: /etc/salt/minion
```

21.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

Augeas can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.`**`change`**(*name*, *context=None*, *changes=None*, *lens=None*, *load_path=None*, ***kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.
name State name
context A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.`

`0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv`/`move`, `ins`/`insert`, and `rm`/`remove`.

lens The lens to use, needs to be suffixed with *.lns*, e.g.: *Nginx.lns*. See the list of stock lenses shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

Note: Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many preconfigured lenses that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
  augeas.change:
    - lens: redis.lns
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

Note: Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
  augeas.change:
    - lens: services.lns
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] "zabbix-agent"
      - set "service-name[. = 'zabbix-agent']/port" 10050
      - set "service-name[. = 'zabbix-agent']/protocol" tcp
      - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
      - rm "service-name[. = 'im-obsolete']"
    - unless: grep "zabbix-agent" /etc/services
```

Warning: Don't forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise *`augeas_cfg`* execute will fail because it will receive more parameters than expected.

Note: Order is important when defining a service with Augeas, in this case it's `port`, `protocol` and `#comment`. For more info about the lens check *services lens documentation*.

---

http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record

21.19.14 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```
myqueue:
    aws_sqs.exists:
        - region: eu-west-1
```

`salt.states.aws_sqs.`**`absent`**(*name, region, user=None, opts=False*)

Remove the named SQS queue if it exists.

name Name of the SQS queue.

region Region to remove the queue from

user Name of the user performing the SQS operations

opts Include additional arguments and options to the aws command line

`salt.states.aws_sqs.`**`exists`**(*name, region, user=None, opts=False*)

Ensure the SQS queue exists.

name Name of the SQS queue.

region Region to create the queue

user Name of the user performing the SQS operations

opts Include additional arguments and options to the aws command line

21.19.15 salt.states.azurearm_compute

Azure (ARM) Compute State Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`

- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
    user_pass_auth:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        username: fletch
        password: 123pass
    mysubscription:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        secret: XXXXXXXXXXXXXXXXXXXXXXXX
        cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure availability set exists:
    azurearm_compute.availability_set_present:
        - name: my_avail_set
        - resource_group: my_rg
        - virtual_machines:
            - my_vm1
            - my_vm2
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure availability set is absent:
    azurearm_compute.availability_set_absent:
        - name: other_avail_set
        - resource_group: my_rg
        - connection_auth: {{ profile }}
```

`salt.states.azurearm_compute.`**`availability_set_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

Parameters

- **name** – Name of the availability set.
- **resource_group** – Name of the resource group containing the availability set.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_compute.`**`availability_set_present`**(*name*, *resource_group*, *tags=None*, *platform_update_domain_count=None*, *platform_fault_domain_count=None*, *virtual_machines=None*, *sku=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure an availability set exists.

Parameters

- **`name`** – Name of the availability set.
- **`resource_group`** – The resource group assigned to the availability set.
- **`tags`** – A dictionary of strings can be passed as tag metadata to the availability set object.
- **`platform_update_domain_count`** – An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **`platform_fault_domain_count`** – An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **`virtual_machines`** – A list of names of existing virtual machines to be included in the availability set.
- **`sku`** – The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure availability set exists:
    azurearm_compute.availability_set_present:
        - name: aset1
        - resource_group: group1
        - platform_update_domain_count: 5
        - platform_fault_domain_count: 3
        - sku: aligned
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
```

21.19.16 salt.states.azurearm_network

Azure (ARM) Network State Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0

- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
    user_pass_auth:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        username: fletch
        password: 123pass
    mysubscription:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        secret: XXXXXXXXXXXXXXXXXXXXXXXX
        cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure virtual network exists:
    azurearm_network.virtual_network_present:
        - name: my_vnet
        - resource_group: my_rg
        - address_prefixes:
```

(continues on next page)

(continued from previous page)

```
            - '10.0.0.0/8'
            - '192.168.0.0/16'
        - dns_servers:
            - '8.8.8.8'
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure virtual network is absent:
    azurearm_network.virtual_network_absent:
        - name: other_vnet
        - resource_group: my_rg
        - connection_auth: {{ profile }}
```

`salt.states.azurearm_network.`**`load_balancer_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`load_balancer_present`**(*name*, *resource_group*, *sku=None*, *frontend_ip_configurations=None*, *backend_address_pools=None*, *load_balancing_rules=None*, *probes=None*, *inbound_nat_rules=None*, *inbound_nat_pools=None*, *outbound_nat_rules=None*, *tags=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a load balancer exists.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **sku** – The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** – A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend_ip_configurations** – An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `private_ip_address`: The private IP address of the IP configuration. Required if 'private_ip_allocation_method' is 'Static'.
  - `private_ip_allocation_method`: The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - `subnet`: Name of an existing subnet inside of which the frontend IP will reside.
  - `public_ip_address`: Name of an existing public IP address which will be

assigned to the frontend IP object.

- **backend_address_pools** – An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probes** – An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `protocol`: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - `port`: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - `interval_in_seconds`: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum value is 5.
  - `number_of_probes`: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
  - `request_path`: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.
- **load_balancing_rules** – An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `load_distribution`: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - `frontend_port`: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.
  - `backend_port`: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.
  - `idle_timeout_in_minutes`: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - `enable_floating_ip`: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
  - `disable_outbound_snat`: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the load balancing rule object.
  - `backend_address_pool`: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
  - `probe`: Name of the probe object used by the load balancing rule object.
- **inbound_nat_rules** – An optional list of dictionaries representing valid In-

boundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - `protocol`: Possible values include 'Udp', 'Tcp', or 'All'.
  - `frontend_port`: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - `backend_port`: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - `idle_timeout_in_minutes`: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - `enable_floating_ip`: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- **`inbound_nat_pools`** – An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the inbound NAT pool object.
  - `protocol`: Possible values include 'Udp', 'Tcp', or 'All'.
  - `frontend_port_range_start`: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
  - `frontend_port_range_end`: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
  - `backend_port`: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.
- **`outbound_nat_rules`** – An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - `backend_address_pool`: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - `allocated_outbound_ports`: The number of outbound ports to be used for NAT.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure load balancer exists:
    azurearm_network.load_balancer_present:
        - name: lb1
        - resource_group: group1
        - location: eastus
        - frontend_ip_configurations:
          - name: lb1_feip1
            public_ip_address: pub_ip1
        - backend_address_pools:
          - name: lb1_bepool1
        - probes:
          - name: lb1_webprobe1
            protocol: tcp
            port: 80
            interval_in_seconds: 5
            number_of_probes: 2
        - load_balancing_rules:
          - name: lb1_webprobe1
            protocol: tcp
            frontend_port: 80
            backend_port: 80
            idle_timeout_in_minutes: 4
            frontend_ip_configuration: lb1_feip1
            backend_address_pool: lb1_bepool1
            probe: lb1_webprobe1
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
          - azurearm_network: Ensure public IP exists
```

`salt.states.azurearm_network.`**`network_interface_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

Parameters

- **name** – Name of the network interface.
- **resource_group** – The resource group assigned to the network interface.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`network_interface_present`**(*name*, *ip_configurations*, *subnet*, *virtual_network*, *resource_group*, *tags=None*, *virtual_machine=None*, *network_security_group=None*, *dns_settings=None*, *mac_address=None*, *primary=None*, *enable_accelerated_networking=None*, *enable_ip_forwarding=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a network interface exists.

Parameters

- **name** – Name of the network interface.
- **ip_configurations** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – Name of the existing subnet assigned to the network interface.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **tags** – A dictionary of strings can be passed as tag metadata to the network interface object.
- **network_security_group** – The name of the existing network security group to assign to the network interface.
- **virtual_machine** – The name of the existing virtual machine to assign to the network interface.
- **dns_settings** – An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - `dns_servers`: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns_servers collection.
  - `internal_dns_name_label`: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - `internal_fqdn`: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - `internal_domain_name_suffix`: Even if internal_dns_name_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal_domain_name_suffix.
- **mac_address** – Optional string containing the MAC address of the network interface.
- **primary** – Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.
- **enable_accelerated_networking** – Optional boolean indicating whether accelerated networking should be enabled for the interface.
- **enable_ip_forwarding** – Optional boolean indicating whether IP forwarding should be enabled for the interface.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure network interface exists:
    azurearm_network.network_interface_present:
        - name: iface1
        - subnet: vnet1_sn1
        - virtual_network: vnet1
        - resource_group: group1
        - ip_configurations:
          - name: iface1_ipc1
            public_ip_address: pub_ip2
        - dns_settings:
            internal_dns_name_label: decisionlab-int-test-label
        - primary: True
        - enable_accelerated_networking: True
```

(continues on next page)

(continued from previous page)

```
        - enable_ip_forwarding: False
        - network_security_group: nsg1
        - connection_auth: {{ profile }}
        - require:
          - azurearm_network: Ensure subnet exists
          - azurearm_network: Ensure network security group exists
          - azurearm_network: Ensure another public IP exists
```

`salt.states.azurearm_network.`**`network_security_group_absent`**`(`*name, resource_group, connection_auth=None*`)`

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

Parameters

- **name** – Name of the network security group.
- **resource_group** – The resource group assigned to the network security group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`network_security_group_present`**`(`*name, resource_group, tags=None, security_rules=None, connection_auth=None, **kwargs*`)`

New in version 2019.2.0.

Ensure a network security group exists.

Parameters

- **name** – Name of the network security group.
- **resource_group** – The resource group assigned to the network security group.
- **tags** – A dictionary of strings can be passed as tag metadata to the network security group object.
- **security_rules** – An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the security_rule_present state or security_rule_create_or_update execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure network security group exists:
    azurearm_network.network_security_group_present:
        - name: nsg1
        - resource_group: group1
        - security_rules:
          - name: nsg1_rule1
            priority: 100
            protocol: tcp
            access: allow
            direction: outbound
```

(continues on next page)

(continued from previous page)

```
            source_address_prefix: virtualnetwork
            destination_address_prefix: internet
            source_port_range: '*'
            destination_port_range: '*'
          - name: nsg1_rule2
            priority: 101
            protocol: tcp
            access: allow
            direction: inbound
            source_address_prefix: internet
            destination_address_prefix: virtualnetwork
            source_port_range: '*'
            destination_port_ranges:
              - '80'
              - '443'
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
```

`salt.states.azurearm_network.`**`public_ip_address_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

Parameters

- **`name`** – Name of the public IP address.
- **`resource_group`** – The resource group assigned to the public IP address.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`public_ip_address_present`**(*name*, *resource_group*, *tags=None*, *sku=None*, *public_ip_allocation_method=None*, *public_ip_address_version=None*, *dns_settings=None*, *idle_timeout_in_minutes=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a public IP address exists.

Parameters

- **`name`** – Name of the public IP address.
- **`resource_group`** – The resource group assigned to the public IP address.
- **`dns_settings`** – An optional dictionary representing a valid PublicIPAddressDnsSettings object. Parameters include 'domain_name_label' and 'reverse_fqdn', which accept strings. The 'domain_name_label' parameter is concatenated with the regionalized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.

- **sku** – The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public_ip_allocation_method** – The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public_ip_address_version** – The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle_timeout_in_minutes** – An integer representing the idle timeout of the public IP address.
- **tags** – A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure public IP exists:
    azurearm_network.public_ip_address_present:
        - name: pub_ip1
        - resource_group: group1
        - dns_settings:
            domain_name_label: decisionlab-ext-test-label
        - sku: basic
        - public_ip_allocation_method: static
        - public_ip_address_version: ipv4
        - idle_timeout_in_minutes: 4
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
```

`salt.states.azurearm_network.`**`route_absent`**(*name*, *route_table*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

- **name** – Name of the route table.
- **route_table** – The name of the existing route table containing the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`route_present`**(*name*, *address_prefix*, *next_hop_type*, *route_table*, *resource_group*, *next_hop_ip_address=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a route exists within a route table.

Parameters

- **name** – Name of the route.
- **address_prefix** – The destination CIDR to which the route applies.
- **next_hop_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next_hop_ip_address** – The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route_table** – The name of the existing route table which will contain the route.

- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route exists:
    azurearm_network.route_present:
        - name: rt1_route2
        - route_table: rt1
        - resource_group: group1
        - address_prefix: '192.168.0.0/16'
        - next_hop_type: vnetlocal
        - connection_auth: {{ profile }}
        - require:
          - azurearm_network: Ensure route table exists
```

`salt.states.azurearm_network.`**`route_table_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

- **name** – Name of the route table.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`route_table_present`**(*name*, *resource_group*, *tags=None*, *routes=None*, *disable_bgp_route_propagation=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a route table exists.

Parameters

- **name** – Name of the route table.
- **resource_group** – The resource group assigned to the route table.
- **routes** – An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the route_present state or route_create_or_update execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present. When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.
- **disable_bgp_route_propagation** – An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
- **tags** – A dictionary of strings can be passed as tag metadata to the route table object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route table exists:
    azurearm_network.route_table_present:
        - name: rt1
        - resource_group: group1
        - routes:
          - name: rt1_route1
            address_prefix: '0.0.0.0/0'
```

(continues on next page)

(continued from previous page)

```
            next_hop_type: internet
          - name: rt1_route2
            address_prefix: '192.168.0.0/16'
            next_hop_type: vnetlocal
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
```

salt.states.azurearm_network.**security_rule_absent**(*name*, *security_group*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

Parameters

- **name** – Name of the security rule.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.**security_rule_present**(*name*, *access*, *direction*, *priority*, *protocol*, *security_group*, *resource_group*, *destination_address_prefix=None*, *destination_port_range=None*, *source_address_prefix=None*, *source_port_range=None*, *description=None*, *destination_address_prefixes=None*, *destination_port_ranges=None*, *source_address_prefixes=None*, *source_port_ranges=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a security rule exists.

Parameters

- **name** – Name of the security rule.
- **access** – ’allow’ or ’deny’
- **direction** – ’inbound’ or ’outbound’
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – ’tcp’, ’udp’, or ’*’
- **security_group** – The name of the existing network security group to contain the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **description** – Optional description of the security rule.
- **destination_address_prefix** – The CIDR or destination IP range. Asterix ’*’ can also be used to match all destination IPs. Default tags such as ’VirtualNetwork’, ’AzureLoadBalancer’ and ’Internet’ can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** – The destination port or range. Integer or range between 0 and 65535. Asterix ’*’ can also be used to match all ports.

- **source_address_prefix** – The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** – The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **destination_address_prefixes** – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure security rule exists:
    azurearm_network.security_rule_present:
        - name: nsg1_rule2
        - security_group: nsg1
        - resource_group: group1
        - priority: 101
        - protocol: tcp
        - access: allow
        - direction: inbound
        - source_address_prefix: internet
        - destination_address_prefix: virtualnetwork
        - source_port_range: '*'
        - destination_port_ranges:
          - '80'
          - '443'
        - connection_auth: {{ profile }}
        - require:
          - azurearm_network: Ensure network security group exists
```

`salt.states.azurearm_network.`**`subnet_absent`**(*name*, *virtual_network*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

Parameters

- **name** – Name of the subnet.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`subnet_present`**(*name*, *address_prefix*, *virtual_network*, *resource_group*, *security_group=None*, *route_table=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a subnet exists.

Parameters

- **`name`** – Name of the subnet.
- **`address_prefix`** – A CIDR block used by the subnet within the virtual network.
- **`virtual_network`** – Name of the existing virtual network to contain the subnet.
- **`resource_group`** – The resource group assigned to the virtual network.
- **`security_group`** – The name of the existing network security group to assign to the subnet.
- **`route_table`** – The name of the existing route table to assign to the subnet.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure subnet exists:
    azurearm_network.subnet_present:
        - name: vnet1_sn1
        - virtual_network: vnet1
        - resource_group: group1
        - address_prefix: '192.168.1.0/24'
        - security_group: nsg1
        - route_table: rt1
        - connection_auth: {{ profile }}
        - require:
          - azurearm_network: Ensure virtual network exists
          - azurearm_network: Ensure network security group exists
          - azurearm_network: Ensure route table exists
```

`salt.states.azurearm_network.`**`virtual_network_absent`**(*name*, *resource_group*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

Parameters

- **`name`** – Name of the virtual network.
- **`resource_group`** – The resource group assigned to the virtual network.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.`**`virtual_network_present`**(*name*, *address_prefixes*, *resource_group*, *dns_servers=None*, *tags=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a virtual network exists.

Parameters

- **`name`** – Name of the virtual network.
- **`resource_group`** – The resource group assigned to the virtual network.
- **`address_prefixes`** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **`dns_servers`** – A list of DNS server addresses.
- **`tags`** – A dictionary of strings can be passed as tag metadata to the virtual network object.
- **`connection_auth`** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure virtual network exists:
    azurearm_network.virtual_network_present:
        - name: vnet1
        - resource_group: group1
        - address_prefixes:
            - '10.0.0.0/8'
            - '192.168.0.0/16'
        - dns_servers:
            - '8.8.8.8'
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
        - require:
          - azurearm_resource: Ensure resource group exists
```

21.19.17 salt.states.azurearm_resource

Azure (ARM) Resource State Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>

maturity new

depends

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
    user_pass_auth:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        username: fletch
        password: 123pass
    mysubscription:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        secret: XXXXXXXXXXXXXXXXXXXXXXXX
        cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure resource group exists:
    azurearm_resource.resource_group_present:
        - name: my_rg
        - location: westus
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure resource group is absent:
    azurearm_resource.resource_group_absent:
        - name: other_rg
        - connection_auth: {{ profile }}
```

`salt.states.azurearm_resource.`**`policy_assignment_absent`**`(`*name, scope, connection_auth=None*`)`

New in version 2019.2.0.

Ensure a policy assignment does not exist in the provided scope.

Parameters

- **`name`** – Name of the policy assignment.
- **`scope`** – The scope of the policy assignment.

connection_auth A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_resource.`**`policy_assignment_present`**`(`*name, scope, definition_name, display_name=None, description=None, assignment_type=None, parameters=None, connection_auth=None, **kwargs*`)`

New in version 2019.2.0.

Ensure a security policy assignment exists.

Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.
- **definition_name** – The name of the policy definition to assign.
- **display_name** – The display name of the policy assignment.
- **description** – The policy assignment description.
- **assignment_type** – The type of policy assignment.
- **parameters** – Required dictionary if a parameter is used in the policy rule.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure policy assignment exists:
    azurearm_resource.policy_assignment_present:
        - name: testassign
        - scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
        - definition_name: testpolicy
        - display_name: Test Assignment
        - description: Test assignment for testing assignments.
        - connection_auth: {{ profile }}
```

`salt.states.azurearm_resource.`**`policy_definition_absent`**`(`*name, connection_auth=None*`)`

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

Parameters

- **name** – Name of the policy definition.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_resource.`**`policy_definition_present`**`(`*name, policy_rule=None, policy_type=None, mode=None, display_name=None, description=None, metadata=None, parameters=None, policy_rule_json=None, policy_rule_file=None, template='jinja', source_hash=None, source_hash_name=None, skip_verify=False, connection_auth=None, **kwargs*`)`

New in version 2019.2.0.

Ensure a security policy definition exists.

Parameters

- **name** – Name of the policy definition.
- **policy_rule** – A YAML dictionary defining the policy rule. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
- **policy_rule_json** – A text field defining the entirety of a policy definition in JSON. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the *name* field in the JSON will override the `name` parameter in the state.
- **policy_rule_file** – The source of a JSON file defining the entirety of a policy definition. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the *name* field in the JSON will override the `name` parameter in the state.
- **skip_verify** – Used for the `policy_rule_file` parameter. If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.
- **source_hash** – This can be a source hash string or the URI of a file that contains source hash strings.
- **source_hash_name** – When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.
- **policy_type** – The type of policy definition. Possible values are NotSpecified, BuiltIn, and Custom. Only used with the `policy_rule` parameter.
- **mode** – The policy definition mode. Possible values are NotSpecified, Indexed, and All. Only used with the `policy_rule` parameter.
- **display_name** – The display name of the policy definition. Only used with the `policy_rule` parameter.
- **description** – The policy definition description. Only used with the `policy_rule` parameter.
- **metadata** – The policy definition metadata defined as a dictionary. Only used with the `policy_rule` parameter.
- **parameters** – Required dictionary if a parameter is used in the policy rule. Only used with the `policy_rule` parameter.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure policy definition exists:
    azurearm_resource.policy_definition_present:
        - name: testpolicy
        - display_name: Test Policy
        - description: Test policy for testing policies.
        - policy_rule:
            if:
              allOf:
                - equals: Microsoft.Compute/virtualMachines/write
                  source: action
                - field: location
                  in:
                    - eastus
```

(continues on next page)

(continued from previous page)

```
                    - eastus2
                    - centralus
            then:
              effect: deny
        - connection_auth: {{ profile }}
```

salt.states.azurearm_resource.**resource_group_absent**(*name*, *connection_auth=None*)

New in version 2019.2.0.

Ensure a resource group does not exist in the current subscription.

Parameters

- **name** – Name of the resource group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.**resource_group_present**(*name*, *location*, *managed_by=None*, *tags=None*, *connection_auth=None*, ***kwargs*)

New in version 2019.2.0.

Ensure a resource group exists.

Parameters

- **name** – Name of the resource group.
- **location** – The Azure location in which to create the resource group. This value cannot be updated once the resource group is created.
- **managed_by** – The ID of the resource that manages this resource group. This value cannot be updated once the resource group is created.
- **tags** – A dictionary of strings can be passed as tag metadata to the resource group object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure resource group exists:
    azurearm_resource.resource_group_present:
        - name: group1
        - location: eastus
        - tags:
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}
```

21.19.18 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
        salt-master: running
        apache2: stopped
```

(continues on next page)

(continued from previous page)

```
sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
        1m:
          - 0.0
          - 2.0
        5m:
          - 0.0
          - 1.5
        15m:
          - 0.1
          - 1.0

.. versionadded:: 3000

Beginning in the 3000 release, multiple copies of a beacon can be configured
using the ``beacon_module`` parameter.

inotify_infs:
  beacon.present:
    - save: True
    - enable: True
    - files:
       /etc/infs.conf:
         mask:
           - create
           - delete
           - modify
         recurse: True
         auto_add: True
    - interval: 10
    - beacon_module: inotify
    - disable_during_state_run: True

inotify_ntp:
  beacon.present:
    - save: True
    - enable: True
    - files:
       /etc/ntp.conf:
         mask:
           - create
           - delete
           - modify
         recurse: True
         auto_add: True
    - interval: 10
    - beacon_module: inotify
    - disable_during_state_run: True
```

`salt.states.beacon.`**`absent`**(*name*, *save=False*, ***kwargs*)

Ensure beacon is absent.

name The name of the beacon ensured absent.

save True/False, if True the beacons.conf file be updated too. Default is False.

`salt.states.beacon.`**`disabled`**`(`*name*, ***kwargs*`)`
Disable a beacon.
name The name of the beacon to disable.

`salt.states.beacon.`**`enabled`**`(`*name*, ***kwargs*`)`
Enable a beacon.
name The name of the beacon to enable.

`salt.states.beacon.`**`present`**`(`*name*, *save=False*, ***kwargs*`)`
Ensure beacon is configured with the included beacon data.
name The name of the beacon ensure is configured.
save True/False, if True the beacons.conf file be updated too. Default is False.

21.19.19 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5_bigip_11.6

`salt.states.bigip.`**`add_pool_member`**`(`*hostname*, *username*, *password*, *name*, *member*`)`
A function to connect to a bigip device and add a new member to an existing pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The member to add to the pool

`salt.states.bigip.`**`create_monitor`**`(`*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*`)`
A function to connect to a bigip device and create a monitor.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.`**`create_node`**`(`*hostname*, *username*, *password*, *name*, *address*`)`
Create a new node if it does not already exist.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to create
address The address of the node

`salt.states.bigip.`**`create_pool`**(*hostname*, *username*, *password*, *name*, *members=None*, *allow_nat=None*, *allow_snat=None*, *description=None*, *gateway_failsafe_device=None*, *ignore_persisted_weight=None*, *ip_tos_to_client=None*, *ip_tos_to_server=None*, *link_qos_to_client=None*, *link_qos_to_server=None*, *load_balancing_mode=None*, *min_active_members=None*, *min_up_members=None*, *min_up_members_action=None*, *min_up_members_checking=None*, *monitor=None*, *profiles=None*, *queue_depth_limit=None*, *queue_on_connection_limit=None*, *queue_time_limit=None*, *reselect_tries=None*, *service_down_action=None*, *slow_ramp_time=None*)

Create a new node if it does not already exist.

`salt.states.bigip.`**`delete_monitor`**`(`*hostname*, *username*, *password*, *monitor_type*, *name*`)`

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

> Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.`**`delete_node`**`(`*hostname*, *username*, *password*, *name*`)`

Delete an existing node.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node which will be deleted.

`salt.states.bigip.`**`delete_pool`**`(`*hostname*, *username*, *password*, *name*`)`

Delete an existing pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool which will be deleted

`salt.states.bigip.`**`delete_pool_member`**`(`*hostname*, *username*, *password*, *name*, *member*`)`

Delete an existing pool member.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to be modified
member The name of the member to delete from the pool

`salt.states.bigip.`**`delete_profile`**`(`*hostname*, *username*, *password*, *profile_type*, *name*`)`

Modify an existing profile. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

> Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.`**`delete_virtual`**`(`*hostname*, *username*, *password*, *name*`)`

Delete an existing virtual.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual which will be deleted

`salt.states.bigip.`**`list_monitor`**(*hostname*, *username*, *password*, *monitor_type*, *name*)

A function to list an existing monitor.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to list
name The name of the monitor to list

`salt.states.bigip.`**`list_node`**(*hostname*, *username*, *password*, *name*)

A function to connect to a bigip device and list a specific node.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list.

`salt.states.bigip.`**`list_pool`**(*hostname*, *username*, *password*, *name*)

A function to connect to a bigip device and list a specific pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list.

`salt.states.bigip.`**`list_profile`**(*hostname*, *username*, *password*, *profile_type*, *name*)

A function to list an existing profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to list
name The name of the profile to list

`salt.states.bigip.`**`list_virtual`**(*hostname*, *username*, *password*, *name*)

A function to list a specific virtual.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to list

`salt.states.bigip.`**`manage_monitor`**(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)

Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

> Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.`**`manage_node`**`(`*hostname*, *username*, *password*, *name*, *address*, *connection_limit=None*, *description=None*, *dynamic_ratio=None*, *logging=None*, *monitor=None*, *rate_limit=None*, *ratio=None*, *session=None*, *node_state=None*`)`

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to manage.
address The address of the node
connection_limit [integer]
description [string]
dynam c_ratio: [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
node_state (state) [user-down | user-up]

`salt.states.bigip.`**`manage_pool`**`(`*hostname*, *username*, *password*, *name*, *allow_nat=None*, *allow_snat=None*, *description=None*, *gateway_failsafe_device=None*, *ignore_persisted_weight=None*, *ip_tos_to_client=None*, *ip_tos_to_server=None*, *link_qos_to_client=None*, *link_qos_to_server=None*, *load_balancing_mode=None*, *min_active_members=None*, *min_up_members=None*, *min_up_members_action=None*, *min_up_members_checking=None*, *monitor=None*, *profiles=None*, *queue_depth_limit=None*, *queue_on_connection_limit=None*, *queue_time_limit=None*, *reselect_tries=None*, *service_down_action=None*, *slow_ramp_time=None*`)`

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create
allow_nat [yes | no]
allow_snat [yes | no]
description [string]
gateway_failsafe_device [string]
ignore_persisted_weight [enabled | disabled]
ip_tos_to_client [pass-through | [integer]]

slow_ramp_time [integer]

`salt.states.bigip.`**`manage_pool_members`**(*hostname*, *username*, *password*, *name*, *members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members list of pool members to manage.

`salt.states.bigip.`**`manage_profile`**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

> Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.`**`manage_virtual`**(*hostname*, *username*, *password*, *name*, *destination*, *pool=None*, *address_status=None*, *auto_lasthop=None*, *bwc_policy=None*, *cmp_enabled=None*, *connection_limit=None*, *dhcp_relay=None*, *description=None*, *fallback_persistence=None*, *flow_eviction_policy=None*, *gtm_score=None*, *ip_forward=None*, *ip_protocol=None*, *internal=None*, *twelve_forward=None*, *last_hop_pool=None*, *mask=None*, *mirror=None*, *nat64=None*, *persist=None*, *profiles=None*, *policies=None*, *rate_class=None*, *rate_limit=None*, *rate_limit_mode=None*, *rate_limit_dst=None*, *rate_limit_src=None*, *rules=None*, *related_rules=None*, *reject=None*, *source=None*, *source_address_translation=None*, *source_port=None*, *virtual_state=None*, *traffic_classes=None*, *translate_address=None*, *translate_port=None*, *vlans=None*)

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create

21.19.20 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.`**`formatted`**(*name*, *fs_type='ext4'*, *force=False*, ***kwargs*)

Manage filesystems of partitions.

name The name of the block device

fs_type The filesystem it should be formatted as

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.`**`tuned`**(*name*, ***kwargs*)

Manage options of block device

name The name of the block device

opts:

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

21.19.21 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
# Using a profile from pillars
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

```
# Passing in a profile
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
```

(continues on next page)

(continued from previous page)

```
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto3_elasticache.`**`cache_cluster_absent`**`(`*name, wait=600, region=None, key=None, keyid=None, profile=None, **args*`)`

Ensure a given cache cluster is deleted.

name Name of the cache cluster.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

CacheClusterId The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

FinalSnapshotIdentifier The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.`**`cache_cluster_present`**`(`*name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args*`)`

Ensure a given cache cluster exists.

name Name of the cache cluster (cache cluster id).

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

CacheClusterId The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as 'name' is used if it's not provided.

ReplicationGroupId The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

AZMode Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

Note: This parameter is ONLY supported for Memcached cache clusters.

PreferredAvailabilityZone The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

PreferredAvailabilityZones A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

Note: This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

NumCacheNodes The initial (integer) number of cache nodes that the cache cluster has.

Note: For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at https://aws.amazon.com/elasticache/pricing/

Note:

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

Engine The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

EngineVersion The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

CacheSubnetGroupName The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

CacheSecurityGroupNames A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

SecurityGroupIds One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotName The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

Note: This parameter is ONLY valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port The port number on which each of the cache nodes accepts connections.

Default: 6379

NotificationTopicArn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This (boolean) parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is ONLY valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or "@".

CacheNodeIdsToRemove A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.`**`cache_subnet_group_absent`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*`)`

Ensure a given cache subnet group is deleted.

name Name of the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.`**`cache_subnet_group_present`**`(`*name*, *subnets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*`)`

Ensure cache subnet group exists.

name A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

subnets A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

CacheSubnetGroupDescription A description for the cache subnet group.

SubnetIds A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.`**`replication_group_absent`**`(`*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*`)`

Ensure a given replication group is deleted.

name Name of the replication group.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

ReplicationGroupId The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

RetainPrimaryCluster If set to true, all of the read replicas are deleted, but the primary node is retained.

FinalSnapshotIdentifier The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.`**`replication_group_present`**`(`*name*, *wait=900*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*`)`

Ensure a replication group exists and is in the given state.

name Name of replication group

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

ReplicationGroupId The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as 'name' is used if it's not provided.

ReplicationGroupDescription A user-created description for the replication group.

PrimaryClusterId The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

AutomaticFailoverEnabled Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

Note: AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

NumCacheClusters The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled , the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

PreferredCacheClusterAZs A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

Note: If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

NumNodeGroups An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

ReplicasPerNodeGroup An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

NodeGroupConfiguration A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). See https://aws.amazon.com/elasticache/pricing/ for current sizing, prices, and constraints.

Engine The name of the cache engine to be used for the cache clusters in this replication group.

EngineVersion The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

Note: If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use CacheParameterGroupName=default.redis3.2

To create a Redis (cluster mode enabled) replication group, use CacheParameterGroupName=default.redis3.2.cluster.on

---

CacheSubnetGroupName The name of the cache subnet group to be used for the replication group.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a s group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

CacheSecurityGroupNames A list of cache security group names to associate with this replication group.

SecurityGroupIds One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotName The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port The port number on which each member of the replication group accepts connections.

NotificationTopicArn The ARN of an SNS topic to which notifications are sent.

Note: The SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is only valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server. Password constraints:
- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or "@".

SnapshottingClusterId The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.22 salt.states.boto3_elasticsearch module

Manage Elasticsearch Service

New in version Natrium.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

codeauthor Herbert Buurman <herbert.buurman@ogd.nl>

depends boto3

`salt.states.boto3_elasticsearch.`**`absent`**(*name, blocking=True, region=None, keyid=None, key=None, profile=None*)

Ensure the Elasticsearch Domain specified does not exist.

Parameters
- **name** (*str*) – The name of the Elasticsearch domain to be made absent.
- **blocking** (*bool*) – Whether or not the state should wait for the deletion to be completed. Default: `True`

New in version Natrium.

Example:

```
Remove Elasticsearch Domain:
  boto3_elasticsearch.absent:
  - name: my_domain
  - region: eu-west-1
```

`salt.states.boto3_elasticsearch.`**`latest`**(*name*, *minor_only=True*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensures the Elasticsearch domain specifies runs on the latest compatible version of elasticsearch, upgrading it if it is not.

Note that this operation is blocking until the upgrade is complete.

Parameters

- **name** (*str*) – The name of the Elasticsearch domain to upgrade.
- **minor_only** (*bool*) – Only upgrade to the latest minor version.

New in version Natrium.

Example:

The following example will ensure the elasticsearch domain `my_domain` is upgraded to the latest minor version. So if it is currently 5.1 it will be upgraded to 5.6.

```
Upgrade Elasticsearch Domain:
  boto3_elasticsearch.latest:
  - name: my_domain
  - minor_only: True
  - region: eu-west-1
```

`salt.states.boto3_elasticsearch.`**`present`**(*name*, *elasticsearch_version=None*, *elasticsearch_cluster_config=None*, *ebs_options=None*, *access_policies=None*, *snapshot_options=None*, *vpc_options=None*, *cognito_options=None*, *encryption_at_rest_options=None*, *node_to_node_encryption_options=None*, *advanced_options=None*, *log_publishing_options=None*, *blocking=True*, *tags=None*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensure an Elasticsearch Domain exists.

Parameters

- **name** (*str*) – The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **elasticsearch_version** (*str*) – String of format X.Y to specify version for the Elasticsearch domain eg. ”1.5” or ”2.3”.
- **elasticsearch_cluster_config** (*dict*) – Dict specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (str): The instance type for an Elasticsearch cluster.
  - InstanceCount (int): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled.

    - ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
      - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
    - DedicatedMasterType (str): The instance type for a dedicated master node.
    - DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- **ebs_options** (*dict*) – Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **access_policies** (*str or dict*) – Dict or JSON string with the IAM access policy.
- **snapshot_options** (*dict*) – Dict specifying the snapshot options. Keys (case senstive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc_options** (*dict*) – Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- **cognito_options** (*dict*) – Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case senstive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- **encryption_at_rest_options** (*dict*) – Dict specifying the encryption at rest options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.
- **node_to_node_encryption_options** (*dict*) – Dict specifying the node to node encryption options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.
- **advanced_options** (*dict*) – Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide /es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.
- **log_publishing_options** (*dict*) – Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS

The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) – Whether or not the state should wait for all operations (create/update/upgrade) to be completed. Default: `True`
- **tags** (*dict*) – Dict of tags to ensure are present on the Elasticsearch domain.

New in version Natrium.

Example:

This will create an elasticsearch domain consisting of a single t2.small instance in the eu-west-1 region (Ireland) and will wait until the instance is available before returning from the state.

```
Create new domain:
  boto3_elasticsearch.present:
  - name: my_domain
  - elasticsearch_version: '5.1'
  - elasticsearch_cluster_config:
      InstanceType: t2.small.elasticsearch
      InstanceCount: 1
      DedicatedMasterEnabled: False
      ZoneAwarenessEnabled: False
  - ebs_options:
      EBSEnabled: True
      VolumeType: gp2
      VolumeSize: 10
  - snapshot_options:
      AutomatedSnapshotStartHour: 3
  - vpc_options:
      SubnetIds:
      - subnet-12345678
      SecurityGroupIds:
      - sg-12345678
  - node_to_node_encryption_options:
      Enabled: False
  - region: eu-west-1
  - tags:
      foo: bar
      baz: qux
```

`salt.states.boto3_elasticsearch.`**`tagged`**(*name, tags=None, replace=False, region=None, keyid=None, key=None, profile=None*)

Ensures the Elasticsearch domain has the tags provided. Adds tags to the domain unless `replace` is set to `True`, in which case all existing tags will be replaced with the tags provided in `tags`. (This will remove all tags if `replace` is `True` and `tags` is empty).

Parameters

- **name** (*str*) – The Elasticsearch domain to work with.
- **tags** (*dict*) – The tags to add to/replace on the Elasticsearch domain.
- **replace** (*bool*) – Whether or not to replace (`True`) all existing tags on the Elasticsearch domain, or add (`False`) tags to the ES domain.

New in version Natrium.

`salt.states.boto3_elasticsearch.`**`upgraded`**(*name, elasticsearch_version, blocking=True, region=None, keyid=None, key=None, profile=None*)

Ensures the Elasticsearch domain specified runs on the specified version of elasticsearch. Only upgrades are possible as downgrades require a manual snapshot and an S3 bucket to store them in.

Note that this operation is blocking until the upgrade is complete.

Parameters

- **name** (*str*) – The name of the Elasticsearch domain to upgrade.
- **elasticsearch_version** (*str*) – String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

New in version Natrium.

Example:

```
Upgrade Elasticsearch Domain:
  boto3_elasticsearch.upgraded:
  - name: my_domain
  - elasticsearch_version: '7.2'
  - region: eu-west-1
```

21.19.23 salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
An exciting new AWS Route 53 Hosted Zone:
  boto_route53.hosted_zone_present:
    - Name: example.com.
    - PrivateZone: true
    - VPCs:
      - VPCName: MyLittleVPC
        VPCRegion: us-east-1
      - VPCId: vpc-12345678
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

mycnamerecord:
  boto_route53.rr_present:
    - Name: test.example.com.
    - ResourceRecords:
```

(continues on next page)

(continued from previous page)

```
      - my-elb.us-east-1.elb.amazonaws.com.
    - DomainName: example.com.
    - TTL: 60
    - Type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto3_route53.`**`hosted_zone_absent`**`(`*name, Name=None, PrivateZone=False, region=None, key=None, keyid=None, profile=None*`)`

Ensure the Route53 Hostes Zone described is absent

name The name of the state definition.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

PrivateZone Set True if deleting a private hosted zone.

`salt.states.boto3_route53.`**`hosted_zone_present`**`(`*name, Name=None, PrivateZone=False, CallerReference=None, Comment=None, VPCs=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure a hosted zone exists with the given attributes.

name The name of the state definition.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

PrivateZone Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

Comment Any comments you want to include about the hosted zone.

CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

VPCs A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

- **VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
- **VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.
- **VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for VPCRegion.

`salt.states.boto3_route53.`**`rr_absent`**`(`*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure the Route53 record is deleted.

name The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId The ID of the zone to delete the record from. Exclusive with DomainName.

DomainName The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

PrivateZone Set to True if the RR to be removed is in a private zone, False if public.

Name Name of the resource record.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

`salt.states.boto3_route53.`**`rr_present`**`(`*name*, *HostedZoneId=None*, *DomainName=None*, *PrivateZone=False*, *Name=None*, *Type=None*, *SetIdentifier=None*, *Weight=None*, *Region=None*, *GeoLocation=None*, *Failover=None*, *TTL=None*, *ResourceRecords=None*, *AliasTarget=None*, *HealthCheckId=None*, *TrafficPolicyInstanceId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure the Route53 record is present.

name The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId The ID of a zone to create the record in. Exclusive with DomainName.

DomainName The domain name of a zone to create the record in. Exclusive with HostedZoneId.

PrivateZone Set to True if the resource record should be in a private zone, False if public.

Name Name of the Route 53 resource record being managed.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

Weight Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover in the Amazon Route 53 Developer Guide.

Region Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

GeoLocation Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a

Type of A and a ContinentCode of AF.

```
ContinentCode
    The two-letter code for the continent.
    Valid values: AF | AN | AS | EU | OC | NA | SA
    Constraint: Specifying ContinentCode with either CountryCode or␣
↪SubdivisionCode
                returns an InvalidInput error.
CountryCode
    The two-letter code for the country.
SubdivisionCode
    The code for the subdivision, for example, a state in the United States␣
↪or a
    province in Canada.
```

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a * resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see Supported DNS Resource Record Types in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'

This tells salt to lookup an EC2 instance with a tag 'some_tag_name' which has the value 'some_string' and substitute the 'some_instance_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to getattr(instance, 'attribute') as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automgically create Route 53 records for them.

AliasTarget The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the Boto 3 Route 53 page and/or the AWS Route 53 docs and suss them for yourself - I sure won't claim to understand them partcularly well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

21.19.24 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure Apigateway API exists:
  boto_apigateway.present:
    - name: myfunction
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_apigateway.`**`absent`**(*name*, *api_name*, *stage_name*, *nuke_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the stage_name associated with the given api_name deployed by boto_apigateway's present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

name Name of the swagger file in YAML format

api_name Name of the rest api on AWS ApiGateway to ensure is absent.

stage_name Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.

nuke_api If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_apigateway.`**`present`**(*name*, *api_name*, *swagger_file*, *stage_name*, *api_key_required*, *lambda_integration_role*, *lambda_region=None*, *stage_variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *lambda_funcname_format='{stage}_{api}_{resource}_{method}'*, *authorization_type='NONE'*, *error_response_template=None*, *response_template=None*)

Ensure the spcified api_name with the corresponding swaggerfile is deployed to the given stage_name in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
    "api_name": api_name,
    "swagger_file": basename_of_swagger_file
    "swagger_file_md5sum": md5sum_of_swagger_file,
    "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided lambda_funcname_format parameters:

- the default lambda_funcname_format is a string with the following substitutable keys: "{stage}_{api}_{resource}_{method}". The user can choose to reorder the known keys.
- the stage key corresponds to the stage_name passed in.
- the api key corresponds to the api_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default lambda_funcname_format, given the following input:

```
api_name = '  Test    Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: 'test_service_alpha_a_b_c_post'

The canconicalization of these input parameters is done in the following order:

1. lambda_funcname_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with '_'
5. consecutive '_' are replaced with '_'

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```
Error:
  type: object
  properties:
    stackTrace:
      type: array
      items:
        type: array
        items:
          type: string
      description: call stack
  errorType:
    type: string
    description: error type
  errorMessage:
    type: string
    description: |
      Error message, will be matched based on pattern.
      If no pattern is specified, the default pattern used for response mapping
↪will be +*.
```

name The name of the state definition

api_name The name of the rest api that we want to ensure exists in AWS API Gateway

swagger_file Name of the location of the swagger rest api definition file in YAML format.

stage_name Name of the stage we want to be associated with the given api_name and swagger_file definition

api_key_required True or False - whether the API Key is required to call API methods

lambda_integration_role The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

lambda_region The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. lambda_region as passed in (is not None)
2. if lambda_region is None, use the region as if a boto_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto_apigateway functions, a final lookup will be attempted using the boto_apigateway region.

stage_variables A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. {'string': 'string'}

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

lambda_funcname_format Please review the earlier example for the usage. The only substituable keys in the funcname format are {stage}, {api}, {resource}, {method}. Any other keys or positional subsitution parameters will be flagged as an invalid input.

authorization_type This field can be either 'NONE', or 'AWS_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'

error_response_template String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html

If set to None, the following default value is used:

```
'#set($inputRoot = $input.path('$'))\n'
'{\n'
'  "errorMessage" : "$inputRoot.errorMessage",\n'
'  "errorType" : "$inputRoot.errorType",\n'
'  "stackTrace" : [\n'
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
'    [\n'
'#foreach($elem in $stackTrace)\n'
'      "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'    ]\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'  ]\n'
```

New in version 2017.7.0.

response_template String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({}) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

`salt.states.boto_apigateway.`**`usage_plan_absent`**`(`*name, plan_name, region=None, key=None, keyid=None, profile=None*`)`

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

name name of the state

plan_name name of the plan to remove

```yaml
usage plan absent:
  boto_apigateway.usage_plan_absent:
    - plan_name: my_usage_plan
    - profile: my_profile
```

`salt.states.boto_apigateway.`**`usage_plan_association_absent`**`(`*name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None*`)`

Ensures usage plan identified by name is removed from provided api_stages If a plan is associated to stages not listed in api_stages parameter, those associations remain intact.

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

  apiId apiId of the api to detach usage plan from

  stage stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
  boto_apigateway.usage_plan_association_absent:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

`salt.states.boto_apigateway.`**`usage_plan_association_present`**`(`*name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None*`)`

Ensures usage plan identified by name is added to provided api_stages

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

  apiId apiId of the api to attach usage plan to

  stage stage name of the api to attach usage plan to

```
UsagePlanAssociationPresent:
  boto_apigateway.usage_plan_association_present:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

`salt.states.boto_apigateway.`**`usage_plan_present`**`(`*name, plan_name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure the spcifieda usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

name name of the state

plan_name [Required] name of the usage plan

throttle [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

  rateLimit rate per second at which capacity bucket is populated

  burstLimit maximum rate allowed

quota [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

  limit [Required] number of calls permitted per quota period

  offset [Optional] number of calls to be subtracted from the limit at the beginning of the period

  period [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```
UsagePlanPresent:
  boto_apigateway.usage_plan_present:
    - plan_name: my_usage_plan
    - throttle:
        rateLimit: 70
        burstLimit: 100
    - quota:
        limit: 1000
        offset: 0
        period: DAY
    - profile: my_profile
```

21.19.25 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
```

(continues on next page)

(continued from previous page)

```
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - suspended_processes:
        - AddToLoadBalancer
        - AlarmNotification
    - scaling_policies
        - adjustment_type: ChangeInCapacity
        - as_name: api-production-iad
        - cooldown: 1800
        - min_adjustment_step: None
        - name: ScaleDown
        - scaling_adjustment: -1
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1

# Deleting an autoscale group with running instances.
```

(continues on next page)

(continued from previous page)

```
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True
```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms:
        CPU:
          name: 'ASG CPU **MANAGED BY SALT**'
          attributes:
            metric: CPUUtilization
            namespace: AWS/EC2
            statistic: Average
            comparison: '>='
            threshold: 65.0
            period: 60
            evaluation_periods: 30
            unit: null
            description: 'ASG CPU'
            alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
            insufficient_data_actions: []
            ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```
my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
```

(continues on next page)

(continued from previous page)

```
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

Overriding the alarm values on the resource:

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm
    # override CPU:attributes:threshold
    - alarms:
        CPU:
          attributes:
            threshold: 50.0
```

`salt.states.boto_asg.`**`absent`**(*name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False*)

Ensure the named autoscale group is deleted.

name Name of the autoscale group.

force Force deletion of autoscale group.

remove_lc Delete the launch config as well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.`**`present`**(*name, launch_config_name, availability_zones, min_size, max_size, launch_config=None, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, subnet_names=None, tags=None, termination_policies=None, termination_policies_from_pillar='boto_asg_termination_policies', suspended_processes=None, scaling_policies=None, scaling_policies_from_pillar='boto_asg_scaling_policies', scheduled_actions=None, scheduled_actions_from_pillar='boto_asg_scheduled_actions', alarms=None, alarms_from_pillar='boto_asg_alarms', region=None, key=None, keyid=None, profile=None, notification_arn=None, notification_arn_from_pillar='boto_asg_notification_arn', notification_types=None, notification_types_from_pillar='boto_asg_notification_types'*)

Ensure the autoscale group exists.

name Name of the autoscale group.

launch_config_name Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

launch_config A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```
my_asg:
  boto_asg.present:
  - launch_config:
    - ebs_optimized: false
    - instance_profile_name: my_iam_profile
    - kernel_id: ''
    - ramdisk_id: ''
    - key_name: my_ssh_key
    - image_name: aws2015091-hvm
    - instance_type: c3.xlarge
    - instance_monitoring: false
    - security_groups:
      - my_sec_group_01
      - my_sec_group_02
```

availability_zones List of availability zones for the group.

min_size Minimum size of the group.

max_size Maximum size of the group.

desired_capacity The desired capacity of the group.

load_balancers List of load balancers for the group. Once set this can not be updated (Amazon restriction).

default_cooldown Number of seconds after a Scaling Activity completes before any further scaling activities can start.

health_check_type The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

health_check_period Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

placement_group Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

vpc_zone_identifier A list of the subnet identifiers of the Virtual Private Cloud.

subnet_names For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with vpc_zone_identifier.

tags A list of tags. Example:

```
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

termination_policies A list of termination policies. Valid values are:

- `OldestInstance`
- `NewestInstance`
- `OldestLaunchConfiguration`
- `ClosestToNextInstanceHour`
- `Default`

If no value is specified, the `Default` value is used.

termination_policies_from_pillar: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

suspended_processes List of processes to be suspended. see http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html

scaling_policies List of scaling policies. Each policy is a dict of key-values described by https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
    scale_up_at_10:
        desired_capacity: 4
        min_size: 3
        max_size: 5
        recurrence: "0 9 * * 1-5"
    scale_down_at_7:
        desired_capacity: 1
        min_size: 1
        max_size: 1
        recurrence: "0 19 * * 1-5"
```

scheduled_actions_from_pillar: name of pillar dict that contains scheduled_actions settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include ":self:" this will be replaced with the asg name. For example, alarm_actions reading "['scaling_policy:self:ScaleUp']" will map to the arn for this asg's scaling policy named "ScaleUp". In addition, any alarms that have only scaling_policy as actions will be ignored if min_size is equal to max_size for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

notification_arn The AWS arn that notifications will be sent to

notification_arn_from_pillar name of the pillar dict that contains `notifcation_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

notification_types_from_pillar name of the pillar dict that contains `notifcation_types` settings. `notification_types` defined for this specific state will override those from the pillar.

21.19.26 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
stack-absent:
  boto_cfn.absent:
    - name: mystack
```

`salt.states.boto_cfn.`**`absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cfn.`**`present`**(*name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, region=None, key=None, keyid=None, profile=None*)

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the SNS_console or your Command Line Interface (CLI).

disable_rollback (bool) – Indicates whether or not to rollback on failure.

timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack_policy_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack_policy_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack.If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use_previous_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack_policy_during_update_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

stack_policy_during_update_url (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.27 salt.states.boto_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid`, and `region` via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
aws:
    region:
        us-east-1:
            profile:
                keyid: GKTADJGHEIQSXMKKRBJ08H
                key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
                region: us-east-1
```

depends boto3

`salt.states.boto_cloudfront.`**`present`**(*name, config, tags, region=None, key=None, keyid=None, profile=None*)

Ensure the CloudFront distribution is present.

name (string) Name of the CloudFront distribution

config (dict) Configuration for the distribution

tags (dict) Tags to associate with the distribution

region (string) Region to connect to

key (string) Secret key to use

keyid (string) Access key to use

profile (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

```
Manage my_distribution CloudFront distribution:
    boto_cloudfront.present:
      - name: my_distribution
      - config:
          Comment: 'partial config shown, most parameters elided'
          Enabled: True
      - tags:
          testing_key: testing_value
```

21.19.28 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure trail exists:
    boto_cloudtrail.present:
        - Name: mytrail
        - S3BucketName: mybucket
        - S3KeyPrefix: prefix
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_cloudtrail.`**`absent`**(*name, Name, region=None, key=None, keyid=None, profile=None*)

Ensure trail with passed properties is absent.

name The name of the state definition.

Name Name of the trail.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.`**`present`**(*name, Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the trail.

S3BucketName Specifies the name of the Amazon S3 bucket designated for publishing log files.

S3KeyPrefix Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

SnsTopicName Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

IncludeGlobalServiceEvents Specifies whether the trail is publishing events from global services such as IAM to the log files.

EnableLogFileValidation Specifies whether log file integrity validation is enabled. The default is false.

CloudWatchLogsLogGroupArn Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

CloudWatchLogsRoleArn Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

KmsKeyId Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

LoggingEnabled Whether logging should be enabled for the trail

Tags A dictionary of tags that should be set on the trail

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.29 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
        metric: ApproximateNumberOfMessagesVisible
        namespace: AWS/SQS
        statistic: Average
        comparison: ">="
        threshold: 20000.0
        period: 60
        evaluation_periods: 1
        description: test alarm via salt
        dimensions:
          QueueName:
            - the-sqs-queue-name
        alarm_actions:
          - arn:aws:sns:us-east-1:1111111:myalerting-action
```

`salt.states.boto_cloudwatch_alarm.`**`absent`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Ensure the named cloudwatch alarm is deleted.

name Name of the alarm.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.`**`present`**`(`*name, attributes, region=None, key=None, keyid=None, profile=None*`)`

Ensure the cloudwatch alarm exists.

name Name of the alarm

attributes A dict of key/value cloudwatch alarm attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.30 salt.states.boto_cloudwatch_event module

Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure event rule exists:
    boto_cloudwatch_event.present:
        - Name: mytrail
        - ScheduleExpression: 'rate(120 minutes)'
        - State: 'DISABLED'
        - Targets:
          - Id: "target1"
```

(continues on next page)

(continued from previous page)

```
          Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
          Input: '{"arbitrary": "json"}'
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_cloudwatch_event.`**`absent`**`(`*name, Name=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure CloudWatch event rule with passed properties is absent.

name The name of the state definition.

Name Name of the event rule. Defaults to the value of the 'name' param if not provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.`**`present`**`(`*name, Name=None, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, Targets=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure trail exists.

name The name of the state definition

Name Name of the event rule. Defaults to the value of the 'name' param if not provided.

ScheduleExpression The scheduling expression. For example, `cron(0 20 * * ? *)`, "rate(5 minutes)"

EventPattern The event pattern.

Description A description of the rule

State Indicates whether the rule is ENABLED or DISABLED.

RoleArn The Amazon Resource Name (ARN) of the IAM role associated with the rule.

Targets A list of rresources to be invoked when the rule is triggered.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.31 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure function exists:
    boto_cognitoidentity.pool_present:
        - PoolName: my_identity_pool
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.`**`pool_absent`**`(`*name, IdentityPoolName, RemoveAllMatched=False, region=None, key=None, keyid=None, profile=None*`)`

Ensure cognito identity pool with passed properties is absent.

name The name of the state definition.

IdentityPoolName Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

RemoveAllMatched If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cognitoidentity.`**`pool_present`**`(`*name, IdentityPoolName, AuthenticatedRole, AllowUnauthenticatedIdentities=False, UnauthenticatedRole=None, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure Cognito Identity Pool exists.

name The name of the state definition

IdentityPoolName Name of the Cognito Identity Pool

AuthenticatedRole An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

AllowUnauthenticatedIdentities Whether to allow anonymous user identities

UnauthenticatedRole An IAM role name or ARN that will be associated with anonymous user identities

SupportedLoginProviders A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

DeveloperProviderName A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

OpenIdConnectProviderARNs A list or pillar name that contains a list of OpenID Connect provider ARNs.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.32 salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
  boto_datapipeline.present:
    - name: my-datapipeline
    - pipeline_objects:
        DefaultSchedule:
          name: Every 1 day
          fields:
            period: 1 Day
            type: Schedule
            startAt: FIRST_ACTIVATION_DATE_TIME
    - parameter_values:
        myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.`**`absent`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

Ensure a pipeline with the service_name does not exist
name Name of the service to ensure a data pipeline does not exist for.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_datapipeline.present`(*name*, *pipeline_objects=None*, *pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects'*, *parameter_objects=None*, *parameter_objects_from_pillars='boto_datapipeline_parameter_objects'*, *parameter_values=None*, *parameter_values_from_pillars='boto_datapipeline_parameter_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

name Name of the service to ensure a data pipeline exists for.

pipeline_objects Pipeline objects to use. Will override objects read from pillars.

pipeline_objects_from_pillars The pillar key to use for lookup.

parameter_objects Parameter objects to use. Will override objects read from pillars.

parameter_objects_from_pillars The pillar key to use for lookup.

parameter_values Parameter values to use. Will override values read from pillars.

parameter_values_from_pillars The pillar key to use for lookup.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.33 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure DynamoDB table does not exist:
  boto_dynamodb.absent:
    - table_name: new_table
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

(continues on next page)

(continued from previous page)

```
Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - table_name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
    - local_indexes:
        - index:
            - name: "primary_id_end_timestamp_index"
            - hash_key: primary_id
            - hash_key_data_type: N
            - range_key: end_timestamp
            - range_key_data_type: N
    - global_indexes:
        - index:
            - name: "name_end_timestamp_index"
            - hash_key: name
            - hash_key_data_type: S
            - range_key: end_timestamp
            - range_key_data_type: N
            - read_capacity_units: 3
            - write_capacity_units: 4
```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```
Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - alarms:
         ConsumedWriteCapacityUnits:
            name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
            attributes:
              metric: ConsumedWriteCapacityUnits
              namespace: AWS/DynamoDB
              statistic: Sum
              comparison: '>='
              # threshold_percent is used to calculate the actual threshold
              # based on the provisioned capacity for the table.
              threshold_percent: 0.75
              period: 300
              evaluation_periods: 2
              unit: Count
```

(continues on next page)

(continued from previous page)

```
              description: 'DynamoDB ConsumedWriteCapacityUnits'
              alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
              insufficient_data_actions: []
              ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_dynamodb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - alarms:
         ConsumedWriteCapacityUnits:
            attributes:
              threshold_percent: 0.90
              period: 900
```

exception `salt.states.boto_dynamodb.`**`GsiNotUpdatableError`**

Raised when a global secondary index cannot be updated.

`salt.states.boto_dynamodb.`**`absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure the DynamoDB table does not exist.

name Name of the DynamoDB table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_dynamodb.`**`present`**`(`*name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backup_configs'*`)`

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

21.19.34 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
import-key-pair:
   boto_ec2.key_present:
```

(continues on next page)

(continued from previous page)

```
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
   boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_ec2.`**`eni_absent`**(*name*, *release_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

name Name tag associated with the ENI.
release_eip True/False - release any EIP associated with the ENI
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`eni_present`**(*name*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *description=None*, *groups=None*, *source_dest_check=True*, *allocate_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

name Name tag associated with the ENI.
subnet_id The VPC subnet ID the ENI will exist within.
subnet_name The VPC subnet name the ENI will exist within.
private_ip_address The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.
description Description of the key.
groups A list of security groups to apply to the ENI.
source_dest_check Boolean specifying whether source/destination checking is enabled on the ENI.
allocate_eip allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

arecords A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`instance_absent`**`(`*name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None*`)`

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.
name (string) - The name of the state definition.
instance_name (string) - The name of the instance.
instance_id (string) - The ID of the instance.
release_eip (bool) - Release any associated EIPs during termination.
region (string) - Region to connect to.
key (string) - Secret key to be used.
keyid (string) - Access key to be used.
profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
filters (dict) - A dict of additional filters to use in matching the instance to delete.
YAML example fragment:

```
- filters:
    vpc-id: vpc-abcdef12
```

`salt.states.boto_ec2.`**`instance_present`**`(`*name, instance_name=None, instance_id=None, image_id=None, image_name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type=None, placement=None, kernel_id=None, ramdisk_id=None, vpc_id=None, vpc_name=None, monitoring_enabled=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interfaces=None, network_interface_name=None, network_interface_id=None, attributes=None, target_state=None, public_ip=None, allocation_id=None, allocate_eip=False, region=None, key=None, keyid=None, profile=None*`)`

Ensure an EC2 instance is running with the given attributes and state.
name (string) - The name of the state definition. Recommended that this match the instance_name attribute

(generally the FQDN of the instance).

instance_name (string) - The name of the instance, generally its FQDN. Exclusive with 'instance_id'.

instance_id (string) - The ID of the instance (if known). Exclusive with 'instance_name'.

image_id (string) – The ID of the AMI image to run.

image_name (string) – The name of the AMI image to run.

tags (dict) - Tags to apply to the instance.

key_name (string) – The name of the key pair with which to launch instances.

security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances

user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

instance_type (string) – The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

placement (string) – The Availability Zone to launch the instance into.

kernel_id (string) – The ID of the kernel with which to launch the instances.

ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.

vpc_id (string) - The ID of a VPC to attach the instance to.

vpc_name (string) - The name of a VPC to attach the instance to.

monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.

subnet_id (string) – The ID of the subnet within which to launch the instances for VPC.

subnet_name (string) – The name of the subnet within which to launch the instances for VPC.

private_ip_address (string) – If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- 'stop'
- 'terminate'

placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

security_group_ids (list of strings) – The IDs of the VPC security groups with which to associate instances.

security_group_names (list of strings) – The names of the VPC security groups with which to associate instances.

additional_info (string) – Specifies additional information to make available to the instance(s).

tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are:"default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.

network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

network_interface_name

(string) - The name of Elastic Network Interface to attach

New in version 2016.11.0.

network_interface_id

(string) - The id of Elastic Network Interface to attach

New in version 2016.11.0.

attributes (dict) - Instance attributes and value to be applied to the instance. Available options are:

- instanceType - A valid instance type (m1.small)
- kernel - Kernel ID (None)
- ramdisk - Ramdisk ID (None)
- userData - Base64 encoded String (None)
- disableApiTermination - Boolean (true)
- instanceInitiatedShutdownBehavior - stop|terminate
- blockDeviceMapping - List of strings - ie: ['/dev/sda=false']
- sourceDestCheck - Boolean (true)
- groupSet - Set of Security Groups or IDs
- ebsOptimized - Boolean (false)
- sriovNetSupport - String - ie: 'simple'

target_state (string) - The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

public_ip: (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation_id instead.

allocation_id: (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public_ip instead.

allocate_eip: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to releaase this address when terminating the instance, either manually or via the 'release_eip' flag to 'instance_absent'.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.`**`key_absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key pair

`salt.states.boto_ec2.`**`key_present`**(*name*, *save_private=None*, *upload_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure key pair is present.

`salt.states.boto_ec2.`**`private_ips_absent`**(*name*, *network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an ENI does not have secondary private ip addresses associated with it

name (String) - State definition name

network_interface_id (String) - The EC2 network interface id, example eni-123456789

private_ip_addresses (List or String) - The secondary private ip address(es) that should be absent on the ENI.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`private_ips_present`**`(`*name*, *network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *allow_reassignment=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure an ENI has secondary private ip addresses associated with it

name (String) - State definition name

network_interface_id (String) - The EC2 network interface id, example eni-123456789

private_ip_addresses (List or String) - The secondary private ip address(es) that should be present on the ENI.

allow_reassignment (Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`snapshot_created`**`(`*name*, *ami_name*, *instance_name*, *wait_until_available=True*, *wait_timeout_seconds=300*, ***kwargs*`)`

Create a snapshot from the given instance

New in version 2016.3.0.

`salt.states.boto_ec2.`**`volume_absent`**`(`*name*, *volume_name=None*, *volume_id=None*, *instance_name=None*, *instance_id=None*, *device=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

name State definition name.

volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

volume_id Resource ID of the volume.

instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance_id'. Requires 'device'.

instance_id Only remove volume if it is attached to this instance. Exclusive with 'instance_name'. Requires 'device'.

device Match by device rather than ID. Requires one of 'instance_name' or 'instance_id'.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`volume_present`**`(`*name*, *volume_name=None*, *volume_id=None*, *instance_name=None*, *instance_id=None*, *device=None*, *size=None*, *snapshot_id=None*, *volume_type=None*, *iops=None*, *encrypted=False*, *kms_key_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure the EC2 volume is present and attached.

name State definition name.

volume_name The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.

volume_id Resource ID of the volume. Exclusive with 'volume_name'.

instance_name Attach volume to instance with this Name tag. Exclusive with 'instance_id'.

instance_id Attach volume to instance with this ID. Exclusive with 'instance_name'.

device The device on the instance through which the volume is exposed (e.g. /dev/sdh)

size The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

snapshot_id The snapshot ID from which the new Volume will be created. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

volume_type The type of the volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'. Valid volume types for AWS can be found here: http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html

iops The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

encrypted Specifies whether the volume should be encrypted. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

kms_key_id If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'. e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.`**`volumes_tagged`**(*name, tag_maps, authoritative=False, region=None, key=None, keyid=None, profile=None*)

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

name State definition name.

tag_maps List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of boto_ec2.get_all_volumes(), and 'tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

```
- filters:
    attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
    attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
    instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative Should un-declared tags currently set on matched volumes be deleted? Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.35 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H

```

`salt.states.boto_elasticache.`**`absent`**(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

name Name of the cache cluster.

wait Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.`**`cache_cluster_absent`**(**args*, ***kwargs*)

`salt.states.boto_elasticache.`**`cache_cluster_present`**(**args*, ***kwargs*)

`salt.states.boto_elasticache.`**`creategroup`**(*name*, *primary_cluster_id*, *replication_group_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

name Name of replication group

wait Waits for the group to be available

primary_cluster_id Name of the master cache node

replication_group_description Description for the group

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.`**`present`**(*name*, *engine=None*, *cache_node_type=None*, *num_cache_nodes=None*, *preferred_availability_zone=None*, *port=None*, *cache_parameter_group_name=None*, *cache_security_group_names=None*, *replication_group_id=None*, *auto_minor_version_upgrade=True*, *security_group_ids=None*, *cache_subnet_group_name=None*, *engine_version=None*, *notification_topic_arn=None*, *preferred_maintenance_window=None*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cache cluster exists.

name Name of the cache cluster (cache cluster id).

engine The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

cache_node_type The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster

num_cache_nodes The number of cache nodes that the cache cluster will have.

preferred_availability_zone The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

port The port number on which each of the cache nodes will accept connections.

cache_parameter_group_name The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

cache_security_group_names A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

replication_group_id The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

auto_minor_version_upgrade Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

security_group_ids One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

cache_subnet_group_name The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

engine_version The version number of the cache engine to be used for this cluster.

notification_topic_arn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

wait Boolean. Wait for confirmation from boto that the cluster is in the available state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.`**`replication_group_absent`**`(`*name, tags=None, region=None, key=None, keyid=None, profile=None*`)`

`salt.states.boto_elasticache.`**`replication_group_present`**`(`**args, **kwargs*`)`

`salt.states.boto_elasticache.`**`subnet_group_absent`**`(`*name, tags=None, region=None, key=None, keyid=None, profile=None*`)`

`salt.states.boto_elasticache.`**`subnet_group_present`**`(`*name, subnet_ids=None, subnet_names=None, description=None, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

name The name for the ElastiCache subnet group. This value is stored as a lowercase string.

subnet_ids A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet_names.

subnet_names A list of VPC subnet names for the cache subnet group. Exclusive with subnet_ids.

description Subnet group description.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.36 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure domain exists:
    boto_elasticsearch_domain.present:
        - DomainName: mydomain
        - profile='user-credentials'
        - ElasticsearchVersion: "2.3"
        - ElasticsearchClusterConfig:
            InstanceType": "t2.micro.elasticsearch"
            InstanceCount: 1
            DedicatedMasterEnabled: False
            ZoneAwarenessEnabled: False
        - EBSOptions:
            EBSEnabled: True
            VolumeType: "gp2"
            VolumeSize: 10
            Iops: 0
        - AccessPolicies:
            Version: "2012-10-17"
            Statement:
              - Effect: "Allow"
              - Principal:
                  AWS: "*"
              - Action:
                - "es:*"
```

(continues on next page)

(continued from previous page)

```
              - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
              - Condition:
                  IpAddress:
                    "aws:SourceIp":
                      - "127.0.0.1"
                      - "127.0.0.2"
        - SnapshotOptions:
            AutomatedSnapshotStartHour: 0
        - AdvancedOptions:
            rest.action.multi.allow_explicit_index": "true"
        - Tags:
            a: "b"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_elasticsearch_domain.absent`(*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

name The name of the state definition.

DomainName Name of the domain.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion='1.5'*)

Ensure domain exists.

name The name of the state definition

DomainName Name of the domain.

ElasticsearchClusterConfig Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) – The instance type for an Elasticsearch cluster.

InstanceCount (integer) – The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) – A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) – A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) – The instance type for a dedicated master node.

DedicatedMasterCount (integer) – Total number of dedicated master nodes, active and on standby, for the cluster.

EBSOptions Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) – Specifies whether EBS-based storage is enabled.

VolumeType (string) – Specifies the volume type for EBS-based storage.

VolumeSize (integer) – Integer to specify the size of an EBS volume.

Iops (integer) – Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

AccessPolicies IAM access policy

SnapshotOptions Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) – Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

AdvancedOptions Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

ElasticsearchVersion String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

21.19.37 salt.states.boto_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - availability_zones:
            - us-east-1a
            - us-east-1c
            - us-east-1d
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - listeners:
            - elb_port: 443
```

(continues on next page)

(continued from previous page)

```
              instance_port: 80
              elb_protocol: HTTPS
              instance_protocol: HTTP
              certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
              policies:
                  - my-ssl-policy
                  - cookie-policy
            - elb_port: 8210
              instance_port: 8210
              elb_protocol: TCP
        - backends:
            - instance_port: 80
              policies:
                  - enable-proxy-protocol
        - health_check:
            target: 'HTTP:80/'
        - attributes:
            cross_zone_load_balancing:
              enabled: true
            access_log:
              enabled: true
              s3_bucket_name: 'mybucket'
              s3_bucket_prefix: 'my-logs'
              emit_interval: 5
            connecting_settings:
              idle_timeout: 60
        - cnames:
            - name: mycname.example.com.
              zone: example.com.
              ttl: 60
            - name: myothercname.example.com.
              zone: example.com.
        - security_groups:
            - my-security-group
        - policies:
            - policy_name: my-ssl-policy
              policy_type: SSLNegotiationPolicyType
              policy:
                Protocol-TLSv1.2: true
                Protocol-SSLv3: false
                Server-Defined-Cipher-Order: true
                ECDHE-ECDSA-AES128-GCM-SHA256: true
            - policy_name: cookie-policy
              policy_type: LBCookieStickinessPolicyType
              policy: {}  # no policy means this is a session cookie
            - policy_name: enable-proxy-protocol
              policy_type: ProxyProtocolPolicyType
              policy:
                ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
```

(continues on next page)

(continued from previous page)

```
# Passing in a profile
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillard by setting the attributes on the resource. The module will use the default pillar key 'boto_elb_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```
my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - attributes_from_pillar: my_elb_attributes
        # override cross_zone_load_balancing:enabled
        - attributes:
            cross_zone_load_balancing:
              enabled: false
        - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - alarms:
            UnHealthyHostCount:
              name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
              attributes:
                metric: UnHealthyHostCount
                namespace: AWS/ELB
                statistic: Average
                comparison: '>='
```

(continues on next page)

(continued from previous page)

```
                threshold: 1.0
                period: 600
                evaluation_periods: 6
                unit: null
                description: ELB UnHealthyHostCount
                alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
                insufficient_data_actions: []
                ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_elb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - alarms_from_pillar: my_elb_alarm
        # override UnHealthyHostCount:attributes:threshold
        - alarms:
            UnHealthyHostCount:
              attributes:
                threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - tags:
```

(continues on next page)

(continued from previous page)

```
            MyTag: 'My Tag Value'
            OtherTag: 'My Other Value'
```

`salt.states.boto_elb.`**`absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

name name of the ELB

`salt.states.boto_elb.`**`present`**(*name, listeners, availability_zones=None, subnets=None, subnet_names=None, security_groups=None, scheme='internet-facing', health_check=None, attributes=None, attributes_from_pillar='boto_elb_attributes', cnames=None, alarms=None, alarms_from_pillar='boto_elb_alarms', policies=None, policies_from_pillar='boto_elb_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, tags=None, instance_ids=None, instance_names=None*)

Ensure the ELB exists.

name Name of the ELB.

availability_zones A list of availability zones for this ELB.

listeners A list of listener lists; example:

```
[
    ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
    ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
↪mycert']
]
```

subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.

subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.

security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

scheme The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

health_check A dict defining the health check for this ELB.

attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the *`salt.modules.boto_elb.set_attributes`* function for recognized attributes.

attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

cnames A list of cname dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as kwargs.

See the *`salt.states.boto_route53`* state for information about these attributes.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.

See the *`salt.states.boto_cloudwatch_alarm`* state for information about these attributes.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

tags dict of tags

instance_ids list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_names.

instance_names list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_ids.

`salt.states.boto_elb.`**`register_instances`**(*name*, *instances*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

name The name of the Elastic Load Balancer to add EC2 instances to.

instances A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2
```

21.19.38 salt.states.boto_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

`salt.states.boto_elbv2.`**`create_target_group`**(*name*, *protocol*, *port*, *vpc_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *health_check_protocol='HTTP'*, *health_check_port='traffic-port'*, *health_check_path='/'*, *health_check_interval_seconds=30*, *health_check_timeout_seconds=5*, *healthy_threshold_count=5*, *unhealthy_threshold_count=2*, ***kwargs*)

New in version 2017.11.0.

Create target group if not present.
name (string) - The name of the target group.
protocol (string) - The protocol to use for routing traffic to the targets
port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.
vpc_id (string) - The identifier of the virtual private cloud (VPC).
health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.
health_check_port (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.
health_check_path (string) - The ping path that is the destination on the targets for health checks. The default is /.
health_check_interval_seconds (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.
health_check_timeout_seconds (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.
healthy_threshold_count (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.
unhealthy_threshold_count (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.
returns (bool) - True on success, False on failure.
CLI example: .. code-block:: yaml

create-target:

  boto_elb2.create_targets_group:

- name: myALB
- protocol: https
- port: 443
- vpc_id: myVPC

`salt.states.boto_elbv2.`**`delete_target_group`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.
name (string) - The Amazon Resource Name (ARN) of the resource.
returns (bool) - True on success, False on failure.
CLI example:

```
check-target:
  boto_elb2.delete_targets_group:
```

(continues on next page)

(continued from previous page)

```
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

salt.states.boto_elbv2.**targets_deregistered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Remove targets to an Application Load Balancer target group.

name The ARN of the Application Load Balancer Target Group to remove targets from.

targets A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

salt.states.boto_elbv2.**targets_registered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

name The ARN of the Application Load Balancer Target Group to add targets to.

targets A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
  boto_elb.targets_registered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

21.19.39 salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
        mypolicy: |
            {
                "Version": "2012-10-17",
                "Statement": [{
                "Effect": "Allow",
                "Action": "*",
                "Resource": "*"}]
            }
    - password: NewPassword$$1
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
        mypolicy: |

    - key: 'safsdfsal;fdkjsafkljsASSADFalkfj'
```

`salt.states.boto_iam.`**`account_policy`**`(`*name=None, allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, password_reuse_prevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None*`)`

Change account policy.

New in version 2015.8.0.

name (string) The name of the account policy

allow_users_to_change_password (bool) Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

hard_expiry (bool) Prevents IAM users from setting a new password after their password has expired.

max_password_age (int) The number of days that an IAM user password is valid.

minimum_password_length (int) The minimum number of characters allowed in an IAM user password.

password_reuse_prevention (int) Specifies the number of previous passwords that IAM users are prevented from reusing.

require_lowercase_characters (bool) Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

require_numbers (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

require_symbols (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # $ % ^ & * ( ) _ + - = [ ] { } | '

require_uppercase_characters (bool) Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string)

`salt.states.boto_iam.`**`group_absent`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

New in version 2015.8.0.

Ensure the IAM group is absent.

name (string) The name of the group.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`group_present`**`(`*name*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *users=None*, *path='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*`)`

New in version 2015.8.0.

Ensure the IAM group is present

name (string) The name of the new group.

path (string) The path for the group, defaults to '/'

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of policy names or ARNs that should be attached to this group.

users (list) A list of users to be added to the group.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies (boolean) Delete or detach existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

`salt.states.boto_iam.`**`keys_absent`**`(`*access_keys*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

New in version 2015.8.0.

Ensure the IAM user access_key_id is absent.

access_key_id (list) A list of access key ids

user_name (string) The username of the user

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`keys_present`**`(`*name, number, save_dir, region=None, key=None, keyid=None, profile=None, save_format='{2}\n{0}\n{3}\n{1}\n'*`)`

New in version 2015.8.0.

Ensure the IAM access keys are present.

name (string) The name of the new user.

number (int) Number of keys that user should have.

save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username privided.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

save_format (dict) Save format is repeated for each key. Default format is "{2}n{0}n{3}n{1}n", where {0} and {1} are placeholders for new key_id and key respectively, whereas {2} and {3} are "key_id-{number}" and 'key-{number}' strings kept for compatibility.

`salt.states.boto_iam.`**`policy_absent`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

name (string) The name of the new policy.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`policy_present`**`(`*name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*`)`

New in version 2015.8.0.

Ensure the IAM managed policy is present

name (string) The name of the new policy.

policy_document (dict) The document of the new policy

path (string) The path in which the policy will be created. Default is '/'.

description (string) Description

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`saml_provider_absent`**`(`*name, region=None, key=None, keyid=None, profile=None*`)`

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`saml_provider_present`**(*name*, *saml_metadata_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`server_cert_absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.`**`server_cert_present`**(*name*, *public_key*, *private_key*, *cert_chain=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Crete server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

public_key (string) The contents of the public key certificate in PEM-encoded format.

private_key (string) The contents of the private key in PEM-encoded format.

cert_chain (string) The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

path (string) The path for the server certificate.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.`**`user_absent`**(*name*, *delete_keys=True*, *delete_mfa_devices=True*, *delete_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

name (string) The name of the new user.

delete_keys (bool) Delete all keys from user.

delete_mfa_devices (bool) Delete all mfa devices from user.

New in version 2016.3.0.

delete_profile (bool) Delete profile from user.

New in version 2016.3.0.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.`**`user_present`**`(`*name, policies=None, policies_from_pillars=None, managed_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None*`)`

New in version 2015.8.0.

Ensure the IAM user is present

name (string) The name of the new user.

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of managed policy names or ARNs that should be attached to this user.

password (string) The password for the new user. Must comply with account policy.

path (string) The path of the user. Default is '/'.

New in version 2015.8.2.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.40 salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```yaml
myrole:
    boto_iam_role.present:
        - region: us-east-1
        - key: GKTADJGHEIQSXMKKRBJ08H
        - keyid: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - policies_from_pillars:
            - shared_iam_bootstrap_policy
        - policies:
            MySQSPolicy:
                Statement:
                  - Action:
                        - sqs:*
                    Effect: Allow
                    Resource:
                        - arn:aws:sqs:*:*:*
                    Sid: MyPolicySQS1
            MyS3Policy:
                Statement:
                  - Action:
                        - s3:GetObject
                    Effect: Allow
                    Resource:
                        - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
    boto_iam_role.present:
        - profile: myiamprofile

# Passing in a credentials profile
myrole:
    boto_iam_role.present:
        - profile:
            key: GKTADJGHEIQSXMKKRBJ08H
            keyid: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
            region: us-east-1
```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the `profile` parameter and `region` is set outside of the profile group, region is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.`**`absent`**`(`*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure the IAM role is deleted.

name Name of the IAM role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam_role.`**`present`**(*name*, *policy_document=None*, *policy_document_from_pillars=None*, *path=None*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *create_instance_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*)

Ensure the IAM role exists.

name Name of the IAM role.

policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policy_document_from_pillars A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the policy_document argument.

New in version 2017.7.0.

path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policies A dict of IAM role policies.

policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies A list of (AWS or Customer) managed policies to be attached to the role.

create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies Deletes existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

21.19.41 salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure policy exists:
    boto_iot.policy_present:
        - policyName: mypolicy
        - policyDocument:
            Version: "2012-10-17"
            Statement:
              Action:
                - iot:Publish
              Resource:
                - "*"
              Effect: "Allow"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

Ensure topic rule exists:
    boto_iot.topic_rule_present:
        - ruleName: myrule
        - sql: "SELECT * FROM 'iot/test'"
        - description: 'test rule'
        - ruleDisabled: false
        - actions:
          - lambda:
              functionArn: "arn:aws:us-east-1:1234:function/functionname"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_iot.`**`policy_absent`**(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

name The name of the state definition.

policyName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`policy_attached`**(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`policy_detached`**`(`*name, policyName, principal, region=None, key=None, keyid=None, profile=None*`)`

Ensure policy is attached to the given principal.

name The name of the state definition.

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`policy_present`**`(`*name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None*`)`

Ensure policy exists.

name The name of the state definition

policyName Name of the policy.

policyDocument The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`thing_type_absent`**`(`*name, thingTypeName, region=None, key=None, keyid=None, profile=None*`)`

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

name The name of the state definition.

thingTypeName Name of the thing type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`thing_type_present`**`(`*name, thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None*`)`

Ensure thing type exists.

New in version 2016.11.0.

name The name of the state definition

thingTypeName Name of the thing type

thingTypeDescription Description of the thing type

searchableAttributesList List of string attributes that are searchable for the thing type

region Region to connect to.

key Secret key to be used.

keyid Access key to be used

profile A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid `salt.states.boto_iot.`**`topic_rule_absent`**`(`*name, ruleName, region=None, key=None, keyid=None, profile=None*`)`

Ensure topic rule with passed properties is absent.

name The name of the state definition.

ruleName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.`**`topic_rule_present`**`(`*name, ruleName, sql, actions, description=", ruleDisabled=False, region=None, key=None, keyid=None, profile=None*`)`

Ensure topic rule exists.

name The name of the state definition

ruleName Name of the rule.

sql The SQL statement used to query the topic.

actions The actions associated with the rule.

description The description of the rule.

ruleDisable Specifies whether the rule is disabled.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.42 salt.states.boto_kinesis module

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure Kinesis stream does not exist:
  boto_kinesis.absent:
    - name: new_stream
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1

Ensure Kinesis stream exists:
  boto_kinesis.present:
    - name: new_stream
    - retention_hours: 168
    - enhanced_monitoring: ['ALL']
    - num_shards: 2
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

`salt.states.boto_kinesis.`**`absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Delete the kinesis stream, if it exists.

name (string) Stream name

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_kinesis.`**`present`**(*name, retention_hours=None, enhanced_monitoring=None, num_shards=None, do_reshard=True, region=None, key=None, keyid=None, profile=None*)

Ensure the kinesis stream is properly configured and scaled.

name (string) Stream name

retention_hours (int) Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

enhanced_monitoring (list of string) Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

num_shards (int) Reshard stream (if necessary) to this number of shards !!!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^N+1) !!!!!

do_reshard (boolean) If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.43 salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_kms.`**`key_present`**(*name, policy, description=None, key_usage=None, grants=None, manage_grants=False, key_rotation=False, enabled=True, region=None, key=None, keyid=None, profile=None*)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

name Name of the key.

policy Key usage policy.

description Description of the key.

key_usage Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.

grants A list of grants to apply to the key. Not currently implemented.

manage_grants Whether or not to manage grants. False by default, which will not manage any grants.

key_rotation Whether or not key rotation is enabled for the key. False by default.

enabled Whether or not the key is enabled. True by default.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.44 salt.states.boto_lambda module

Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure function exists:
    boto_lambda.function_present:
        - FunctionName: myfunction
        - Runtime: python2.7
        - Role: iam_role_name
        - Handler: entry_function
        - ZipFile: code.zip
        - S3Bucket: bucketname
        - S3Key: keyname
        - S3ObjectVersion: version
        - Description: "My Lambda Function"
        - Timeout: 3
        - MemorySize: 128
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_lambda.`**`alias_absent`**(*name, FunctionName, Name, region=None, key=None, keyid=None, profile=None*)

Ensure alias with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

Name Name of the alias.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.`**`alias_present`**(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

name The name of the state definition.

FunctionName Name of the function for which you want to create an alias.

Name The name of the alias to be created.

FunctionVersion Function version for which you are creating the alias.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.`**`event_source_mapping_absent`**(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

name The name of the state definition.

EventSourceArn ARN of the event source.

FunctionName Name of the lambda function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.`**`event_source_mapping_present`**(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

name The name of the state definition.

EventSourceArn The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

FunctionName The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

StartingPosition The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)

Enabled Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

BatchSize The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.`**`function_absent`**`(`*name, FunctionName, region=None, key=None, keyid=None, profile=None*`)`

Ensure function with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.`**`function_present`**`(`*name, FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description=", Timeout=3, MemorySize=128, Permissions=None, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None*`)`

Ensure function exists.

name The name of the state definition

FunctionName Name of the Function.

Runtime The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'

Role The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

Handler The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.classname.

ZipFile A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

S3Bucket Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3Key The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3ObjectVersion The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

Timeout The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

MemorySize The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

VpcConfig If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```
VpcConfig:
  SecurityGroupNames:
    - mysecgroup1
    - mysecgroup2
  SecurityGroupIds:
    - sg-abcdef1234
  SubnetNames:
    - mysubnet1
  SubnetIds:
    - subnet-1234abcd
    - subnet-abcd1234
```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

Permissions A list of permission definitions to be added to the function's policy

RoleRetries IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will atuomatically retry this number of times. The default is 5.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

New in version 2017.7.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.45 salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
        - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
        - '/dev/sda1':
            size: 20
            volume_type: 'io1'
            iops: 220
            delete_on_termination: true
    - cloud_init:
        boothooks:
          'disable-master.sh': |
            #!/bin/bash
            echo "manual" > /etc/init/salt-master.override
        scripts:
          'run_salt.sh': |
            #!/bin/bash

            add-apt-repository -y ppa:saltstack/salt
            apt-get update
            apt-get install -y salt-minion
            salt-call state.highstate
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
```

(continues on next page)

(continued from previous page)

    - image_id: ami-0b9c9f62
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

`salt.states.boto_lc.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

name Name of the launch configuration.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lc.present`(*name*, *image_id*, *key_name=None*, *vpc_id=None*, *vpc_name=None*, *security_groups=None*, *user_data=None*, *cloud_init=None*, *instance_type='m1.small'*, *kernel_id=None*, *ramdisk_id=None*, *block_device_mappings=None*, *delete_on_termination=None*, *instance_monitoring=False*, *spot_price=None*, *instance_profile_name=None*, *ebs_optimized=False*, *associate_public_ip_address=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the launch configuration exists.

name Name of the launch configuration.

image_id AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

key_name Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

vpc_id The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_name.

vpc_name Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_id.

security_groups List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

user_data The user data available to launched EC2 instances.

cloud_init A dict of cloud_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user_data.

instance_type The instance type. ex: m1.small.

kernel_id The kernel id for the instance.

ramdisk_id The RAM disk ID for the instance.

block_device_mappings A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.

- **volume_type** Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.
- **delete_on_termination** Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.
- **iops** For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
- **size** Desired volume size (in GiB).
- **encrypted** Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

instance_monitoring Whether instances in group are launched with detailed monitoring.

spot_price The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.46 salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure myrds RDS exists:
  boto_rds.present:
    - name: myrds
    - allocated_storage: 5
    - storage_type: standard
    - db_instance_class: db.t2.micro
    - engine: MySQL
    - master_username: myuser
    - master_user_password: mypass
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

(continues on next page)

(continued from previous page)

```
    - tags:
        key: value
```

```
Ensure parameter group exists:
    create-parameter-group:
      boto_rds.parameter_present:
        - name: myparametergroup
        - db_parameter_group_family: mysql5.6
        - description: "parameter group family"
        - parameters:
          - binlog_cache_size: 32768
          - binlog_checksum: CRC32
        - region: eu-west-1
```

depends boto3

`salt.states.boto_rds.`**`absent`**(*name, skip_final_snapshot=None, final_db_snapshot_identifier=None, tags=None, wait_for_deletion=True, timeout=180, region=None, key=None, keyid=None, profile=None*)

Ensure RDS instance is absent.

name Name of the RDS instance.

skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.

tags A dict of tags.

wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.

timeout (in seconds) The amount of time that can pass before raising an Exception.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.`**`parameter_present`**(*name, db_parameter_group_family, description, parameters=None, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure DB parameter group exists and update parameters.

name The name for the parameter group.

db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

description Parameter group description.

parameters The DB parameters that need to be changed of type dictionary.

apply_method The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.`**`present`**(*name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None*)

Ensure RDS instance exists.

name Name of the RDS state definition.

allocated_storage The amount of storage (in gigabytes) to be initially allocated for the database instance.

db_instance_class The compute and memory capacity of the Amazon RDS DB instance.

engine The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS create_db_instance documentation.

master_username The name of master user for the client DB instance.

master_user_password The password for the master database user. Can be any printable ASCII character except ”/”, ’”’, or ”@”.

db_name The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance

storage_type Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the Iops parameter.

db_security_groups A list of DB security groups to associate with this DB instance.

vpc_security_group_ids A list of EC2 VPC security group IDs to associate with this DB instance.

vpc_security_groups A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

availability_zone The EC2 Availability Zone that the database instance will be created in.

db_subnet_group_name A DB subnet group to associate with this DB instance.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur.

db_parameter_group_name A DB parameter group to associate with this DB instance.

db_cluster_identifier If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

tde_credential_arn The ARN from the Key Store with which the instance is associated for TDE encryption.

tde_credential_password The password to use for TDE encryption if an encryption key is not used.

storage_encrypted Specifies whether the DB instance is encrypted.

kms_keyid If storage_encrypted is true, the KMS key identifier for the encrypted DB instance.

backup_retention_period The number of days for which automated backups are retained.

preferred_backup_window The daily time range during which automated backups are created if automated backups are enabled.

port The port number on which the database accepts connections.

multi_az Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.

engine_version The version number of the database engine to use.

auto_minor_version_upgrade Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

license_model License model information for this DB instance.

iops The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

option_group_name Indicates that the DB instance should be associated with the specified option group.

character_set_name For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.

publicly_accessible Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

wait_status Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

tags A dict of tags.

copy_tags_to_snapshot Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

region Region to connect to.

domain The identifier of the Active Directory Domain.

key AWS secret key to be used.

keyid AWS access key to be used.

monitoring_interval The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

monitoring_role_arn The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

domain_iam_role_name Specify the name of the IAM role to be used when making API calls to the Directory Service.

promotion_tier A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.`**`replica_present`**(*name, source, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, region=None, key=None, keyid=None, profile=None, db_parameter_group_name=None*)

Ensure RDS replica exists.

```
Ensure myrds replica RDS exists:
  boto_rds.create_replica:
    - name: myreplica
    - source: mydb
```

`salt.states.boto_rds.`**`subnet_group_absent`**(*name, tags=None, region=None, key=None, keyid=None, profile=None*)

`salt.states.boto_rds.`**`subnet_group_present`**(*name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure DB subnet group exists.

name The name for the DB subnet group. This value is stored as a lowercase string.

subnet_ids A list of the EC2 Subnet IDs for the DB subnet group. Either subnet_ids or subnet_names must be provided.

subnet_names A list of The EC2 Subnet names for the DB subnet group. Either subnet_ids or subnet_names must be provided.

description Subnet group description.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.47 salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
```

(continues on next page)

(continued from previous page)

```
    - profile: myprofile

# Passing in a profile
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_route53.`**`absent`**`(`*name, zone, record_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False*`)`

Ensure the Route53 record is deleted.

name Name of the record.

zone The zone to delete the record from.

record_type The record type (A, NS, MX, TXT, etc.)

identifier An identifier to match for deletion.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using split_dns, specify if this is the private zone.

`salt.states.boto_route53.`**`hosted_zone_absent`**`(`*name, domain_name=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure the Route53 Hostes Zone described is absent

name The name of the state definition.

domain_name The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

`salt.states.boto_route53.`**`hosted_zone_present`**`(`*name, domain_name=None, private_zone=False, caller_ref=None, comment=”, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private_zone (AWS API limitation).
- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc_id (same story - we really need to rewrite this module with boto3)
- vpc_name (really just a pointer to vpc_id anyway).
- vpc_region (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3_route53 module instead.

name The name of the state definition.

domain_name The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

private_zone Set True if creating a private hosted zone.

caller_ref A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

comment Any comments you want to include about the hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored when creating a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored when creating a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

`salt.states.boto_route53.`**`present`**`(`*name*, *value*, *zone*, *record_type*, *ttl=None*, *identifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*`)`

Ensure the Route53 record is present.

name Name of the record.

value

Value of the record. As a special case, you can pass in: *private:<Name tag>* to have the function autodetermine the private IP *public:<Name tag>* to have the function autodetermine the public IP

zone The zone to create the record in.

record_type The record type (A, NS, MX, TXT, etc.)

ttl The time to live for the record.

identifier The unique identifier to use for this record.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53 before returning success.

split_dns Route53 supports parallel public and private DNS zones with the same name.

private_zone If using split_dns, specify if this is the private zone.

`salt.states.boto_route53.`**`rr_absent`**`(`**args*, ***kwargs*`)`

`salt.states.boto_route53.`**`rr_present`**`(`**args*, ***kwargs*`)`

21.19.48 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure bucket exists:

                  ReplaceKeyWith: "string"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_s3_bucket.`**`absent`**`(`*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure bucket with passed properties is absent.

name The name of the state definition.

Bucket Name of the bucket.

Force Empty the bucket first if necessary - Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_s3_bucket.`**`present`**`(`*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*`)`

Ensure bucket exists.

name The name of the state definition

Bucket Name of the bucket.

LocationConstraint 'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

ACL The permissions on a bucket using access control lists (ACL).

CORSRules The cors configuration for a bucket.

LifecycleConfiguration Lifecycle configuration for your bucket

Logging The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

NotificationConfiguration notifications of specified events for a bucket

Policy Policy on the bucket

Replication Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

RequestPayment The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

Tagging A dictionary of tags that should be set on the bucket

Versioning The versioning state of the bucket

Website The website configuration of the bucket

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.49 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - vpc_name: myvpc
        - rules:
            - ip_protocol: tcp
              from_port: 80
              to_port: 80
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
            - ip_protocol: tcp
              from_port: 8080
              to_port: 8090
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
            - ip_protocol: icmp
              from_port: -1
              to_port: -1
              source_group_name: mysecgroup
            - ip_protocol: tcp
              from_port: 8080
              to_port: 8080
              source_group_name: MyOtherSecGroup
              source_group_name_vpc: MyPeeredVPC
        - rules_egress:
            - ip_protocol: all
              from_port: -1
              to_port: -1
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
        - tags:
            SomeTag: 'My Tag Value'
            SomeOtherTag: 'Other Tag Value'
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
```

(continues on next page)

(continued from previous page)

```
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - profile: myprofile

# Passing in a profile
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
            region: us-east-1
```

Note: When using the `profile` parameter and `region` is set outside of the profile group, region is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_secgroup.`**`absent`**`(`*name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure a security group with the specified name does not exist.

name Name of the security group.

vpc_id The ID of the VPC to remove the security group from, if any. Exclusive with vpc_name.

vpc_name The name of the VPC to remove the security group from, if any. Exclusive with vpc_name.

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_secgroup.`**`present`**`(`*name, description, vpc_id=None, vpc_name=None, rules=None, rules_egress=None, delete_ingress_rules=True, delete_egress_rules=True, region=None, key=None, keyid=None, profile=None, tags=None*`)`

Ensure the security group exists with the specified rules.

name Name of the security group.

description A description of this security group.

vpc_id The ID of the VPC to create the security group in, if any. Exclusive with vpc_name.

vpc_name The name of the VPC to create the security group in, if any. Exclusive with vpc_id.

New in version 2016.3.0.

New in version 2015.8.2.

rules A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

rules_egress A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

delete_ingress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

delete_egress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.

tags List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

21.19.50 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
mytopic:
    boto_sns.present:
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
mytopic:
    boto_sns.present:
        - region: us-east-1
        - profile: mysnsprofile

# Passing in a profile
mytopic:
    boto_sns.present:
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_sns.`**`absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

name Name of the SNS topic.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

unsubscribe If True, unsubscribe all subcriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.`**`present`**(*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

name Name of the SNS topic.

subscriptions List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
{'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
{'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.51 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - attributes:
            ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - profile: mysqsprofile

# Passing in a profile
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_sqs.`**`absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

name Name of the SQS queue.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_sqs.`**`present`**(*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SQS queue exists.

name Name of the SQS queue.

attributes A dict of key/value SQS attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.52 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
      - subnet_names:
```

(continues on next page)

(continued from previous page)

```
        - subnet1
        - subnet2
      - region: us-east-1
      - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```
accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering
```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```
accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_id: pcx-1873c371
    - region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```
delete a named vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

Delete also accepts a VPC peering connection id.

```
delete a vpc peering connection by id:
  boto_vpc.delete_vpc_peering_connection:
    - conn_id: pcx-1873c371
```

`salt.states.boto_vpc.`**`absent`**`(`*name, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure VPC with passed properties is absent.

name Name of the VPC.

tags A list of tags. All tags must match.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`accept_vpc_peering_connection`**`(`*name=None, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None*`)`

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state

conn_id The connection ID to accept. Exclusive with conn_name. String type.

conn_name The name of the VPC peering connection to accept. Exclusive with conn_id. String type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2
```

`salt.states.boto_vpc.`**`delete_vpc_peering_connection`**`(`*name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None*`)`

name Name of the state

conn_id ID of the peering connection to delete. Exclusive with conn_name.

conn_name The name of the peering connection to delete. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

`salt.states.boto_vpc.`**`dhcp_options_absent`**`(`*name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure a set of DHCP options with the given settings exist.

name (string) Name of the DHCP options set.

dhcp_options_id (string) Id of the DHCP options set.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.`**`dhcp_options_present`**`(`*name, dhcp_options_id=None, vpc_name=None, vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.

name (string) Name of the DHCP options.

vpc_name (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

vpc_id (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

domain_name (string) Domain name to be assiciated with this option set.

domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.

ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.

netbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.

netbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

tags (dict of key:value pairs) A set of tags to be added.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.`**`internet_gateway_absent`**`(`*name, detach=False, region=None, key=None, keyid=None, profile=None*`)`

Ensure the named internet gateway is absent.

name Name of the internet gateway.

detach First detach the internet gateway from a VPC, if attached.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`internet_gateway_present`**`(`*name, vpc_name=None, vpc_id=None, tags=None, region=None, key=None, keyid=None, profile=None*`)`

Ensure an internet gateway exists.

name Name of the internet gateway.

vpc_name Name of the VPC to which the internet gateway should be attached.

vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.

tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`nat_gateway_absent`**(*name=None, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, wait_for_delete_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.
name Name of the state.
subnet_name Name of the subnet within which the nat gateway should exist
subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.`**`nat_gateway_present`**(*name, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, allocation_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet
```

name Name of the state
subnet_name Name of the subnet within which the nat gateway should exist
subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.
allocation_id If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new allocation_id is created and used.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`present`**(*name, cidr_block, instance_tenancy=None, dns_support=None, dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure VPC exists.

name Name of the VPC.
cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.
instance_tenancy Instances launched in this VPC will be ingle-tenant or dedicated hardware.
dns_support Indicates whether the DNS resolution is supported for the VPC.
dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`request_vpc_peering_connection`**(*name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None*)

name Name of the state
requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name. String type.
requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.
peer_vpc_id ID of the VPC tp crete VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.
peer_vpc_name Name tag of the VPC tp crete VPC peering connection with. This can only be a VPC the same account. Exclusive with peer_vpc_id. String type.
conn_name The (optional) name to use for this VPC peering connection. String type.
peer_owner_id ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4b3522e
    - peer_vpc_id: vpc-ae83f9ca
    - conn_name: salt_peering_connection
```

`salt.states.boto_vpc.`**`route_table_absent`**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named route table is absent.

name Name of the route table.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`route_table_present`**(*name, vpc_name=None, vpc_id=None, routes=None, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gatewyas are specified.

Example:

```
boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: eni-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
  - subnet_names:
    - subnet1
    - subnet2
```

name Name of the route table.
vpc_name Name of the VPC with which the route table should be associated.
vpc_id Id of the VPC with which the route table should be associated. Either vpc_name or vpc_id must be provided.
routes A list of routes. Each route has a cidr and a target.
subnet_ids A list of subnet ids to associate
subnet_names A list of subnet names to associate
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`subnet_absent`**(*name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.
name Name of the subnet.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`subnet_present`**(*name, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None, auto_assign_public_ipv4=False*)

Ensure a subnet exists.
name Name of the subnet.

cidr_block The range if IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

vpc_name Name of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

vpc_id Id of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

availability_zone AZ in which the subnet should be placed.

tags A list of tags.

route_table_id A route table ID to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.`**`vpc_peering_connection_absent`**`(`*name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None*`)`

`salt.states.boto_vpc.`**`vpc_peering_connection_present`**`(`*name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None*`)`

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.

peer_vpc_id ID of the VPC tp crete VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

peer_vpc_name Name tag of the VPC tp crete VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer_vpc_id.

conn_name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
```

(continues on next page)

(continued from previous page)

```
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321
```

21.19.53 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply `npm` and `git` in most cases), and npm.installed state for the package which provides bower.

Example:

```
npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

`salt.states.bower.`**`bootstrap`**`(`*name*, *user=None*`)`

Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.
user The user to run Bower with

`salt.states.bower.`**`installed`**`(`*name*, *dir*, *pkgs=None*, *user=None*, *env=None*`)`

Verify that the given package is installed and is at the correct version (if specified).

```
underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project
```

name The package to install
dir The target directory in which to install the package
pkgs A list of packages to install with a single Bower invocation; specifying this argument will ignore the `name` argument
user The user to run Bower with
env A list of environment variables to be set prior to execution. The format is the same as the *`cmd.run`*. state function.

`salt.states.bower.`**`pruned`**`(`*name*, *user=None*, *env=None*`)`

New in version 2017.7.0.

Cleans up local bower_components directory.

Will execute 'bower prune' on the specified directory (param: name)

user The user to run Bower with

`salt.states.bower.`**`removed`**`(`*name*, *dir*, *user=None*`)`

Verify that the given package is not installed.

dir The target directory in which to install the package

user The user to run Bower with

21.19.54 salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

cabal-install: pkg.installed

ShellCheck:

cabal.installed:

- require: - pkg: cabal-install

`salt.states.cabal.`**`installed`**`(`*name*, *pkgs=None*, *user=None*, *install_global=False*, *env=None*`)`

Verify that the given package is installed and is at the correct version (if specified).

```yaml
ShellCheck-0.3.5:
  cabal:
    - installed:
```

name The package to install

user The user to run cabal install with

install_global Install package globally instead of locally

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run`. state function.

`salt.states.cabal.`**`removed`**`(`*name*, *user=None*, *env=None*`)`

Verify that given package is not installed.

21.19.55 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.`**`quorum`**`(`*name*, ***kwargs*`)`

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

21.19.56 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

`salt.states.chef.`**`client`**`(`*name*, ***kwargs*`)`

name Unique identifier for the state. Does not affect the Chef run.
server The chef server URL
client_key Set the client key file location
config The configuration file to use
config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
localmode Point chef-client at local repository if True
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
pid Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist Permanently replace current run list with specified items
user User to set privilege to
validation_key Set the validation key file location, used for registering new clients

`salt.states.chef.`**`solo`**`(`*name*, ***kwargs*`)`

name Unique identifier for the state. Does not affect the Chef run.
config The configuration file to use
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL

log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to

21.19.57 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

Note: Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

`salt.states.chocolatey.`**`installed`**(*name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False*)

Installs a package if not already installed

Parameters

- **`name`** (*`str`*) – The name of the package to be installed. Required.
- **`version`** (*`str`*) – Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **`source`** (*`str`*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **`force`** (*`bool`*) – Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **`pre_versions`** (*`bool`*) – Include pre-release packages. Default is False.
- **`install_args`** (*`str`*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **`override_args`** (*`bool`*) – Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is False.
- **`force_x86`** (*`bool`*) – Force x86 (32bit) installation on 64 bit systems. Default is False.
- **`package_args`** (*`str`*) – Arguments you want to pass to the package. Default is None.
- **`allow_multiple`** (*`bool`*) – Allow mulitiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

  New in version 2017.7.0.

```
Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
```

`salt.states.chocolatey.`**`uninstalled`**(*name, version=None, uninstall_args=None, override_args=False*)

Uninstalls a package

name The name of the package to be uninstalled

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller)in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

```
Removemypackage:
  chocolatey.uninstalled:
    - name: mypackage
    - version: '21.5'
```

`salt.states.chocolatey.`**`upgraded`**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*)

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.

Parameters

- **name** (*str*) – The name of the package to be installed. Required.
- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is `None`.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is `None`.
- **force** (*bool*) – `True` will reinstall an existing package with the same version. Default is `False`.
- **pre_versions** (*bool*) – `True` will nclude pre-release packages. Default is `False`.
- **install_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is `None`.
- **override_args** (*bool*) – `True` will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. `False` will append install_args to the end of the default arguments. Default is `False`.
- **force_x86** (*bool*) – `True` forces 32bit installation on 64 bit systems. Default is `False`.
- **package_args** (*str*) – Arguments you want to pass to the package. Default is `None`.

```
upgrade_some_package:
  chocolatey.upgraded:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
```

21.19.58 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
```

(continues on next page)

(continued from previous page)

```
        schedule: "R//PT2S"
        command: "echo 'hi'"
        owner: "me@example.com"
```

New in version 2015.8.2.

`salt.states.chronos_job.`**`absent`**(*name*)

Ensure that the chronos job with the given name is not present.

Parameters **`name`** – The app name

Returns A standard Salt changes dictionary

`salt.states.chronos_job.`**`config`**(*name*, *config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

- **`name`** – The job name
- **`config`** – The configuration to apply (dict)

Returns A standard Salt changes dictionary

21.19.59 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

codeauthor `Spencer Ervin <spencer_ervin@hotmail.com>`

maturity new

depends none

platform unix

About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

See also:

`CIMC Proxy Module`

`salt.states.cimc.`**`hostname`**(*name*, *hostname=None*)

Ensures that the hostname is set to the specified value.

New in version 2019.2.0.

name: The name of the module function to execute.

hostname(str): The hostname of the server.

SLS Example:

```
set_name:
  cimc.hostname:
    - hostname: foobar
```

`salt.states.cimc.`**`logging_levels`**(*name*, *remote=None*, *local=None*)

Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

name: The name of the module function to execute.

remote(str): The logging level for SYSLOG logs.

local(str): The logging level for the local device.

SLS Example:

```
logging_levels:
  cimc.logging_levels:
    - remote: informational
    - local: notice
```

`salt.states.cimc.`**`ntp`**`(`*name*, *servers*`)`

Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

name: The name of the module function to execute.

servers(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

```
ntp_configuration_list:
  cimc.ntp:
    - servers:
      - foo.bar.com
      - 10.10.10.10

ntp_configuration_str:
  cimc.ntp:
    - servers: foo.bar.com
```

`salt.states.cimc.`**`power_configuration`**`(`*name*, *policy=None*, *delayType=None*, *delayValue=None*`)`

Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

name: The name of the module function to execute.

policy(str): The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:

> reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
>
> stay-off: The server remains off until it is manually restarted.
>
> last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.

delayType(str): If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:

> fixed: The server restarts after a fixed delay.
>
> random: The server restarts after a random delay.

delayValue(int): If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

```
reset_power:
  cimc.power_configuration:
    - policy: reset
    - delayType: fixed
    - delayValue: 0

power_off:
  cimc.power_configuration:
    - policy: stay-off
```

`salt.states.cimc.`**`syslog`**`(`*name, primary=None, secondary=None*`)`

Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

name: The name of the module function to execute.

primary(str): The IP address or FQDN of the primary syslog server.

secondary(str): The IP address or FQDN of the secondary syslog server.

SLS Example:

```
syslog_configuration:
  cimc.syslog:
    - primary: 10.10.10.10
    - secondary: foo.bar.com
```

`salt.states.cimc.`**`user`**`(`*name, id=", user=", priv=", password=", status='active'*`)`

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

New in version 2019.2.0.

name: The name of the module function to execute.

id(int): The user ID slot on the device.

user(str): The username of the user.

priv(str): The privilege level of the user.

password(str): The password of the user.

status(str): The status of the user. Can be either active or inactive.

SLS Example:

```
user_configuration:
  cimc.user:
    - id: 11
    - user: foo
    - priv: admin
    - password: mypassword
    - status: active
```

21.19.60 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *`salt.proxy.cisconso`*.

`salt.states.cisconso.`**`value_present`**`(`*name*, *datastore*, *path*, *config*`)`

Ensure a specific value exists at a given path

Parameters

- **name** (`str`) – The name for this rule
- **datastore** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list`, `str` OR `tuple`) – The device path to set the value at, a list of element names in order, / separated
- **config** (`dict`) – The new value at the given path

Examples:

```
enable pap auth:
  cisconso.config_present:
    - name: enable_pap_auth
    - datastore: running
    - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
    - config:
        authentication:
            method: pap
            "list-name": foobar
```

21.19.61 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

`salt.states.cloud.`**`absent`**`(`*name*, *onlyif=None*, *unless=None*`)`

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

name The name of the instance to destroy
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed

`salt.states.cloud.`**`present`**`(`*name*, *cloud_provider*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*`)`

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

name The name of the instance to create
cloud_provider The name of the cloud provider to use
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed
opts Any extra opts that need to be used

`salt.states.cloud.`**`profile`**`(`*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*`)`

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

name The name of the instance to create
profile The name of the cloud profile to use
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed
kwargs Any profile override or addition
opts Any extra opts that need to be used

`salt.states.cloud.`**`volume_absent`**`(`*name*, *provider=None*, ***kwargs*`)`

Check that a block volume exists.

`salt.states.cloud.`**`volume_attached`**`(`*name*, *server_name*, *provider=None*, ***kwargs*`)`

Check if a block volume is attached.

`salt.states.cloud.`**`volume_detached`**`(`*name*, *server_name=None*, *provider=None*, ***kwargs*`)`

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.`**`volume_present`**`(`*name*, *provider=None*, ***kwargs*`)`

Check that a block volume exists.

21.19.62 salt.states.cmd

Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch /tmp/foo if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files, in which case this state will run if **any** of the files do not exist:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
```

(continues on next page)

(continued from previous page)

```
    - creates:
      - /tmp/bar
      - /tmp/baz
```

Note: The `creates` option was added to version 2014.7.0

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes**. Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {})**. If it's key=value pairs then quoting may be used to include spaces. (Python's shlex module is used to parse the key=value string)

   Two special keys or attributes are recognized in the output:

   ```
   changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
   comment: str  (i.e., any string)
   ```

   So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.
3. **If there's a comment then it will be used as the comment of the state**.

   Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo  # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
        - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The stateful argument can optionally include a test_name parameter.**

   This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

   New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

Note: Use `cmd.run` together with *onchanges* instead of `cmd.wait`.

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then *cmd.wait* does just that. *cmd.wait* is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself do not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the env option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.`**`call`**(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, output_loglevel='debug', hide_output=False, use_vt=False, **kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the *salt.renderers.pydsl* renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of *cmd.run*, and all other arguments(`cwd`, `runas`, ...) allowed by *cmd.run* are allowed here, except that their effects apply only to the commands specified in *onlyif* and *unless* rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
    'name': name
    'changes': {'retval': result},
    'result': True if result is None else bool(result),
    'comment': result if isinstance(result, six.string_types) else ''
}
```

`salt.states.cmd.`**`mod_run_check`**(*cmd_kwargs*, *onlyif*, *unless*, *creates*)

Execute the onlyif and unless logic. Return a result dict if: * onlyif failed (onlyif != 0) * unless succeeded (unless == 0) else return True

`salt.states.cmd.`**`mod_watch`**(*name*, ***kwargs*)

Execute a cmd function based on a watch call

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.cmd.`**`run`**(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *root=None*, *runas=None*, *shell=None*, *env=None*, *prepend_path=None*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *hide_output=False*, *timeout=None*, *ignore_timeout=False*, *use_vt=False*, *success_retcodes=None*, ***kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns a zero exit status

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns a non-zero exit status

cwd The current working directory to execute the command in, defaults to /root

root Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

prepend_path $PATH segment to prepend (trailing ':' not necessary) to $PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

umask The umask (in octal) to use when running the command.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

use_vt [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

bg [False] If `True`, run command in background and do not await or deliver its results.

New in version 2016.3.6.

success_retcodes: This parameter will be allow a list of
non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

Note: cmd.run supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your cmd.run does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
```

(continues on next page)

(continued from previous page)

```
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True
```

`salt.states.cmd.script`(*name, source=None, template=None, onlyif=None, unless=None, creates=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, timeout=None, use_vt=False, output_loglevel='debug', hide_output=False, defaults=None, context=None, success_retcodes=None, **kwargs*)

Download a script and execute it with specified arguments.

source The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name Either "cmd arg1 arg2 arg3..." (cmd is not used) or a source "salt://...".

onlyif Run the named command only if the command passed to the `onlyif` option returns true

unless Run the named command only if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The name of the user to run the command as

shell The shell to use for execution. The default is set in grains['shell']

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

saltenv `[base]` The Salt environment to use

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

args String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

creates Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults New in version 2016.3.0.

Default context passed to the template.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

> **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

> **Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes: This parameter will be allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

`salt.states.cmd.wait`(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *root=None*, *runas=None*, *shell=None*, *env=()*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *hide_output=False*, *use_vt=False*, *success_retcodes=None*, ***kwargs*)

Run the given command only if the watch statement calls it.

> **Note:** Use *`cmd.run`* together with `onchanges` instead of *`cmd.wait`*.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

root Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

runas The user name to run the command as

shell The shell to use for execution, defaults to /bin/sh

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
```

(continues on next page)

(continued from previous page)

```
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

creates Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

success_retcodes: This parameter will be allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

`salt.states.cmd.`**`wait_call`**(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, stateful=False, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs*) `salt.states.cmd.`**`wait_script`**`(`*name, source=None, template=None, onlyif=None, unless=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs*`)`

Download a script from a remote source and execute it only if a watch statement calls it.

source The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes: This parameter will be allow a list of
non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

21.19.63 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```
get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
    - cwd: /root/
    - watch:
      - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true
```

`salt.states.composer.`**`installed`**(*name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True, env=None*)

Verify that the correct versions of composer dependencies are present.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source `--prefer-source` option of composer.

prefer_dist `--prefer-dist` option of composer.

no_scripts `--no-scripts` option of composer.

no_plugins `--no-plugins` option of composer.

optimize `--optimize-autoloader` option of composer. Recommended for production.

no_dev `--no-dev` option for composer. Recommended for production.

quiet `--quiet` option for composer. Whether or not to return output from composer.

composer_home `$COMPOSER_HOME` environment variable

always_check If `True`, *always* run `composer install` in the directory. This is the default behavior. If `False`, only run `composer install` if there is no vendor directory present.

env A list of environment variables to be set prior to execution.

`salt.states.composer.`**`update`**`(`*name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None*`)`

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source `--prefer-source` option of composer.

prefer_dist `--prefer-dist` option of composer.

no_scripts `--no-scripts` option of composer.

no_plugins `--no-plugins` option of composer.

optimize `--optimize-autoloader` option of composer. Recommended for production.

no_dev `--no-dev` option for composer. Recommended for production.

quiet `--quiet` option for composer. Whether or not to return output from composer.

composer_home `$COMPOSER_HOME` environment variable

env A list of environment variables to be set prior to execution.

21.19.64 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- `minute`
- `hour`
- `daymonth`
- `month`
- `dayweek` (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of `*`. This means that setting `hour` to `5`, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 7
    - hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 7
    - hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 3
    - hour: 4
```

New in version 2014.1.2.

The old **date > /tmp/crontest** will be replaced by **superscript > /tmp/crontest**.

Additionally, Salt also supports running a cron every `x minutes` very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like '@reboot' or '@hourly'. Quotes must be used, otherwise PyYAML will strip the '@' sign.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.`**`absent`**(*name*, *user='root'*, *identifier=False*, *special=None*, ***kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

name The command that should be absent in the user crontab.

user The name of the user whose crontab needs to be modified, defaults to the root user

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special The special keyword used in the job (eg. @reboot, @hourly…). Quotes must be used, otherwise PyYAML will strip the '@' sign.

`salt.states.cron.`**`env_absent`**(*name*, *user='root'*)

Verifies that the specified environment variable is absent from the crontab for the specified user

name The name of the environment variable to remove from the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.`**`env_present`**(*name*, *value=None*, *user='root'*)

Verifies that the specified environment variable is present in the crontab for the specified user.

name The name of the environment variable to set in the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

value The value to set for the given environment variable `salt.states.cron.`**`file`**(*name*, *source_hash=''*, *source_hash_name=None*, *user='root'*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *backup=''*, ***kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required

source_hash This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```yaml
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

user The user to whom the crontab should be assigned. This defaults to root.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context Overrides default context variables passed to the template.

replace If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults Default context passed to the template.

backup Overrides the default backup mode for the user's crontab.

`salt.states.cron.`**`present`**(*name*, *user='root'*, *minute='*'*, *hour='*'*, *daymonth='*'*, *month='*'*, *dayweek='*'*, *comment=None*, *commented=False*, *identifier=False*, *special=None*)

Verifies that the specified cron job is present for the specified user. It is recommended to use *identifier*. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

name The command that should be executed by the cron job.

user The name of the user whose crontab needs to be modified, defaults to the root user

minute The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is `*`

hour The information to be set in the hour section. Default is `*`

daymonth The information to be set in the day of month section. Default is `*`

month The information to be set in the month section. Default is `*`

dayweek The information to be set in the day of week section. Default is `*`

comment User comment to be added on line previous the cron job

commented The cron job is set commented (prefixed with `#DISABLED#`). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special A special keyword to specify periodicity (eg. @reboot, @hourly…). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

21.19.65 salt.states.csf module

CSF Ip tables management

depends

- csf utility

configuration See http://download.configserver.com/csf/install.txt for setup instructions.

```
Simply allow/deny rules:
  csf.rule_present:
    ip: 1.2.3.4
    method: allow
```

`salt.states.csf.`**`nics_skip`**(*name*, *nics*, *ipv6*)

Alias for *`csf.nics_skipped`*

`salt.states.csf.`**`nics_skipped`**(*name*, *nics*, *ipv6=False*)

name Meaningless arg, but required for state.

nics A list of nics to skip.

ipv6 Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.`**`option_present`**(*name*, *value*, *reload=False*)

Ensure the state of a particular option/setting in csf.

name The option name in csf.conf

value The value it should be set to.

reload Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.`**`ports_open`**(*name*, *ports*, *proto='tcp'*, *direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP_IN in the csf.conf file.

ports A list of ports that should be open.

proto The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

direction Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.`**`rule_absent`**(*name*, *method*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='s'*, *ttl=None*, *reload=False*)

Ensure iptable is not present.

name The ip address or CIDR for the rule.
method The type of rule. Either 'allow' or 'deny'.
port Optional port to be open or closed for the iptables rule.
proto The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.
direction The diretion of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.
port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.
ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.
ttl How long the rule should exist. If supplied, *csf.tempallow()* or csf.tempdeny()‘ are used.
reload Reload the csf service after applying this rule. Default false.

`salt.states.csf.`**`rule_present`**(*name*, *method*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='s'*, *ttl=None*, *comment=''*, *reload=False*)

Ensure iptable rule exists.
name The ip address or CIDR for the rule.
method The type of rule. Either 'allow' or 'deny'.
port Optional port to be open or closed for the iptables rule.
proto The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.
direction The diretion of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.
port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.
ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.
ttl How long the rule should exist. If supplied, *csf.tempallow()* or csf.tempdeny()‘ are used.
comment An optional comment to appear after the rule as a #comment .
reload Reload the csf service after applying this rule. Default false.

`salt.states.csf.`**`testing_off`**(*name*, *reload=False*)

Ensure testing mode is enabled in csf.
reload Reload CSF after changing the testing status. Default false.

`salt.states.csf.`**`testing_on`**(*name*, *reload=False*)

Ensure testing mode is enabled in csf.
reload Reload CSF after changing the testing status. Default false.

21.19.66 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

class `salt.states.cyg.`**`DictDiffer`**(*current_dict*, *past_dict*)

Calculate the difference between two dictionaries.

(1) items added
(2) items removed
(3) keys same in both but changed values
(4) keys same in both and unchanged values

`added`()

Return a set of additions to past_dict.

`changed`()

Return a set of the keys with changed values.

removed()
Return a set of things removed from past_dict.

same()
True if the two dicts are the same.

unchanged()
Return a set of the keys with unchanged values.

`salt.states.cyg.`**installed**(*name*, *cyg_arch='x86_64'*, *mirrors=None*)
Make sure that a package is installed.

name The name of the package to install

cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.`**removed**(*name*, *cyg_arch='x86_64'*, *mirrors=None*)
Make sure that a package is not installed.

name The name of the package to uninstall

cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.`**updated**(*name=None*, *cyg_arch='x86_64'*, *mirrors=None*)
Make sure all packages are up to date.

name [None] No affect, salt fails poorly without the arg available

cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

21.19.67 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends

- dnspython

Note: The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspy_tsig_key.txt
```

`salt.states.ddns.`**`absent`**(*name*, *zone*, *data=None*, *rdtype=None*, ***kwargs*)

Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check

data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

rdtype DNS resource type. If omitted, all types will be purged.

`**kwargs` Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname). Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must follow the dnspython spec.

`salt.states.ddns.`**`present`**(*name*, *zone*, *ttl*, *data*, *rdtype='A'*, ***kwargs*)

Ensures that the named DNS record is present with the given ttl.

name The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check/update

ttl TTL for the record

data Data for the DNS record. E.g., the IP address for an A record.

rdtype DNS resource type. Default 'A'.

`**kwargs` Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname). Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must follow the dnspython spec.

21.19.68 salt.states.debconfmod

Management of debconf selections

depends

- debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

Available Functions

The debconfmod state has two functions, the `set` and `set_file` functions

set Set debconf selections from the state itself

set_file Set debconf selections from a file

```
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
        'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
        'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
  debconf.set:
    - name: ferm
    - data:
        'ferm/enable': {'type': 'boolean', 'value': True}
```

Note: Due to how PyYAML imports nested dicts (see *here*), the values in the `data` dict must be indented four spaces instead of two.

If you're setting debconf values that requires *dpkg-reconfigure*, you can use the `onchanges` requisite to reconfigure your package:

```
set-default-shell:
  debconf.set:
    - name: dash
    - data:
        'dash/sh': {'type': 'boolean', 'value': false}

reconfigure-dash:
  cmd.run:
    - name: dpkg-reconfigure -f noninteractive dash
    - onchanges:
      - debconf: set-default-shell
```

Every time the `set-default-shell` state changes, the `reconfigure-dash` state will also run.

Note: For boolean types, the value should be `true` or `false`, not `'true'` or `'false'`.

`salt.states.debconfmod.`**`set`**`(`*name*, *data*, ***kwargs*`)`

Set debconf selections

```
<state_id>:
  debconf.set:
    - name: <name>
    - data:
        <question>: {'type': <type>, 'value': <value>}
        <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
        <question>: {'type': <type>, 'value': <value>}
        <question>: {'type': <type>, 'value': <value>}
```

name: The package name to set answers for.

data: A set of questions/answers for debconf. Note that everything under this must be indented twice.
question: The question the is being pre-answered
type: The type of question that is being asked (string, boolean, select, etc.)
value: The answer to the question

`salt.states.debconfmod.`**`set_file`**`(`*name*, *source*, *template=None*, *context=None*, *defaults=None*, ***kwargs*`)`

Set debconf selections from a file or a template

```
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
        some_value: "false"
```

source: The location of the file containing the package selections
template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported
context Overrides default context variables passed to the template.
defaults Default context passed to the template.

21.19.69 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
```

(continues on next page)

(continued from previous page)

```
admin_username: root
fallback_admin_username: root
passwords:
  - super-secret
  - old-secret
proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

  servers:
    server-1:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.132
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-2:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.2
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-3:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.20
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-4:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.2
      netmask: 255.255.0.0
      gateway: 172.17.17.1

  switches:
    switch-1:
      ip: 192.168.1.2
      netmask: 255.255.255.0
      gateway: 192.168.1.1
      snmp: nonpublic
      password: saltstack1
    switch-2:
      ip: 192.168.1.3
      netmask: 255.255.255.0
      gateway: 192.168.1.1
```

(continues on next page)

(continued from previous page)

```
        snmp: nonpublic
        password: saltstack1
```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```
{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]]  }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades.  racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
  dellchassis.blade_idrac:
    - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}
```

Note: This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

`salt.states.dellchassis.`**`blade_idrac`**`(`*name, idrac_password=None, idrac_ipmi=None, idrac_ip=None, idrac_netmask=None, idrac_gateway=None, idrac_dnsname=None, idrac_dhcp=None*`)`

Set parameters for iDRAC in a blade.

Parameters

- **`idrac_password`** – Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **`idrac_ipmi`** – Enable/Disable IPMI over LAN
- **`idrac_ip`** – Set IP address for iDRAC
- **`idrac_netmask`** – Set netmask for iDRAC
- **`idrac_gateway`** – Set gateway for iDRAC
- **`idrac_dhcp`** – Turn on DHCP for iDRAC (True turns on, False does nothing becaause setting a static IP will disable DHCP).

Returns A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

`salt.states.dellchassis.`**`chassis`**`(`*name, chassis_name=None, password=None, datacenter=None, location=None, mode=None, idrac_launch=None, slot_names=None, blade_power_states=None*`)`

Manage a Dell Chassis.

chassis_name The name of the chassis.

datacenter The datacenter in which the chassis is located

location The location of the chassis.

password Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.

mode The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

idrac_launch The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

slot_names The names of the slots, provided as a list identified by their slot numbers.

blade_power_states The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```yaml
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
```

(continues on next page)

(continued from previous page)

```
    - 1: my-slot-name
    - 2: my-other-slot-name
  - blade_power_states:
    - server-1: on
    - server-2: off
    - server-3: powercycle
```

`salt.states.dellchassis.`**`firmware_update`**(*hosts=None, directory=''*)

State to update the firmware on host using the `racadm` command

firmwarefile filename (string) starting with `salt://`

host string representing the hostname supplied to the `racadm` command

directory Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

`salt.states.dellchassis.`**`switch`**(*name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None*)

Manage switches in a Dell Chassis.

name The switch designation (e.g. switch-1, switch-2)

ip The Static IP Address of the switch

netmask The netmask for the static IP

gateway The gateway for the static IP

dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

password The access (root) password for the switch

snmp The SNMP community string for the switch

Example:

```
my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
    - netmask: 255.255.255.0
    - gateway: 192.168.1.254
    - dhcp: True
    - password: secret
    - snmp: public
```

21.19.70 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True
```

`salt.states.disk.`**`status`**`(`*name, maximum=None, minimum=None, absolute=False, free=False*`)`

Return the current disk usage stats for the named mount point

name Disk mount or directory for which to check used space

maximum The maximum disk utilization

minimum The minimum disk utilization

absolute By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

free By default, *minimum* & *maximum* refer to the amount of used space. Set to *True* to evaluate the free space instead.

21.19.71 salt.states.docker_container

Management of Docker containers

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *`pip.install`*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release. When running the *`docker_container.running`* state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `None`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

Note: To pull from a Docker registry, authentication must be configured. See *here* for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_container.`**`absent`**`(`*name*, *force=False*`)`

Ensure that a container is absent

name Name of the container

force [False] Set to `True` to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker_container.absent

multiple_containers:
  docker_container.absent:
    - names:
      - foo
      - bar
      - baz
```

`salt.states.docker_container.`**`mod_run_check`**`(`*onlyif*, *unless*, *creates*`)`

Execute the onlyif/unless/creates logic. Returns a result dict if any of the checks fail, otherwise returns True

`salt.states.docker_container.`**`mod_watch`**`(`*name*, *sfun=None*, ***kwargs*`)`

The docker_container watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_container.`**`run`**`(`*name*, *image=None*, *onlyif=None*, *unless=None*, *creates=None*, *bg=False*, *failhard=True*, *replace=False*, *force=False*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *client_timeout=60*, ***kwargs*`)`

New in version 2018.3.0.

Note: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is not implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

Like the *`cmd.run`* state, only for Docker. Does the equivalent of a `docker run` and returns information about the container that was created, as well as its output.

This state accepts the same arguments as *docker_container.running*, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from *docker.logs*, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

onlyif A command or list of commands to run as a check. The container will only run if any of the specified commands returns a zero exit status.

unless A command or list of commands to run as a check. The container will only run if any of the specified commands returns a non-zero exit status.

creates A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.

bg [False] If `True`, run container in background and do not await or deliver its results.

> **Note:** This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to `True`, so keep this in mind.

failhard [True] If `True`, the state will return a `False` result if the exit code of the container is non-zero. When this argument is set to `False`, the state will return a `True` result regardless of the container's exit code.

> **Note:** This has no effect if `bg` is set to `True`.

replace [False] If `True`, and if the named container already exists, this will remove the existing container. The default behavior is to return a `False` result when the container already exists.

force [False] If `True`, and the named container already exists, *and* `replace` is also set to `True`, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪sh
```

USAGE EXAMPLE

```
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
build_package:
  docker_container.run:
    - image: myuser/builder:latest
    - binds: /home/myuser/builds:/build_dir
    - command: /scripts/build.sh {{ pkg_version }}
    - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
    - replace: True
    - networks:
      - mynet
    - require:
      - docker_network: mynet
```

`salt.states.docker_container.`**`running`**(*name, image=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, force=False, watch_action='force', start=True, shutdown_timeout=None, client_timeout=60, networks=None, **kwargs*)

Ensure that a container with a specific configuration is present and running

name Name of the container

image Image to use for the container

Note: This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

skip_translate This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80
```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format docker-py needs:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

ignore_collisions [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

force [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

watch_action [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

Note: If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

start [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the Django `migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

shutdown_timeout If the container needs to be replaced, the container will be stopped using *`docker.stop`*. If a `shutdown_timout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the `networks` option is used, any networks (including the default `bridge` network) which are not specified will be disconnected.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` and `bridge` are being configured *without* arguments:

```
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks:
      - net1:
        - aliases:
          - bar
          - baz
        - ipv4_address: 10.0.20.50
      - net2
      - bridge
    - require:
      - docker_network: net1
      - docker_network: net2
```

The supported arguments are the ones from the docker-py's connect_container_to_network function (other than `container` and `net_id`).

Important: Unlike with the arguments described in the **CONTAINER CONFIGURATION PARAMETERS** section below, these network configuration parameters are not translated at all. Consult the connect_container_to_network documentation for the correct type/format of data to pass.

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```yaml
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks: []
```

CONTAINER CONFIGURATION PARAMETERS

auto_remove (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

binds Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```yaml
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both ro/rw and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

blkio_weight Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

blkio_weight_device Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100
```

cap_add List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

cap_drop List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

---

command (or *cmd*) Command to run in the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash
```

cpuset_cpus (or *cpuset*) CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"
```

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

cpu_group The length of a CPU period in microseconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

cpu_period Microseconds of CPU time that the container can get in a CPU period

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - cpu_shares: 512
```

detach [False] If `True`, run the container's command in the background (daemon mode)

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - detach: True
```

devices List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices:
      - /dev/net/tun
      - /dev/xvda1:/dev/xvda1
      - /dev/xvdb1:/dev/xvdb1:r
```

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

dns List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

dns_search List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

domainname The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dommainname: domain.tld
```

entrypoint Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

extra_hosts Additional hosts to add to the container's /etc/hosts file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

Note: This option requires Docker 1.3.0 or newer.

group_add List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

hostname Hostname of the container. If not provided, the value passed as the container's``name`` will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

Warning: `hostname` cannot be set if `network_mode` is set to `host`. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

interactive (or *stdin_open*) [False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

ipc_mode (or *ipc*) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
- `host`: use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

> **Warning:** Using `host` gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

> **Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

labels Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
        foo: ''
        bar: baz
        hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

links Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

log_driver and log_opt Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of `key=value` pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

---

lxc_conf Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64
```

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. `512M`, `2G`, etc.). A value of `0` (the default) means no memory limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M
```

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - mem_swappiness: 60
```

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to `-1` to disable swap. A value of `0` means no swap limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G
```

network_disabled [False] If `True`, networking will be disabled within the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
```

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

> **Warning:** Using `host` mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1
```

oom_kill_disable Whether to disable OOM killer

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False
```

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500
```

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host
```

Note: This option requires Docker 1.5.0 or newer.

---

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

port_bindings (or *publish*) Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
      - 4505-4506:14505-14506
      - 2123:2123/udp
      - 8080
```

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

privileged [False] If `True`, runs the exec process with extended privileges

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True
```

publish_all_ports (or *publish_all*) [False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

read_only [False] If `True`, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

restart_policy (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

security_opt (or *security_opts*): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size Size of /dev/shm

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

stop_signal Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

stop_timeout Timeout to stop the container, in seconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refer's to the container's configured stop timeout.

storage_opt Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

sysctls (or *sysctl*) Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

tmpfs A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

tty [False] Attach TTYs

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

ulimits List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
```

(continues on next page)

(continued from previous page)

```
      - nofile=1024:1024
      - nproc=60
```

user User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

userns_mode (or *user_ns_mode*) Sets the user namsepace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - userns_mode: host
```

volumes (or *volume*) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

volumes_from Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

volume_driver sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

working_dir (or *workdir*) Working directory inside the container

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

`salt.states.docker_container.`**`stopped`**`(`*name=None, containers=None, shutdown_timeout=None, unpause=False, error_on_absent=True, **kwargs*`)`

Ensure that a container (or containers) is stopped

name Name or ID of the container

containers Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker_container.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

shutdown_timeout Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container's configured `stop_timeout` will be observed. If `stop_timeout` was also unset on the container, then a timeout of 10 seconds will be used.

unpause [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

error_on_absent [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

21.19.72 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *`pip.install`*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release.

Note: To pull from a Docker registry, authentication must be configured. See *here* for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_image.`**`absent`**`(`*name=None, images=None, force=False*`)`

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

images Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  docker_image.absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

force [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.`**`mod_watch`**`(`*name, sfun=None, **kwargs*`)`

The docker_image watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_image.`**`present`**`(`*name, tag=None, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None, sls=None, base='opensuse/python', saltenv='base', pillarenv=None, pillar=None, **kwargs*`)`

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
  docker_image.present:
    - tag: mytag
```

tag Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

build Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag

myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag
    - dockerfile: Dockerfile.alternative
```

The image will be built using *`docker.build`* and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

load Loads a tar archive created with *`docker.load`* (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:
  docker_image.present:
    - load: salt://path/to/image.tar
    - tag: mytag
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

force [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version 2016.11.0.

sls Allow for building of image with *`docker.sls_build`* by specifying the SLS files with which to build. This can be a list or comma-seperated string.

```
myuser/myimage:
  docker_image.present:
    - tag: latest
```

(continues on next page)

(continued from previous page)

```
    - sls:
        - webapp1
        - webapp2
    - base: centos
    - saltenv: base
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

base Base image with which to start *docker.sls_build*

New in version 2017.7.0.

saltenv Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

21.19.73 salt.states.docker_network

Management of Docker networks

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release.

`salt.states.docker_network.`**`absent`**`(`*name*`)`

Ensure that a network is absent.

name Name of the network

Usage Example:

```
network_foo:
  docker_network.absent
```

`salt.states.docker_network.`**`present`**(*name*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *containers=None*, *reconnect=True*, ***kwargs*)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present

Note: This state supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the *NETWORK CONFIGURATION* and *IP ADDRESS MANAGEMENT (IPAM)* sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

name Network name

skip_translate This function translates Salt SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

ignore_collisions [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

validate_ip_addrs [True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

containers A list of containers which should be connected to this network.

Note: As of the 2018.3.0 release, this is not the recommended way of managing a container's membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container's IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that

the `docker_network.present` state ends up being run *before* the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use *docker_container.running's network management support*.

---

reconnect [True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when *managing static IPs in docker_container.running*. For instance, if a network's subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network *again* and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

NETWORK CONFIGURATION ARGUMENTS

driver Network driver

```
mynet:
  docker_network.present:
    - driver: macvlan
```

driver_opts (or *driver_opt*, or *options*) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts: macvlan_mode=bridge,parent=eth0
```

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode=bridge
      - parent=eth0
```

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode: bridge
      - parent: eth0
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
  docker_network.present:
    - driver: macvlan
```

(continues on next page)

(continued from previous page)

```
    - driver_opts:
        macvlan_mode: bridge
        parent: eth0
```

check_duplicate [True] If `True`, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option providess a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```
mynet:
  docker_network.present:
    - check_duplicate: False
```

internal [False] If `True`, restricts external access to the network

```
mynet:
  docker_network.present:
    - internal: True
```

labels Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
        foo: ''
        bar: baz
        hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

enable_ipv6 (or *ipv6*) [False] Enable IPv6 on the network

```
mynet:
  docker_network.present:
    - enable_ipv6: True
```

Note: While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the Docker IPv6 docs for information on how to do this.

attachable [False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```
mynet:
  docker_network.present:
    - attachable: True
```

Note: This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inpsect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

---

scope Specify the network's scope (`local`, `global` or `swarm`)

```
mynet:
  docker_network.present:
    - scope: local
```

ingress [False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

```
mynet:
  docker_network.present:
    - ingress: True
```

IP ADDRESS MANAGEMENT (IPAM)

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the *IPAM pool arguments* below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument (click *here* for some examples). These docs also have more information on these arguments.

IPAM ARGUMENTS

ipam_driver IPAM driver to use, if different from the default one

```
mynet:
  docker_network.present:
    - ipam_driver: foo
```

ipam_opts Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts: foo=bar,baz=qux
```

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo=bar
      - baz=qux
```

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo: bar
      - baz: qux
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
  docker_network.present:
    - ipam_driver: macvlan
    - ipam_opts:
        foo: bar
        baz: qux
```

IPAM POOL ARGUMENTS

subnet Subnet in CIDR format that represents a network segment

iprange (or *ip_range*) Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

gateway IPv4 or IPv6 gateway for the master subnet

aux_addresses (or *aux_address*) A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

IPAM CONFIGURATION EXAMPLES

Below is an example of an IPv4-only network (keep in mind that `subnet` is the only required argument).

```
mynet:
  docker_network.present:
    - subnet: 10.0.20.0/24
    - iprange: 10.0.20.128/25
    - gateway: 10.0.20.254
    - aux_addresses:
      - foo.bar.tld: 10.0.20.50
      - hello.world.tld: 10.0.20.51
```

Note: The `aux_addresses` can be passed differently, in the same way that `driver_opts` and `ipam_opts` can.

This same network could also be configured this way:

```
mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        iprange: 10.0.20.128/25
        gateway: 10.0.20.254
        aux_addresses:
          foo.bar.tld: 10.0.20.50
          hello.world.tld: 10.0.20.51
```

Here is an example of a mixed IPv4/IPv6 subnet.

```
mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        gateway: 10.0.20.1
      - subnet: fe3f:2180:26:1::/123
        gateway: fe3f:2180:26:1::1
```

21.19.74 salt.states.docker_volume

Management of Docker volumes

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *`pip.install`*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release.

`salt.states.docker_volume.`**`absent`**(*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from **docker.volume_absent** to **docker_volume.absent**

name Name of the volume

Usage Examples:

```
volume_foo:
  docker_volume.absent
```

`salt.states.docker_volume.`**`present`**(*name*, *driver=None*, *driver_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from **docker.volume_present** to **docker_volume.present**

name Name of the volume

driver Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

driver_opts Options for the volume driver

force [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  docker_volume.present
```

```
volume_bar:
  docker_volume.present
    - name: bar
    - driver: local
    - driver_opts:
        foo: bar
```

```
volume_bar:
  docker_volume.present
    - name: bar
    - driver: local
    - driver_opts:
        - foo: bar
        - option: value
```

21.19.75 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1
```

`salt.states.drac.`**`absent`**`(`*name*`)`

Ensure a user does not exist on the Dell DRAC

name: The users username

`salt.states.drac.`**`network`**`(`*ip, netmask, gateway*`)`

Ensure the DRAC network settings are consistent

`salt.states.drac.`**`present`**`(`*name, password, permission*`)`

Ensure the user exists on the Dell DRAC

name: The users username

password The password used to authenticate

permission The permissions that should be assigned to a user

21.19.76 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

`salt.states.elasticsearch.`**`alias_absent`**`(`*name, index*`)`

Ensure that the index alias is absent.

name Name of the index alias to remove

index Name of the index for the alias

`salt.states.elasticsearch.`**`alias_present`**`(`*name, index, definition=None*`)`

Ensure that the named index alias is present.

name Name of the alias

index Name of the index

definition Optional dict for filters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

Example:

```
mytestalias:
  elasticsearch.alias_present:
    - index: testindex
    - definition:
        filter:
          term:
            user: kimchy
```

`salt.states.elasticsearch.`**`index_absent`**`(`*name*`)`

Ensure that the named index is absent.

name Name of the index to remove

`salt.states.elasticsearch.`**`index_present`**`(`*name, definition=None*`)`

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
          index:
            number_of_shards: 10
```

`salt.states.elasticsearch.`**`index_template_absent`**`(`*name*`)`

Ensure that the named index template is absent.

name Name of the index to remove

`salt.states.elasticsearch.`**`index_template_present`**`(`*name, definition, check_definition=False*`)`

Ensure that the named index template is present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

check_definition If the template already exists and the definition is up to date

Example:

```
mytestindex2_template:
  elasticsearch.index_template_present:
    - definition:
        template: logstash-*
        order: 1
        settings:
          number_of_shards: 1
```

`salt.states.elasticsearch.`**`pipeline_absent`**`(`*name*`)`

Ensure that the named pipeline is absent

name Name of the pipeline to remove

`salt.states.elasticsearch.`**`pipeline_present`**`(`*name*, *definition*`)`

Ensure that the named pipeline is present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

Example:

```
test_pipeline:
  elasticsearch.pipeline_present:
    - definition:
        description: example pipeline
        processors:
          - set:
              field: collector_timestamp_millis
              value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'
```

`salt.states.elasticsearch.`**`search_template_absent`**`(`*name*`)`

Ensure that the search template is absent

name Name of the search template to remove

`salt.states.elasticsearch.`**`search_template_present`**`(`*name*, *definition*`)`

Ensure that the named search template is present.

name Name of the search template to add

definition Required dict for creation parameters as per http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html

Example:

```
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
        inline:
          size: 10
```

21.19.77 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead `salt.states.elasticsearch_index.`**`absent`**`(`*name*`)`

Ensure that the named index is absent.

name Name of the index to remove

`salt.states.elasticsearch_index.`**`present`**`(`*name, definition=None*`)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as optional.

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
          index:
            number_of_shards: 10
```

21.19.78 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index_template.`**`absent`**`(`*name*`)`

Ensure that the named index template is absent.

name Name of the index to remove

`salt.states.elasticsearch_index_template.`**`present`**`(`*name, definition*`)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as required.

Ensure that the named index templat eis present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

Example:

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
        template: logstash-*
        order: 1
        settings:
          number_of_shards: 1
```

21.19.79 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.`**`setenv`**(*name*, *value*, *false_unsets=False*, *clear_all=False*, *update_minion=False*, *permanent=False*)

Set the salt process environment variables.

name The environment key to set. Must be a string.

value Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
   environ.setenv:
     - name: foo
     - value: bar
     - update_minion: True

a_dict_env:
   environ.setenv:
     - name: does_not_matter
     - value:
         foo: bar
         baz: quux
```

21.19.80 salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

`salt.states.eselect.`**`set_`**(*name*, *target*, *module_parameter=None*, *action_parameter=None*)

Verify that the given module is set to the given target

name The name of the module

target The target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

```
profile:
  eselect.set:
    - target: hardened/linux/amd64
```

21.19.81 salt.states.etcd_mod

Manage etcd Keys

New in version 2015.8.0.

depends

- python-etcd

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *`pillar_opts`* must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Etcd profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`.

```
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass
```

Available Functions

- `set`

  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- `wait_set`

  Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

  This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- `wait_rm`

  Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.`**`directory`**(*name*, *profile=None*, ***kwargs*)

Create a directory in etcd.

name The etcd directory name, for example: `/foo/bar/baz`.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`mod_watch`**(*name*, ***kwargs*)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.etcd_mod.`**`rm`**(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to `False`. If `True` performs a recursive delete.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`set_`**(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`wait_rm`**(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to `False`. If `True` performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`wait_set`**(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

21.19.82 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

`salt.states.ethtool.`**`coalesce`**(*name*, ***kwargs*)

Manage coalescing settings of network device

name Interface name to apply coalescing settings

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
    - rx_frames_high: 0
    - tx_usecs_high: 0
    - tx_frames_high: 0
    - sample_interval: 0
```

`salt.states.ethtool.`**`offload`**(*name*, ***kwargs*)

Manage protocol offload and other features of network device

name Interface name to apply coalescing settings

```
eth0:
```

(continues on next page)

(continued from previous page)

```
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

`salt.states.ethtool.ring(name, **kwargs)`

Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

name Interface name to apply ring parameters

```
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max
```

21.19.83 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This state module was written to be used in conjunction with Salt's *`ESXi Proxy Minion`*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

`salt.states.esxi.`**`coredump_configured`**(*name, enabled, dump_ip, host_vnic='vmk0', dump_port=6500*)

Ensures a host's core dump configuration.

name Name of the state.

enabled Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many `old` references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system coredemp network configuration command returns data.

dump_ip The IP address of host that will accept the dump.

host_vnic Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

`salt.states.esxi.`**`diskgroups_configured`**`(`*name*, *diskgroups*, *erase_disks=False*`)`

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises and errors if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn't exist
3. Adds extra capacity disks to the existing diskgroup

Example:

```
{
    'cache_scsi_addr': 'vmhba1:C0:T0:L0',
    'capacity_scsi_addrs': [
        'vmhba2:C0:T0:L0',
        'vmhba3:C0:T0:L0',
        'vmhba4:C0:T0:L0',
    ]
}
```

name Mandatory state name

diskgroups Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

erase_disks Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

`salt.states.esxi.`**`host_cache_configured`**`(`*name*, *enabled*, *datastore*, *swap_size='100%'*, *dedicated_backing_disk=False*, *erase_backing_disk=False*`)`

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn't exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is `True` and partitions already exist on the backing disk
4. Configures host_cache to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

Examples

Percentage swap size (can't be 100%)

```
{
    'enabled': true,
    'datastore': {
        'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
        'vmfs_version': 5,
        'name': 'hostcache'
        }
    'dedicated_backing_disk': false
    'swap_size': '98%',
}
```

Fixed sized swap size

```
{
    'enabled': true,
    'datastore': {
        'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
```

(continues on next page)

(continued from previous page)

```
        'vmfs_version': 5,
        'name': 'hostcache'
        }
    'dedicated_backing_disk': true
    'swap_size': '10GiB',
}
```

name Mandatory state name.

enabled Specifies whether the host cache is enabled.

datastore Specifies the host cache datastore.

swap_size Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is `100%`.

dedicated_backing_disk Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is False

erase_backing_disk Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

`salt.states.esxi.`**`ntp_configured`**(*name*, *service_running*, *ntp_servers=None*, *service_policy=None*, *service_restart=False*, *update_datetime=False*)

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

name Name of the state.

service_running Ensures the running state of the ntp daemon for the host. Boolean value where `True` indicates that ntpd should be running and `False` indicates that it should be stopped.

ntp_servers A list of servers that should be added to the ESXi host's NTP configuration.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the ntp daemon will be restarted, regardless of its previous running state. Default is `False`.

update_datetime If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```

`salt.states.esxi.`**`password_present`**(*name*, *password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using test=True functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

name Name of the state.

password The new password to change on the host.

Example:

```
configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'
```

`salt.states.esxi.`**`ssh_configured`**`(`*name, service_running, ssh_key=None, ssh_key_file=None, service_policy=None, service_restart=False, certificate_verify=False*`)`

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

name Name of the state.

service_running Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should stopped.

In order to update SSH keys, the SSH service must be running.

ssh_key Public SSH key to added to the authorized_keys file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

ssh_key_file File containing the public SSH key to be added to the authorized_keys file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

certificate_verify If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```
configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True
```

`salt.states.esxi.`**`syslog_configured`**`(`*name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None*`)`

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

name Name of the state.

syslog_configs Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (–))

Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each syslog_config option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

reset_syslog_config Resets the syslog service to it's default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

reset_configs A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```
configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
        loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
        default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout
```

`salt.states.esxi.`**`vmotion_configured`**(*name*, *enabled*, *device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

name Name of the state.

enabled Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

device The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

`salt.states.esxi.`**`vsan_configured`**(*name*, *enabled*, *add_disks_to_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

name Name of the state.

enabled Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

add_disks_to_vsan If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```

21.19.84 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.`**`send`**`(`*name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs*`)`

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *`event.send`* execution module of the same name, with the additional argument:

Parameters **`show_changed`** – If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
        status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.`**`wait`**`(`*name, sfun=None*`)`

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache
```

21.19.85 salt.states.file

Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - attrs: ai
    - template: jinja
    - defaults:
        custom_var: "default value"
        other_var: 123
{% if grains['os'] == 'Ubuntu' %}
    - context:
        custom_var: "override"
{% endif %}
```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context])  # Arguments as globals
    return '\n\n'.join(lines)
```

Note: The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information*.

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - attrs: i
    - backup: minion
```

Note: Salt supports backing up managed files via the backup option. For more details on this functionality please review the *backup_mode documentation*.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
    - user: foo
    - group: users
    - mode: '0644'
    - attrs: i
```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state `name` and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
  file.managed:
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

Note: There is more documentation about this feature in the *Names declaration* section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
    - group: named
    - mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

Symlinks can be easily created; the symlink function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 14
        first_of_week: 6
        first_of_month: 6
        first_of_year: all
```

`salt.states.file.`**`absent`**(*name*, ***kwargs*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

name The path which should be deleted

`salt.states.file.`**`accumulated`**(*name*, *filename*, *text*, ***kwargs*)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

name Accumulator name

filename Filename which would receive this accumulator (see file.managed state documentation about `name`)

text String or list for adding in accumulator

require_in / watch_in One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↪animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

Note: The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

`salt.states.file.`**`append`**`(`*name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, ignore_whitespace=True*`)`

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
  file.append:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
        - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.append:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - append
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
```

(continues on next page)

(continued from previous page)

```
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 0.9.5.

`salt.states.file.`**`blockreplace`**`(`*name, marker_start='#– start managed zone –', marker_end='#– end managed zone –', source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', show_changes=True, append_newline=None*`)`

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use *`file.accumulated`* and target this state. All accumulated data dictionaries' content will be added in the content block.

---

name Filesystem path to the file to be edited

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content The content to be used between the two lines identified by `marker_start` and `marker_end`

source The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
  file.blockreplace:
```

(continues on next page)

(continued from previous page)

```
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

context Overrides default context variables passed to the template

defaults Default context passed to the template

append_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be appended to the file.

prepend_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be prepended to the file.

backup The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

dry_run [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.

show_changes [True] Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If False, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

append_newline Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
```

(continues on next page)

(continued from previous page)

```
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
         text 3
         text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

`salt.states.file.`**`cached`**`(`*name, source_hash='', source_hash_name=None, skip_verify=False, saltenv='base'*`)`

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

> **Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

source_hash See the documentation for this same argument in the `file.managed` state.

> **Note:** For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

source_hash_name See the documentation for this same argument in the *file.managed* state.
skip_verify See the documentation for this same argument in the *file.managed* state.

> **Note:** Setting this to `True` will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                   source_hash=source_hash,
                                   source_hash_name=source_hash_name,
                                   skip_verify=skip_verify,
                                   saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a try/except.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using *cp.is_cached*:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

`salt.states.file.`**`comment`**(*name, regex, char='#', backup='.bak'*)

Comment out specified lines in a file.

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you _need_ the leading ^, otherwise each time you run highstate, another comment char will be inserted.

char [#] The character to be inserted at the beginning of a line in order to comment it out

backup [`.bak`] The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/fstab:
  file.comment:
    - regex: ^bind 127.0.0.1
```

New in version 0.9.5.

`salt.states.file.`**`copy_`**(*name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, **kwargs*)

If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the `force` option is set to `True`.

Note: This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a *`file.managed`* state.

---

name The location of the file to copy to

source The location of the file to copy to the location specified with name

force If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

makedirs If the target subdirectories don't exist create them

preserve New in version 2015.5.0.

Set `preserve: True` to preserve user/group ownership and mode after copying. Default is `False`. If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

user New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

group New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

mode New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

subdir New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *`states.file.managed`* and *`states.file.recurse`*.

`salt.states.file.`**`decode`**`(`*name, encoded_data=None, contents_pillar=None, encoding_type='base64', checksum='md5'*`)`

Decode an encoded file and write it to disk

New in version 2016.3.0.

name Path of the file to be written.

encoded_data The encoded file. Either this option or `contents_pillar` must be specified.

contents_pillar A Pillar path to the encoded file. Uses the same path syntax as *`pillar.get`*. The *`hashutil.base64_encodefile`* function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

encoding_type [`base64`] The type of encoding.

checksum [`md5`] The hashing algorithm to use to generate checksums. Wraps the *`hashutil.digest`* execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
```

(continues on next page)

(continued from previous page)

```
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
        Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
        {{ salt.pillar.get('path:to:data') | indent(8) }}
```

`salt.states.file.`**`directory`**`(`*name, user=None, group=None, recurse=None, max_depth=None, dir_mode=None, file_mode=None, makedirs=False, clean=False, require=None, exclude_pat=None, follow_symlinks=False, force=False, backupname=None, allow_symlink=True, children_only=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs*`)`

Ensure that a named directory is present and has the right perms

name The location to create or manage a directory, as an absolute path

user The user to own the directory; this defaults to the user salt is running as on the minion

group The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

recurse Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If `mode` is defined, will recurse on both `file_mode` and `dir_mode` if they are defined. If `ignore_files` or `ignore_dirs` is included, files or directories will be left unchanged respectively. Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
```

(continues on next page)

(continued from previous page)

```
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs
```

New in version 2015.5.0.

max_depth Limit the recursion depth. The default is no limit=None. 'max_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

dir_mode / mode The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

file_mode The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to dir_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

makedirs If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max_depth' are mutually exclusive.

require Require other resources such as packages or files

exclude_pat When 'clean' is set to True, exclude this pattern from removal list and preserve in the destination.

follow_symlinks [False] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

force If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

backupname If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

allow_symlink [True] If allow_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

children_only [False] If children_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/* are still operated on.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` is optional and defaults to `this_folder_subfolder_files`.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset [False] If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```
create_config_dir:
  file.directory:
    - name: 'C:\config\'
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
          applies_to: this_folder_only
        joe_snuffy:
          perms: read
          applies_to: this_folder_files
    - win_deny_perms:
        fred_snuffy:
          perms: full_control
    - win_inheritance: False
```

`salt.states.file.`**`exists`**(*name*, ***kwargs*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn't exist, it will return an error.

name Absolute path which must exist

`salt.states.file.`**`hardlink`**(*name*, *target*, *force=False*, *makedirs=False*, *user=None*, *group=None*, *dir_mode=None*, ***kwargs*)

Create a hard link If the file already exists and is a hard link pointing to any location other than the specified target, the hard link will be replaced. If the hard link is a regular file or directory then the state will return False. If the regular file is desired to be replaced with a hard link pass force: True

name The location of the hard link to create

target The location that the hard link points to

force If the name of the hard link exists and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the hard link file will be deleted to make room for the hard link, unless backupname is set, when it will be renamed

makedirs If the location of the hard link does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

user The user to own any directories made if makedirs is set to true. This defaults to the user salt is running as on the minion

group The group ownership set on any directories made if makedirs is set to true. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode If directories are to be created, passing this option specifies the permissions for those directories.

`salt.states.file.line`(*name*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*, *create=False*, *user=None*, *group=None*, *file_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

Parameters

- **`name`** – Filesystem path to the file to be edited.
- **`content`** – Content of the line. Allowed to be empty if mode=delete.
- **`match`** – Match the target line for an action by a fragment of a string or regular expression.

  If neither `before` nor `after` are provided, and `match` is also `None`, match becomes the `content` value.
- **`mode`** – Defines how to edit a line. One of the following options is required:
  - **ensure** If line does not exist, it will be added.
  - **replace** If line already exists, it will be replaced.
  - **delete** Delete the line, once found.
  - **insert** Insert a line.

  Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.
- **`location`** – Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:
  - **start** Place the content at the beginning of the file.
  - **end** Place the content at the end of the file.
- **`before`** – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- **`after`** – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- **`show_changes`** – Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

  Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.
- **`backup`** – Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".
- **`quiet`** – Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- **`indent`** – Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.
- **`create`** – Create an empty file if doesn't exists.

  New in version 2016.11.0.
- **`user`** – The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

- **group** – The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.

  New in version 2016.11.0.

- **file_mode** – The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

  New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

`salt.states.file.`**`managed`**(*name, source=None, source_hash=”, source_hash_name=None, keep_source=True, user=None, group=None, mode=None, attrs=None, template=None, makedirs=False, dir_mode=None, context=None, replace=True, defaults=None, backup=”, show_changes=True, create=True, contents=None, tmp_dir=”, tmp_ext=”, contents_pillar=None, contents_grains=None, contents_newline=True, contents_delimiter=’:’, encoding=None, encoding_errors=’strict’, allow_empty=True, follow_symlinks=True, check_cmd=None, skip_verify=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs*)

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

name The location of the file to manage, as an absolute path.

source The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or None, please also set replaced to False to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
```

(continues on next page)

(continued from previous page)

```
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512   128
sha384    96
sha256    64
sha224    56
sha1      40
md5       32
```

Using a Source Hash File The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a  /
↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

Inserting the Source Hash in the SLS Data

The source_hash can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
↪src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

Note: Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
↪src-0.7.3.tar.gz
    - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

Known issues: If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz/+md5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

Note: keep does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

attrs The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

New in version 2018.3.0.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

makedirs [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

backup Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create [True] If set to `False`, then the file will only be managed if the file already exists on the system.

contents Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
        This is line 1
        This is line 2
```

contents_pillar New in version 0.17.0.

Changed in version 2016.11.0: contents_pillar can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in *`pillar.get`*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - attrs: a
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
        -----BEGIN RSA PRIVATE KEY-----
        MIIEowIBAAKCAQEAoQiwO3JhBquPAalQF9qP1lLZNXVjYMIswrMe2HcWUVBgh+vY
        U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGl1vgAObJAnMT623dMXjVKwnEagZPRJIxDy
        B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0pqxu+UyFbAGLin+
        GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5IeO4Z3rjkCP1cxI
        -----END RSA PRIVATE KEY-----
```

Note: The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *`file_tree external pillar`* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

---

contents_grains New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in *`grains.get`*. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

contents_newline [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will ensure the final line, or entry, does not contain a new line. If the last line, or entry in the file does contain a new line already, this option will not remove it.

contents_delimiter New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to *`pillar.get`* or *`grains.get`* when retrieving the contents.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors ['strict'] Error encoding scheme. Default is ```'strict'```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

allow_empty [True] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - attrs: i
    - source: salt://sudoers/files/sudoers.jinja
```

(continues on next page)

(continued from previous page)

```
    - template: jinja
    - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

tmp_dir Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0755
    - tmp_dir: '/etc/dhcp'
    - contents: "# Managed by Salt"
    - check_cmd: dhcpd -t -cf
```

tmp_ext Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
      - 'start on started mountall'
      - 'stop on shutdown'
      - 'respawn'
      - 'exec salt-minion'
    - check_cmd: init-checkconf -f
```

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset [False] If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```
create_config_file:
  file.managed:
    - name: C:\config\settings.cfg
    - source: salt://settings.cfg
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
        joe_snuffy:
          perms: read
    - win_deny_perms:
        fred_snuffy:
          perms: full_control
    - win_inheritance: False
```

`salt.states.file.`**`missing`**(*name*, ***kwargs*)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

name Absolute path which must NOT exist

`salt.states.file.`**`mknod`**(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*)

Create a special file similar to the 'nix mknod command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix `mknod`. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

name name of the file

ntype node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)

major major number of the device does not apply to a fifo pipe

minor minor number of the device does not apply to a fifo pipe

user owning user of the device/pipe

group owning group of the device/pipe

mode permissions on the device/pipe

Usage:

```
/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
```

(continues on next page)

(continued from previous page)

```
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660
```

New in version 0.17.0.

`salt.states.file.`**`mod_run_check_cmd`**(*cmd*, *filename*, ***check_cmd_opts*)

Execute the check_cmd logic.

Return a result dict if `check_cmd` succeeds (check_cmd == 0) otherwise return True

`salt.states.file.`**`not_cached`**(*name*, *saltenv='base'*)

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

`salt.states.file.`**`patch`**(*name*, *source=None*, *source_hash=None*, *source_hash_name=None*, *skip_verify=False*, *template=None*, *context=None*, *defaults=None*, *options=''*, *reject_file=None*, *strip=None*, *saltenv=None*, ***kwargs*)

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The `hash` and `dry_run_first` options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the `strip` option) instead of a file.

Note: A suitable `patch` executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

name The file or directory to which the patch should be applied

source The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (`salt://`, `http://`, `https://`, `ftp://`, etc.). Templating is also now supported.

source_hash Works the same way as in *`file.managed`*.

New in version 2019.2.0.

source_hash_name Works the same way as in *`file.managed`*

New in version 2019.2.0.

skip_verify Works the same way as in *`file.managed`*

New in version 2019.2.0.

template Works the same way as in *`file.managed`*

New in version 2019.2.0.

context Works the same way as in *`file.managed`*

New in version 2019.2.0.

defaults Works the same way as in *`file.managed`*

New in version 2019.2.0.

options Extra options to pass to patch. This should not be necessary in most cases.

Note: For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

reject_file If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

Important: The parent directory must exist. Also, this will overwrite the file if it is already present.

New in version 2019.2.0.

strip Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
  file.patch:
    - source: salt://myfile.patch
    - strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

saltenv Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Note: Ignored when the patch file is from a non-`salt://` source.

Usage:

```
# Equivalent to ``patch --forward /opt/myfile.txt myfile.patch``
/opt/myfile.txt:
  file.patch:
    - source: salt://myfile.patch
```

`salt.states.file.`**`prepend`**`(`*name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None*`)`

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
  file.prepend:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
        - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 2014.7.0.

`salt.states.file.`**`recurse`**(*name, source, keep_source=True, clean=False, require=None, user=None, group=None, dir_mode=None, file_mode=None, sym_mode=None, template=None, context=None, replace=True, defaults=None, include_empty=False, backup=", include_pat=None, exclude_pat=None, maxdepth=None, keep_symlinks=False, force_symlinks=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, **kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

name The directory to set the recursion in

source The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

require Require other resources such as packages or files

user The user to own the directory. This defaults to the user salt is running as on the minion

group The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

file_mode The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

sym_mode The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

Note: The template option is required when recursively applying templates.

replace [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

include_empty Set this to True if empty directories should also be created (default is False)

backup Overrides the default backup mode for all replaced files. See *backup_mode documentation* for more details.

include_pat When copying, include only this pattern from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

```
- include_pat: hello*       :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello      :: regexp matches 'otherhello',
                               'hello01' ...
```

exclude_pat Exclude this pattern from the source when copying. If both *include_pat* and *exclude_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on include_pat, and then within that result apply exclude_pat.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*               :: glob matches APPDATA.01,
                                         APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                                         or TEMPDATA for exclusion
```

maxdepth When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

```
- maxdepth: 0      :: Only include files located in the source
                      directory
- maxdepth: 1      :: Only include files located in the source
                      or immediate subdirectories
```

keep_symlinks Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

force_symlinks Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

win_owner [None] The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

`salt.states.file.`**`rename`**(*name*, *source*, *force=False*, *makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

name The location of the file to rename to

source The location of the file to move to the location specified with name

force If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

makedirs If the target subdirectories don't exist create them

`salt.states.file.`**`replace`**(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *show_changes=True*, *ignore_if_missing=False*, *backslash_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

name Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `re.search()`.

Note: If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

```
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

---

repl The replacement text

count Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

flags A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to `8` (which equates to `['MULTILINE']`).

Note: `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to `['MULTILINE']`. When overriding the default value for `flags`, if `'MULTILINE'` is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add `'MULTILINE'` to the list of flags.

---

bufsize How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found [False] If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

prepend_if_not_found [False] If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

not_found_content Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

backup The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

show_changes [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

backslash_literal [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
```

(continues on next page)

(continued from previous page)

```
    - pattern: |
        CentOS \(2.6.32[^\\n]+\\n\s+root[^\\n]+\\n\)+
```

Note: When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might loose line feeds.

When regex capture groups are used in `pattern:`, their captured value is available for reuse in the `repl:` part as a backreference (ex. `\1`).

```
add_login_group_to_winbind_ssh_access_list:
  file.replace:
    - name: '/etc/security/pam_winbind.conf'
    - pattern: '^(require_membership_of = )(.*)$'
    - repl: '\1\2,append-new-group-to-line'
```

Note: The `file.replace` state uses Python's `re` module. For more advanced options, see https://docs.python.org/2/library/re.html

`salt.states.file.`**`retention_schedule`**`(`*name, retain, strptime_format=None, timezone=None*`)`

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Parameters

- **`name`** – The filesystem path to the directory containing backups to be managed.
- **`retain`** – Delete the backups, except for the ones we want to keep. The N below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to None, which means to not keep files based on this criteria.

  most_recent N Keep the most recent N files.

  first_of_hour N For the last N hours from now, keep the first file after the hour.

  first_of_day N For the last N days from now, keep the first file after midnight. See also `timezone`.

  first_of_week N For the last N weeks from now, keep the first file after Sunday midnight.

  first_of_month N For the last N months from now, keep the first file after the start of the month.

  first_of_year N For the last N years from now, keep the first file after the start of the year.
- **`strptime_format`** – A python strptime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime Defaults to None, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **`timezone`** – The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```
/var/backups/example_directory:
```

(continues on next page)

(continued from previous page)

```
file.retention_schedule:
  - retain:
      most_recent: 5
      first_of_hour: 4
      first_of_day: 7
      first_of_week: 6    # NotImplemented yet.
      first_of_month: 6
      first_of_year: all
  - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
  - timezone: None
```

`salt.states.file.`**`serialize`**(*name, dataset=None, dataset_pillar=None, user=None, group=None, mode=None, backup='', makedirs=False, show_changes=True, create=True, merge_if_exists=False, encoding=None, encoding_errors='strict', serializer_opts=None, deserializer_opts=None, **kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

name The location of the file to create

dataset The dataset that will be serialized

dataset_pillar Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in *`pillar.get`*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

formatter Write the data as this format. See the list of `serializer modules` for supported output formats.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors ['strict'] Error encoding scheme. Default is ``` `'strict'` ```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

user The user to own the directory, this defaults to the user salt is running as on the minion

group The group ownership set for the directory, this defaults to the group salt is running as on the minion

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

backup Overrides the default backup mode for this specific file.

makedirs Create parent directories for destination file.

New in version 2014.1.3.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create Default is True, if create is set to False then the file will only be managed if the file already exists on the system.

merge_if_exists Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

serializer_opts Pass through options to serializer. For example:

```
/etc/dummy/package.yaml
  file.serialize:
    - formatter: yaml
    - serializer_opts:
      - explicit_start: True
      - default_flow_style: True
      - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: yaml.dump()
- For **json**: json.dumps()
- For **python**: pprint.pformat()

deserializer_opts Like `serializer_opts` above, but only used when merging with an existing file (i.e. when `merge_if_exists` is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml
  file.serialize:
    - formatter: yaml
    - serializer_opts:
      - explicit_start: True
      - default_flow_style: True
      - indent: 4
    - deserializer_opts:
      - encoding: latin-1
    - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: yaml.load()
- For **json**: json.loads()

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

For example, this state:

```
/etc/dummy/package.json:
  file.serialize:
    - dataset:
        name: naive
        description: A package using naive versioning
        author: A confused individual <iam@confused.com>
        dependencies:
          express: '>= 1.2.0'
          optimist: '>= 0.1.0'
        engine: node 0.4.1
    - formatter: json
```

will manage the file `/etc/dummy/package.json`:

```
{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
  "name": "naive"
}
```

`salt.states.file.`**`shortcut`**(*name*, *target*, *arguments=None*, *working_dir=None*, *description=None*, *icon_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, ***kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass force: True, if it is to be renamed, pass a backupname.

name The location of the shortcut to create. Must end with either ".lnk" or ".url"

target The location that the shortcut points to

arguments Any arguments to pass in the shortcut

working_dir Working directory in which to execute target

description Description to set on shortcut

icon_location Location of shortcut's icon

force If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

backupname If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

user The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

`salt.states.file.`**`symlink`**(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=None*, ***kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If an entry with the same name exists then the state will return False. If the existing entry is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

name The location of the symlink to create

target The location that the symlink points to

force If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the existing entry in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

Changed in version 3000: Force will now remove all types of existing file system entries, not just files, directories and symlinks.

backupname If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination's parent directory.

makedirs If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

win_owner [None] The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

`salt.states.file.`**`tidied`**(*name*, *age=0*, *matches=None*, *rmdirs=False*, *size=0*, ***kwargs*)

Remove unwanted files based on specific criteria. Multiple criteria are OR'd together, so a file that is too large but is not old enough will still get tidied.

If neither age nor size is given all files which match a pattern in matches will be removed.

name The directory tree that should be tidied

age Maximum age in days after which files are considered for removal

matches List of regular expressions to restrict what gets removed. Default: ['.*']

rmdirs Whether or not it's allowed to remove directories

size Maximum allowed file size. Files greater or equal to this size are removed. Doesn't apply to directories or symbolic links

```
cleanup:
  file.tidied:
    - name: /tmp/salt_test
    - rmdirs: True
    - matches:
      - foo
      - b.*r
```

`salt.states.file.`**`touch`**(*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the 'nix "touch" command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source`/`template`/`contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

name name of the file

atime atime of the file

mtime mtime of the file

makedirs whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
  file.touch
```

New in version 0.9.5.

`salt.states.file.`**`uncomment`**`(`*name*, *regex*, *char='#'*, *backup='.bak'*`)`

Uncomment specified commented lines in a file

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend '^[t]*')

char [#] The character to remove in order to uncomment a line

backup [`.bak`] The file will be backed up before edit with this file extension;

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

21.19.86 salt.states.firewall module

State to check firewall configurations

New in version 2016.3.0.

`salt.states.firewall.`**`check`**`(`*name*, *port=None*, ***kwargs*`)`

Checks if there is an open connection from the minion to the defined host on a specific port.

name host name or ip address to test connection to

port The port to test the connection on

kwargs

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

21.19.87 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

class `salt.states.firewalld.`**`ForwardingMapping`**(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

`todict`()

Returns a pretty dictionary meant for command line output.

`salt.states.firewalld.`**`present`**(*name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=False, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=False, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False*)

Ensure a zone has specific attributes.

name The zone to modify.

default [None] Set this zone as the default zone if `True`.

masquerade [False] Enable or disable masquerade for a zone.

block_icmp [None] List of ICMP types to block in the zone.

prune_block_icmp [False] If `True`, remove all but the specified block_icmp from the zone.

ports [None] List of ports to add to the zone.

prune_ports [False] If `True`, remove all but the specified ports from the zone.

port_fwd [None] List of port forwards to add to the zone.

prune_port_fwd [False] If `True`, remove all but the specified port_fwd from the zone.

services [None] List of services to add to the zone.

prune_services [False] If `True`, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.

interfaces [None] List of interfaces to add to the zone.

prune_interfaces [False] If `True`, remove all but the specified interfaces from the zone.

sources [None] List of sources to add to the zone.

prune_sources [False] If `True`, remove all but the specified sources from the zone.

rich_rules [None] List of rich rules to add to the zone.

prune_rich_rules [False] If `True`, remove all but the specified rich rules from the zone.

`salt.states.firewalld.`**`service`**(*name, ports=None, protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

21.19.88 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
  gem.installed:
    - user: rvm
    - ruby: jruby@jgemset
```

`salt.states.gem.`**`installed`**(*name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None*)

Make sure that a gem is installed.

name The name of the gem to install

ruby: **None** Only for RVM or rbenv installations: the ruby version and gemset to target.

gem_bin: None Custom `gem` command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

user: None The user under which to run the `gem` command

New in version 0.17.0.

version [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

rdoc [False] Generate RDoc documentation for the gem(s).

ri [False] Generate RI documentation for the gem(s).

pre_releases [False] Install pre-release version of gem(s) if available.

proxy [None] Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname{[}:port]

source [None] Use the specified HTTP gem source server to download gem. Format: http://hostname{[}:port]

`salt.states.gem.`**`removed`**(*name*, *ruby=None*, *user=None*, *gem_bin=None*)

Make sure that a gem is not installed.

name The name of the gem to uninstall

gem_bin [None] Full path to `gem` binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

user: None The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.`**`sources_add`**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.

name The URL of the gem source to be added

ruby: None For RVM or rbenv installations: the ruby version and gemset to target.

user: None The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.`**`sources_remove`**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.

name The URL of the gem source to be removed

ruby: None For RVM or rbenv installations: the ruby version and gemset to target.

user: None The user under which to run the `gem` command

New in version 0.17.0.

21.19.89 salt.states.git

States to manage git repositories and git configuration

Important: Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.`**`cloned`**(*name*, *target=None*, *branch=None*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *output_encoding=None*)

New in version 2018.3.3,2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

name Address of the remote repository

target Name of the target directory where repository should be cloned

branch Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

Note: The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched. If your use case requires that you keep the clone up to date with the remote repository, then consider using *`git.latest`*.

---

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

identity Path to a private key to use for ssh URLs. Works the same way as in *`git.latest`*, see that state's documentation for more information.

https_user HTTP Basic Auth username for HTTPS (only) clones

https_pass HTTP Basic Auth password for HTTPS (only) clones

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

`salt.states.git.`**`config_set`**`(`*name, value=None, multivar=None, repo=None, user=None, password=None, output_encoding=None, **kwargs*`)`

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

name Name of the git config value to set

value Set a single value for the config item

multivar Set multiple values for the config item

Note: The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.

repo Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user User under which to run git commands. By default, the commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global [False] If `True`, this will set a global git config option

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Local Config Example:

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

Global Config Example (User ``foo``):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

`salt.states.git.`**`config_unset`**`(`*name*, *value_regex=None*, *repo=None*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*`)`

New in version 2015.8.0.

Ensure that the named config key is not present

name The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

value_regex Regex indicating the values to unset for the matching key(s)

Note: This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

all [False] If `True`, unset all matches

repo Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global [False] If `True`, this will set a global git config option

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Examples:

```
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

`salt.states.git.`**`detached`**(*name, rev, target=None, remote='origin', user=None, password=None, force_clone=False, force_checkout=False, fetch_remote=True, hard_reset=False, submodules=False, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, output_encoding=None, **kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

name Address of the remote repository.

rev The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

target Name of the target directory where repository is about to be cloned.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

force_clone [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_checkout [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

fetch_remote [True] If `False` a fetch will not be performed and only local refs will be reachable.

hard_reset [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

---

submodules [False] Update submodules

identity A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

https_user HTTP Basic Auth username for HTTPS (only) clones

https_pass HTTP Basic Auth password for HTTPS (only) clones

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

`salt.states.git.`**`latest`**`(`*name, rev='HEAD', target=None, branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, refspec_branch='*', refspec_tag='*', output_encoding=None, **kwargs*`)`

Make sure the repository is cloned to the given directory and is up-to-date.

name Address of the remote repository, as passed to `git clone`

Note: From the Git documentation, there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh://` URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on Atlassian Stash/BitBucket Server. In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

rev [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be `HEAD`, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

target Name of the target directory where repository is about to be cloned

branch Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

Note: If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

user Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

Note: This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

update_head [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

force_checkout [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

force_clone [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_fetch [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

force_reset [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to `remote-changes`, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

submodules [False] Update submodules on clone or branch change

bare [False] Set to `True` if the repository is to be a bare clone of the remote repository.

mirror Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

fetch_tags [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

sync_tags [True] If `True`, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2018.3.4.

depth Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use rev to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

identity Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```yaml
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

https_user HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

https_pass HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

refspec_branch [*] A glob expression defining which branches to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

refspec_tag [*] A glob expression defining which tags to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```yaml
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
```

(continues on next page)

(continued from previous page)

```
    - target: /usr/share/nginx/staging
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com
```

`salt.states.git.`**`mod_run_check`**`(`*cmd_kwargs, onlyif, unless*`)`

Execute the onlyif and unless logic. Return a result dict if:

- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0)

Otherwise, returns `True`

`salt.states.git.`**`present`**`(`*name, force=False, bare=True, template=None, separate_git_dir=None, shared=None, user=None, password=None, output_encoding=None*`)`

Ensure that a repository exists in the given directory

> **Warning:** If the minion has Git 2.5 or later installed, `name` points to a worktree, and `force` is set to `True`, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

name Path to the directory

Changed in version 2015.8.0: This path must now be absolute

force [False] If `True`, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

bare [True] If `True`, and a repository must be initialized, then the repository will be a bare repository.

> **Note:** This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

template If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

separate_git_dir If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.5.0.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

21.19.90 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
    github.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

`salt.states.github.`**`absent`**`(`*name*, *profile='github'*, ***kwargs*`)`

Ensure a github user is absent

```
ensure user test is absent in github:
    github.absent:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

The following parameters are required:

name Github handle of the user in organization

`salt.states.github.`**`present`**`(`*name*, *profile='github'*, ***kwargs*`)`

Ensure a user is present

```
ensure user test is present in github:
    github.present:
        - name: 'gitexample'
```

The following parameters are required:

name This is the github handle of the user in the organization `salt.states.github.`**`repo_absent`**(*name*, *profile='github'*, ***kwargs*)

Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
    github.repo_absent:
        - name: 'test'
```

The following parameters are required:

name This is the name of the repository in the organization.

New in version 2016.11.0.

`salt.states.github.`**`repo_present`**(*name*, *description=None*, *homepage=None*, *private=None*, *has_issues=None*, *has_wiki=None*, *has_downloads=None*, *auto_init=False*, *gitignore_template=None*, *license_template=None*, *teams=None*, *profile='github'*, ***kwargs*)

Ensure a repository is present

name This is the name of the repository.

description The description of the repository.

homepage The URL with more information about the repository.

private The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.

gitignore_template The desired language or platform for a .gitignore, e.g "Haskell".

license_template The desired LICENSE template to apply, e.g "mit" or "mozilla".

teams The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
    github.repo_present:
        - name: 'my-repo'
        - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.`**`team_absent`**(*name*, *profile='github'*, ***kwargs*)

Ensure a team is absent.

Example:

```
ensure team test is present in github:
    github.team_absent:
        - name: 'test'
```

The following parameters are required:

name This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.`**`team_present`**(*name*, *description=None*, *repo_names=None*, *privacy='secret'*, *permission='pull'*, *members=None*, *enforce_mfa=False*, *no_mfa_grace_seconds=0*, *profile='github'*, ***kwargs*)

Ensure a team is present

name This is the name of the team in the organization.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.

permission The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.

members The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce_mfa_from' and 'mfa_exempt'.

enforce_mfa Whether to enforce MFA requirements on members of the team. If True then all members without *mfa_exempt: True* configured will be removed from the team. Note that *no_mfa_grace_seconds* may be set to allow members a grace period.

no_mfa_grace_seconds The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce_mfa_from* on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
    github.team_present:
        - name: 'test'
        - members:
            user1: {}
            user2: {}

Ensure team test_mfa is present in github:
    github.team_present:
        - name: 'test_mfa'
        - members:
            user1:
                enforce_mfa_from: 2016/06/15
        - enforce_mfa: True
```

New in version 2016.11.0.

21.19.91 salt.states.glance

Managing Images in OpenStack Glance

`salt.states.glance.`**`image_present`**(*name*, *visibility='public'*, *protected=None*, *checksum=None*, *location=None*, *disk_format='raw'*, *wait_for=None*, *timeout=30*)

Checks if given image is present with properties set as specified.

An image should got through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don't specify 'wait_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

Supported properties:

- visibility ('public' or 'private')
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)
- disk_format ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

21.19.92 salt.states.glance_image

Management of OpenStack Glance Images

New in version 2018.3.0.

depends shade

configuration see `salt.modules.glanceng` for setup instructions

Example States

```
create image:
  glance_image.present:
    - name: cirros
    - filename: cirros.raw
    - image_format: raw

delete image:
  glance_image.absent:
    - name: cirros
```

`salt.states.glance_image.`**`absent`**`(`*name, auth=None*`)`
Ensure image does not exist
name Name of the image

`salt.states.glance_image.`**`present`**`(`*name, auth=None, **kwargs*`)`
Ensure image exists and is up-to-date
name Name of the image
enabled Boolean to control if image is enabled
description An arbitrary description of the image

21.19.93 salt.states.glusterfs

Manage GlusterFS pool.

`salt.states.glusterfs.`**`add_volume_bricks`**`(`*name, bricks*`)`
Add brick(s) to an existing volume
name Volume name
bricks List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
        - host1:/srv/gluster/drive1
        - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.`**`max_op_version`**`(`*name*`)`
New in version 2019.2.0.

Add brick(s) to an existing volume
name Volume name

```
myvolume:
  glusterfs.max_op_version:
    - name: volume1
    - version: 30707
```

salt.states.glusterfs.**op_version**(*name*, *version*)

New in version 2019.2.0.

Add brick(s) to an existing volume

name Volume name

version Version to which the cluster.op-version should be set

```
myvolume:
  glusterfs.op_version:
    - name: volume1
    - version: 30707
```

salt.states.glusterfs.**peered**(*name*)

Check if node is peered.

name The remote host with which to peer.

```
peer-cluster:
  glusterfs.peered:
    - name: two

peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four
```

salt.states.glusterfs.**started**(*name*)

Check if volume has been started

name name of the volume

```
mycluster:
  glusterfs.started: []
```

salt.states.glusterfs.**volume_present**(*name*, *bricks*, *stripe=False*, *replica=False*, *device_vg=False*, *transport='tcp'*, *start=False*, *force=False*, *arbiter=False*)

Ensure that the volume exists

name name of the volume

bricks list of brick paths

replica replica count for volume

arbiter use every third brick as arbiter (metadata only)

New in version 2019.2.0.

start ensure that the volume is also started

```
myvolume:
  glusterfs.volume_present:
    - bricks:
        - host1:/srv/gluster/drive1
        - host2:/srv/gluster/drive2
```

(continues on next page)

(continued from previous page)

```
Replicated Volume:
  glusterfs.volume_present:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True

Replicated Volume with arbiter brick:
  glusterfs.volume_present:
    - name: volume3
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
      - host3:/srv/gluster/drive4
    - replica: 3
    - arbiter: True
    - start: True
```

21.19.94 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
    gnomedesktop.wm_preferences:
        - user: username
        - audible_bell: false
        - action_double_click_titlebar: 'toggle-maximize'
        - visual_bell: true
        - num_workspaces: 6
localdesktop_lockdown:
    gnomedesktop.desktop_lockdown:
        - user: username
        - disable_user_switching: true
localdesktop_interface:
    gnomedesktop.desktop_interface:
        - user: username
        - clock_show_date: true
        - clock_format: 12h
```

`salt.states.gnomedesktop.`**`desktop_interface`**`(`*name, user=None, automatic_mnemonics=None, buttons_have_icons=None, can_change_accels=None, clock_format=None, clock_show_date=None, clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None, cursor_blink_timeout=None, cursor_size=None, cursor_theme=None, document_font_name=None, enable_animations=None, font_name=None, gtk_color_palette=None, gtk_color_scheme=None, gtk_im_module=None, gtk_im_preedit_style=None, gtk_im_status_style=None, gtk_key_theme=None, gtk_theme=None, gtk_timeout_initial=None, gtk_timeout_repeat=None, icon_theme=None, menubar_accel=None, menubar_detachable=None, menus_have_icons=None, menus_have_tearoff=None, monospace_font_name=None, show_input_method_menu=None, show_unicode_menu=None, text_scaling_factor=None, toolbar_detachable=None, toolbar_icons_size=None, toolbar_style=None, toolkit_accessibility=None, **kwargs*`)`

desktop_interface: sets values in the org.gnome.desktop.interface schema

`salt.states.gnomedesktop.`**`desktop_lockdown`**`(`*name, user=None, disable_application_handlers=None, disable_command_line=None, disable_lock_screen=None, disable_log_out=None, disable_print_setup=None, disable_printing=None, disable_save_to_disk=None, disable_user_switching=None, user_administration_disabled=None, **kwargs*`)`

desktop_lockdown: sets values in the org.gnome.desktop.lockdown schema `salt.states.gnomedesktop.`**`wm_preferences`**(*name*, *user=None*, *action_double_click_titlebar=None*, *action_middle_click_titlebar=None*, *action_right_click_titlebar=None*, *application_based=None*, *audible_bell=None*, *auto_raise=None*, *auto_raise_delay=None*, *button_layout=None*, *disable_workarounds=None*, *focus_mode=None*, *focus_new_windows=None*, *mouse_button_modifier=None*, *num_workspaces=None*, *raise_on_click=None*, *resize_with_right_button=None*, *theme=None*, *titlebar_font=None*, *titlebar_uses_system_font=None*, *visual_bell=None*, *visual_bell_type=None*, *workspace_names=None*, ***kwargs*)

wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

21.19.95 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

`salt.states.gpg.`**`absent`**(*name*, *keys=None*, *user=None*, *gnupghome=None*, ***kwargs*)

Ensure GPG public key is absent in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Remove GPG keys from the specified user's keychain

gnupghome Override GNUPG Home directory

`salt.states.gpg.`**`present`**(*name*, *keys=None*, *user=None*, *keyserver=None*, *gnupghome=None*, *trust=None*, ***kwargs*)

Ensure GPG public key is present in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the specified user's keychain

keyserver The keyserver to retrieve the keys from.

gnupghome Override GNUPG Home directory

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

21.19.96 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```
mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```

```
# Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
  grafana.dashboard_present:
    - name: myservice
    - dashboard_from_pillar: default
    - rows_from_pillar:
        - systemhealth
        - requests

# Passing hosts in
Ensure myservice dashboard is managed:
  grafana.dashboard_present:
    - name: myservice
    - dashboard_from_pillar: default
    - rows:
        - collapse: false
          editable: true
          height: 150px
          title: System Health
          panels:
            - aliasColors: {}
              id: 200000
              annotate:
                enable: false
              bars: false
              datasource: null
              editable: true
              error: false
              fill: 7
              grid:
                leftMax: 100

        templating:
          enable: true
          list: []
        time:
          from: now-2h
          to: now
        timezone: browser
    - rows_from_pillars:
      - systemhealth
      - requests
    - profile: mygrafanaprofile
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana.`**`dashboard_absent`**(*name*, *hosts=None*, *profile='grafana'*)

Ensure the named grafana dashboard is deleted.

name Name of the grafana dashboard.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

`salt.states.grafana.`**`dashboard_present`**(*name*, *dashboard=None*, *dashboard_from_pillar=None*, *rows=None*, *rows_from_pillar=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

dashboard A dict that defines a dashboard that should be managed.

dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

rows A list of grafana rows.

rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

21.19.97 salt.states.grafana4_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

```
Ensure minimum dashboard is managed:
  grafana4_dashboard.present:
    - name: insightful-dashboard
    - base_dashboards_from_pillar:
      - default_dashboard
    - base_rows_from_pillar:
      - default_row
    - base_panels_from_pillar:
      - default_panel
    - dashboard:
        rows:
          - title: Usage
            panels:
              - targets:
                  - target: alias(constantLine(50), 'max')
                title: Imaginary
                type: graph
```

`salt.states.grafana4_dashboard.`**`absent`**(*name, orgname=None, profile='grafana'*)

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_dashboard.`**`present`**(*name, base_dashboards_from_pillar=None, base_panels_from_pillar=None, base_rows_from_pillar=None, dashboard=None, orgname=None, profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from

dashboard A dict that defines a dashboard that should be managed.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.98 salt.states.grafana4_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

```
Ensure influxdb data source is present:
  grafana4_datasource.present:
    - name: influxdb
    - type: influxdb
    - url: http://localhost:8086
    - access: proxy
    - basic_auth: true
    - basic_auth_user: myuser
    - basic_auth_password: mypass
    - is_default: true
```

`salt.states.grafana4_datasource.`**`absent`**`(`*name, orgname=None, profile='grafana'*`)`

Ensure that a data source is present.

name Name of the data source to remove.

orgname Name of the organization from which the data source should be absent.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_datasource.`**`present`**`(`*name, type, url, access=None, user=None, password=None, database=None, basic_auth=None, basic_auth_user=None, basic_auth_password=None, tls_auth=None, json_data=None, is_default=None, with_credentials=None, type_logo_url=None, orgname=None, profile='grafana'*`)`

Ensure that a data source is present.

name Name of the data source.
type Type of the datasource ('graphite', 'influxdb' etc.).
access Use proxy or direct. Default: proxy
url The URL to the data source API.
user Optional - user to authenticate with the data source.
password Optional - password to authenticate with the data source.
database Optional - database to use with the data source.
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
json_data Optional - additional json data to post (eg. "timeInterval").
is_default Optional - set data source as default.
with_credentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url Optional - Logo to use for this datasource.
orgname Name of the organization in which the data source should be present.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.99 salt.states.grafana4_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

```
Ensure foobar org is present:
  grafana4_org.present:
    - name: foobar
    - theme:  ""
    - home_dashboard_id: 0
    - timezone: "utc"
    - address1: ""
    - address2: ""
    - city: ""
    - zip_code: ""
    - state: ""
    - country: ""
```

`salt.states.grafana4_org.`**`absent`**`(`*name, profile='grafana'*`)`
Ensure that a org is present.

name Name of the org to remove.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_org.`**`present`**(*name, users=None, theme=None, home_dashboard_id=None, timezone=None, address1=None, address2=None, city=None, zip_code=None, address_state=None, country=None, profile='grafana'*)

Ensure that an organization is present.

name Name of the org.

users Optional - Dict of user/role associated with the org. Example:

```
users:
  foo: Viewer
  bar: Editor
```

theme Optional - Selected theme for the org.

home_dashboard_id Optional - Home dashboard for the org.

timezone Optional - Timezone for the org (one of: "browser", "utc", or "").

address1 Optional - address1 of the org.

address2 Optional - address2 of the org.

city Optional - city of the org.

zip_code Optional - zip_code of the org.

address_state Optional - state of the org.

country Optional - country of the org.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.100 salt.states.grafana4_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

```
Ensure foobar user is present:
  grafana4_user.present:
    - name: foobar
    - password: mypass
    - email: "foobar@localhost"
    - fullname: Foo Bar
    - is_admin: true
```

`salt.states.grafana4_user.`**`absent`**`(`*name, profile='grafana'*`)`

Ensure that a user is present.

name Name of the user to remove.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_user.`**`present`**`(`*name, password, email, is_admin=False, fullname=None, theme=None, profile='grafana'*`)`

Ensure that a user is present.

name Name of the user.

password Password of the user.

email Email of the user.

is_admin Optional - Set user as admin user. Default: False

fullname Optional - Full name of the user.

theme Optional - Selected theme of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.101 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
  grafana_dashboard.present:
    - name: insightful-dashboard
    - base_dashboards_from_pillar:
      - default_dashboard
    - base_rows_from_pillar:
      - default_row
    - base_panels_from_pillar:
      - default_panel
    - dashboard:
        rows:
          - title: Usage
            panels:
              - targets:
                  - target: alias(constantLine(50), 'max')
                title: Imaginary
                type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana_dashboard.`**`absent`**`(`*name, profile='grafana'*`)`

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

profile A pillar key or dict that contains grafana information `salt.states.grafana_dashboard.`**`present`**`(`*name, base_dashboards_from_pillar=None, base_panels_from_pillar=None, base_rows_from_pillar=None, dashboard=None, profile='grafana'*`)`

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from

dashboard A dict that defines a dashboard that should be managed.

profile A pillar key or dict that contains grafana information

21.19.102 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
  grafana_datasource.present:
    - name: influxdb
    - type: influxdb
    - url: http://localhost:8086
    - access: proxy
    - basic_auth: true
    - basic_auth_user: myuser
    - basic_auth_password: mypass
    - is_default: true
```

`salt.states.grafana_datasource.`**`absent`**`(`*name, profile='grafana'*`)`

Ensure that a data source is present.

name Name of the data source to remove.

`salt.states.grafana_datasource.`**`present`**`(`*name, type, url, access='proxy', user='', password='', database='', basic_auth=False, basic_auth_user='', basic_auth_password='', is_default=False, json_data=None, profile='grafana'*`)`

Ensure that a data source is present.

name Name of the data source.

type Which type of data source it is ('graphite', 'influxdb' etc.).

url The URL to the data source API.

user Optional - user to authenticate with the data source

password Optional - password to authenticate with the data source

basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basic_auth_user Optional - HTTP basic auth username.

basic_auth_password Optional - HTTP basic auth password.

is_default Default: False

21.19.103 salt.states.grains

Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

`salt.states.grains.`**`absent`**(*name*, *destructive=False*, *delimiter=':'*, *force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

name The grain name

destructive If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent
```

`salt.states.grains.`**`append`**(*name*, *value*, *convert=False*, *delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.

name The grain name

value The value to append

convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

`salt.states.grains.`**`exists`**(*name*, *delimiter=':'*)

Ensure that a grain is set

name The grain name

delimiter A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

`salt.states.grains.`**`list_absent`**(*name*, *value*, *delimiter=':'*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

name The grain name.
value The value to delete from the grain list.
delimiter A delimiter different from the default **:** can be provided.

New in version v2015.8.2.

The grain should be list type

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

`salt.states.grains.`**`list_present`**(*name*, *value*, *delimiter=':'*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.
name The grain name.
value The value is present in the list type grain.
delimiter A delimiter different from the default **:** can be provided.

New in version v2015.8.2.

The grain should be list type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.`**`make_hashable`**(*list_grain*, *result=None*)

Ensure that a list grain is hashable.
list_grain The list grain that should be hashable
result This function is recursive, so it must be possible to use a sublist as parameter to the function. Should not be used by a caller outside of the function.
Make it possible to compare two list grains to each other if the list contains complex objects.

`salt.states.grains.`**`present`**(*name*, *value*, *delimiter=':'*, *force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.
name The grain name
value The value to set on the grain
force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ','
```

21.19.104 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
```

(continues on next page)

(continued from previous page)

```
    - user1
    - user2
```

`salt.states.group.`**`absent`**(*name*)

Ensure that the named group is absent

Parameters **name** (*str*) – The name of the group to remove

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

`salt.states.group.`**`present`**(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*)

Ensure that a group is present

Parameters

- **name** (*str*) – The name of the group to manage
- **gid** (*str*) – The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) – Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'. Ignored on Windows
- **addusers** (*list*) – List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** (*list*) – Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** (*list*) – Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

21.19.105 salt.states.heat module

Management of Heat

New in version 2017.7.0.

depends

- heat Python module

configuration See `salt.modules.heat` for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```
heat.deployed:
  - name:
  - template: #Required
  - environment:
  - params: {}
  - poll: 5
  - rollback: False
  - timeout: 60

heat.absent:
  - name:
  - poll: 5
```

mysql:

heat.deployed:

- template: salt://templates/mysql.heat.yaml
- params: image: Debian 7
- rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

`salt.states.heat.`**`absent`**`(`*name*, *poll=5*, *timeout=60*, *profile=None*`)`

Ensure that the named stack is absent

name The name of the stack to remove

poll Poll(in sec.) and report events until stack complete

timeout Stack creation timeout in minutes

profile Profile to use

`salt.states.heat.`**`deployed`**`(`*name*, *template=None*, *environment=None*, *params=None*, *poll=5*, *rollback=False*, *timeout=60*, *update=False*, *profile=None*, ***connection_args*`)`

Deploy stack with the specified properties

name The name of the stack

template File of template

environment File of environment

params Parameter dict used to create the stack

poll Poll (in sec.) and report events until stack complete

rollback Enable rollback on create failure

timeout Stack creation timeout in minutes

profile Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

21.19.106 salt.states.hg

Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known_hosts, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
    hg.latest:
      - rev: tip
      - target: /tmp/example_repo
```

`salt.states.hg.latest`(*name*, *rev=None*, *target=None*, *clean=False*, *user=None*, *identity=None*, *force=False*, *opts=False*, *update_head=True*)

Make sure the repository is cloned to the given directory and is up to date

name Address of the remote repository as passed to "hg clone"

rev The remote branch, tag, or revision hash to clone/pull

target Target destination directory path on minion to clone into

clean Force a clean update with -C (Default: False)

user Name of the user performing repository management operations

New in version 0.17.0.

identity Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

force Force hg to clone into pre-existing directories (deletes contents)

opts Include additional arguments and options to the hg command line

update_head Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

21.19.107 salt.states.host

Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

Note: Changing the `names` in `host.present` does not cause an update to remove the old entry.

```
server1:
  host.present:
    - ip:
```

(continues on next page)

(continued from previous page)

```
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
    host.only:
      - hostnames: []
```

`salt.states.host.`**`absent`**`(`*name*, *ip*`)`
Ensure that the named host is absent

name The host to remove

ip The ip addr(s) of the host to remove

`salt.states.host.`**`only`**`(`*name*, *hostnames*`)`
Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name The IP address to associate with the given hostnames.

hostnames Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.`**`present`**`(`*name*, *ip*, *clean=False*`)`
Ensures that the named host is present with the given ip

name The host to assign an ip to

ip The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.

clean Remove any entries which don't match those configured in the `ip` option. Default is `False`.

New in version 2018.3.4.

21.19.108 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.`**`query`**`(`*name*, *match=None*, *match_type='string'*, *status=None*, *status_type='string'*, *wait_for=None*, ***kwargs*`)`
Perform an HTTP query and statefully return the result

Passes through all the parameters described in the *`utils.http.query function`*:

name The name of the query.

match Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

match_type Specifies the type of pattern matching to use on match. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

> **Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

status The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

status_type Specifies the type of pattern matching to use for status. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

> **Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the *HTTP Tutorial*.

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200

query_example2:
  http.query:
    - name: 'http://example.com/'
    - status:
        - 200
        - 201
    - status_type: list
```

`salt.states.http.`**`wait_for_successful_query`**`(`*name*, *wait_for=300*, ***kwargs*`)`

Like query but, repeat and wait until match/match_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within wait_for timeout.

name The name of the query.

wait_for Total time to wait for requests that succeed.

request_interval Optional interval to delay requests by N seconds to reduce the number of requests sent.

> **Note:** All other arguments are passed to the http.query state.

21.19.109 salt.states.icinga2 module

Icinga2 state

New in version 2017.7.0.

depends

- Icinga2 Python module

configuration See `salt.modules.icinga2` for setup instructions.

The icinga2 module is used to execute commands. Its output may be stored in a file or in a grain.

```
command_id:
  icinga2.generate_ticket:
    - name: domain.tld
    - output:  "/tmp/query_id.txt"
```

`salt.states.icinga2.`**`generate_cert`**`(`*name*`)`

Generate an icinga2 certificate and key on the client.

name The domain name for which this certificate and key will be generated

`salt.states.icinga2.`**`generate_ticket`**`(`*name, output=None, grain=None, key=None, overwrite=True*`)`

Generate an icinga2 ticket on the master.

name The domain name for which this ticket will be generated

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

`salt.states.icinga2.`**`node_setup`**`(`*name, master, ticket*`)`

Setup the icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

`salt.states.icinga2.`**`request_cert`**`(`*name, master, ticket, port='5665'*`)`

Request CA certificate from master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

port Icinga2 port, defaults to 5665

`salt.states.icinga2.`**`save_cert`**`(`*name, master*`)`

Save the certificate on master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

21.19.110 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for trigging events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6

`salt.states.ifttt.`**`trigger_event`**`(`*name*, *event*, *value1=None*, *value2=None*, *value3=None*`)`

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

name The unique name for this event.

event The name of the event to trigger in IFTTT.

The following parameters are optional:

value1 One of the values that we can send to IFTT.

value2 One of the values that we can send to IFTT.

value3 One of the values that we can send to IFTT.

21.19.111 salt.states.incron

Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
    incron.present:
        - user: root
        - path: /home/user
        - mask:
            - IN_MODIFY
        - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
    incron.present:
        - user: root
        - path: /home/user
        - mask:
            - IN_MODIFY
            - IN_ACCESS
        - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

`salt.states.incron.`**`absent`**`(`*name*, *path*, *mask*, *cmd*, *user='root'*`)`

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed

`salt.states.incron.`**`present`**`(`*name*, *path*, *mask*, *cmd*, *user='root'*`)`

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed

21.19.112 salt.states.influxdb08_database module

Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.`**`absent`**`(`*name*, *user=None*, *password=None*, *host=None*, *port=None*`)`

Ensure that the named database is absent

name The name of the database to remove
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

`salt.states.influxdb08_database.`**`present`**`(`*name*, *user=None*, *password=None*, *host=None*, *port=None*`)`

Ensure that the named database is present

name The name of the database to create
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

21.19.113 salt.states.influxdb08_user module

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.`**`absent`**(*name, database=None, user=None, password=None, host=None, port=None*)

Ensure that the named cluster admin or database user is absent.

name The name of the user to remove

database The database to remove the user from

user The user to connect as (must be able to remove the user)

password The password of the user

host The host to connect to

port The port to connect to

`salt.states.influxdb08_user.`**`present`**(*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Ensure that the cluster admin or database user is present.

name The name of the user to manage

passwd The password of the user

database The database to create the user in

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

21.19.114 salt.states.influxdb_continuous_query module

Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_continuous_query.`**`absent`**(*name, database, **client_args*)

Ensure that given continuous query is absent.

name Name of the continuous query to remove.

database Name of the database that the continuous query was defined on.

`salt.states.influxdb_continuous_query.`**`present`**(*name, database, query, resample_time=None, coverage_period=None, **client_args*)

Ensure that given continuous query is present.

name Name of the continuous query to create.

database Database to create continuous query on.

query The query content

resample_time [None] Duration between continuous query resampling.

coverage_period [None] Duration specifying time period per sample.

21.19.115 salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.`**`absent`**(*name, **client_args*)

Ensure that given database is absent.

name Name of the database to remove.

`salt.states.influxdb_database.`**`present`**(*name*, ***client_args*)

Ensure that given database is present.

name Name of the database to create.

21.19.116 salt.states.influxdb_retention_policy module

Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_retention_policy.`**`absent`**(*name*, *database*, ***client_args*)

Ensure that given retention policy is absent.

name Name of the retention policy to remove.

database Name of the database that the retention policy was defined on.

`salt.states.influxdb_retention_policy.`**`convert_duration`**(*duration*)

Convert the a duration string into XXhYYmZZs format

duration Duration to convert

Returns: **duration_string** String representation of duration in XXhYYmZZs format

`salt.states.influxdb_retention_policy.`**`present`**(*name*, *database*, *duration='7d'*, *replication=1*, *default=False*, ***client_args*)

Ensure that given retention policy is present.

name Name of the retention policy to create.

database Database to create retention policy on.

21.19.117 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.`**`absent`**(*name*, ***client_args*)

Ensure that given user is absent.

name The name of the user to manage

`salt.states.influxdb_user.`**`present`**(*name*, *passwd*, *admin=False*, *grants=None*, ***client_args*)

Ensure that given user is present.

name Name of the user to manage

passwd Password of the user

admin [False] Whether the user should have cluster administration privileges or not.

grants Optional - Dict of database:privilege items associated with the user. Example:

grants: foo_db: read bar_db: all

Example:

```
example user present in influxdb:
  influxdb_user.present:
    - name: example
    - passwd: somepassword
    - admin: False
    - grants:
        foo_db: read
        bar_db: all
```

21.19.118 salt.states.infoblox_a

Infoblox A record managment.

functions accept api_opts:

> api_verifyssl: verify SSL [default to True or pillar value] api_url: server to connect to [default to pillar value] api_username: [default to pillar value] api_password: [default to pillar value]

`salt.states.infoblox_a.`**`absent`**(*name=None*, *ipv4addr=None*, ***api_opts*)

Ensure infoblox A record is removed.

State example:

```yaml
infoblox_a.absent:
    - name: example-ha-0.domain.com

infoblox_a.absent:
    - name:
    - ipv4addr: 127.0.23.23
```

`salt.states.infoblox_a.`**`present`**(*name=None*, *ipv4addr=None*, *data=None*, *ensure_data=True*, ***api_opts*)

Ensure infoblox A record.

When you wish to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

State example:

```yaml
infoblox_a.present:
    - name: example-ha-0.domain.com
    - data:
        name: example-ha-0.domain.com
        ipv4addr: 123.0.31.2
        view: Internal
```

21.19.119 salt.states.infoblox_cname

Infoblox CNAME managment.

functions accept api_opts:

> api_verifyssl: verify SSL [default to True or pillar value] api_url: server to connect to [default to pillar value] api_username: [default to pillar value] api_password: [default to pillar value]

`salt.states.infoblox_cname.`**`absent`**(*name=None*, *canonical=None*, ***api_opts*)

Ensure the CNAME with the given name or canonical name is removed

`salt.states.infoblox_cname.`**`present`**(*name=None*, *data=None*, *ensure_data=True*, ***api_opts*)

Ensure the CNAME with the given data is present.

name CNAME of record

data raw CNAME api data see: https://INFOBLOX/wapidoc

State example:

```yaml
infoblox_cname.present:
    - name: example-ha-0.domain.com
    - data:
        name: example-ha-0.domain.com
```

(continues on next page)

(continued from previous page)

```
        canonical: example.domain.com
        zone: example.com
        view: Internal
        comment: Example comment

infoblox_cname.present:
    - name: example-ha-0.domain.com
    - data:
        name: example-ha-0.domain.com
        canonical: example.domain.com
        zone: example.com
        view: Internal
        comment: Example comment

    - api_username: username
    - api_password: passwd
```

21.19.120 salt.states.infoblox_host_record

Infoblox host record managment.

functions accept api_opts:

> api_verifyssl: verify SSL [default to True or pillar value] api_url: server to connect to [default to pillar value] api_username: [default to pillar value] api_password: [default to pillar value]

`salt.states.infoblox_host_record.`**`absent`**`(`*name=None, ipv4addr=None, mac=None, **api_opts*`)`

Ensure the host with the given Name ipv4addr or mac is removed.

State example:

```
infoblox_host_record.absent:
    - name: hostname.of.record.to.remove

infoblox_host_record.absent:
    - name:
    - ipv4addr: 192.168.0.1

infoblox_host_record.absent:
    - name:
    - mac: 12:02:12:31:23:43
```

`salt.states.infoblox_host_record.`**`present`**`(`*name=None, data=None, ensure_data=True, **api_opts*`)`

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data If the host is not found then one will be created.

When trying to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

Avoid race conditions, use func:nextavailableip:

- func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default
- func:nextavailableip:10.0.0.0/8
- func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns
- func:nextavailableip:10.0.0.3-10.0.0.10

State Example:

```
# this would update `original_hostname.example.ca` to changed `data`.
infoblox_host_record.present:
    - name: original_hostname.example.ca
    - data: {'namhostname.example.cae': 'hostname.example.ca',
        'aliases': ['hostname.math.example.ca'],
        'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}}],
        'ipv4addrs': [{'configure_for_dhcp': True,
            'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
            'mac': '00:50:56:84:6e:ae'}],
        'ipv6addrs': [], }
```

21.19.121 salt.states.infoblox_range

Infoblox host record managment.

functions accept api_opts:

> api_verifyssl: verify SSL [default to True or pillar value] api_url: server to connect to [default to pillar value] api_username: [default to pillar value] api_password: [default to pillar value]

`salt.states.infoblox_range.`**`absent`**(*name=None*, *start_addr=None*, *end_addr=None*, *data=None*, ***api_opts*)

Ensure the range is removed

Supplying the end of the range is optional.

State example:

```
infoblox_range.absent:
    - name: 'vlan10'

infoblox_range.absent:
    - name:
    - start_addr: 127.0.1.20
```

`salt.states.infoblox_range.`**`present`**(*name=None*, *start_addr=None*, *end_addr=None*, *data=None*, ***api_opts*)

Ensure range record is present.
infoblox_range.present: start_addr: '129.97.150.160', end_addr: '129.97.150.170',
Verbose state example:

```
infoblox_range.present:
    data: {
        'always_update_dns': False,
        'authority': False,
        'comment': 'range of IP addresses used for salt.. was used for ghost
↪images deployment',
        'ddns_generate_hostname': True,
        'deny_all_clients': False,
        'deny_bootp': False,
        'disable': False,
        'email_list': [],
        'enable_ddns': False,
        'enable_dhcp_thresholds': False,
        'enable_email_warnings': False,
        'enable_ifmap_publishing': False,
        'enable_snmp_warnings': False,
```

(continues on next page)

(continued from previous page)

```
        'end_addr': '129.97.150.169',
        'exclude': [],
        'extattrs': {},

        'use_ddns_domainname': False,
        'use_ddns_generate_hostname': True,
        'use_deny_bootp': False,
        'use_email_list': False,
        'use_enable_ddns': False,
        'use_enable_dhcp_thresholds': False,
        'use_enable_ifmap_publishing': False,
        'use_ignore_dhcp_option_list_request': False,
        'use_known_clients': False,
        'use_lease_scavenge_time': False,
        'use_nextserver': False,
        'use_options': False,
        'use_recycle_leases': False,
        'use_unknown_clients': False,
        'use_update_dns_on_lease_renewal': False
    }
```

21.19.122 salt.states.ini_manage

Manage ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

`salt.states.ini_manage.`**`options_absent`**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.options_absent:
    - separator: '='
    - sections:
        test:
          - testkey
          - secondoption
        test1:
          - testkey1
```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.`**`options_present`**(*name*, *sections=None*, *separator='='*, *strict=False*)

```
/home/saltminion/api-paste.ini:
  ini.options_present:
    - separator: '='
    - strict: True
    - sections:
        test:
          testkey: 'testval'
          secondoption: 'secondvalue'
        test1:
          testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless *strict: True* flag is used

changes dict will contain the list of changes made

`salt.states.ini_manage.`**`sections_absent`**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.sections_absent:
    - separator: '='
    - sections:
        - test
        - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.`**`sections_present`**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.sections_present:
    - separator: '='
    - sections:
        - section_one
        - section_two
```

This will only create empty sections. To also create options, use options_present state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

21.19.123 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
    ipmi.boot_device:
        - name: network
        - api_host: myipmi.hostname.com
        - api_user: root
        - api_pass: apassword
        - api_kg: None

ensure myipmi system is powered on:
    ipmi.power:
        - name: boot
        - api_host: myipmi.hostname.com
        - api_user: root
        - api_pass: apassword
```

`salt.states.ipmi.`**`boot_device`**(*name='default'*, ***kwargs*)

Request power state change

name = `default`

- network – Request network boot
- hd – Boot from hard drive
- safe – Boot from hard drive, requesting 'safe mode'
- optical – boot from CD/DVD/BD drive
- setup – Boot into setup utility
- default – remove any IPMI directed boot device request

kwargs

- api_host=localhost
- api_user=admin
- api_pass=

- api_port=623
- api_kg=None

`salt.states.ipmi.`**`power`**`(`*name='power_on', wait=300, **kwargs*`)`

Request power state change

name

Ensure power state one of:

- power_on – system turn on
- power_off – system turn off (without waiting for OS)
- shutdown – request OS proper shutdown
- reset – reset (without waiting for OS)
- boot – If system is off, then 'on', else 'reset'

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

`salt.states.ipmi.`**`user_absent`**`(`*name, channel=14, **kwargs*`)`

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

`salt.states.ipmi.`**`user_present`**`(`*name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs*`)`

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter privilege_level, for both callback and non-callback connections.

True = User Privilege Limit is determined by the privilege_level parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) ipmi_msg

privilege_level

- callback

- user
- operator
- administrator
- proprietary
- no_access

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

21.19.124 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```
setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:

  ipset.flush:
```

`salt.states.ipset.`**`absent`**(*name*, *entry=None*, *entries=None*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Remove a entry or entries from a chain

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

family Network family, ipv4 or ipv6.

`salt.states.ipset.`**`flush`**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Flush current ipset set

family Networking family, either ipv4 or ipv6

`salt.states.ipset.`**`present`**(*name*, *entry=None*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Append a entry to a set

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

entry A single entry to add to a set or a list of entries to add to a set

family Network family, ipv4 or ipv6.

`salt.states.ipset.`**`set_absent`**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Verify the set is absent.

family Networking family, either ipv4 or ipv6

`salt.states.ipset.`**`set_present`**(*name*, *set_type*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Verify the set exists.

name A user-defined set name.

set_type The type for the set.

family Networking family, either ipv4 or ipv6

21.19.125 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
```

(continues on next page)

    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
    - chain: INPUT
    - policy: ACCEPT
```

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

Example rules for IPSec policy:

```
accept_esp_in:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - source: 10.20.0.0/24
    - destination: 10.10.0.0/24
    - in-interface: eth0
    - match: policy
    - dir: in
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_in:
  iptables.append:
    - use:
      - iptables: accept_esp_in
    - chain: FORWARD

accept_esp_out:
  iptables.append:
    - table: filter
    - chain: OUTPUT
    - jump: ACCEPT
    - source: 10.10.0.0/24
    - destination: 10.20.0.0/24
    - out-interface: eth0
    - match: policy
    - dir: out
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_out:
  iptables.append:
    - use:
      - iptables: accept_esp_out
    - chain: FORWARD
```

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of iptables-save. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.`**`append`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain.

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain which should be modified

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`chain_absent`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is absent.

table The table to remove the chain from

family Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`chain_present`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`delete`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`flush`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Flush current iptables state

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`insert`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

position The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`mod_aggregate`**`(`*low*, *chunks*, *running*`)`

The mod_aggregate function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.`**`set_policy`**`(`*name*, *table='filter'*, *family='ipv4'*, ***kwargs*`)`

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

policy The requested table policy

21.19.126 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss_config dictionary with the following properties must be passed:

```
jboss:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the cli_user and cli_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that jboss_config is contained in the pillar.

`salt.states.jboss7.`**`bindings_exist`**`(`*name*, *jboss_config*, *bindings*, *profile=None*`)`

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

jboss_config: Dict with connection properties (see state description)

bindings: Dict with bindings to set.

profile: The profile name (domain mode only)

Example:

```
jndi_entries_created:
  jboss7.bindings_exist:
   - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
↪properties'
   - jboss_config: {{ pillar['jboss'] }}
```

`salt.states.jboss7.`**`datasource_exists`**`(`*name, jboss_config, datasource_properties, recreate=False, profile=None*`)`

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

name Datasource property name

jboss_config Dict with connection properties (see state description)

datasource_properties Dict with datasource properties

recreate [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not me possible to remove it.

profile [None] The profile name for this datasource (domain mode only)

Example:

```
sampleDS:
  jboss7.datasource_exists:
   - recreate: False
   - datasource_properties:
       driver-name: mysql
       connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
       jndi-name: 'java:jboss/datasources/sampleDS'
       user-name: sampleuser
       password: secret
       min-pool-size: 3
       use-java-context: True
   - jboss_config: {{ pillar['jboss'] }}
   - profile: full-ha
```

`salt.states.jboss7.`**`deployed`**`(`*name, jboss_config, salt_source=None*`)`

Ensures that the given application is deployed on server.

jboss_config: Dict with connection properties (see state description)

salt_source:

How to find the artifact to be deployed.

- **target_file**: Where to look in the minion's file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.
- **source**: (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target_file will be used for the deployment.
- **undeploy**: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.
- **undeploy_force**: (optional) If True, the artifact will be undeployed although it has not changed.

Examples:

Deployment of a file from minion's local file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
  jboss7.deployed:
   - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
   - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.`**`reloaded`**`(`*name*, *jboss_config*, *timeout=60*, *interval=5*`)`

Reloads configuration of jboss server.

jboss_config: Dict with connection properties (see state description)

timeout: Time to wait until jboss is back in running state. Default timeout is 60s.

interval: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
   jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

21.19.127 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.`**`absent`**`(`*name*, ***kwargs*`)`

Ensure the job is absent from the Jenkins configured jobs

name The name of the Jenkins job to remove

`salt.states.jenkins.`**`present`**`(`*name*, *config=None*, ***kwargs*`)`

Ensure the job is present in the Jenkins configured jobs

name The unique name for the Jenkins job

config The Salt URL for the file to use for configuring the job

21.19.128 salt.states.junos module

State modules to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to `junos` for information on connecting to junos proxy.

`salt.states.junos.`**`cli`**`(`*name*, ***kwargs*`)`

Executes the CLI commands and reutrns the text output.

```
show version:
  junos:
    - cli
    - format: xml
```

Parameters

- **`Required`** –
  - command: The command that need to be executed on Junos CLI. (default = None)
- **`Optional`** –
  - kwargs: **Keyworded arguments which can be provided like-**
    - format: Format in which to get the CLI output. (text or xml, default = 'text')
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - dest: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.`**`commit`**`(`*name*, ***kwargs*`)`

Commits the changes loaded into the candidate configuration.

```
commit the changes:
  junos:
    - commit
    - confirm: 10
```

Parameters **`Optional`** –

- kwargs: **Keyworded arguments which can be provided like-**
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane,checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When true return commit detail.

`salt.states.junos.`**`commit_check`**`(`*name*`)`

Perform a commit check on the configuration.

```
perform commit check:
  junos.commit_check
```

`salt.states.junos.`**`diff`**(*name*, *d_id*)

Gets the difference between the candidate and the current configuration.

```
get the diff:
  junos:
    - diff
    - id: 10
```

Parameters **`Optional`** –
- id: The rollback id value [0-49]. (default = 0)

`salt.states.junos.`**`file_copy`**(*name*, *dest=None*, ***kwargs*)

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
  junos:
    - file_copy
    - dest: info_copy.txt
```

Parameters **`Required`** –
- src: The sorce path where the file is kept.
- dest: The destination path where the file will be copied.

`salt.states.junos.`**`install_config`**(*name*, ***kwargs*)

Loads and commits the configuration provided.

```
Install the mentioned config:
  junos:
    - install_config
    - path: salt//configs/interface.set
    - timeout: 100
    - diffs_file: 'var/log/diff'
```

```
Install the mentioned config:
  junos:
    - install_config
    - template_path: salt//configs/interface.set
    - timeout: 100
    - template_vars:
        interface_name: lo0
        description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands

template_vars The dictionary of data for the jinja variables present in the jinja template

timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite [False]

Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

comment Provide a comment to the commit. (default = None)

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

> **Note:** The file will be stored on the proxy minion. To push the files to the master use *`cp.push`*.

`salt.states.junos.`**`install_os`**`(`*name*, ***kwargs*`)`

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

```
salt://images/junos_image.tgz:
  junos:
    - install_os
    - timeout: 100
    - reboot: True
```

Parameters

- **`Required`** –
  - path: Path where the image file is present on the pro xy minion.
- **`Optional`** –
  - **kwargs: keyworded arguments to be given such as timeout, reboot etc**
    - timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    - reboot: Whether to reboot after installation (default = False)
    - no_copy: When True the software package will not be SCP'd to the device. (default = False)

`salt.states.junos.`**`load`**`(`*name*, ***kwargs*`)`

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
  junos:
    - load
    - path: salt//configs/interface.set
```

```
Install the mentioned config:
  junos:
    - load
    - template_path: salt//configs/interface.set
    - template_vars:
        interface_name: lo0
        description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

format: Determines the format of the contents.

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)

template_vars Variables to be passed into the template processing engine in addition to those present in __pillar__, __opts__, __grains__, etc. You may reference these variables in your template like so: {{ template_vars["var_name"] }}

`salt.states.junos.`**`lock`**`(`*name*`)`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

```
lock the config:
  junos.lock
```

`salt.states.junos.`**`resultdecorator`**`(`*function*`)`

`salt.states.junos.`**`rollback`**`(`*name, id, **kwargs*`)`

Rollbacks the committed changes.

```
rollback the changes:
  junos:
    - rollback
    - id: 5
```

Parameters **`Optional`** –

- id: The rollback id value [0-49]. (default = 0)
- **kwargs: Keyworded arguments which can be provided like-**
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - diffs_file: Path to the file where any diffs will be written. (default = None)

`salt.states.junos.`**`rpc`**`(`*name, dest=None, format='xml', args=None, **kwargs*`)`

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with dest as an argument

```
get-interface-information:
    junos:
      - rpc
      - dest: /home/user/rpc.log
      - interface_name: lo0
```

Parameters

- **`Required`** –
  - cmd: The rpc to be executed. (default = None)
- **`Optional`** –
  - dest: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: `cp.push`
  - format: The format in which the rpc reply must be stored in file specified in the dest (used only when dest is specified) (default = xml)
  - **kwargs: keyworded arguments taken by rpc call like-**
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)

      - filter: Only to be used with 'get-config' rpc to get specific configuration.
      - terse: Amount of information you want.
      - interface_name: Name of the interface whose information you want.

salt.states.junos.**set_hostname**(*name*, ***kwargs*)

Changes the hostname of the device.

```
device_name:
  junos:
    - set_hostname
    - comment: "Host-name set via saltstack."
```

Parameters

- **Required** –
  - hostname: The name to be set. (default = None)
- **Optional** –
  - kwargs: **Keyworded arguments which can be provided like-**
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - comment: Provide a comment to the commit. (default = None)
    - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.

salt.states.junos.**shutdown**(*name*, ***kwargs*)

Shuts down the device.

```
shut the device:
  junos:
    - shutdown
    - in_min: 10
```

Parameters **Optional** –

- kwargs:
  - reboot: Whether to reboot instead of shutdown. (default=False)
  - at: Specify time for reboot. (To be used only if reboot=yes)
  - in_min: Specify delay in minutes for shutdown

salt.states.junos.**unlock**(*name*)

Unlocks the candidate configuration.

```
unlock the config:
  junos.unlock
```

salt.states.junos.**zeroize**(*name*)

Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

21.19.129 salt.states.kapacitor module

Kapacitor state module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.`**`task_absent`**`(`*name*`)`

Ensure that a task is absent from Kapacitor.

name Name of the task.

`salt.states.kapacitor.`**`task_present`**`(`*name, tick_script, task_type='stream', database=None, retention_policy='default', enable=True, dbrps=None*`)`

Ensure that a task is present and up-to-date in Kapacitor.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a salt:// source.

task_type Task type. Defaults to 'stream'

dbrps A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrps.

New in version 2019.2.0.

database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

retention_policy Which retention policy to fetch data from. Defaults to 'default'.

enable Whether to enable the task or not. Defaults to True.

21.19.130 salt.states.kernelpkg

Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```
install-latest-kernel:
  kernel.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```
boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
```

Example state chaining the install and reboot operations:

```
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
    - onchanges:
      - kernel: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_wait:
    - at_time: 1
    - listen:
      - kernel: install-latest-kernel
```

`salt.states.kernelpkg.`**`latest_active`**(*name*, *at_time=None*, ***kwargs*)

Initiate a reboot if the running kernel is not the latest one installed.

Note: This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will reboot the system.

See `kernelpkg.upgrade` and `latest_installed()` for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See `latest_wait()` for a waitable state that can be called with the *listen* requesite.

---

name Arbitrary name for the state. Does not affect behavior.
at_time The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.`**`latest_installed`**(*name*, ***kwargs*)

Ensure that the latest version of the kernel available in the repositories is installed.

Note: This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See `kernelpkg.needs_reboot` for details on how to detect this condition, and `latest_active()` to initiale a reboot when needed.

---

name Arbitrary name for the state. Does not affect behavior.

`salt.states.kernelpkg.`**`latest_wait`**(*name*, *at_time=None*, ***kwargs*)

Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of `latest_active()` and will not take any action unless triggered by a watch or listen requesite.

Note: Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using *listen* or *listen_in* requisites.

```
system-up-to-date:
  pkg.uptodate:
    - refresh: true

boot-latest-kernel:
  kernelpkg.latest_wait:
    - at_time: 1
    - listen:
      - pkg: system-up-to-date
```

---

name Arbitrary name for the state. Does not affect behavior.

at_time The wait time in minutes before the system will be rebooted.

salt.states.kernelpkg.**mod_watch**(*name*, *sfun*, ***kwargs*)
Execute a kernelpkg state based on a watch or listen call

21.19.131 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

salt.states.keyboard.**system**(*name*)
Set the keyboard layout for the system

name The keyboard layout to use

salt.states.keyboard.**xorg**(*name*)
Set the keyboard layout for XOrg

layout The keyboard layout to use

21.19.132 salt.states.keystone

Management of Keystone users

depends

- keystoneclient Python module

configuration See `salt.modules.keystone` for setup instructions.

```
Keystone tenants:
  keystone.tenant_present:
    - names:
      - admin
      - demo
      - service

Keystone roles:
  keystone.role_present:
    - names:
      - admin
      - Member

admin:
  keystone.user_present:
    - password: R00T_4CC3SS
```

(continues on next page)

(continued from previous page)

```
    - email: admin@domain.com
    - roles:
        admin:   # tenants
          - admin  # roles
        service:
          - admin
          - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service
```

`salt.states.keystone.`**`endpoint_absent`**`(`*name, region=None, profile=None, interface=None, **connection_args*`)`

Ensure that the endpoint for a service doesn't exist in Keystone catalog

name The name of the service whose endpoints should not exist

region (optional) The region of the endpoint. Defaults to `RegionOne`.

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.`**`endpoint_present`**`(`*name, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args*`)`

Ensure the specified endpoints exists for service

name The Service name

publicurl The public url of service endpoint (for V2 API)

internalurl The internal url of service endpoint (for V2 API)

adminurl The admin url of the service endpoint (for V2 API)

region The region of the endpoint

url The endpoint URL (for V3 API)
interface The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.`**`project_absent`**`(`*name*, *profile=None*, ***connection_args*`)`
Ensure that the keystone project is absent. Alias for tenant_absent from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.
name The name of the project that should not exist

```
delete_nova:
    keystone.project_absent:
        - name: nova
```

`salt.states.keystone.`**`project_present`**`(`*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*`)`
Ensures that the keystone project exists Alias for tenant_present from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.
name The name of the project to manage
description The description to use for this project
enabled Availability state for this project

```
nova:
    keystone.project_present:
        - enabled: True
        - description: 'Nova Compute Service'
```

`salt.states.keystone.`**`role_absent`**`(`*name*, *profile=None*, ***connection_args*`)`
Ensure that the keystone role is absent.
name The name of the role that should not exist

`salt.states.keystone.`**`role_present`**`(`*name*, *profile=None*, ***connection_args*`)`
' Ensures that the keystone role exists
name The name of the role that should be present

`salt.states.keystone.`**`service_absent`**`(`*name*, *profile=None*, ***connection_args*`)`
Ensure that the service doesn't exist in Keystone catalog
name The name of the service that should not exist

`salt.states.keystone.`**`service_present`**`(`*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*`)`
Ensure service present in Keystone catalog
name The name of the service
service_type The type of Openstack Service
description (optional) Description of the service

`salt.states.keystone.`**`tenant_absent`**`(`*name*, *profile=None*, ***connection_args*`)`
Ensure that the keystone tenant is absent.
name The name of the tenant that should not exist

`salt.states.keystone.`**`tenant_present`**`(`*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*`)`
Ensures that the keystone tenant exists
name The name of the tenant to manage
description The description to use for this tenant
enabled Availability state for this tenant

`salt.states.keystone.`**`user_absent`**(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone user is absent.

name The name of the user that should not exist

`salt.states.keystone.`**`user_present`**(*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password_reset=True*, *project=None*, ***connection_args*)

Ensure that the keystone user is present with the specified properties.

name The name of the user to manage

password The password to use for this user.

> **Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

password_reset Whether or not to reset password after initial set. Defaults to `True`.

email The email address for this user

tenant The tenant (name) for this user

project The project (name) for this user (overrides tenant in api v3)

enabled Availability state for this user

roles The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
    admin:   # tenant
      - admin  # role
    service:
      - admin
      - Member
```

21.19.133 salt.states.keystone_domain

Management of OpenStack Keystone Domains

New in version 2018.3.0.

depends shade

configuration see *`salt.modules.keystoneng`* for setup instructions

Example States

```
create domain:
  keystone_domain.present:
    - name: domain1

create domain with optional params:
  keystone_domain.present:
    - name: domain1
    - enabled: False
    - description: 'my domain'

delete domain:
  keystone_domain.absent:
    - name: domain1
```

`salt.states.keystone_domain.`**`absent`**`(`*name, auth=None*`)`

Ensure domain does not exist

name Name of the domain

`salt.states.keystone_domain.`**`present`**`(`*name, auth=None, **kwargs*`)`

Ensure domain exists and is up-to-date

name Name of the domain

enabled Boolean to control if domain is enabled

description An arbitrary description of the domain

21.19.134 salt.states.keystone_endpoint

Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create endpoint:
  keystone_endpoint.present:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

destroy endpoint:
  keystone_endpoint.absent:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

create multiple endpoints:
  keystone_endpoint.absent:
    - names:
        - public
        - admin
        - internal
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance
```

`salt.states.keystone_endpoint.`**`absent`**`(`*name, service_name, auth=None, **kwargs*`)`

Ensure an endpoint does not exists

name Interface name

url URL of the endpoint

service_name Service name or ID

region The region name to assign the endpoint

`salt.states.keystone_endpoint.`**`present`**`(`*name, service_name, auth=None, **kwargs*`)`

Ensure an endpoint exists and is up-to-date

name Interface name

url URL of the endpoint

service_name Service name or ID
region The region name to assign the endpoint
enabled Boolean to control if endpoint is enabled

21.19.135 salt.states.keystone_group

Management of OpenStack Keystone Groups

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'
```

`salt.states.keystone_group.`**`absent`**`(`*name, auth=None, **kwargs*`)`
Ensure group does not exist
name Name of the group
domain The name or id of the domain

`salt.states.keystone_group.`**`present`**`(`*name, auth=None, **kwargs*`)`
Ensure an group exists and is up-to-date
name Name of the group
domain The name or id of the domain
description An arbitrary description of the group

21.19.136 salt.states.keystone_project

Management of OpenStack Keystone Projects

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create project:
  keystone_project.present:
    - name: project1
```

(continues on next page)

(continued from previous page)

```
delete project:
  keystone_project.absent:
    - name: project1

create project with optional params:
  keystone_project.present:
    - name: project1
    - domain: domain1
    - enabled: False
    - description: 'my project'
```

`salt.states.keystone_project.`**`absent`**(*name*, *auth=None*, ***kwargs*)

Ensure a project does not exists

name Name of the project

domain The name or id of the domain

`salt.states.keystone_project.`**`present`**(*name*, *auth=None*, ***kwargs*)

Ensure a project exists and is up-to-date

name Name of the project

domain The name or id of the domain

description An arbitrary description of the project

21.19.137 salt.states.keystone_role

Management of OpenStack Keystone Roles

New in version 2018.3.0.

depends shade

configuration see *`salt.modules.keystoneng`* for setup instructions

Example States

```
create role:
  keystone_role.present:
    - name: role1

delete role:
  keystone_role.absent:
    - name: role1

create role with optional params:
  keystone_role.present:
    - name: role1
    - description: 'my group'
```

`salt.states.keystone_role.`**`absent`**(*name*, *auth=None*, ***kwargs*)

Ensure role does not exist

name Name of the role

`salt.states.keystone_role.`**`present`**(*name*, *auth=None*, ***kwargs*)

Ensure an role exists

name Name of the role

description An arbitrary description of the role

21.19.138 salt.states.keystone_role_grant

Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'
```

`salt.states.keystone_role_grant.`**`absent`**(*name*, *auth=None*, ***kwargs*)

`salt.states.keystone_role_grant.`**`present`**(*name*, *auth=None*, ***kwargs*)

21.19.139 salt.states.keystone_service

Management of OpenStack Keystone Services

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

create service with optional params:
  keystone_service.present:
    - name: glance
    - type: image
    - enabled: False
    - description: 'OpenStack Image'
```

`salt.states.keystone_service.`**`absent`**`(`*name*, *auth=None*`)`

Ensure service does not exist

name Name of the service

`salt.states.keystone_service.`**`present`**`(`*name*, *auth=None*, ***kwargs*`)`

Ensure an service exists and is up-to-date

name Name of the group

type Service type

enabled Boolean to control if service is enabled

description An arbitrary description of the service

21.19.140 salt.states.keystone_user

Management of OpenStack Keystone Users

New in version 2018.3.0.

depends shade

configuration see *`salt.modules.keystoneng`* for setup instructions

Example States

```
create user:
  keystone_user.present:
    - name: user1

delete user:
  keystone_user.absent:
    - name: user1

create user with optional params:
  keystone_user.present:
    - name: user1
    - domain: domain1
    - enabled: False
    - password: password123
    - email: "user1@example.org"
    - description: 'my user'
```

`salt.states.keystone_user.`**`absent`**`(`*name*, *auth=None*, ***kwargs*`)`

Ensure user does not exists

name Name of the user

domain The name or id of the domain

`salt.states.keystone_user.`**`present`**`(`*name*, *auth=None*, ***kwargs*`)`

Ensure domain exists and is up-to-date

name Name of the domain

domain The name or id of the domain

enabled Boolean to control if domain is enabled

description An arbitrary description of the domain

password The user password

email The users email address

21.19.141 salt.states.keystore

State management of a java keystore

`salt.states.keystore.`**`managed`**(*name*, *passphrase*, *entries*, *force_remove=False*)

Create or manage a java keystore.

name The path to the keystore file

passphrase The password to the keystore

entries A list containing an alias, certificate, and optional private_key. The certificate and private_key can be a file or a string

```
- entries:
  - alias: hostname2
    certificate: /path/to/cert.crt
    private_key: /path/to/key.key
  - alias: stringhost
    certificate: |
      -----BEGIN CERTIFICATE-----
      MIICEjCCAXsCAg36MA0GCSqGSIb3DQEBBQUAMIGbMQswCQYDVQQGEwJKUDEOMAwG
      ...
      2VguKv4SWjRFoRkIfIlHX0qVviMhSlNy2ioFLy7JcPZb+v3ftDGywUqcBiVDoea0
      -----END CERTIFICATE-----
```

force_remove If True will cause the state to remove any entries found in the keystore which are not defined in the state. The default is False.

Example

```
define_keystore:
  keystore.managed:
    - name: /path/to/keystore
    - passphrase: changeit
    - force_remove: True
    - entries:
      - alias: hostname1
        certificate: /path/to/cert.crt
      - alias: remotehost
        certificate: /path/to/cert2.crt
        private_key: /path/to/key2.key
      - alias: pillarhost
        certificate: {{ salt.pillar.get('path:to:cert') }}
```

21.19.142 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

`salt.states.kmod.`**`absent`**`(`*name, persist=False, comment=True, mods=None*`)`

Verify that the named kernel module is not loaded

name The name of the kernel module to verify is not loaded

persist Remove module from `/etc/modules`

comment Comment out module in `/etc/modules` rather than remove it

mods A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

`salt.states.kmod.`**`present`**`(`*name, persist=False, mods=None*`)`

Ensure that the specified kernel module is loaded

name The name of the kernel module to verify is loaded

persist Also add module to `/etc/modules`

mods A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

21.19.143 salt.states.kubernetes

Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See salt.modules.kubernetesmod for more information.

Warning: Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

```
my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1
        template:
          metadata:
            labels:
              run: my-nginx
          spec:
            containers:
            - name: my-nginx
```

(continues on next page)

(continued from previous page)

```
              image: nginx
              ports:
              - containerPort: 80

my-mariadb:
  kubernetes.deployment_absent:
    - namespace: default

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
redis-master-deployment:
  kubernetes.deployment_present:
    - name: redis-master
    - source: salt://k8s/redis-master-deployment.yml
  require:
    - pip: kubernetes-python-module

# kubernetes service as specified inside of
# a file containing the definition of the the
# service using the official kubernetes format
redis-master-service:
  kubernetes.service_present:
    - name: redis-master
    - source: salt://k8s/redis-master-service.yml
  require:
    - kubernetes.deployment_present: redis-master

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
# plus some jinja directives
 nginx-source-template:
  kubernetes.deployment_present:
    - source: salt://k8s/nginx.yml.jinja
    - template: jinja
  require:
    - pip: kubernetes-python-module

# Kubernetes secret
k8s-secret:
  kubernetes.secret_present:
    - name: top-secret
      data:
        key1: value1
        key2: value2
        key3: value3
```

salt.states.kubernetes.**configmap_absent**(name, namespace=’default’, **kwargs)

Ensures that the named configmap is absent from the given namespace.

name The name of the configmap

namespace The namespace holding the configmap. The ’default’ one is going to be used unless a different one is specified.

salt.states.kubernetes.**configmap_present**(name, namespace=’default’, data=None, source=None, template=None, **kwargs)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

name The name of the configmap.

namespace The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

data The dictionary holding the configmaps.

source A file containing the data of the configmap in plain format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.`**`deployment_absent`**(*name*, *namespace='default'*, ***kwargs*)

Ensures that the named deployment is absent from the given namespace.

name The name of the deployment

namespace The name of the namespace

`salt.states.kubernetes.`**`deployment_present`**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source="*, *template="*, ***kwargs*)

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the deployment.

namespace The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the deployment object.

spec The spec of the deployment object.

source A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.`**`namespace_absent`**(*name*, ***kwargs*)

Ensures that the named namespace is absent.

name The name of the namespace

`salt.states.kubernetes.`**`namespace_present`**(*name*, ***kwargs*)

Ensures that the named namespace is present.

name The name of the namespace.

`salt.states.kubernetes.`**`node_label_absent`**(*name*, *node*, ***kwargs*)

Ensures that the named label is absent from the node.

name The name of the label

node The name of the node

`salt.states.kubernetes.`**`node_label_folder_absent`**(*name*, *node*, ***kwargs*)

Ensures the label folder doesn't exist on the specified node.

name The name of label folder

node The name of the node

`salt.states.kubernetes.`**`node_label_present`**(*name*, *node*, *value*, ***kwargs*)

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

name The name of the label.

value Value of the label.

node Node to change.

`salt.states.kubernetes.`**`pod_absent`**(*name*, *namespace='default'*, ***kwargs*)

Ensures that the named pod is absent from the given namespace.

name The name of the pod

namespace The name of the namespace

`salt.states.kubernetes.`**`pod_present`**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source="*, *template="*, ***kwargs*)

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.

name The name of the pod.

namespace The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the pod object.

spec The spec of the pod object.

source A file containing the definition of the pod (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.`**`secret_absent`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Ensures that the named secret is absent from the given namespace.

name The name of the secret

namespace The name of the namespace

`salt.states.kubernetes.`**`secret_present`**`(`*name*, *namespace='default'*, *data=None*, *source=None*, *template=None*, ***kwargs*`)`

Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

name The name of the secret.

namespace The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.

data The dictionary holding the secrets.

source A file containing the data of the secret in plain format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.`**`service_absent`**`(`*name*, *namespace='default'*, ***kwargs*`)`

Ensures that the named service is absent from the given namespace.

name The name of the service

namespace The name of the namespace

`salt.states.kubernetes.`**`service_present`**`(`*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, ***kwargs*`)`

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the service.

namespace The namespace holding the service. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the service object.

spec The spec of the service object.

source A file containing the definition of the service (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

21.19.144 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```
sunrise:
    layman.present
```

`salt.states.layman.`**`absent`**`(`*name*`)`

Verify that the overlay is absent

name The name of the overlay to delete `salt.states.layman.`**`present`**`(`*name*`)`

Verify that the overlay is present

name The name of the overlay to add

21.19.145 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.`**`managed`**`(`*name*, *entries*, *connect_spec=None*`)`

Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
  ldap.managed:
    - connect_spec:
        bind:
          method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
        - delete_others: True

      # make sure the entry exists with only the specified
      # attribute values
      - cn=admin,dc=example,dc=com:
        - delete_others: True
        - replace:
            cn:
              - admin
            description:
              - LDAP administrator
            objectClass:
              - simpleSecurityObject
              - organizationalRole
            userPassword:
              - {{pillar.ldap_admin_password}}

      # make sure the entry exists, its olcRootDN attribute
      # has only the specified value, the olcRootDN attribute
      # doesn't exist, and all other attributes are ignored
      - 'olcDatabase={1}hdb,cn=config':
        - replace:
            olcRootDN:
              - cn=admin,dc=example,dc=com
            # the admin entry has its own password attribute
            olcRootPW: []

      # note the use of 'default'.  also note how you don't
      # have to use list syntax if there is only one attribute
      # value
```

(continues on next page)

(continued from previous page)

```
      - cn=foo,ou=users,dc=example,dc=com:
        - delete_others: True
        - default:
            userPassword: changeme
            shadowLastChange: 0
            # keep sshPublicKey if present, but don't create
            # the attribute if it is missing
            sshPublicKey: []
        - replace:
            cn: foo
            uid: foo
            uidNumber: 1000
            gidNumber: 1000
            gecos: Foo Bar
            givenName: Foo
            sn: Bar
            homeDirectory: /home/foo
            loginShell: /bin/bash
            objectClass:
              - inetOrgPerson
              - posixAccount
              - top
              - ldapPublicKey
              - shadowAccount
```

Parameters

- **`name`** – The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **`entries`** – A description of the desired state of zero or more LDAP entries.

  `entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

  The DNs are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

  The structure of `entries` looks like this:

  ```
  [{dn1: [{directive1: directive1_state,
           directive2: directive2_state},
          {directive3: directive3_state}],
    dn2: [{directive4: directive4_state,
           directive5: directive5_state}]},
   {dn3: [{directive6: directive6_state}]}]
  ```

  These are the directives:
  - **`'delete_others'`** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

    If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.

    - **`'default'`** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

      An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.
    - **`'add'`** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

      An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.
    - **`'delete'`** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.
    - **`'replace'`** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

  In the above directives, the iterables of attribute values may instead be `None`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

  Note that if all attribute values are removed from an entry, the entire entry is deleted.
- **`connect_spec`** – See the description of the `connect_spec` parameter of the *`ldap3.connect`* function in the *`ldap3`* execution module. If this is a dict and the `'url'` entry is not specified, the `'url'` entry is set to the value of the `name` parameter.

Returns

A dict with the following keys:

- **`'name'`** This is the same object passed to the `name` parameter.
- **`'changes'`** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

  Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:
  - **`'old'`** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
  - **`'new'`** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

  Example `'changes'` dict where a new entry was created with a single attribute containing two values:

  ```
  {'dn1': {'old': None,
           'new': {'attr1': ['val1', 'val2']}}}
  ```

  Example `'changes'` dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
         'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
  - `True` if no changes were necessary or if all changes were applied successfully.
  - `False` if at least one change was unable to be applied.
  - `None` if changes would be applied but it is in test mode.

21.19.146 salt.states.libcloud_dns module

Manage DNS records and zones using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

configuration This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
    - profile: profile1
my-website:
  libcloud_dns.record_present:
    - name: www
    - zone: mywebsite.com
    - type: A
    - data: 12.34.32.3
    - profile: profile1
    - require:
      - libcloud_dns: my-zone
```

depends apache-libcloud

`salt.states.libcloud_dns.`**`record_absent`**(*name*, *zone*, *type*, *data*, *profile*)

Ensures a record is absent.

Parameters

- **name** (`str`) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.

- **zone** (`str`) – Zone where the requested record is created, the domain name
- **type** (`str`) – DNS record type (A, AAAA, …).
- **data** (`str`) – Data for the record (depends on the record type).
- **profile** (`str`) – The profile key

`salt.states.libcloud_dns.`**`record_present`**(*name*, *zone*, *type*, *data*, *profile*)

Ensures a record is present.

Parameters

- **name** (`str`) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.
- **zone** (`str`) – Zone where the requested record is created, the domain name
- **type** (`str`) – DNS record type (A, AAAA, …).
- **data** (`str`) – Data for the record (depends on the record type).
- **profile** (`str`) – The profile key

`salt.states.libcloud_dns.`**`state_result`**(*result*, *message*, *name*, *changes=None*)

`salt.states.libcloud_dns.`**`zone_absent`**(*domain*, *profile*)

Ensures a record is absent.

Parameters

- **domain** (`str`) – Zone name, i.e. the domain name
- **profile** (`str`) – The profile key

`salt.states.libcloud_dns.`**`zone_present`**(*domain*, *type*, *profile*)

Ensures a record is present.

Parameters

- **domain** (`str`) – Zone name, i.e. the domain name
- **type** (`str`) – Zone type (master / slave), defaults to master
- **profile** (`str`) – The profile key

21.19.147 salt.states.libcloud_loadbalancer module

Apache Libcloud Load Balancer State

Manage load balancers using libcloud

codeauthor `Anthony Shaw <anthonyshaw@apache.org>`

Apache Libcloud load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Cloud providers

```
libcloud_loadbalancer:
    profile_test1:
      driver: gce
      key: GOOG0123456789ABCXYZ
      secret: mysecret
    profile_test2:
      driver: alb
      key: 12345
      secret: mysecret
```

Example:

Using States to deploy a load balancer with extended arguments to specify region

```
lb_test:
    libcloud_loadbalancer.balancer_present:
        - name: example
        - port: 80
        - protocol: http
        - profile: google
        - ex_region: us-east1
```

depends apache-libcloud

`salt.states.libcloud_loadbalancer.`**`balancer_absent`**`(`*name*, *profile*, ***libcloud_kwargs*`)`

Ensures a load balancer is absent.

Parameters

- **`name`** (`str`) – Load Balancer name
- **`profile`** (`str`) – The profile key

`salt.states.libcloud_loadbalancer.`**`balancer_present`**`(`*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, ***libcloud_kwargs*`)`

Ensures a load balancer is present.

Parameters

- **`name`** (`str`) – Load Balancer name
- **`port`** (`str`) – Port the load balancer should listen on, defaults to 80
- **`protocol`** (`str`) – Loadbalancer protocol, defaults to http.
- **`profile`** (`str`) – The profile key
- **`algorithm`** (`str`) – Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **`members`** (`list` of `dict` (ip, port)) – An optional list of members to create on deployment

`salt.states.libcloud_loadbalancer.`**`member_absent`**`(`*ip*, *port*, *balancer_id*, *profile*, ***libcloud_kwargs*`)`

Ensure a load balancer member is absent, based on IP and Port

Parameters

- **`ip`** (`str`) – IP address for the member
- **`port`** (`int`) – Port for the member
- **`balancer_id`** (`str`) – id of a load balancer you want to detach the member from
- **`profile`** (`str`) – The profile key

`salt.states.libcloud_loadbalancer.`**`member_present`**`(`*ip*, *port*, *balancer_id*, *profile*, ***libcloud_kwargs*`)`

Ensure a load balancer member is present

Parameters

- **`ip`** (`str`) – IP address for the new member
- **`port`** (`int`) – Port for the new member
- **`balancer_id`** (`str`) – id of a load balancer you want to attach the member to
- **`profile`** (`str`) – The profile key

`salt.states.libcloud_loadbalancer.`**`state_result`**`(`*result*, *message*, *name*, *changes=None*`)`

21.19.148 salt.states.libcloud_storage module

Apache Libcloud Storage State

Manage cloud storage using libcloud

codeauthor `Anthony Shaw <anthonyshaw@apache.org>`

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
    profile_test1:
      driver: google_storage
      key: GOOG0123456789ABCXYZ
      secret: mysecret
    profile_test2:
      driver: s3
      key: 12345
      secret: mysecret
```

Examples

Creating a container and uploading a file

```
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

Downloading a file

This example will download the file from the remote cloud and keep it locally

```
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

depends apache-libcloud

`salt.states.libcloud_storage.`**`container_absent`**`(`*name, profile*`)`

Ensures a container is absent.

Parameters

- **`name`** (`str`) – Container name

- **profile** (str) – The profile key

`salt.states.libcloud_storage.`**`container_present`**(*name, profile*)

Ensures a container is present.

Parameters

- **name** (str) – Container name
- **profile** (str) – The profile key

`salt.states.libcloud_storage.`**`file_present`**(*container, name, path, profile, overwrite_existing=False*)

Ensures a object is downloaded locally.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **path** (str) – Local path to file
- **profile** (str) – The profile key
- **overwrite_existing** (bool) – Replace if already exists

`salt.states.libcloud_storage.`**`object_absent`**(*container, name, profile*)

Ensures a object is absent.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **profile** (str) – The profile key

`salt.states.libcloud_storage.`**`object_present`**(*container, name, path, profile*)

Ensures a object is presnt.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **path** (str) – Local path to file
- **profile** (str) – The profile key

`salt.states.libcloud_storage.`**`state_result`**(*result, message, name, changes*)

21.19.149 salt.states.linux_acl

Linux File Access Control Lists

The Linux ACL state module requires the *getfacl* and *setfacl* binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL list is present

```
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

Ensure a Linux ACL list does not exist

```
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

`salt.states.linux_acl.`**`absent`**(*name, acl_type, acl_name=”, perms=”, recurse=False*)

Ensure a Linux ACL does not exist

name The acl path

acl_type The type of the acl is used for, it can be 'user' or 'group'

acl_name The user or group

perms Remove the permissions eg.: rwx

recurse Set the permissions recursive in the path

`salt.states.linux_acl.`**`list_absent`**(*name, acl_type, acl_names=None, recurse=False*)

Ensure a Linux ACL list does not exist

Takes a list of acl names and remove them from the given path

name The acl path

acl_type The type of the acl is used for, it can be 'user' or 'group'

acl_names The list of users or groups

perms Remove the permissions eg.: rwx

recurse Set the permissions recursive in the path

`salt.states.linux_acl.`**`list_present`**(*name, acl_type, acl_names=None, perms=”, recurse=False, force=False*)

Ensure a Linux ACL list is present

Takes a list of acl names and add them to the given path

name The acl path

acl_type The type of the acl is used for it can be 'user' or 'group'

acl_names The list of users or groups

perms Set the permissions eg.: rwx

recurse Set the permissions recursive in the path

force Wipe out old permissions and ensure only the new permissions are set

`salt.states.linux_acl.`**`present`**(*name, acl_type, acl_name=”, perms=”, recurse=False, force=False*)

Ensure a Linux ACL is present

name The acl path

acl_type The type of the acl is used for it can be 'user' or 'group'

acl_name The user or group

perms Set the permissions eg.: rwx

recurse Set the permissions recursive in the path
force Wipe out old permissions and ensure only the new permissions are set

21.19.150 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

`salt.states.locale.`**`present`**`(`*name*`)`

Generate a locale if it is not present

New in version 2014.7.0.

name The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.`**`system`**`(`*name*`)`

Set the locale for the system
name The name of the locale to use

21.19.151 salt.states.logadm module

Management of logs using Solaris logadm.

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.modulus.logadm

platform Oracle Solaris, Sun Solaris, illumos

New in version nitrogen.

```
.. note::
    TODO
```

`salt.states.logadm.`**`remove`**`(`*name, log_file=None*`)`

Remove a log from the logadm configuration
name [string] entryname
log_file [string] (optional) log file path

Note: If log_file is specified it will be used instead of the entry name.

`salt.states.logadm.`**`rotate`**`(`*name, **kwargs*`)`

Add a log to the logadm configuration

name [string] alias for entryname
kwargs [boolean|string|int] optional additional flags and parameters

21.19.152 salt.states.logrotate module

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.set_`(*name*, *key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line.

Parameters

- **key** (*str*) – The command or block to configure.
- **value** (*str*) – The command value or command of the block specified by the key parameter.
- **setting** (*str*) – The command value for the command specified by the value parameter.
- **conf_file** (*str*) – The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
  logrotate.set:
    - key: rotate
    - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
  logrotate.set:
    - key: /var/log/wtmp
    - value: rotate
    - setting: 2
    - conf_file: /etc/logrotate.conf
```

21.19.153 salt.states.loop module

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

In both examples below, the execution module function `boto_elb.get_instance_health` returns a list of dicts. The condition checks the `state`-key of the first dict in the returned list and compares its value to the string *InService*.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
    - m_args:
      - {{ elb }}
    - m_kwargs:
        keyid: {{ access_key }}
```

(continues on next page)

(continued from previous page)

```
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

Warning: This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python `operator` to compare the result of the function called in `name`, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, *compare_operator* can be filled with a function from an execution module in `__salt__` or `__utils__` like the example below. The function `data.subdict_match` checks if the `expected` expression matches the data returned by calling the `name` function (with passed `args` and `kwargs`).

```
Wait for service to be healthy:
  loop.until_no_eval:
    - name: boto_elb.get_instance_health
    - expected: '0:state:InService'
    - compare_operator: data.subdict_match
    - period: 5
    - timeout: 20
    - args:
      - {{ elb }}
    - kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

`salt.states.loop.`**`until`**(*name*, *m_args=None*, *m_kwargs=None*, *condition=None*, *period=1*, *timeout=60*)

Loop over an execution module until a condition is met.

Parameters

- **name** (*str*) – The name of the execution module
- **m_args** (*list*) – The execution module's positional arguments
- **m_kwargs** (*dict*) – The execution module's keyword arguments
- **condition** (*str*) – The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.
- **period** (*int or float*) – The number of seconds to wait between executions
- **timeout** (*int or float*) – The timeout in seconds

`salt.states.loop.`**`until_no_eval`**(*name*, *expected*, *compare_operator='eq'*, *timeout=60*, *period=1*, *init_wait=0*, *args=None*, *kwargs=None*)

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

Parameters

- **name** (*str*) – Name of the module.function to call
- **expected** – Expected return value. This can be almost anything.
- **compare_operator** (*str*) – Operator to use to compare the result of the module.function call with the expected value. This can be anything present in __salt__ or __utils__. Will be called with 2 args: result, expected.
- **timeout** (*int or float*) – Abort after this amount of seconds (excluding init_wait).
- **period** (*int or float*) – Time (in seconds) to wait between attempts.

- **init_wait** (*int or float*) – Time (in seconds) to wait before trying anything.
- **args** (*list*) – args to pass to the salt module.function.
- **kwargs** (*dict*) – kwargs to pass to the salt module.function.

New in version 3000.

21.19.154 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

`salt.states.lvm.`**`lv_absent`**(*name, vgname=None*)

Remove a given existing Logical Volume from a named existing volume group

name The Logical Volume to remove

vgname The name of the Volume Group on which the Logical Volume resides

`salt.states.lvm.`**`lv_present`**(*name, vgname=None, size=None, extents=None, snapshot=None, pv=", thinvolume=False, thinpool=False, force=False, **kwargs*)

Create a new Logical Volume

name The name of the Logical Volume

vgname The name of the Volume Group on which the Logical Volume resides

size The initial size of the Logical Volume

extents The number of logical extents to allocate

snapshot The name of the snapshot

pv The Physical Volume to use

kwargs Any supported options to lvcreate. See `linux_lvm` for more details.

New in version to_complete.

thinvolume Logical Volume is thinly provisioned

thinpool Logical Volume is a thin pool

New in version 2018.3.0.

force Assume yes to all prompts

`salt.states.lvm.`**`pv_absent`**(*name*)

Ensure that a Physical Device is not being used by lvm

name The device name to initialize.

`salt.states.lvm.`**`pv_present`**(*name, **kwargs*)

Set a Physical Device to be used as an LVM Physical Volume

name The device name to initialize.

kwargs Any supported options to pvcreate. See `linux_lvm` for more details.

`salt.states.lvm.`**`vg_absent`**(*name*)

Remove an LVM volume group

name The volume group to remove

`salt.states.lvm.`**`vg_present`**(*name*, *devices=None*, ***kwargs*)

Create an LVM Volume Group

name The Volume Group name to create

devices A list of devices that will be added to the Volume Group

kwargs Any supported options to vgcreate. See `linux_lvm` for more details.

21.19.155 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.`**`absent`**(*name*, *protocol=None*, *service_address=None*, *server_address=None*)

Ensure the LVS Real Server in specified service is absent.

name The name of the LVS server.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The LVS real server address.

`salt.states.lvs_server.`**`present`**(*name*, *protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method='dr'*, *weight=1*)

Ensure that the named service is present.

name The LVS server name

protocol The service protocol

service_address The LVS service address

server_address The real server address.

packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

21.19.156 salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.`**`absent`**(*name*, *protocol=None*, *service_address=None*)

Ensure the LVS service is absent.

name The name of the LVS service

protocol The service protocol

service_address The LVS service address

`salt.states.lvs_service.`**`present`**(*name*, *protocol=None*, *service_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

name The LVS service name

protocol The service protocol
service_address The LVS service address
scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

21.19.157 salt.states.lxc

Manage Linux Containers

`salt.states.lxc.`**`absent`**(*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present
name Name of the container to destroy
stop stop before destroying default: false

New in version 2015.5.2.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

`salt.states.lxc.`**`edited_conf`**(*name*, *lxc_conf=None*, *lxc_conf_unset=None*)

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

Issue #35523 was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
        - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
        - lxc.utsname
```

`salt.states.lxc.`**`frozen`**(*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use *`lxc.present`*.

---

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

start [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

`salt.states.lxc.`**`present`**`(`*name, running=None, clone_from=None, snapshot=False, profile=None, network_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, thinpool=None, path=None*`)`

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

name The name of the container to be created

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

running [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

clone_from Create named container as a clone of the specified container

snapshot [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

profile Profile to use in container creation (see the *LXC Tutorial* for more information). Values in a profile will be overridden by the parameters listed below.

network_profile Network Profile to use in container creation (see the *LXC Tutorial* for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the *`lxc.templates`* function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the *`lxc.images`* function.

---

options

New in version 2015.5.0.

Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
        dist: centos
        release: 6
        arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

For available template options, refer to the lxc template scripts which are ususally located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

fstype Filesystem type to use on LVM logical volume

size Size of the volume to create. Only applicable if `backing` is set to `lvm`.

vgname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

thinpool Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.`**`running`**(*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

Note: This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use *`lxc.present`*.

---

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

restart [False] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.`**`set_pass`**(*name*, ***kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that *`lxc.set_password`* uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.`**`stopped`**(*name*, *kill=False*, *path=None*)

Ensure that a container is stopped

Note: This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

---

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

kill [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

21.19.158 salt.states.mac_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osacript:
  assistive.installed:
    - enabled: True
```

`salt.states.mac_assistive.`**`installed`**(*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

name The bundle ID or path to command

enable Should assistive access be enabled on this application?

21.19.159 salt.states.macdefaults

Writing/reading defaults from a macOS minion

`salt.states.macdefaults.`**`absent`**(*name*, *domain*, *user=None*)

Make sure the defaults value is absent

name The key of the given domain to remove

domain The name of the domain to remove from

user The user to write the defaults to

`salt.states.macdefaults.`**`write`**(*name*, *domain*, *value*, *vtype='string'*, *user=None*)

Write a default to the system

name The key of the given domain to write to

domain The name of the domain to write to

value The value to write to the given key

vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user The user to write the defaults to

21.19.160 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

`salt.states.mac_keychain.`**`default_keychain`**(*name*, *domain='user'*, *user=None*)

Set the default keychain to use

name The chain in which to use as the default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to run as

`salt.states.mac_keychain.`**`installed`**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, ***kwargs*)

Install a p12 certificate file into the macOS keychain

name The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.`**`uninstalled`**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, *keychain_password=None*)

Uninstall a p12 certificate file from the macOS keychain

name The certificate to uninstall, this can be a path for a .p12 or the friendly name

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

cert_name The friendly name of the certificate, this can be used instead of giving a certificate

keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

21.19.161 salt.states.macpackage

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
```

(continues on next page)

(continued from previous page)

```
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1\n.*7B91b
```

`salt.states.macpackage.`**`installed`**(*name, target='LocalSystem', dmg=False, store=False, app=False, mpkg=False, user=None, onlyif=None, unless=None, force=False, allow_untrusted=False, version_check=None*)

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name The pkg or dmg file to install

target The location in which to install the package. This can be a path or LocalSystem

dmg Is the given file a dmg file?

store Should the pkg be installed as if it was from the Mac OS Store?

app Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

user Name of the user performing the unless or onlyif checks

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

force Force the package to be installed even if its already been found installed

allow_untrusted Allow the installation of untrusted packages

version_check The command and version that we want to check against, the version number can use regex.

```
version_check: python --version_check=2.7.[0-9]
```

21.19.162 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```
/path/to/file:
  xattr.exists:
    - attributes:
        - com.file.attr=test
        - com.apple.quarantine=0x00001111
```

`salt.states.mac_xattr.`**`delete`**(*name, attributes*)

Make sure the given attributes are deleted from the file/directory

name The path to the file/directory

attributes The attributes that should be removed from the file/directory, this is accepted as an array.

`salt.states.mac_xattr.`**`exists`**(*name, attributes*)

Make sure the given attributes exist on the file/directory

name The path to the file/directory

attributes The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

21.19.163 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's `make.conf` file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

`salt.states.makeconf.`**`absent`**`(`*name*`)`

Verify that the variable is not in the `make.conf`.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

`salt.states.makeconf.`**`present`**`(`*name, value=None, contains=None, excludes=None*`)`

Verify that the variable is in the `make.conf` and has the provided settings. If value is set, contains and excludes will be ignored.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

value Enforce that the value of the variable is set to the provided value

contains Enforce that the value of the variable contains the provided value

excludes Enforce that the value of the variable does not contain the provided value.

21.19.164 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```
my_app:
  marathon_app.config:
    - config:
        cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
        cpus: 0.1
        mem: 10
        instances: 3
```

New in version 2015.8.2.

`salt.states.marathon_app.`**`absent`**`(`*name*`)`

Ensure that the marathon app with the given id is not present.

Parameters **`name`** – The app name/id

Returns A standard Salt changes dictionary

`salt.states.marathon_app.`**`config`**`(`*name, config*`)`

Ensure that the marathon app with the given id is present and is configured to match the given config values.

Parameters

- **`name`** – The app name/id
- **`config`** – The configuration to apply (dict)

Returns A standard Salt changes dictionary `salt.states.marathon_app.`**`running`**(*name*, *restart=False*, *force=True*)

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **`name`** – The app name/id
- **`restart`** – Restart the app
- **`force`** – Override the current deployment

Returns A standard Salt changes dictionary

21.19.165 salt.states.mdadm_raid

Managing software RAID with mdadm

depends mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

`salt.states.mdadm_raid.`**`absent`**(*name*)

Verify that the raid is absent

name The name of raid device to be destroyed

```
/dev/md0:
  raid:
    - absent
```

`salt.states.mdadm_raid.`**`present`**(*name*, *level*, *devices*, ***kwargs*)

Verify that the raid is present

Changed in version 2014.7.0.

name The name of raid device to be created

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

kwargs Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

21.19.166 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.`**`absent`**(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

name The key

value [None] If specified, only ensure that the key is absent if it matches the specified value.

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

`salt.states.memcached.`**`managed`**(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Manage a memcached key.

name The key to manage

value The value to set for that key

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```

21.19.167 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.`**`worker_activated`**(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.`**`worker_disabled`**(*name*, *workers=None*, *profile='default'*)

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.`**`worker_recover`**(*name*, *workers=None*, *profile='default'*)

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.`**`worker_stopped`**(*name*, *workers=None*, *profile='default'*)

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

21.19.168 salt.states.modjk_worker

Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.*** functions (see *here* for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module *`documentation`*

`salt.states.modjk_worker.`**`activate`**(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.`**`disable`**(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.`**`stop`**`(`*name, lbn, target, profile='default', tgt_type='glob'*`)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

21.19.169 salt.states.module

Execution of Salt modules from within states

Note: There are two styles of calling `module.run`. **The legacy style will no longer be available starting in the Sodium release**. To opt-in early to the new style you must add the following to your `/etc/salt/minion` config file:

```
use_superseded:
  - module.run
```

With *module.run* these states allow individual execution module calls to be made via states. Here's a contrived example, to show you how it's done:

```
# New Style
test.random_hash:
  module.run:
    - test.random_hash:
      - size: 42
      - hash_type: sha256

# Legacy Style
test.random_hash:
  module.run:
    - size: 42
    - hash_type: sha256
```

In the new style, the state ID (`test.random_hash`, in this case) is irrelevant when using `module.run`. It could have very well been written:

```
Generate a random hash:
  module.run:
    - test.random_hash:
      - size: 42
      - hash_type: sha256
```

For a simple state like that it's not a big deal, but if the module you're using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured file_roots):

```
def bar(name, names, fun, state, saltenv):
    return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv: {saltenv}".
↪format(**locals())
```

Your legacy state has to look like this:

```
# Legacy style
Unfortunate example:
  module.run:
  - name: foo.bar
  - m_name: Some name
  - m_names:
    - Such names
    - very wow
  - m_state: Arkansas
  - m_fun: Such fun
  - m_saltenv: Salty
```

With the new style it's much cleaner:

```
# New style
Better:
  module.run:
  - foo.bar:
    - name: Some name
    - names:
      - Such names
      - very wow
    - state: Arkansas
    - fun: Such fun
    - saltenv: Salty
```

The new style also allows multiple modules in one state. For instance, you can do this:

```
Do many things:
  module.run:
    - test.random_hash:
      - size: 10
      - hash_type: md5
    # Note the `:` at the end
    - test.true:
    - test.arg:
      - this
      - has
      - args
      - and: kwargs
      - isn't: that neat?
```

(continues on next page)

(continued from previous page)

```
    # Note the `:` at the end, too
    - test.version:
    - test.fib:
      - 4
```

Where in the legacy style you would have had to split your states like this:

```
test.random_hash:
  module.run:
    - size: 10
    - hash_type: md5

test.nop:
  module.run

test.arg:
  module.run:
    - args:
      - this
      - has
      - args
    - kwargs:
        and: kwargs
        isn't: that neat?

test.version:
  module.run
```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```
show off module.run with args:
  module.run:
    - name: test.random_hash
    - size: 42
    - hash_type: sha256
```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```
show off module.run with args:
  module.run:
    # Note the lack of `name: `, and trailing `:`
    - test.random_hash:
      - size: 42
      - hash_type: sha256
```

If the function takes `*args`, they can be passed in as well:

```
args and kwargs:
  module.run:
    - test.arg:
      - isn't
      - this
      - fun
      - this: that
      - salt: stack
```

Modern Examples

Here are some other examples using the modern `module.run`:

```
fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

A more complex example:

```
eventsviewer:
  module.run:
    - task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the *`module.wait`* state can be used:

```
add example to hosts:
  file.append:
    - name: /etc/hosts
    - text: 203.0.113.13     example.com

# New Style
mine.send:
  module.wait:
    # Again, note the trailing `:`
    - hosts.list_hosts:
    - watch:
      - file: add example to hosts
```

Legacy (Default) Examples

If you're using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state
- saltenv

For example:

```
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
          ssh_username: 'ubuntu',
          image: 'ami-8d6d9daa',
          securitygroup: 'default',
          size: 'c3.large',
          location: 'ap-northeast-1',
          delvol_on_destroy: 'True'
      }
```

Other modules take the keyword arguments using this style:

```
mac_enable_ssh:
  module.run:
    - name: system.set_remote_login
    - enable: True
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```
eventsviewer:
  module.run:
    - name: task.create_task
    - m_name: 'events-viewer'
    - user_name: System
    - kwargs: {
          action_type: 'Execute',
          cmd: 'c:\netops\scripts\events_viewer.bat',
          trigger_type: 'Daily',
          start_date: '2017-1-20',
          start_time: '11:59PM'
    }
```

`salt.states.module.`**`run`**`(`***kwargs*`)`

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

Parameters

- **`returner`** – Specify a common returner for the whole batch to send the return data
- **`kwargs`** – Pass any arguments needed to execute the function(s)

```
some_id_of_state:
  module.run:
    - network.ip_addrs:
      - interface: eth0
    - cloud.create:
      - names:
        - test-isbm-1
        - test-isbm-2
      - ssh_username: sles
      - image: sles12sp2
      - securitygroup: default
      - size: 'c3.large'
      - location: ap-northeast-1
      - delvol_on_destroy: True
```

Returns

`salt.states.module.`**`wait`**(*name*, ***kwargs*)

Run a single module function only if the watch statement calls it

`name` The module function to execute

`**kwargs` Pass any arguments needed to execute the function

Note: Like the *`cmd.run`* state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a *watch requisite*, and the state which it is watching changes.
2. Another state has a *watch_in requisite* which references this state, and the state wth the `watch_in` changes.

21.19.170 salt.states.mongodb_database

Management of MongoDB Databases

depends

- pymongo Python module

Only deletion is supported, creation doesn't make sense and can be done using *`mongodb_user.present`*.

`salt.states.mongodb_database.`**`absent`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Ensure that the named database is absent. Note that creation doesn't make sense in MongoDB.

name The name of the database to remove

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

authdb The database in which to authenticate

21.19.171 salt.states.mongodb_user

Management of MongoDB Users

depends

- pymongo Python module

`salt.states.mongodb_user.`**`absent`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Ensure that the named user is absent

name The name of the user to remove

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified by the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database from which to remove the user specified by the `name` parameter

authdb The database in which to authenticate

`salt.states.mongodb_user.`**`present`**(*name*, *passwd*, *database='admin'*, *user=None*, *password=None*, *host='localhost'*, *port=27017*, *authdb=None*, *roles=None*)

Ensure that the user is present with the specified properties

name The name of the user to manage

passwd The password of the user to manage

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified with the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database in which to create the user

Note: If the database doesn't exist, it will be created.

authdb The database in which to authenticate

roles The roles assigned to user specified with the `name` parameter

Example:

```
mongouser-myapp:
  mongodb_user.present:
  - name: myapp
  - passwd: password-of-myapp
  - database: admin
  # Connect as admin:sekrit
  - user: admin
  - password: sekrit
  - roles:
      - readWrite
      - userAdmin
      - dbOwner
```

21.19.172 salt.states.monit

Monit state

Manage monit states

```
monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
```

(continues on next page)

(continued from previous page)

```
  monit.unmonitor:
    - name: service
```

Note: Use of these states require that the *monit* execution module is available.

`salt.states.monit.`**`monitor`**(*name*)

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

`salt.states.monit.`**`unmonitor`**(*name*)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

21.19.173 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True

/var/lib/bigdata:
  mount.mounted:
    - device: /srv/bigdata
    - fstype: none
    - opts: bind
    - dump: 0
    - pass_num: 0
    - persist: True
    - mkmnt: True
```

`salt.states.mount.`**`fstab_absent`**(*name, fs_file, mount_by=None, config='/etc/fstab'*)

Makes sure that a fstab mount point is absent.

name The name of block device. Can be any valid fs_spec value.

fs_file Mount point (target) for the filesystem.

mount_by Select the final value for fs_spec. Can be [`None`, `device`, `label`, `uuid`, `partlabel`, `partuuid`]. If `None`, the value for fs_spect will be the parameter `name`, in other case will search the correct value based on the device name. For example, for `uuid`, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in `name`.

config Place where the fstab file lives

`salt.states.mount.`**`fstab_present`**`(`*name, fs_file, fs_vfstype, fs_mntops='defaults', fs_freq=0, fs_passno=0, mount_by=None, config='/etc/fstab', mount=True, match_on='auto', not_change=False*`)`

Makes sure that a fstab mount point is pressent.

name The name of block device. Can be any valid fs_spec value.

fs_file Mount point (target) for the filesystem.

fs_vfstype The type of the filesystem (e.g. ext4, xfs, btrfs, …)

fs_mntops The mount options associated with the filesystem. Default is `defaults`.

fs_freq Field is used by dump to determine which fs need to be dumped. Default is `0`

fs_passno Field is used by fsck to determine the order in which filesystem checks are done at boot time. Default is `0`

mount_by Select the final value for fs_spec. Can be [`None`, `device`, `label`, `uuid`, `partlabel`, `partuuid`]. If `None`, the value for fs_spect will be the parameter `name`, in other case will search the correct value based on the device name. For example, for `uuid`, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in `name`.

config Place where the fstab file lives. Default is `/etc/fstab`

mount Set if the mount should be mounted immediately. Default is `True`

match_on A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

not_change By default, if the entry is found in the fstab file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to `True` and the line is found, the original content will be preserved.

`salt.states.mount.`**`mod_watch`**`(`*name, user=None, **kwargs*`)`

The mounted watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

name The name of the mount point

`salt.states.mount.`**`mounted`**`(`*name, device, fstype, mkmnt=False, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', persist=True, mount=True, user=None, match_on='auto', device_name_regex=None, extra_mount_invisible_options=None, extra_mount_invisible_keys=None, extra_mount_ignore_fs_keys=None, extra_mount_translate_options=None, hidden_opts=None, **kwargs*`)`

Verify that a device is mounted

name The path to the location where the device is to be mounted

device The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

fstype The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of nfs mounts

mkmnt If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

opts A list object of options or a comma delimited list

dump The dump value to be passed into the fstab, Default is `0`

pass_num The pass value to be passed into the fstab, Default is `0`

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be saved in the fstab, Default is `True`

mount Set if the mount should be mounted immediately, Default is `True`

user The account used to execute the mount; this defaults to the user salt is running as on the minion

match_on A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

device_name_regex A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the /proc/self/mountinfo will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

extra_mount_invisible_options A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

extra_mount_invisible_keys A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

extra_mount_ignore_fs_keys A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
    'ramfs': ['size']
}
```

extra_mount_translate_options A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
    'tcp': 'proto=tcp',
    'udp': 'proto=udp'
}
```

hidden_opts A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

`salt.states.mount.`**`swap`**`(`*name*, *persist=True*, *config='/etc/fstab'*`)`

Activates a swap device

```
/root/swapfile:
  mount.swap
```

Note: `swap` does not currently support LABEL

`salt.states.mount.`**`unmounted`**`(`*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*, ***kwargs*`)`

New in version 0.17.0.

Verify that a device is not mounted

name The path to the location where the device is to be unmounted from

device The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be purged from the fstab, Default is `False`

user The user to own the mount; this defaults to the user salt is running as on the minion

21.19.174 salt.states.msteams module

Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url:  https://outlook.office.com/webhook/837
```

The hook_url can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

`salt.states.msteams.`**`post_card`**`(`*name*, *message*, *hook_url=None*, *title=None*, *theme_color=None*`)`

Send a message to a Microsft Teams channel

```
send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

message The message that is to be sent to the MS Teams channel.

The following parameters are optional:

hook_url The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

title The title for the card posted to the channel

theme_color A hex code for the desired highlight color

21.19.175 salt.states.mysql_database

Management of MySQL databases (schemas)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The mysql_database module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.`**`absent`**`(`*name*, ***connection_args*`)`
Ensure that the named database is absent
name The name of the database to remove

`salt.states.mysql_database.`**`present`**`(`*name*, *character_set=None*, *collate=None*, ***connection_args*`)`
Ensure that the named database is present with the specified properties
name The name of the database to manage

21.19.176 salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.

The `name` you pass in purely symbolic and does not have anything to do with the grant itself.

The `database` parameter needs to specify a 'priv_level' in the same specification as defined in the MySQL documentation:

- *
- *.*
- db_name.*
- db_name.tbl_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exampledb:
   mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe
```

`salt.states.mysql_grants.`**`absent`**`(`*name, grant=None, database=None, user=None, host='localhost', grant_option=False, escape=True, **connection_args*`)`

Ensure that the grant is absent

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

`salt.states.mysql_grants.`**`present`**`(`*name, grant=None, database=None, user=None, host='localhost', grant_option=False, escape=True, revoke_first=False, ssl_option=False, **connection_args*`)`

Ensure that the grant is present with the specified properties

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

grant_option Adds the WITH GRANT OPTION to the defined grant. Default is `False`

escape Defines if the database value gets escaped or not. Default is `True`

revoke_first By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the 'revoke_first options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

ssl_option Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
```

(continues on next page)

(continued from previous page)

```
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

21.19.177 salt.states.mysql_query

Execution of MySQL queries

New in version 2014.7.0.

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The mysql_query module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
    - database: my_database
    - query:    "SELECT * FROM table;"
    - output:   "/tmp/query_id.txt"
```

`salt.states.mysql_query.`**`run`**(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *check_db_exists=True*, ***connection_args*)

Execute an arbitrary query on the specified database

name Used only as an ID

database The name of the database to execute the query on

query The query to execute

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

`salt.states.mysql_query.`**`run_file`**(*name*, *database*, *query_file=None*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *saltenv=None*, *check_db_exists=True*, ***connection_args*)

Execute an arbitrary query on the specified database

New in version 2017.7.0.

name Used only as an ID

database The name of the database to execute the query_file on

query_file The file of mysql commands to run

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

saltenv: The saltenv to pull the query_file from

check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

21.19.178 salt.states.mysql_user

Management of MySQL users

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

`salt.states.mysql_user.`**`absent`**`(`*name*, *host='localhost'*, ***connection_args*`)`

Ensure that the named user is absent

name The name of the user to remove

`salt.states.mysql_user.`**`present`**`(`*name*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=False*, *password_column=None*, *auth_plugin='mysql_native_password'*, ***connection_args*`)`

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

name The name of the user to manage

host Host for which this user/password combo applies

password The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

unix_socket If `True` and allow_passwordless is `True`, the unix_socket auth plugin will be used.

21.19.179 salt.states.netacl

Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by Capirca.

New in version 2017.7.0.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>

maturity new

depends capirca, napalm

platform unix

Dependencies

Capirca

To install Capirca, execute: `pip install capirca`.

NAPALM

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.netacl.`**`filter`**(*name, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False*)

Generate and load the configuration of a policy filter.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: `True` When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: `acl` The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `False` Merge `terms` with the corresponding value from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

only_lower_merge: `False` Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: `True` Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True` Commit? Default: `True`.

debug: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:
----------
          ID: my-filter
    Function: netacl.filter
      Result: None

Summary for edge01.flw01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   2.437 s
```

Pillar example:

```
acl:
  - my-filter:
      options:
        - inet6
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
```

State SLS Example:

```
{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key=
↪'firewall') -%}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:

```
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

`salt.states.netacl.`**`managed`**(*name, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False*)

Manage the whole firewall configuration.

filters Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`False`** Merge the `filters` will the corresponding values from the pillar. Default: `False`.

> **Note:** By default this state does not merge, to avoid any unexpected behaviours.
>
> The merge logic depends on the `prepend` argument.
>
> The filters specified through the `filters` argument have higher priority than the pillar.

only_lower_merge: **`False`** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:

                              }
                          }
                      }

    Summary for edge01.bjm01
    ------------
    Succeeded: 1 (unchanged=1, changed=1)
    Failed:    0
    ------------
    Total states run:     1
    Total run time:   5.569 s
```

The policy configuration has been loaded from the pillar, having the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
  - block-icmp:
      terms:
        - first-term:
            protocol:
              - icmp
            action: reject
```

Example SLS file:

```
{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:

```
netacl_example:
  netacl.managed:
    - pillar_key: firewall
    - merge_pillar: true
    - revision_no: 2
    - debug: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

`salt.states.netacl.`**`term`**`(`*name, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields*`)`

Manage the configuration of a specific policy term.

filter_name The name of the policy filter.

term_name The name of the term.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`False`** Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.

revision_id Add a comment in the term config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *`file state`*.

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords.

Some platforms have few other optional keywords.

Note: The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened

- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:
----------
          ID: update_icmp_first_term
    Function: netacl.term
      Result: None
     Comment: Testing mode: Configuration discarded.
     Started: 12:49:09.174179
    Duration: 5751.882 ms
     Changes:
              ----------
              diff:
                  [edit firewall]
                  +    family inet {
                  +        /*
                  +         ** $Id: update_icmp_first_term $
                  +         ** $Date: 2017/02/30 $
                  +         **
                  +         */
                  +        filter block-icmp {
                  +            term first-term {
                  +                from {
                  +                    protocol icmp;
                  +                }
                  +                then {
                  +                    reject;
                  +                }
                  +            }
                  +        }
                  +    }

Summary for edge01.bjm01
------------
Succeeded: 1 (unchanged=1, changed=1)
```

(continues on next page)

(continued from previous page)

```
Failed:    0
------------
Total states run:     1
Total run time:   5.752 s
```

Pillar example:

```
firewall:
  - block-icmp:
      terms:
        - first-term:
            protocol:
              - icmp
            action: reject
```

State SLS example:

```
{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
    - filter_options:
        - not-interface-specific
    - term_name: {{ term_name }}
    - {{ my_term_cfg | json }}
```

Or directly referencing the pillar keys:

```
update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
        - not-interface-specific
    - term_name: first-term
    - merge_pillar: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

21.19.180 salt.states.netconfig

Network Config

Manage the configuration on a network device given a specific static config or template.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

`salt.states.netconfig.`**`commit_cancelled`**`(`*name*`)`

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_cancelled
```

`salt.states.netconfig.`**`commit_confirmed`**`(`*name*`)`

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_confirmed
```

`salt.states.netconfig.`**`managed`**`(`*name, template_name=None, template_source=None, template_hash=None, template_hash_name=None, saltenv='base', template_engine='jinja', skip_verify=False, context=None, defaults=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, **template_vars*`)`

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

template_name Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
     - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

template_source: **None** Inline config template to be rendered and loaded on the device.

template_hash: **None** Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

template_hash_name: **None** When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

saltenv: **base** Specifies the template environment. This will influence the relative imports inside the templates.

template_engine: **jinja** The following templates engines are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

skip_verify: **False** If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

test: **False** Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` (will commit the changes on the device).

commit: **True** Commit? Default: `True`.

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

Note: This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the *`state.sls`* or `state.apply` (see below for an example).

---

commit_in: **`None`** Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: **`None`** Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: **`None`** Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: `None` Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

replace: False Load and replace the configuration. Default: `False` (will apply load merge).

context: None Overrides default context variables passed to the template.

New in version 2019.2.0.

defaults: None Default variables/context passed to the template.

template_vars Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

Note: It is more recommended to use the `context` argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under salt://router/config.sls) :

```
whole_config_example:
    netconfig.managed:
        - template_name: salt://path/to/complete_config.jinja
        - debug: True
        - replace: True
bgp_config_example:
    netconfig.managed:
        - template_name: /absolute/path/to/bgp_neighbors.mako
        - template_engine: mako
prefix_lists_example:
    netconfig.managed:
        - template_name: prefix_lists.cheetah
        - debug: True
        - template_engine: cheetah
ntp_peers_example:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
```

(continues on next page)

(continued from previous page)

```
        - skip_verify: False
        - debug: True
        - peers:
            - 192.168.0.1
            - 192.168.0.1
ntp_peers_example_using_pillar:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
        - peers: {{ pillar.get('ntp.peers', []) }}
```

Multi template example:

```
hostname_and_ntp:
  netconfig.managed:
    - template_name:
        - https://bit.ly/2OhSgqP
        - https://bit.ly/2M6C4Lx
        - https://bit.ly/2OIWVTs
    - debug: true
    - context:
        hostname: {{ opts.id }}
        servers:
          - 172.17.17.1
          - 172.17.17.2
        peers:
          - 192.168.0.1
          - 192.168.0.2
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True

$ sudo salt -N all-routers state.sls router.config pillar="{'debug': True}"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
----------
          ID: ntp_peers_example_using_pillar
    Function: netconfig.managed
      Result: None
     Comment: Testing mode: Configuration discarded.
     Started: 12:01:40.744535
    Duration: 8755.788 ms
     Changes:
              ----------
              diff:
                  [edit system ntp]
                       peer 192.168.0.1 { ... }
                  +    peer 172.17.17.1;
                  +    peer 172.17.17.3;
```

(continues on next page)

(continued from previous page)

```
Summary for juniper.device
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   8.756 s
```

Raw output example (useful when the output is reused in other states/execution modules):

```
$ sudo salt --out=pprint 'juniper.device' state.sls router.config test=True
↪debug=True
```

```
{
    'juniper.device': {
        'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_using_
↪pillar_|-managed': {
            '__id__': 'ntp_peers_example_using_pillar',
            '__run_num__': 0,
            'already_configured': False,
            'changes': {
                'diff': '[edit system ntp]   peer 192.168.0.1 { ... }+   peer 172.
↪17.17.1;+   peer 172.17.17.3;'
            },
            'comment': 'Testing mode: Configuration discarded.',
            'duration': 7400.759,
            'loaded_config': 'system {  ntp {  peer 172.17.17.1;  peer 172.17.17.
↪3; } }',
            'name': 'ntp_peers_example_using_pillar',
            'result': None,
            'start_time': '12:09:09.811445'
        }
    }
}
```

`salt.states.netconfig.`**`replace_pattern`**(*name, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, search_only=False, show_changes=True, backslash_literal=False, source='running', path=None, test=False, replace=True, debug=False, commit=True*)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

pattern A regular expression, to be matched using Python's `search()`.

repl The replacement text.

count: `0` Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): `8` A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): `1` How much of the configuration to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: **`False`** If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: **`False`** If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

search_only: **`False`** If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: **`True`** If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

backslash_literal: **`False`** Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

source: **`running`** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path Save the temporary configuration to a specific path, then read from there.

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit the configuration changes? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`** Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```
update_policy_name:
  netconfig.replace_pattern:
    - pattern: OLD-POLICY-NAME
    - repl: new-policy-name
    - debug: true
```

`salt.states.netconfig.`**`saved`**(*name, source='running', user=None, group=None, mode=None, attrs=None, makedirs=False, dir_mode=None, replace=True, backup='', show_changes=True, create=True, tmp_dir='', tmp_ext='', encoding=None, encoding_errors='strict', allow_empty=False, follow_symlinks=True, check_cmd=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs*)

New in version 2019.2.0.

Save the configuration to a file on the local file system.

name Absolute path to file where to save the configuration. To push the files to the Master, use *`cp.push`* Execution function.

source: **`running`** The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`. The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

attrs The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

makedirs: **`False`** If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace: **`True`** If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

backup Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

show_changes: **`True`** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create: **`True`** If set to `False`, then the file will only be managed if the file already exists on the system.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

encoding_errors: **`'strict'`** Error encoding scheme. Default is ```'strict'```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

allow_empty: **`True`** If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks: **`True`** If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

tmp_dir Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

tmp_ext Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

win_owner: **`None`** The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

win_perms: **`None`** A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_deny_perms: **`None`** A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_inheritance: **`True`** True to inherit permissions from the parent directory, False not to inherit permission.

win_perms_reset: **`False`** If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

State SLS Example:

```
/var/backups/{{ opts.id }}/{{ salt.status.time('%s') }}.cfg:
  netconfig.saved:
    - source: running
    - makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion `core1.lon01`, the configuration would saved in the file: `/var/backups/core01.lon01/1533316558.cfg`

21.19.181 salt.states.netntp

Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- Requires netaddr to be installed: *pip install netaddr* to check if IP Addresses are correctly specified
- Requires dnspython to be installed: *pip install dnspython* to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- *NAPALM proxy minion*
- *NTP operational and configuration management module*

`salt.states.netntp.`**`managed`**`(`*name*, *peers=None*, *servers=None*`)`

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
    netntp.managed:
         - peers:
            - 192.168.0.1
            - 172.17.17.1
         - servers:
            - 24.124.0.251
            - 138.236.128.36
```

Output example:

```
{
    'edge01.nrt04': {
        'netntp_|-netntp_example_|-netntp_example_|-managed': {
            'comment': 'NTP servers already configured as needed.',
            'name': 'netntp_example',
            'start_time': '12:45:24.056659',
```

(continues on next page)

(continued from previous page)

```
                'duration': 2938.857,
                'changes': {
                    'peers': {
                        'removed': [
                            '192.168.0.2',
                            '192.168.0.3'
                        ],
                        'added': [
                            '192.168.0.1',
                            '172.17.17.1'
                        ]
                    }
                },
                'result': None
            }
        }
}
```

21.19.182 salt.states.netsnmp

Network SNMP

Manage the SNMP configuration on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>

maturity new

depends napalm

platform unix

Dependencies

- *napalm snmp management module (salt.modules.napalm_snmp)*

salt.states.netsnmp.**managed**(*name*, *config=None*, *defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
    netsnmp.managed:
         - config:
            location: Honolulu, HI, US
         - defaults:
            contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
----------
          ID: snmp_example
    Function: snmp.managed
```

(continues on next page)

21.19.183 salt.states.netusers

Network Users

Manage the users configuration on network devices via the NAPALM proxy.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

`salt.states.netusers.`**`managed`**(*name, users=None, defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
    netusers.managed:
         - users:
            admin:
                level: 15
```

(continues on next page)

(continued from previous page)

```

```

21.19.184 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: ipaddr_start, and ipaddr_end.

Other platforms are not yet supported.

Note: On Debian-based systems, networking configuration can be specified in */etc/network/interfaces* or via included files such as (by default) */etc/network/interfaces.d/**. This can be problematic for configuration management. It is recommended to use either *file.managed or network.managed*.

If using *network.managed*, it can be useful to ensure *interfaces.d/* is empty. This can be done using:

/etc/network/interfaces.d:

  file.directory:

  - clean: True

```
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: static
    - ipaddr: 10.1.0.7
    - netmask: 255.255.255.0
    - gateway: 10.1.0.1
    - enable_ipv6: true
    - ipv6proto: static
    - ipv6ipaddrs:
      - 2001:db8:dead:beef::3/64
      - 2001:db8:dead:beef::7/64
    - ipv6gateway: 2001:db8:dead:beef::1
    - ipv6netmask: 64
    - dns:
      - 8.8.8.8
      - 8.8.4.4

eth0-range0:
```

(continues on next page)

(continued from previous page)

```
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

bond0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

eth1.0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000

bond0.1-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000

.. note::
    add support of ranged interfaces (vlan, bond and eth) for redhat system,
    Important:type must be eth.

routes:
  network.routes:

    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
```

(continues on next page)

(continued from previous page)

```
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True
    - apply_hostname: True

lo:
  network.managed:
    - name: lo
    - type: eth
    - proto: loopback
    - onboot: yes
    - userctl: no
    - ipv6_autoconf: no
    - enable_ipv6: true

.. note::
    Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

.. note::
    Use `retain_settings` to retain current network settings that are not
    otherwise specified in the state. Particularly useful if only setting
    the hostname. Default behavior is to delete unspecified network
    settings.

.. versionadded:: 2016.11.0
```

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

`salt.states.network.`**`managed`**(*name, type, enabled=True, **kwargs*)

Ensure that the named interface is configured properly.

name The name of the interface to manage

type Type of interface and configuration.

enabled Designates the state of this interface.

kwargs The IP parameters for this interface.

`salt.states.network.`**`routes`**(*name, **kwargs*)

Manage network interface static routes.

name Interface name to apply the route to.

kwargs Named routes

`salt.states.network.`**`system`**(*name, **kwargs*)

Ensure that global network settings are configured properly.

name Custom name to represent this configuration change.

kwargs The global parameters for the system.

21.19.185 salt.states.net_napalm_yang

NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.net_napalm_yang.`**`configured`**`(`*name*, *data*, ***kwargs*`)`

Configure the network device, given the input data strucuted according to the YANG models.

> **Note:** The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

data YANG structured data.

models A list of models to be used when generating the config.

profiles: **`None`** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`False`** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config =  pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
```

(continues on next page)

(continued from previous page)

```
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

`salt.states.net_napalm_yang.`**`managed`**`(`*name*, *data*, ***kwargs*`)`

Manage the device configuration given the input data structured according to the YANG models.

data YANG structured data.

models A list of models to be used when generating the config.

profiles: **`None`** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

compliance_report: **`False`** Return the compliance report in the comment.

New in version 2017.7.3.

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`False`** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config =  pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

21.19.186 salt.states.neutron_network

Management of OpenStack Neutron Networks

New in version 2018.3.0.

depends shade

configuration see *`salt.modules.neutronng`* for setup instructions

Example States

```
create network:
  neutron_network.present:
    - name: network1

delete network:
  neutron_network.absent:
    - name: network1

create network with optional params:
  neutron_network.present:
    - name: network1
    - vlan: 200
    - shared: False
    - external: False
    - project: project1
```

`salt.states.neutron_network.`**`absent`**(*name*, *auth=None*, ***kwargs*)

Ensure a network does not exists

name Name of the network

`salt.states.neutron_network.`**`present`**(*name*, *auth=None*, ***kwargs*)

Ensure a network exists and is up-to-date

name Name of the network

provider A dict of network provider options.

shared Set the network as shared.

external Whether this network is externally accessible.

admin_state_up Set the network administrative state to up.

vlan Vlan ID. Alias for provider

- physical_network: provider
- network_type: vlan
- segmentation_id: (vlan id)

21.19.187 salt.states.neutron_secgroup

Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

depends shade

configuration see `salt.modules.neutronng` for setup instructions

Example States

```
create security group;
  neutron_secgroup.present:
    - name: security_group1
    - description: "Very Secure Security Group"

delete security group:
  neutron_secgroup.absent:
    - name_or_id: security_group1
    - project_name: Project1

create security group with optional params:
```

(continues on next page)

(continued from previous page)

```
  neutron_secgroup.present:
    - name: security_group1
    - description: "Very Secure Security Group"
    - project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
  neutron_secgroup.present:
    - name: security_group1
    - description: "Very Secure Security Group"
    - project_name: Project1
```

`salt.states.neutron_secgroup.`**`absent`**(*name*, *auth=None*, ***kwargs*)

Ensure a security group does not exist

name Name of the security group

`salt.states.neutron_secgroup.`**`present`**(*name*, *auth=None*, ***kwargs*)

Ensure a security group exists.

You can supply either project_name or project_id.

Creating a default security group will not show up as a change; it gets created through the lookup process.

name Name of the security group

description Description of the security group

project_name Name of Project

project_id ID of Project

21.19.188 salt.states.neutron_secgroup_rule

Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

depends shade

configuration see *salt.modules.neutronng* for setup instructions

Example States

```
create security group rule:
  neutron_secgroup_rule.present:
    - name: security_group1
    - project_name: Project1
    - protocol: icmp

delete security group:
  neutron_secgroup_rule.absent:
    - name_or_id: security_group1

create security group with optional params:
  neutron_secgroup_rule.present:
    - name: security_group1
    - description: "Very Secure Security Group"
    - project_id: 1dcac318a83b4610b7a7f7ba01465548
```

`salt.states.neutron_secgroup_rule.`**`absent`**(*name*, *auth=None*, ***kwargs*)

Ensure a security group rule does not exist

name name or id of the security group rule to delete

rule_id uuid of the rule to delete
project_id id of project to delete rule from

`salt.states.neutron_secgroup_rule.`**`present`**`(`*name, auth=None, **kwargs*`)`
Ensure a security group rule exists
defaults: port_range_min=None, port_range_max=None, protocol=None, remote_ip_prefix=None, remote_group_id=None, direction='ingress', ethertype='IPv4', project_id=None
name Name of the security group to associate with this rule
project_name Name of the project associated with the security group
protocol The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

21.19.189 salt.states.neutron_subnet

Management of OpenStack Neutron Subnets

New in version 2018.3.0.

depends shade

configuration see `salt.modules.neutronng` for setup instructions

Example States

```
create subnet:
  neutron_subnet.present:
    - name: subnet1
    - network_name_or_id: network1
    - cidr: 192.168.199.0/24

delete subnet:
  neutron_subnet.absent:
    - name: subnet2

create subnet with optional params:
  neutron_subnet.present:
    - name: subnet1
    - network_name_or_id: network1
    - enable_dhcp: True
    - cidr: 192.168.199.0/24
    - allocation_pools:
      - start: 192.168.199.5
        end: 192.168.199.250
    - host_routes:
      - destination: 192.168..0.0/24
        nexthop: 192.168.0.1
    - gateway_ip: 192.168.199.1
    - dns_nameservers:
      - 8.8.8.8
      - 8.8.8.7

create ipv6 subnet:
  neutron_subnet.present:
    - name: v6subnet1
    - network_name_or_id: network1
    - ip_version: 6
```

`salt.states.neutron_subnet.`**`absent`**`(`*name*, *auth=None*`)`
Ensure a subnet does not exists
name Name of the subnet

`salt.states.neutron_subnet.`**`present`**`(`*name*, *auth=None*, ***kwargs*`)`
Ensure a subnet exists and is up-to-date
name Name of the subnet
network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools
gateway_ip The gateway IP address.
dns_nameservers A list of DNS name servers for the subnet.
host_routes A list of host route dictionaries for the subnet.
ipv6_ra_mode IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.
ipv6_address_mode IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

21.19.190 salt.states.nfs_export

Management of NFS exports

New in version 2018.3.0.

To ensure an NFS export exists:

```
add_simple_export:
  nfs_export.present:
    - name:     '/srv/nfs'
    - hosts:    '10.0.2.0/24'
    - options:
      - 'rw'
```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

```
add_complex_export:
  nfs_export.present:
    - name: '/srv/nfs'
    - clients:
      # First export, same as simple one above
      - hosts: '10.0.2.0/24'
        options:
          - 'rw'
      # Second export
      - hosts: '*.example.com'
        options:
          - 'ro'
          - 'subtree_check'
```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```

Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

```
delete_export:
  nfs_export.absent:
    - name: '/srv/nfs'
```

`salt.states.nfs_export.`**`absent`**`(`*name, exports='/etc/exports'*`)`

Ensure that the named path is not exported

name The export path to remove

`salt.states.nfs_export.`**`present`**`(`*name, clients=None, hosts=None, options=None, exports='/etc/exports'*`)`

Ensure that the named export is present with the given options

name The export path to configure

clients A list of hosts and the options applied to them. This option may not be used in combination with the 'hosts' or 'options' shortcuts.

```
- clients:
  # First export
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  # Second export
  - hosts: '*.example.com'
    options:
      - 'ro'
      - 'subtree_check'
```

hosts A string matching a number of hosts, for example:

```
hosts: '10.0.2.123'

hosts: '10.0.2.0/24'

hosts: 'minion1.example.com'

hosts: '*.example.com'

hosts: '*'
```

options A list of NFS options, for example:

```
options:
  - 'rw'
  - 'subtree_check'
```

21.19.191 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:

```

`salt.states.nftables.`**`append`**`(`*name*, *family='ipv4'*, ***kwargs*`)`

New in version 0.17.0.

Append a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *–state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

`salt.states.nftables.`**`chain_absent`**`(`*name*, *table='filter'*, *family='ipv4'*`)`

New in version 2014.7.0.

Verify the chain is absent.

family Networking family, either ipv4 or ipv6 `salt.states.nftables.`**`chain_present`**(*name*, *table='filter'*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

`salt.states.nftables.`**`delete`**(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *–state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

`salt.states.nftables.`**`flush`**(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Flush current nftables state

family Networking family, either ipv4 or ipv6

`salt.states.nftables.`**`insert`**(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *–state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

21.19.192 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply `npm` in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

`salt.states.npm.`**`bootstrap`**(*name*, *user=None*, *silent=True*)

Bootstraps a node.js application.

Will execute 'npm install –json' on the specified directory.

user The user to run NPM with

New in version 0.17.0.

`salt.states.npm.`**`cache_cleaned`**`(`*name=None, user=None, force=False*`)`

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or None for all packages

user The user to run NPM with

force Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

`salt.states.npm.`**`installed`**`(`*name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None*`)`

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the `name` argument

New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

registry The NPM registry from which to install the package

New in version 2014.7.0.

env A list of environment variables to be set prior to execution. The format is the same as the *`cmd.run`*. state function.

New in version 2014.7.0.

force_reinstall Install the package even if it is already installed

`salt.states.npm.`**`removed`**`(`*name, dir=None, user=None*`)`

Verify that the given package is not installed.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

21.19.193 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.`**`managed`**`(`*name, servers=None*`)`

Manage NTP servers

servers A list of NTP servers

21.19.194 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

`salt.states.nxos.`**`config_absent`**`(`*name*`)`

Ensure a specific configuration line does not exist in the running config

name config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin
```

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after the example for config_present, the ACLs would be removed because they depend on the existence of the group.

`salt.states.nxos.`**`config_present`**`(`*name*`)`

Ensure a specific configuration line exists in the running config

name config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPSTring use-acl snmp-acl-rw
```

`salt.states.nxos.`**`replace`**`(`*name, repl, full_match=False*`)`

Replace all instances of a string or full line in the running config

name String to replace

repl The replacement text

full_match Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, .* is added around *name* for matching in the *show run* config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

Note: The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

`salt.states.nxos.`**`user_absent`**`(`*name*`)`

Ensure a user is not present

name username to remove if it exists

Examples:

```
delete:
  nxos.user_absent:
    - name: daniel
```

`salt.states.nxos.`**`user_present`**`(`*name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256'*`)`

Ensure a user is present with the specified groups

name Name of user

password Encrypted or Plain Text password for user

roles List of roles the user should be assigned. Any roles not in this list will be removed

encrypted Whether the password is encrypted already or not. Defaults to False

crypt_salt Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

algorithm Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
```

(continues on next page)

(continued from previous page)

```
    - roles:
      - network-admin
      - vdc-admin
```

21.19.195 salt.states.openstack_config

Manage OpenStack configuration file settings.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

`salt.states.openstack_config.`**`absent`**(*name*, *filename*, *section*, *parameter=None*)

Ensure a value is not set in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.`**`present`**(*name*, *filename*, *section*, *value*, *parameter=None*)

Ensure a value is set in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
value The value to set

21.19.196 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.`**`absent`**(*name*)

Ensures that the named bridge does not exist, eventually deletes it.

Parameters **`name`** – The name of the bridge.

`salt.states.openvswitch_bridge.`**`present`**(*name*)

Ensures that the named bridge exists, eventually creates it.

Parameters **`name`** – The name of the bridge.

21.19.197 salt.states.openvswitch_port module

Management of Open vSwitch ports.

`salt.states.openvswitch_port.`**`absent`**(*name*, *bridge=None*)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

Parameters

- **`name`** – The name of the port.
- **`bridge`** – The name of the bridge.

`salt.states.openvswitch_port.`**`present`**`(`*name, bridge, tunnel_type=None, id=None, remote=None, dst_port=None, internal=False*`)`

Ensures that the named port exists on bridge, eventually creates it.

Parameters

- **`name`** – The name of the port.
- **`bridge`** – The name of the bridge.
- **`tunnel_type`** – Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **`id`** – Optional tunnel's key.
- **`remote`** – Remote endpoint's IP address.
- **`dst_port`** – Port to use when creating tunnelport in the switch.
- **`internal`** – Create an internal port if one does not exist

21.19.198 salt.states.opsgenie

Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

```
used_space:
  disk.status:
    - name: /
    - maximum: 79%
    - minimum: 20%

opsgenie_create_action_sender:
  opsgenie.create_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - reason: 'Disk capacity is out of designated range.'
    - name: disk.status
    - onfail:
      - disk: used_space

opsgenie_close_action_sender:
  opsgenie.close_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - name: disk.status
    - require:
      - disk: used_space
```

`salt.states.opsgenie.`**`close_alert`**`(`*name=None, api_key=None, reason='Conditions are met.', action_type='Close'*`)`

Close an alert in OpsGenie. It's a wrapper function for create_alert. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

name It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:

api_key It's the API Key you've copied while adding integration in OpsGenie.

reason It will be used as alert's default message in OpsGenie.

action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

`salt.states.opsgenie.`**`create_alert`**`(`*name=None, api_key=None, reason=None, action_type='Create'*`)`

Create an alert in OpsGenie. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

api_key It's the API Key you've copied while adding integration in OpsGenie.

reason It will be used as alert's default message in OpsGenie.

Optional Parameters:

name It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

21.19.199 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

`salt.states.pagerduty.`**`create_event`**`(`*name, details, service_key, profile*`)`

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

name This is a short description of the event.

details This can be a more detailed description of the event.

service_key This key can be found by using pagerduty.list_services.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

21.19.200 salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
    pagerduty_escalation_policy.present:
```

(continues on next page)

(continued from previous page)

```
        - name: bruce test escalation policy
        - escalation_rules:
            - targets:
                - type: schedule
                  id: 'bruce test schedule level1'
                - type: user
                  id: 'Bruce Sherrod'
              escalation_delay_in_minutes: 15
            - targets:
                - type: schedule
                  id: 'bruce test schedule level2'
              escalation_delay_in_minutes: 15
            - targets:
                - type: user
                  id: 'Bruce TestUser1'
                - type: user
                  id: 'Bruce TestUser2'
                - type: user
                  id: 'Bruce TestUser3'
                - type: user
                  id:  'bruce+test4@lyft.com'
              escalation_delay_in_minutes: 15
```

`salt.states.pagerduty_escalation_policy.`**`absent`**`(`*profile='pagerduty', subdomain=None, api_key=None, **kwargs*`)`

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pagerduty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.`**`present`**`(`*profile='pagerduty', subdomain=None, api_key=None, **kwargs*`)`

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```
```

pagerduty_escalation_policy.present:

- name: bruce test escalation policy
- **escalation_rules**:
    - **targets**:
        - type: schedule id: 'bruce test schedule level1'
        - type: user id: 'Bruce Sherrod'

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

21.19.201 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
    pagerduty_schedule.present:
        - name: 'bruce test schedule level1'
        - schedule:
            name: 'bruce test schedule level1'
            time_zone: 'Pacific Time (US & Canada)'
            schedule_layers:
                - name: 'Schedule Layer 1'
                  start: '2015-01-01T00:00:00'
                  users:
                    - user:
                        'id': 'Bruce TestUser1'
                      member_order: 1
                    - user:
                        'id': 'Bruce TestUser2'
                      member_order: 2
                    - user:
                        'id': 'bruce+test3@lyft.com'
                      member_order: 3
                    - user:
                        'id': 'bruce+test4@lyft.com'
                      member_order: 4
                  rotation_virtual_start: '2015-01-01T00:00:00'
                  priority: 1
                  rotation_turn_length_seconds: 604800
```

`salt.states.pagerduty_schedule.`**`absent`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

`salt.states.pagerduty_schedule.`**`present`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called "schedule."

User id's can be pagerduty id, or name, or email address.

21.19.202 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```
ensure test service
    pagerduty_service.present:
        - name: 'my service'
        - escalation_policy_id: 'my escalation policy'
        - type: nagios
```

`salt.states.pagerduty_service.`**`absent`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.`**`present`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
    pagerduty_service.present:
        - name: my email service
        - service:
          description: "email service controlled by salt"
          escalation_policy_id: "my escalation policy"
          type: "generic_email"
          service_key: "test-email"
```

```
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
    pagerduty_service.present:
        - name: my cloudwatch service
        - service:
          escalation_policy_id: "my escalation policy"
          type: aws_cloudwatch
          description: "my cloudwatch service controlled by salt"
```

21.19.203 salt.states.pagerduty_user

Manage PagerDuty users.

Example

ensure bruce test user 1:

pagerduty.user_present:

- name: 'Bruce TestUser1'
- email: bruce+test1@lyft.com
- requester_id: P1GV5NT

`salt.states.pagerduty_user.`**`absent`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

`salt.states.pagerduty_user.`**`present`**(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty user exists. Arguments match those supported by https://developer.pagerduty.com/documentation/rest/users/create.

21.19.204 salt.states.panos

A state module to manage Palo Alto network devices.

codeauthor `Spencer Ervin <spencer_ervin@hotmail.com>`

maturity new

depends none

platform unix

About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

```
panos/takelock:
    panos.add_config_lock
panos/service_tcp_22:
    panos.set_config:
        - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
↪entry[@name='vsys1']/service
        - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></protocol>
↪</entry>
        - commit: False
panos/create_rule1:
    panos.set_config:
        - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
↪entry[@name='vsys1']/rulebase/security/rules
        - value: '
          <entry name="rule1">
            <from><member>trust</member></from>
            <to><member>untrust</member></to>
            <source><member>10.0.0.1</member></source>

```

Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is_required_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is_required_version']('7.0.0') would match both 7.1.0 and 8.0.0.

```
{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system/
↪motd-and-banner
    - value: |
      <banner-header>BANNER TEXT</banner-header>
      <banner-header-color>color2</banner-header-color>
      <banner-header-text-color>color18</banner-header-text-color>
      <banner-header-footer-match>yes</banner-header-footer-match>
    - commit: False
{% endif %}
```

Palo Alto Proxy Module

`salt.states.panos.`**`add_config_lock`**(*name*)

Prevent other users from changing configuration until the lock is released.

name: The name of the module function to execute.

SLS Example:

```
panos/takelock:
    panos.add_config_lock
```

`salt.states.panos.`**`address_exists`**(*name, addressname=None, vsys=1, ipnetmask=None, iprange=None, fqdn=None, description=None, commit=False*)

Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

name: The name of the module function to execute.

addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip_address/mask or ip_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.

iprange(str): A range of addresses using the format ip_address–ip_address where both addresses can be IPv4 or both can be IPv6.

fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/address/h-10.10.10.10:
    panos.address_exists:
      - addressname: h-10.10.10.10
      - vsys: 1
      - ipnetmask: 10.10.10.10
      - commit: False

panos/address/10.0.0.1-10.0.0.50:
    panos.address_exists:
      - addressname: r-10.0.0.1-10.0.0.50
      - vsys: 1
      - iprange: 10.0.0.1-10.0.0.50
      - commit: False

panos/address/foo.bar.com:
    panos.address_exists:
      - addressname: foo.bar.com
      - vsys: 1
      - fqdn: foo.bar.com
      - description: My fqdn object
      - commit: False
```

`salt.states.panos.`**`address_group_exists`**(*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the address group object. The name is case-sensitive and can have up to 31 characters, which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/address-group/my-group:
    panos.address_group_exists:
      - groupname: my-group
      - vsys: 1
```

(continues on next page)

(continued from previous page)

```
    - members:
      - my-address-object
      - my-other-address-group
    - description: A group that needs to exist
    - commit: False
```

salt.states.panos.**clone_config**(*name*, *xpath=None*, *newname=None*, *commit=False*)

Clone a specific XPATH and set it to a new name.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to clone.

newname(str): The new name of the XPATH clone.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/clonerule:
    panos.clone_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
↪rules&from=/config/devices/
      entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
      - value: rule2
      - commit: True
```

salt.states.panos.**commit_config**(*name*)

Commits the candidate configuration to the running configuration.

name: The name of the module function to execute.

SLS Example:

```
panos/commit:
    panos.commit_config
```

salt.states.panos.**delete_config**(*name*, *xpath=None*, *commit=False*)

Deletes a Palo Alto XPATH to a specific value.

Use the xpath parameter to specify the location of the object to be deleted.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/deletegroup:
    panos.delete_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
↪entry[@name='test']
      - commit: True
```

salt.states.panos.**download_software**(*name*, *version=None*, *synch=False*, *check=False*)

Ensures that a software version is downloaded.

name: The name of the module function to execute.

version(str): The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.

synch(bool): If true, after downloading the file it will be synched to its peer.

check(bool): If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.

SLS Example:

```
panos/version8.0.0:
    panos.download_software:
      - version: 8.0.0
      - synch: False
      - check: True
```

`salt.states.panos.`**`edit_config`**(*name*, *xpath=None*, *value=None*, *commit=False*)

Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can replace an existing object hierarchy at a specified location in the configuration with a new value. Use the xpath parameter to specify the location of the object, including the node to be replaced.

This is the recommended state to enforce configurations on a xpath.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to edit. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/addressgroup:
    panos.edit_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
↪entry[@name='test']
      - value: <static><entry name='test'><member>abc</member><member>xyz</member>
↪</entry></static>
      - commit: True
```

`salt.states.panos.`**`move_config`**(*name*, *xpath=None*, *where=None*, *dst=None*, *commit=False*)

Moves a XPATH value to a new location.

Use the xpath parameter to specify the location of the object to be moved, the where parameter to specify type of move, and dst parameter to specify the destination path.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to move.

where(str): The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the dst option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The botoom action will move the XPATH to the bottom of its structure.

dst(str): Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

commit(bool): If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:

```
panos/moveruletop:
    panos.move_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
↪rules/entry[@name='rule1']
      - where: top
      - commit: True

panos/moveruleafter:
    panos.move_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
↪rules/entry[@name='rule1']
      - where: after
      - dst: rule2
      - commit: True
```

`salt.states.panos.`**`remove_config_lock`**(*name*)

Release config lock previously held.

name: The name of the module function to execute.

SLS Example:

```
panos/takelock:
    panos.remove_config_lock
```

`salt.states.panos.`**`rename_config`**(*name*, *xpath=None*, *newname=None*, *commit=False*)

Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

newname(str): The new name of the XPATH value.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/renamegroup:
    panos.rename_config:
      - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address/
↪entry[@name='old_address']
      - value: new_address
      - commit: True
```

`salt.states.panos.`**`security_rule_exists`**(*name*, *rulename=None*, *vsys='1'*, *action=None*, *disabled=None*, *sourcezone=None*, *destinationzone=None*, *source=None*, *destination=None*, *application=None*, *service=None*, *description=None*, *logsetting=None*, *logstart=None*, *logend=None*, *negatesource=None*, *negatedestination=None*, *profilegroup=None*, *datafilter=None*, *fileblock=None*, *spyware=None*, *urlfilter=None*, *virus=None*, *vulnerability=None*, *wildfire=None*, *move=None*, *movetarget=None*, *commit=False*)

Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.

This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.

If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

name: The name of the module function to execute.

rulename(str): The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

action(str): The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

disabled(bool): Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

sourcezone(str, list): The source zone(s). The value 'any' will match all zones.

destinationzone(str, list): The destination zone(s). The value 'any' will match all zones.

source(str, list): The source address(es). The value 'any' will match all addresses.

destination(str, list): The destination address(es). The value 'any' will match all addresses.

application(str, list): The application(s) matched. The value 'any' will match all applications.

service(str, list): The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

description(str): A description for the policy (up to 255 characters).

logsetting(str): The name of a valid log forwarding profile.

logstart(bool): Generates a traffic log entry for the start of a session (disabled by default).

logend(bool): Generates a traffic log entry for the end of a session (enabled by default).

negatesource(bool): Match all but the specified source addresses.

negatedestination(bool): Match all but the specified destination addresses.

profilegroup(str): A valid profile group name.

datafilter(str): A valid data filter profile name. Ignored with the profilegroup option set.

fileblock(str): A valid file blocking profile name. Ignored with the profilegroup option set.

spyware(str): A valid spyware profile name. Ignored with the profilegroup option set.

urlfilter(str): A valid URL filtering profile name. Ignored with the profilegroup option set.

virus(str): A valid virus profile name. Ignored with the profilegroup option set.

vulnerability(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

wildfire(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

move(str): An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

movetarget(str): An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/rulebase/security/rule01:
    panos.security_rule_exists:
      - rulename: rule01
      - vsys: 1
      - action: allow
      - disabled: False
      - sourcezone: untrust
      - destinationzone: trust
      - source:
        - 10.10.10.0/24
        - 1.1.1.1
      - destination:
        - 2.2.2.2-2.2.2.4
      - application:
        - any
      - service:
        - tcp-25
      - description: My test security rule
      - logsetting: logprofile
      - logstart: False
      - logend: True
      - negatesource: False
      - negatedestination: False
      - profilegroup: myprofilegroup
      - move: top
      - commit: False

panos/rulebase/security/rule01:
    panos.security_rule_exists:
      - rulename: rule01
      - vsys: 1
      - action: allow
      - disabled: False
      - sourcezone: untrust
      - destinationzone: trust
      - source:
        - 10.10.10.0/24
        - 1.1.1.1
      - destination:
        - 2.2.2.2-2.2.2.4
      - application:
        - any
      - service:
        - tcp-25
      - description: My test security rule
      - logsetting: logprofile
      - logstart: False
      - logend: False
```

(continues on next page)

(continued from previous page)

```
        - datafilter: foobar
        - fileblock: foobar
        - spyware: foobar
        - urlfilter: foobar
        - virus: foobar
        - vulnerability: foobar
        - wildfire: foobar
        - move: after
        - movetarget: rule02
        - commit: False
```

`salt.states.panos.`**`service_exists`**(*name*, *servicename=None*, *vsys=1*, *protocol=None*, *port=None*, *description=None*, *commit=False*)

Ensures that a service object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

name: The name of the module function to execute.

servicename(str): The name of the security object. The name is case-sensitive and can have up to 31 characters, which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

protocol(str): The protocol that is used by the service object. The only valid options are tcp and udp.

port(str): The port number that is used by the service object. This can be specified as a single integer or a valid range of ports.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service/tcp-80:
    panos.service_exists:
      - servicename: tcp-80
      - vsys: 1
      - protocol: tcp
      - port: 80
      - description: Hypertext Transfer Protocol
      - commit: False

panos/service/udp-500-550:
    panos.service_exists:
      - servicename: udp-500-550
      - vsys: 3
      - protocol: udp
      - port: 500-550
      - commit: False
```

`salt.states.panos.`**`service_group_exists`**(*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service-group/my-group:
    panos.service_group_exists:
      - groupname: my-group
      - vsys: 1
      - members:
        - tcp-80
        - custom-port-group
      - description: A group that needs to exist
      - commit: False
```

`salt.states.panos.`**`set_config`**(*name*, *xpath=None*, *value=None*, *commit=False*)

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the xpath parameter to specify the location of the object in the configuration

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to set. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/hostname:
    panos.set_config:
      - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/
↪system
      - value: <hostname>foobar</hostname>
      - commit: True
```

21.19.205 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

depends pcs

Walkthrough of a complete PCS cluster setup: http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
    pcs.cib_present:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
            - '--master'
        - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
    pcs.cib_pushed:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:
    pcs.auth:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsuser: hacluster
        - pcspasswd: hoonetorg
        - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:
    pcs.cluster_setup:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsclustername: pcscluster
        - extra_args:
```

(continues on next page)

(continued from previous page)

```
            - '--start'
            - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
    pcs.prop_has_value:
        - prop: no-quorum-policy
        - value: ignore
        - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
        - value: 60s
        - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is often not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

7. Add resources to your cluster:

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
             - '--master'
         - cibname: cib_for_galera
```

8. Optional: Add constraints (locations, colocations, orders):

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
    pcs.constraint_present:
        - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
        - constraint_type: colocation
        - constraint_options:
            - 'add'
            - 'vip_galera'
            - 'with'
            - 'haproxy-clone'
        - cibname: cib_for_haproxy
```

New in version 2016.3.0.

`salt.states.pcs.`**`auth`**(*name*, *nodes*, *pcsuser='hacluster'*, *pcspasswd='hacluster'*, *extra_args=None*)

Ensure all nodes are authorized to the cluster

name Irrelevant, not used (recommended: pcs_auth__auth)

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with pcs (default: hacluster)

pcspasswd password for pcsuser (default: hacluster)

extra_args list of extra args for the 'pcs cluster auth' command

Example:

```
pcs_auth__auth:
    pcs.auth:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsuser: hacluster
        - pcspasswd: hoonetorg
        - extra_args: []
```

`salt.states.pcs.`**`cib_present`**(*name*, *cibname*, *scope=None*, *extra_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: {{formulaname}}__cib_present_{{cibname}})

cibname name/path of the file containing the CIB

scope specific section of the CIB (default:

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_present_cib_for_galera:
    pcs.cib_present:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

`salt.states.pcs.`**`cib_pushed`**(*name*, *cibname*, *scope=None*, *extra_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with pcs.cib_present

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: {{formulaname}}__cib_pushed_{{cibname}})

cibname name/path of the file containing the CIB

scope specific section of the CIB

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
    pcs.cib_pushed:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

`salt.states.pcs.`**`cluster_node_present`**(*name*, *node*, *extra_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

name Irrelevant, not used (recommended: pcs_setup__node_add_{{node}})
node node that should be added
extra_args list of extra args for the 'pcs cluster node add' command
Example:

```
pcs_setup__node_add_node1.example.com:
    pcs.cluster_node_present:
        - node: node1.example.com
        - extra_args:
            - '--start'
            - '--enable'
```

`salt.states.pcs.`**`cluster_setup`**(*name*, *nodes*, *pcsclustername='pcscluster'*, *extra_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_setup__setup)
nodes a list of nodes which should be set up
pcsclustername Name of the Pacemaker cluster
extra_args list of extra args for the 'pcs cluster setup' command
Example:

```
pcs_setup__setup:
    pcs.cluster_setup:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsclustername: pcscluster
        - extra_args:
            - '--start'
            - '--enable'
```

`salt.states.pcs.`**`constraint_present`**(*name*, *constraint_id*, *constraint_type*, *constraint_options=None*, *cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__constraint_present_{{constraint_id}})
constraint_id name for the constraint (try first to create manually to find out the autocreated name)
constraint_type constraint type (location, colocation, order)
constraint_options options for creating the constraint
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
    pcs.constraint_present:
        - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
        - constraint_type: colocation
```

(continues on next page)

(continued from previous page)

```
        - constraint_options:
            - 'add'
            - 'vip_galera'
            - 'with'
            - 'haproxy-clone'
        - cibname: cib_for_haproxy
```

`salt.states.pcs.`**`prop_has_value`**(*name*, *prop*, *value*, *extra_args=None*, *cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_properties__prop_has_value_{{prop}})

prop name of the property

value value of the property

extra_args additional options for the pcs property command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
    pcs.prop_has_value:
        - prop: no-quorum-policy
        - value: ignore
        - cibname: cib_for_cluster_settings
```

`salt.states.pcs.`**`resource_defaults_to`**(*name*, *default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_defaults_to_{{default}})

default name of the default resource property

value value of the default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

`salt.states.pcs.`**`resource_op_defaults_to`**(*name*, *op_default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_op_defaults_to_{{op_default}})

op_default name of the operation default resource property

value value of the operation default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
        - value: 60s
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.**resource_present**(*name*, *resource_id*, *resource_type*, *resource_options=None*, *cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__resource_present_{{resource_id}})
resource_id name for the resource
resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
resource_options additional options for creating the resource
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
            - '--master'
        - cibname: cib_for_galera
```

salt.states.pcs.**stonith_present**(*name*, *stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibname=None*)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_stonith__created_{{stonith_id}})
stonith_id name for the stonith resource
stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options additional options for creating the stonith resource
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

21.19.206 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (`php-pear` in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.`**`installed`**`(`*name, version=None, defaults=False, force=False, preferred_state='stable'*`)`

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install

version The pecl extension version to install. This option may be ignored to install the latest stable version.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

preferred_state The pecl extension state to install

`salt.states.pecl.`**`removed`**`(`*name*`)`

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall

21.19.207 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends pdbedit

platform posix

New in version 2017.7.0.

```
wash:
  pdbedit.absent

kaylee:
  pdbedit.managed:
    - password: A70C708517B5DD0EDB67714FE25336EB
    - password_hashed: True
    - drive: 'X:'
    - homedir: '\\serenity\mechanic\profile'
```

`salt.states.pdbedit.`**`absent`**`(`*name*`)`

Ensure user account is absent

name [string] username

`salt.states.pdbedit.`**`managed`**`(`*name*, ***kwargs*`)`

Manage user account

login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

> **Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

`salt.states.pdbedit.`**`present`**`(`*name*, ***kwargs*`)`

Alias for pdbedit.managed

21.19.208 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (`python-pip` in most cases). Example:

```yaml
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.installed`(*name, pkgs=None, pip_bin=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, repo=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, install_options=None, global_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=None, extra_args=None, **kwargs*)

Make sure the package is installed

name The name of the python package to install. You can also specify version numbers here using the standard operators `==, >=, <=`. If `requirements` is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

requirements Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

user The user under which to run pip

use_wheel [False] Prefer wheel archives (requires pip>=1.4)

no_use_wheel [False] Force to not use wheel archives (requires pip>=1.4)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
  pip.installed:
    - no_binary: ':all:'

flask:
  pip.installed:
    - no_binary:
      - itsdangerous
      - click
```

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

find_links URL to look for packages at

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index
mirrors Specific mirror URL(s) to query (automatically adds –use-mirrors)
build Unpack packages into `build` dir
target Install packages into `target` dir
download Download packages into `download` instead of installing them
download_cache Cache downloaded packages in `download_cache` dir
source Check out `editable` packages into `source` dir
upgrade Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps Ignore package dependencies
no_install Download and unpack all packages, but don't actually install them
no_cache_dir: Disable the cache.
cwd Current working directory to run pip from
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
bin_env [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.
env_vars Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```
django:
  pip.installed:
    - name: django_app
    - env_vars:
        CUSTOM_PATH: /opt/django_app
        VERBOSE: True
```

use_vt Use VT terminal emulation (see output while installing)
trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip
```

Or

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip
```

Attention

The following arguments are deprecated, do not use.

---

pip_bin [None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

install_options
: Extra arguments to be supplied to the setup.py install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```
django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip
```

global_options Extra global options to be supplied to the setup.py call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the pip state **needs** an importable pip module. This usually means having the system's pip package installed or running Salt from an active virtualenv.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```
pyopenssl:
    pip.installed:
        - name: pyOpenSSL
        - reload_modules: True
        - exists_action: i
```

extra_args pip keyword and positional arguments not yet implemented in salt

```
pandas:
  pip.installed:
    - name: pandas
    - extra_args:
      - --latest-pip-kwarg: param
      - --latest-pip-arg
```

> **Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

`salt.states.pip_state.`**`pip_has_exceptions_mod`**`(`*ver*`)`
True when the pip version has the *pip.exceptions* module

`salt.states.pip_state.`**`pip_has_internal_exceptions_mod`**`(`*ver*`)`
True when the pip version has the *pip._internal.exceptions* module

`salt.states.pip_state.`**`purge_pip`**`()`
Purge pip and it's sub-modules

`salt.states.pip_state.`**`removed`**`(`*name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False*`)`
Make sure that a package is not installed.

name The name of the package to uninstall
user The user under which to run pip
bin_env [None] the pip executable or virtualenenv to use
use_vt Use VT terminal emulation (see output while installing)

`salt.states.pip_state.`**`uptodate`**`(`*name, bin_env=None, user=None, cwd=None, use_vt=False*`)`
New in version 2015.5.0.

Verify that the system is completely up to date.
name The name has no functional value and is only used as a tracking reference
user The user under which to run pip
bin_env the pip executable or virtualenenv to use
use_vt Use VT terminal emulation (see output while installing)

21.19.209 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
```

(continues on next page)

(continued from previous page)

```
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed:
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the pkgs state module

```
dotdeb.repo:
  pkgrepo.managed:
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

Warning: Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.`**`downloaded`**(*name*, *version=None*, *pkgs=None*, *fromrepo=None*, *ignore_epoch=None*, ***kwargs*)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: *yumpkg*, `zypper` and *zypper*

Parameters

- **name** (*str*) – The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) – Download a specific version of a package.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.downloaded:
    - version: 2:7.4.160-1.el7
```

An **ignore_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

- **resolve_capabilities** (*bool*) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.`**`group_installed`**(*name*, *skip=None*, *include=None*, ***kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in `pacman`

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and `pacman` package managers.

skip Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: Because this is essentially a wrapper around *pkg.install*, any argument which can be passed to pkg.install may also be included here, and it will be passed on to the call to *pkg.install*.

`salt.states.pkg.`**`installed`**(*name*, *version=None*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *skip_suggestions=False*, *pkgs=None*, *sources=None*, *allow_updates=False*, *pkg_verify=False*, *normalize=True*, *ignore_epoch=False*, *reinstall=False*, *update_holds=False*, ***kwargs*)

Ensure that the package is installed, and that it is the correct version (if specified).

Parameters

- **name** (*str*) – The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.
- **version** (*str*) – Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: *apt*, `ebuild`, `pacman`, *pkgin*, *win_pkg*, *yumpkg*, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
    2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *pkg.installed*, *pkg.removed*, and *pkg.purged* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, *pkg.list_repo_pkgs* will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
----------
    bash:
        - 4.2.46-21.el7_3
        - 4.2.46-20.el7_2
```

This function was first added for *pkg.list_repo_pkgs* in 2014.1.0, and was expanded to *Debian/Ubuntu* and `Arch Linux`-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
  pkg.installed:
    - version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **`refresh`** (*`bool`*) – This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

  If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

  If `False`, the package database will *not* be refreshed before installing.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.
- **`cache_valid_time`** (*`str`*) – New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

  Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

  In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

  Note: This parameter is available only on Debian based distributions and has no effect on the rest.

- **`fromrepo`** (*`str`*) – Specify a repository from which to install

---

Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
↪ffmpeg'
ubuntu01:
    ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
        7:0.10.11-1~precise1 0
            500 http://ppa.launchpad.net/jon-severinsson/
↪ffmpeg/ubuntu/ precise/main amd64 Packages
        4:0.8.10-0ubuntu0.12.04.1 0
            500 http://us.archive.ubuntu.com/ubuntu/ precise-
↪updates/main amd64 Packages
            500 http://security.ubuntu.com/ubuntu/ precise-
↪security/main amd64 Packages
        4:0.8.1-0ubuntu1 0
            500 http://us.archive.ubuntu.com/ubuntu/ precise/
↪main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version **4:0.8.10-0ubuntu0.12.04.1** either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

- **`skip_verify`** (*bool*) – Skip the GPG verification check for the package to be installed
- **`skip_suggestions`** (*bool*) – Force strict package naming. Disables lookup of package alternatives.

  New in version 2014.1.1.
- **`resolve_capabilities`** (*bool*) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.
- **`allow_updates`** (*bool*) – Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have

a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- **pkg_verify** (*bool*) – New in version 2014.7.0.

  For requested packages that are already installed and would not be targeted for upgrade or downgrade, use pkg.verify to determine if any of the files installed by the package have been altered. If files have been altered, the reinstall option of pkg.install is used to force a reinstall. Types to ignore can be passed to pkg.verify. Additionally, `verify_options` can be used to modify further the behavior of pkg.verify. See examples below. Currently, this option is supported for the following pkg providers: *yumpkg*.

  Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

- **ignore_types** (*list*) – List of types to ignore when verifying the package

New in version 2014.7.0.

- **verify_options** (*list*) – List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

  New in version 2016.11.0.

- **normalize** (*bool*) – Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

  New in version 2014.7.0.

  Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

- **ignore_epoch** (*bool*) – When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

  Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

  New in version 2015.8.9.

MULTIPLE PACKAGE INSTALLATION OPTIONS: **(not supported in pkgng)**

Parameters

- **pkgs** (*list*) – A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
```

(continues on next page)

(continued from previous page)

```
      - baz
    - hold: True
```

NOTE: For *apt*, `ebuild`, `pacman`, *winrepo*, *yumpkg*, and `zypper`, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, `ebuild`, `pacman`, `zypper`, *yum/dnf*, and *apt* support the <, <=, >=, and > operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

NOTE: When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With `ebuild` is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

- **sources** (*list*) – A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

Parameters

- **hold** (*bool*) – Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

- **`update_holds`** (*bool*) – If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

  Currently works with YUM/DNF & APT based systems.

  New in version 2016.11.0.

- **`names`** (*list*) – A list of packages to install from a software repository. Each package will be installed individually by the package manager.

  Warning: Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **`install_recommends`** (*bool*) – Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

  New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

- **`only_upgrade`** (*bool*) – Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

  New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

- **`report_reboot_exit_codes`** (*bool*) – If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  win_system.set_reboot_required_witnessed

  will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

  New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

Returns A dictionary containing the state of the software installation

Rtype dict

Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the *Reloading Modules* documentation for more information.

See also:

unless and onlyif

You can use the *unless* or *onlyif* syntax to skip a full package run. This can be helpful in large environments with multiple states that include requisites for packages to be installed.

```
# Using file.file_exists for a single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.file_exists
        args:
          - /etc/nginx/nginx.conf
```

```
# Using file.search for a two-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.search
        args:
          - /etc/nginx/nginx.conf
          - 'user www-data;'
```

The above examples use two different methods to reasonably ensure that a package has already been installed. First, with checking for a file that would be created with the package. Second, by checking for specific text within a file that would be created or managed by salt. With these requisists satisfied, unless will return `True` and the `pkg.installed` state will be skipped.

```
# Example of state run without unless used
salt 'saltdev' state.apply nginx
saltdev:
----------
          ID: install_nginx
          Function: pkg.installed
          Name: nginx
          Result: True
          Comment: All specified packages are already installed
          Started: 20:11:56.388331
          Duration: 4290.0 ms
          Changes:

# Example of state run using unless requisite
```

(continues on next page)

(continued from previous page)

```
salt 'saltdev' state.apply nginx
saltdev:
----------
          ID: install_nginx
    Function: pkg.installed
        Name: nginx
      Result: True
     Comment: unless condition is true
     Started: 20:10:50.659215
    Duration: 1530.0 ms
     Changes:
```

The result is a reduction of almost 3 seconds. In larger environments, small reductions in waiting time can add up.

Unless Requisite

`salt.states.pkg.`**`latest`**(*name*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *watch_flags=True*, ***kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the *`installed`* function to be used, as *`latest`* will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.

fromrepo Specify a repository from which to install

skip_verify Skip the GPG verification check for the package to be installed

refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

param bool resolve_capabilities Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)
pkgs A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

report_reboot_exit_codes If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

`salt.states.pkg.`**`mod_aggregate`**`(`*low, chunks, running*`)`

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data `salt.states.pkg.`**`mod_watch`**`(`*name*, ***kwargs*`)`

Install/reinstall a package based on a watch requisite

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.pkg.`**`patch_downloaded`**`(`*name*, *advisory_ids=None*, ***kwargs*`)`

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *`yumpkg`* and `zypper`

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.`**`patch_installed`**`(`*name*, *advisory_ids=None*, *downloadonly=None*, ***kwargs*`)`

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: *`yumpkg`* and `zypper`

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.`**`purged`**`(`*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*`)`

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

name The name of the package to be purged.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *`pkg.installed`*, *`pkg.removed`*, and *`pkg.purged`* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`removed`**(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

name The name of the package to be removed.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *`pkg.installed`*, *`pkg.removed`*, and *`pkg.purged`* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`uptodate`**(*name*, *refresh=False*, *pkgs=None*, ***kwargs*)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

refresh refresh the package database before checking for new upgrades

pkgs list of packages to upgrade

Parameters

- **`cache_valid_time`** (*`str`*) – This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

  In this case cache_valid_time is set, refresh will not take place for amount in seconds since last `apt-get update` executed on the system.

  Note: This parameter available only on Debian based distributions, and have no effect on the rest.

- **`resolve_capabilities`** (*`bool`*) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

kwargs Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

21.19.210 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo
```

`salt.states.pkgbuild.`**`built`**(*name, runas, dest_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, saltenv='base', log_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

name The name to track the build, the name value is otherwise unused

runas The user to run the build process as

dest_dir The directory on the minion to place the built package(s)

spec The location of the spec file (used for rpms)

sources The list of package sources

tgt The target platform to run the build on

template Run the spec file through a templating engine

> Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

env A dictionary of environment variables to be set prior to execution. Example:

```
- env:
    DEB_BUILD_OPTIONS: 'nocheck'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

results The names of the expected rpms that will be built

force [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

saltenv The saltenv to use for files downloaded from the salt filesever

log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

`salt.states.pkgbuild.`**`repo`**(*name, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R5OmgHqvydEnO4pWbn8JzQO9YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
```

(continues on next page)

(continued from previous page)

```
    .
    bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
    4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
    inNqW9c=
    =s1CX
    -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
    OPTIONS: 'ask-passphrase'
```

Warning: The above illustrates a common `PyYAML` pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) `PyYAML` idiosyncrasies can be found *here*.

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

Note: This parameter is not used for making `yum` repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

runas [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

21.19.211 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

salt.states.pkgng.**update_packaging_site**(*name*)

21.19.212 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
↪repo=os
    - comments:
        - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
  pkgrepo.managed:
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True
```

```
base:
  pkgrepo.managed:
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
  pkgrepo.managed:
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True
```

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a bug in their `python-software-properties` package, a missing dependency on pycurl, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.`**`absent`**`(`*name*, ***kwargs*`)`

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around pkg.del_repo.

name The name of the package repo, as it would be referred to when running the regular package manager commands.

UBUNTU-SPECIFIC OPTIONS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

keyid If passed, then the GPG key corresponding to the passed KeyID will also be removed.

keyid_ppa [False] If set to `True`, the GPG key's ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

Note: This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.`**`managed`**`(`*name*, *ppa=None*, ***kwargs*`)`

This state manages software package repositories. Currently, *`yum`*, *`apt`*, and `zypper` repositories are supported.

YUM/DNF/ZYPPER-BASED SYSTEMS

Note: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

---

name This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in /etc/yum.repos.d (e.g. `/etc/yum.repos.d/foo.conf`).

enabled [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

disabled [False] Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

humanname This is used as the "name" value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

baseurl The URL to a yum repository

mirrorlist A URL which points to a file containing a collection of baseurls

comments Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

gpgautoimport Only valid for Zypper package manager. If set to True, automatically trust and import public GPG key for the repository. The key should be specified with `gpgkey` parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

APT-BASED SYSTEMS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

name On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. 'main') which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

---

disabled [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

enabled [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=True`.

architectures On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.

comps On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

file The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

dist This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

keyid The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the `keyserver` option to be set.

keyserver This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

key_url URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

Note: Use either `keyid`/`keyserver` or `key_url`, but not both.

key_text

The string representation of the GPG key to install.

New in version 2018.3.0.

Note: Use either `keyid`/`keyserver`, `key_url`, or `key_text` but not more than one method.

consolidate [False] If set to `True`, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

clean_file [False] If set to `True`, empty the file before config repo

Note: Use with care. This can be dangerous if multiple sources are configured in the same file.

New in version 2015.8.0.

refresh [True] If set to `False` this will skip refreshing the apt package database on debian based systems.

refresh_db [True] This argument has been deprecated. Please use `refresh` instead. The `refresh_db` argument will continue to work to ensure backwards compatibility, but we recommend using the preferred `refresh` argument instead.

require_in Set this to a list of pkg.installed or pkg.latest to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg state will not work for this.

21.19.213 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
    portage_config.flags:
        - use:
            - openssl
```

`salt.states.portage_config.`**`flags`**(*name, use=None, accept_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False*)

Enforce the given flags on the given package or `DEPEND` atom.

> **Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name The name of the package or its DEPEND atom
use A list of `USE` flags
accept_keywords A list of keywords to accept. `~ARCH` means current host arch, and will be translated into a line without keywords
env A list of environment files
license A list of accepted licenses
properties A list of additional properties
unmask A boolean to unmask the package
mask A boolean to mask the package

21.19.214 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a *`ports.installed`* state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.`**`installed`**(*name, options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

options Make sure that the desired non-default options are set

> **Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

21.19.215 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
      - name: 'main'
      - version: '9.3'
```

`salt.states.postgres_cluster.`**`absent`**`(`*version*, *name*`)`

Ensure that the named cluster is absent

version Version of the postgresql server of the cluster to remove

name The name of the cluster to remove

New in version 2015.XX.

`salt.states.postgres_cluster.`**`present`**`(`*version*, *name*, *port=None*, *encoding=None*, *locale=None*, *datadir=None*`)`

Ensure that the named cluster is present with the specified properties. For more information about all of these options see man pg_createcluster(1)

version Version of the postgresql cluster

name The name of the cluster

port Cluster port

encoding The character encoding scheme to be used in this database

locale Locale with which to create cluster

datadir Where the cluster is stored

New in version 2015.XX.

21.19.216 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

`salt.states.postgres_database.`**`absent`**`(`*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Ensure that the named database is absent

name The name of the database to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

user System user all operations should be performed on behalf of

New in version 0.17.0.

`salt.states.postgres_database.`**`present`**(*name, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, owner_recurse=False, template=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

name The name of the database to manage
tablespace Default tablespace for the database
encoding The character encoding scheme to be used in this database
lc_collate The LC_COLLATE setting to be used in this database
lc_ctype The LC_CTYPE setting to be used in this database
owner The username of the database owner
owner_recurse Recurse owner change to all relations in the database
template The template database from which to build this database
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

New in version 0.17.0.

21.19.217 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

`salt.states.postgres_extension.`**`absent`**(*name, if_exists=None, restrict=None, cascade=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*)

Ensure that the named extension is absent.

name Extension name of the extension to remove
if_exists Add if exist slug
restrict Add restrict slug
cascade Drop on cascade
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

`salt.states.postgres_extension.`**`present`**(*name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*)

Ensure that the named extension is present.

Note: Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

For more information about all of these options see `CREATE EXTENSION` SQL command reference in the PostgreSQL documentation.

name The name of the extension to be installed
if_not_exists Add an `IF NOT EXISTS` parameter to the DDL statement
schema Schema to install the extension into
ext_version Version to install
from_version Old extension version if already installed
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.218 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

`salt.states.postgres_group.`**`absent`**(*name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named group is absent
name The groupname of the group to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or defaul
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

`salt.states.postgres_group.`**`present`**(*name, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, replication=None, password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the `LOGIN` privilege and groups the others.
name The name of the group to manage
createdb Is the group allowed to create databases?
createroles Is the group allowed to create other roles/users
encrypted Should the password be encrypted in the system catalog?
login Should the group have login perm

inherit Should the group inherit permissions
superuser Should the new group be a "superuser"
replication Should the new group be allowed to initiate streaming replication
password The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is `None` or `True`, the password will be automatically encrypted to the previous format if it is not already done.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the group should be in
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.219 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

`salt.states.postgres_initdb.`**`present`**(*name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None, waldir=None, checksums=False*)

Initialize the PostgreSQL data directory

name The name of the directory to initialize
user The database superuser name
password The password to set for the postgres user
auth The default authentication method for local connections
encoding The default encoding for new databases
locale The default locale for new databases
waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums If True, the cluster will be created with data page checksums.

> **Note:** Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas The system user the operation should be performed on behalf of

21.19.220 salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```

```
plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

`salt.states.postgres_language.`**`absent`**`(`*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Ensure that a named language is absent in the specified database.

name The name of the language to remove

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_language.`**`present`**`(`*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Ensure that a named language is present in the specified database.

name The name of the language to install

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

21.19.221 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.`**`absent`**`(`*name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Revoke the requested privilege(s) on the specificed object(s)

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object_type: table*.

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when revoking group membership

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_privileges.`**`present`**`(`*name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Grant the requested privilege(s) on the specified object to a role

name Name of the role to which privileges should be granted

object_name Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace

- language
- database
- group
- function

View permissions should specify *object_type: table*.

privileges List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when granting group membership

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

21.19.222 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

`salt.states.postgres_schema.`**`absent`**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is absent.

dbname The database's name will work on

name The name of the schema to remove

user system user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_schema.`**`present`**(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is present in the database.

dbname The database's name will work on

name The name of the schema to manage
user system user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.223 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```
ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
```

New in version 2015.8.0.

`salt.states.postgres_tablespace.`**`absent`**`(`*name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*`)`

Ensure that the named tablespace is absent.
name The name of the tablespace to remove
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or defaul
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

`salt.states.postgres_tablespace.`**`present`**`(`*name, directory, options=None, owner=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.
name The name of the tablespace to create/manage.
directory The directory where the tablespace will be located, must already exist
options A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
        seq_page_cost: 1.0
        random_page_cost: 4.0
```

owner The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user

db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.224 salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

`salt.states.postgres_user.`**`absent`**`(`*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Ensure that the named user is absent
name The username of the user to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

`salt.states.postgres_user.`**`present`**`(`*name*, *createdb=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *replication=None*, *inherit=None*, *login=None*, *password=None*, *default_password=None*, *refresh_password=None*, *valid_until=None*, *groups=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seens as roles with the LOGIN privilege and groups the others.
name The name of the system user to manage.
createdb Is the user allowed to create databases?
createroles Is the user allowed to create other users?
encrypted Should the password be encrypted in the system catalog?
login Should the group have login perm
inherit Should the group inherit permissions
superuser Should the new user be a "superuser"
replication Should the new user be allowed to initiate streaming replication
password The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.
default_password The password used only when creating the user, unless password is set.

New in version 2016.3.0.
refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

valid_until A date and time after which the role's password is no longer valid.

groups A string of comma separated groups the user should be in

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user Postgres database username, if different from config or default.

db_password Postgres user's password, if any password, for a specified db_user.

db_host Postgres database host, if different from config or default.

db_port Postgres database port, if different from config or default.

21.19.225 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

`salt.states.powerpath.`**`license_absent`**`(`*name*`)`

Ensures that the specified PowerPath license key is absent on the host.

name The license key to ensure is absent

`salt.states.powerpath.`**`license_present`**`(`*name*`)`

Ensures that the specified PowerPath license key is present on the host.

name The license key to ensure is present

21.19.226 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *`napalm probes management module`*

`salt.states.probes.`**`managed`**`(`*name*, *probes*, *defaults=None*`)`

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not confiured as expected will trigger config updates.

Parameters

- **`probes`** – Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.
- **`defaults`** – Specifies common parameters for the probes.

SLS Example:

```
rpmprobes:
    probes.managed:
        - probes:
            probe_name1:
                probe1_test1:
                    source: 192.168.0.2
                    target: 192.168.0.1
                probe1_test2:
                    target: 172.17.17.1
                probe1_test3:
                    target: 8.8.8.8
                    probe_type: http-ping
            probe_name2:
                probe2_test1:
                    test_interval: 100
        - defaults:
            target: 10.10.10.10
            probe_count: 15
            test_interval: 3
            probe_type: icmp-ping
```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- `source` - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- `target` - Destination IP Address.
- `probe_count` - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- `probe_interval` - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- `probe_type` - Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```
probe_name1:
    probe1_test1:
        source: 192.168.0.2
        target: 192.168.0.1
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
    probe1_test2:
        target: 172.17.17.1
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
    probe1_test3:
        target: 8.8.8.8
        probe_count: 15
        test_interval: 3
        probe_type: http-ping
probe_name2:
    probe2_test1:
```

(continues on next page)

(continued from previous page)

```
        target: 10.10.10.10
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
```

21.19.227 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

`salt.states.process.`**`absent`**`(`*name*, *user=None*, *signal=None*`)`

Ensures that the named command is not running.

name The pattern to match.

user The user to which the process belongs

signal Signal to send to the process(es).

21.19.228 salt.states.proxy module

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```
192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
        - localhost
        - 127.0.0.1
```

`salt.states.proxy.`**`managed`**`(`*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass_domains=None*, *network_service='Ethernet'*`)`

Manages proxy settings for this mininon

name The proxy server to use

port The port used by the proxy server

services A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

user The username to use for the proxy server if required

password The password to use for the proxy server if required

bypass_domains An array of the domains that should bypass the proxy

network_service The network service to apply the changes to, this only necessary on macOS

21.19.229 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15

`salt.states.pushover.`**`post_message`**(*name*, *user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api_version=1*, *token=None*)

Send a message to a PushOver channel.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:

name The unique name for this event.

user The user or group of users to send the message to. Must be ID of user, not name or email address.

message The message that is to be sent to the PushOver channel.

The following parameters are optional:

title The title to use for the message.

device The device for the user to send the message to.

priority The priority for the message.

expire The message should expire after specified amount of seconds.

retry The message should be resent this many times.

token The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

21.19.230 salt.states.pyenv

Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps

python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

`salt.states.pyenv.`**`absent`**(*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

name The version of python to uninstall

user: **None** The user to run pyenv as.

> New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.`**`install_pyenv`**(*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

user: **None** The user to run pyenv as.

`salt.states.pyenv.`**`installed`**(*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

name The version of python to install

default [False] Whether to make this python the default.

user: **None** The user to run pyenv as.

> New in version 0.17.0.

New in version 0.16.0.

21.19.231 salt.states.pyrax_queues

Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or pip. This module is greatly inspired by boto_* modules from SaltStack code source.

```
myqueue:
    pyrax_queues.present:
        - provider: my-pyrax

myqueue:
    pyrax_queues.absent:
        - provider: my-pyrax
```

`salt.states.pyrax_queues.`**`absent`**`(`*name*, *provider*`)`
Ensure the named Rackspace queue is deleted.
name Name of the Rackspace queue.
provider Salt Cloud provider

`salt.states.pyrax_queues.`**`present`**`(`*name*, *provider*`)`
Ensure the RackSpace queue exists.
name Name of the Rackspace queue.
provider Salt Cloud Provider

21.19.232 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.`**`mode`**`(`*name*, *mode*, *quotatype*`)`
Set the quota for the system
name The filesystem to set the quota mode on
mode Whether the quota system is on or off
quotatype Must be `user` or `group`

21.19.233 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

`salt.states.rabbitmq_cluster.`**`join`**(*name, host, user='rabbit', ram_node=None, runas='root'*)

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node user@host

name Irrelevant, not used (recommended: user@host)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

`salt.states.rabbitmq_cluster.`**`joined`**(*name, host, user='rabbit', ram_node=None, runas='root'*)

Ensure the current node joined to a cluster with node user@host

name Irrelevant, not used (recommended: user@host)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

21.19.234 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.`**`disabled`**(*name, runas=None*)

Ensure the RabbitMQ plugin is disabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

`salt.states.rabbitmq_plugin.`**`enabled`**(*name, runas=None*)

Ensure the RabbitMQ plugin is enabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

21.19.235 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer Benn Eichhorn <benn@getlocalmeasure.com>

maturity new

platform all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

`salt.states.rabbitmq_policy.`**`absent`**`(`*name*, *vhost='/'*, *runas=None*`)`

Ensure the named policy is absent

Reference: http://www.rabbitmq.com/ha.html
name The name of the policy to remove
runas Name of the user to run the command as

`salt.states.rabbitmq_policy.`**`present`**`(`*name*, *pattern*, *definition*, *priority=0*, *vhost='/'*, *runas=None*, *apply_to=None*`)`

Ensure the RabbitMQ policy exists.

Reference: http://www.rabbitmq.com/ha.html
name Policy name
pattern A regex of queues to apply the policy to
definition A json dict describing the policy
priority Priority (defaults to 0)
vhost Virtual host to apply to (defaults to '/')
runas Name of the user to run the command as
apply_to Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

21.19.236 salt.states.rabbitmq_upstream

Manage RabbitMQ Upstreams

Example:

```
rabbit_upstream:
  rabbitmq_upstream.present:
  - name: upstream_1
  - uri: amqp://my_user:my_password@rabbitmq_host
  - trust_user_id: True
  - ack_mode: on-confirm
  - max_hops: 1
```

New in version 3000.

`salt.states.rabbitmq_upstream.`**`absent`**`(`*name*, *runas=None*`)`

Ensure the named upstream is absent.

Parameters

- **name** (*str*) – The name of the upstream to remove
- **runas** (*str*) – User to run the command

New in version 3000.

`salt.states.rabbitmq_upstream.`**`present`**`(`*name*, *uri*, *prefetch_count=None*, *reconnect_delay=None*, *ack_mode=None*, *trust_user_id=None*, *exchange=None*, *max_hops=None*, *expires=None*, *message_ttl=None*, *ha_policy=None*, *queue=None*, *runas=None*`)`

Ensure the RabbitMQ upstream exists.

Parameters

- **name** (*str*) – The name of the upstream connection
- **uri** (*str*) – The URI to connect to. If upstream is a cluster and can have several URIs, you can enter them here separated by spaces. Examples: - amqp://user:password@server_name - amqp://user:password@server_name/vhost When connecting with SSL, several URI-parameters need also be specified: - cacertfile = /path/to/cacert.pem - certfile = /path/to/cert.pem - keyfile = /part/to/key.pem -

verity = verify_peer - fail_if_no_peer_cert = true | false - auth_mechanism = external Example: - amqp://user:password@server_name?cacertfile=/path/to/cacert.pem& certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify_peer - amqp://server-name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem& keyfile=/path/to/key.pem&verify=verify_peer&fail_if_no_peer_cert=true&auth_mechanism=external

- **prefetch_count** (*int*) – Maximum number of unacknowledged messages that may be in flight over a federation link at one time. Default: 1000
- **reconnect_delay** (*int*) – Time in seconds to wait after a network link goes down before attempting reconnection. Default: 5
- **ack_mode** (*str*) – The following values are allowed: on-confirm: Messages are acknowledged to the upstream broker after they have been confirmed downstream. Handles network errors and broker failures without losing messages. The slowest option, and the default. on-publish: Messages are acknowledged to the upstream broker after they have been published downstream. Handles network errors without losing messages, but may lose messages in the event of broker failures. no-ack: Message acknowledgements are not used. The fastest option, but you may lose messages in the event of network or broker failures.
- **trust_user_id** (*bool*) – Set `True` to preserve the "user-id" field across a federation link, even if the user-id does not match that used to republish the message. Set to `False` to clear the "user-id" field when messages are federated. Only set this to `True` if you trust the upstream broker not to forge user-ids.
- **exchange** (*str*) – The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops** (*int*) – Maximum number of federation links that messages can traverse before being dropped. Defaults to 1 if not set.
- **expires** (*int*) – Time in milliseconds that the upstream should remember about this node for. After this time all upstream state will be removed. Set to `None` (Default) to mean "forever".
- **message_ttl** (*int*) – Time in milliseconds that undelivered messages should be held upstream when there is a network outage or backlog. Set to `None` (default) to mean "forever".
- **ha_policy** (*str*) – Determines the "x-ha-policy"-argument for the upstream queue for a federated exchange. Default is "none" meaning the queue is not HA.
- **queue** (*str*) – The name of the upstream queue. Default is to use the same name as the federated queue.

New in version 3000.

21.19.237 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
```

(continues on next page)

(continued from previous page)

```
        - '.*'
        - '.*'
    - runas: rabbitmq
```

`salt.states.rabbitmq_user.`**`absent`**`(`*name*, *runas=None*`)`

Ensure the named user is absent

name The name of the user to remove

runas User to run the command

`salt.states.rabbitmq_user.`**`present`**`(`*name*, *password=None*, *force=False*, *tags=None*, *perms=()*, *runas=None*`)`

Ensure the RabbitMQ user exists.

name User name

password User's password, if one needs to be set

force If user exists, forcibly change the password

tags Optional list of tags for the user

perms A list of dicts with vhost keys and 3-tuple values

runas Name of the user to run the command

21.19.238 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

`salt.states.rabbitmq_vhost.`**`absent`**`(`*name*`)`

Ensure the RabbitMQ Virtual Host is absent

name Name of the Virtual Host to remove

runas User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.`**`present`**`(`*name*`)`

Ensure the RabbitMQ VHost exists.

name VHost name

user Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

owner Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

conf Initial conf string to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

write Initial write permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

read Initial read permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

runas Name of the user to run the command

Deprecated since version 2015.8.0.

21.19.239 salt.states.rbac_solaris

Management of Solaris RBAC

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends rbac_solaris,solaris_user

platform solaris,illumos

New in version 2016.11.0.

```
sjorge:
  rbac.managed:
    - roles:
        - netcfg
    - profiles:
        - System Power
    - authorizations:
        - solaris.audit.*
```

`salt.states.rbac_solaris.managed`(*name*, *roles=None*, *profiles=None*, *authorizations=None*)

Manage RBAC properties for user

name [string] username

roles [list] list of roles for user

profiles [list] list of profiles for user

authorizations [list] list of authorizations for user

> **Warning:** All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.
>
> Set the property to *None* to not manage it.

21.19.240 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/rbenv/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps
```

`salt.states.rbenv.`**`absent`**`(`*name*, *user=None*`)`

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to uninstall

user: **None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.rbenv.`**`install_rbenv`**`(`*name*, *user=None*`)`

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.

user: **None** The user to run rbenv as.

`salt.states.rbenv.`**`installed`**`(`*name*, *default=False*, *user=None*`)`

Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: **None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

21.19.241 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.`**`disabled`**`(`*name*`)`
Disable the RDP service

`salt.states.rdp.`**`enabled`**`(`*name*`)`
Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

21.19.242 salt.states.redismod

Management of Redis server

New in version 2014.7.0.

depends

- redis Python module

configuration See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The redis server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.`**`absent`**`(`*name, keys=None, **connection_args*`)`
Ensure key absent from redis
name Key to ensure absent from redis
keys list of keys to ensure absent, name will be ignored if this is used

`salt.states.redismod.`**`slaveof`**`(`*name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args*`)`
Set this redis instance as a slave.
name Master to make this a slave of
sentinel_host Ip of the sentinel to check for the master
sentinel_port Port of the sentinel to check for the master

`salt.states.redismod.`**`string`**`(`*name, value, expire=None, expireat=None, **connection_args*`)`
Ensure that the key exists in redis with the value specified
name Redis key to manage
value Data to persist in key
expire Sets time to live for key in seconds
expireat Sets expiration time for key via UNIX timestamp, overrides *expire*

21.19.243 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.

- HKEY_CLASSES_ROOT (HKCR)
- HKEY_CURRENT_USER(HKCU)
- HKEY_LOCAL MACHINE (HKLM)
- HKEY_USER (HKU)
- HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (\ vs \\). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

Using single backslashes: HKLMSOFTWAREPython ’HKLMSOFTWAREPython’

Using double backslashes: ”HKLM\SOFTWARE\Python”

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is `(Default)` with a displayed value of `(value not set)`. The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.
↪exe\""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.
↪dll\",TrayApp"
```

In this example these are the values for each:

Hive: `HKEY_LOCAL_MACHINE`

Key and subkeys: `SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.`**`absent`**(*name*, *vname=None*, *use_32bit_registry=False*)

Ensure a registry value is removed. To remove a key use key_absent.

Parameters

- **name** (*str*) – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

  `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt`

  Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU
- **vname** (*str*) – The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the `(Default)` value
- **use_32bit_registry** (*bool*) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns A dictionary showing the results of the registry operation.

Return type dict

CLI Example:

```
'HKEY_CURRENT_USER\\SOFTWARE\\Salt':
  reg.absent
    - vname: version
```

In the above example the value named `version` will be removed from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive. If `vname` was not passed, the `(Default)` value would be deleted.

`salt.states.reg.`**`key_absent`**(*name*, *use_32bit_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

Parameters

- **name** (*str*) – A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
- **use_32bit_registry** (*bool*) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns A dictionary showing the results of the registry operation.

Return type dict

CLI Example:

The following example will delete the `SOFTWARE\DeleteMe` key in the `HKEY_LOCAL_MACHINE` hive including all its subkeys and value pairs.

```
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\DeleteMe` is the key

`salt.states.reg.`**`present`**(*name*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, *win_perms_reset=False*)

Ensure a registry key or value is present.

Parameters

- **`name`** (*`str`*) – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

  `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt`

  Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU
- **`vname`** (*`str`*) – The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the `(Default)` value
- **`vdata`** (*`str, int, list, bytes`*) – The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the `(Default)` value for the key.

  The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:
  - REG_BINARY: Binary data (str in Py2, bytes in Py3)
  - REG_DWORD: int
  - REG_EXPAND_SZ: str
  - REG_MULTI_SZ: list of str
  - REG_QWORD: int
  - REG_SZ: str

  Note: When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:
  `- vdata: Salty Test`
  `- vdata: !!binary U2FsdHkgVGVzdA==\n`
  For more information about the `!!binary` tag see here

  Note: The type for the `(Default)` value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **`vtype`** (*`str`*) – The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ (Default)
- **`use_32bit_registry`** (*`bool`*) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.
- **`win_owner`** (*`str`*) – The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

Note: Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

New in version 2019.2.0.

- **`win_perms`** (*`dict`*) – A dictionary containing permissions to grant and their propagation. If not passed the 'Grant' permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

For each user specify the account name, with a sub dict for the permissions to grant and the 'Applies to' setting. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}`. `perms` must be specified.

Registry permissions are specified using the `perms` key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

Basic (passed as a string):
  - full_control
  - read
  - write

Advanced (passed as a list):
  - delete
  - query_value
  - set_value
  - create_subkey
  - enum_subkeys
  - notify
  - create_link
  - read_control
  - write_dac
  - write_owner

The 'Applies to' setting is optional. It is specified using the `applies_to` key. If not specified `this_key_subkeys` is used. Valid options are:

Applies to settings:
  - this_key_only
  - this_key_subkeys
  - subkeys_only

New in version 2019.2.0.

- **`win_deny_perms`** (*`dict`*) – A dictionary containing permissions to deny and their propagation. If not passed the *Deny* permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

Valid options are the same as those specified in `win_perms`

Note:
'Deny' permissions always take precedence over 'grant' permissions.

New in version 2019.2.0.

- **win_inheritance** (*bool*) – `True` to inherit permissions from the parent key. `False` to disable inheritance. Default is `True`.

  Note: Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

  New in version 2019.2.0.

- **win_perms_reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`

  Note: Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

  New in version 2019.2.0.

Returns A dictionary showing the results of the registry operation.

Return type dict

Example:

The following example will set the `(Default)` value for the `SOFTWARE\\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
  reg.present:
    - vdata: 2016.3.1
```

Example:

The following example will set the value for the `version` entry under the `SOFTWARE\\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`. The value will be reflected in `Wow6432Node`:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\\Salt` is the key
- `vname` is the value name ('version') that will be created under the key
- `vdata` is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of `Salty Test`

```
no_conversion:
  reg.present:
    - name: HKLM\SOFTWARE\SaltTesting
    - vname: test_reg_binary_state
    - vdata: Salty Test
    - vtype: REG_BINARY

conversion:
```

(continues on next page)

(continued from previous page)

```
  reg.present:
    - name: HKLM\SOFTWARE\SaltTesting
    - vname: test_reg_binary_state_with_tag
    - vdata: !!binary U2FsdHkgVGVzdA==\n
    - vtype: REG_BINARY
```

Example:

To set a `REG_MULTI_SZ` value:

```
reg_multi_sz:
  reg.present:
    - name: HKLM\SOFTWARE\Salt
    - vname: reg_multi_sz
    - vdata:
      - list item 1
      - list item 2
```

Example:

To ensure a key is present and has permissions:

```
set_key_permissions:
  reg.present:
    - name: HKLM\SOFTWARE\Salt
    - vname: version
    - vdata: 2016.3.1
    - win_owner: Administrators
    - win_perms:
        jsnuffy:
          perms: full_control
        sjones:
          perms:
            - read_control
            - enum_subkeys
            - query_value
          applies_to:
            - this_key_only
    - win_deny_perms:
        bsimpson:
          perms: full_control
          applies_to: this_key_subkeys
    - win_inheritance: True
    - win_perms_reset: True
```

21.19.244 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
  rsync.synchronized:
    - source: /home
    - force: True
```

`salt.states.rsync.`**`synchronized`**(*name, source, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, prepare=False, dryrun=False, additional_opts=None*)

Guarantees that the source directory is always copied to the target.

name Name of the target directory.

source Source directory.

prepare Create destination directory if it does not exists.

delete Delete extraneous files from the destination dirs (True or False)

force Force deletion of dirs even if not empty

update Skip files that are newer on the receiver (True or False)

passwordfile Read daemon-access password from the file (path)

exclude Exclude files, that matches pattern.

excludefrom Read exclude patterns from the file (path)

dryrun Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.

additional_opts Pass additional options to rsync, should be included as a list.

New in version 2018.3.0.

21.19.245 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```yaml
rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
      - openssl
```

(continues on next page)

(continued from previous page)

```
      - libreadline6
      - libreadline6-dev
      - curl
      - git-core
      - zlib1g
      - zlib1g-dev
      - libssl-dev
      - libyaml-dev
      - libsqlite3-0
      - libsqlite3-dev
      - sqlite3
      - libxml2-dev
      - libxslt1-dev
      - autoconf
      - libc6-dev
      - libncurses5-dev
      - automake
      - libtool
      - bison
      - subversion
      - ruby

jruby-deps:
  pkg.installed:
    - pkgs:
      - curl
      - g++
      - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: mri-deps
      - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
```

(continues on next page)

(continued from previous page)

```
    - user: rvm
    - require:
      - rvm: ruby-1.9.2
```

`salt.states.rvm.`**`gemset_present`**(*name*, *ruby='default'*, *user=None*)
Verify that the gemset is present.

name The name of the gemset.

ruby: **default** The ruby version this gemset belongs to.

user: **None** The user to run rvm as.

New in version 0.17.0.

`salt.states.rvm.`**`installed`**(*name*, *default=False*, *user=None*, *opts=None*, *env=None*)
Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: **None** The user to run rvm as.

env: **None** A list of environment variables to set (ie, RUBY_CONFIGURE_OPTS)

opts: **None** A list of option flags to pass to RVM (ie -C, –patch)

New in version 0.17.0.

21.19.246 salt.states.salt_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

salt-proxy-configure:

salt_proxy.configure_proxy:

- proxyname: p8000
- start: True

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn't exists) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.`**`configure_proxy`**(*name*, *proxyname='p8000'*, *start=True*)
Create the salt proxy file and start the proxy process if required

Parameters

- **`name`** – The name of this state
- **`proxyname`** – Name to be used for this proxy (should match entries in pillar)
- **`start`** – Boolean indicating if the process should be started

Example:

..code-block:: yaml

salt-proxy-configure:

salt_proxy.configure_proxy:

- proxyname: p8000
- start: True

21.19.247 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

> Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *`The Orchestrate runner`*

`salt.states.saltmod.`**`function`**(*name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwargs=None, expect_minions=False, fail_minions=None, fail_function=None, arg=None, kwarg=None, timeout=None, batch=None, subset=None, failhard=None, **kwargs*)

Execute a single module function on a remote minion via salt or salt-ssh

name The name of the function to run, aka cmd.run or pkg.install

tgt The target specification, aka '*' for all minions

tgt_type The target type, defaults to `glob`

arg The list of arguments to pass into the function

kwarg The dict (not a list) of keyword arguments to pass into the function

ret Optionally set a single or a list of returners to use

ret_config Use an alternative returner configuration

ret_kwargs Override individual returner configuration items

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

fail_function An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions

ssh Set to *True* to use the ssh client instead of the standard salt client

batch Execute the command *in batches*. E.g.: `10%`.

subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard pass failhard down to the executing state

New in version 2019.2.2.

`salt.states.saltmod.`**`parallel_runners`**(*name, runners, **kwargs*)

Executes multiple runner modules on the master in parallel.

New in version 2017.x.0: (Nitrogen)

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the `saltmod.runner` state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

name: name identifying this state. The name is provided as part of the output, but not used for anything else.

runners: list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary's name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.

```
parallel-state:
   salt.parallel_runners:
     - runners:
         my_runner_1:
           - name: state.orchestrate
           - kwarg:
               mods: orchestrate_state_1
         my_runner_2:
           - name: state.orchestrate
           - kwarg:
               mods: orchestrate_state_2
```

`salt.states.saltmod.`**`runner`**`(`*name*, ***kwargs*`)`

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

```
run-manage-up:
 salt.runner:
   - name: manage.up
```

`salt.states.saltmod.`**`state`**`(`*name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwargs=None, highstate=None, sls=None, top=None, saltenv=None, test=None, pillar=None, pillarenv=None, expect_minions=True, fail_minions=None, allow_fail=0, concurrent=False, timeout=None, batch=None, queue=False, subset=None, orchestration_jid=None, failhard=None, **kwargs*`)`

Invoke a state run on a given target

name An arbitrary name used to track the state execution

tgt The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

tgt_type The target type to resolve, defaults to `glob`

ret Optionally set a single or a list of returners to use

ret_config Use an alternative returner configuration

ret_kwargs Override individual returner configuration items

highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions

top Should be the name of a top file. If set state.top is called with this top file instead of state.sls.

sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files

test Pass `test=true` or `test=false` through to the state function. This can be used to overide a test mode set in the minion's config file. If left as the default of None and the 'test' mode is supplied on the command line, that value is passed instead.

pillar Pass the `pillar` kwarg through to the state function

pillarenv The pillar environment to grab pillars from

New in version 2017.7.0.

saltenv The default salt environment to pull sls files from

ssh Set to *True* to use the ssh client instead of the standard salt client

roster In the event of using salt-ssh, a roster system can be set

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False

concurrent Allow multiple state runs to occur at once.

> WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue Pass `queue=true` through to the state function

batch Execute the command *in batches*. E.g.: `10%`.

> New in version 2016.3.0.

subset Number of minions from the targeted set to randomly use

> New in version 2017.7.0.

failhard pass failhard down to the executing state

> New in version 2019.2.2.

Examples:

Run a list of sls files via `state.sls` on target minions:

```
webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run a full `state.highstate` on target mininons.

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

`salt.states.saltmod.`**`wait_for_event`**(*name, id_list, event_id='id', timeout=300, node='master'*)

Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

name An event tag to watch for; supports Reactor-style globbing.

id_list A list of event identifiers to watch for – usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

event_id [id] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

timeout [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
```

(continues on next page)

(continued from previous page)

```
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions
```

`salt.states.saltmod.`**`wheel`**`(`*name*, ***kwargs*`)`

Execute a wheel module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the wheel function

```
accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank
```

21.19.248 salt.states.saltutil

Saltutil State

This state wraps the saltutil execution modules to make them easier to run from a states. Rather than needing to to use `module.run` this state allows for improved change detection.

`salt.states.saltutil.`**`sync_all`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_all module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_all:
    - refresh: True
```

`salt.states.saltutil.`**`sync_beacons`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_beacons module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_beacons:
    - refresh: True
```

`salt.states.saltutil.`**`sync_clouds`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_clouds module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_clouds:
    - refresh: True
```

salt.states.saltutil.**sync_engines**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_engines module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_engines:
    - refresh: True
```

salt.states.saltutil.**sync_executors**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_executors module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_executors:
    - refresh: True
```

salt.states.saltutil.**sync_grains**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_grains module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_grains:
    - refresh: True
```

salt.states.saltutil.**sync_log_handlers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_log_handlers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_log_handlers:
    - refresh: True
```

salt.states.saltutil.**sync_matchers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_matchers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_matchers:
    - refresh: True
```

salt.states.saltutil.**sync_modules**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_modules module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_modules:
    - refresh: True
```

salt.states.saltutil.**sync_output**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_output module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_output:
    - refresh: True
```

salt.states.saltutil.**sync_outputters**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_outputters module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_outputters:
    - refresh: True
```

salt.states.saltutil.**sync_pillar**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_pillar module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_pillar:
    - refresh: True
```

salt.states.saltutil.**sync_proxymodules**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_proxymodules module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_proxymodules:
    - refresh: True
```

salt.states.saltutil.**sync_renderers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_renderers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_renderers:
    - refresh: True
```

salt.states.saltutil.**sync_returners**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_returners module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_returners:
    - refresh: True
```

salt.states.saltutil.**sync_sdb**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_sdb module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_sdb:
    - refresh: True
```

salt.states.saltutil.**sync_serializers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_serializers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_serializers:
    - refresh: True
```

`salt.states.saltutil.`**`sync_states`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_states module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_states:
    - refresh: True
```

`salt.states.saltutil.`**`sync_thorium`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_thorium module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_thorium:
    - refresh: True
```

`salt.states.saltutil.`**`sync_utils`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_utils module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_utils:
    - refresh: True
```

21.19.249 salt.states.schedule

Management of the Salt scheduler

```
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10

This will schedule the command: test.ping every 3600 seconds
(every hour) splaying the time between 0 and 10 seconds

job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
        start: 10
        end: 20

This will schedule the command: test.ping every 15 seconds
splaying the time between 10 and 20 seconds

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
```

(continues on next page)

(continued from previous page)

```
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday,
Wednesday and Friday, and 3pm on Tuesday and Thursday.  Requires that
python-dateutil is installed on the minion.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - cron: '*/5 * * * *'

Scheduled jobs can also be specified using the format used by cron.  This will
schedule the command: state.sls httpd test=True to run every 5 minutes.  Requires
that python-croniter is installed on the minion.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
        recipient: user@domain.com

This will schedule the command: state.sls httpd test=True at 5pm on Monday,
Wednesday and Friday, and 3pm on Tuesday and Thursday.  Using the xmpp returner
to return the results of the scheduled job, with the alternative configuration
options found in the xmpp_state_run section.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - hours: 1
    - skip_during_range:
```

(continues on next page)

(continued from previous page)

```
        - start: 2pm
        - end: 3pm
    - run_after_skip_range: True

This will schedule the command: state.sls httpd test=True at 5pm on Monday,
Wednesday and Friday, and 3pm on Tuesday and Thursday.  Requires that
python-dateutil is installed on the minion.
```

`salt.states.schedule.`**`absent`**`(`*name*, ***kwargs*`)`
Ensure a job is absent from the schedule

name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.`**`disabled`**`(`*name*, ***kwargs*`)`
Ensure a job is disabled in the schedule

name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.`**`enabled`**`(`*name*, ***kwargs*`)`
Ensure a job is enabled in the schedule

name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.`**`present`**`(`*name*, ***kwargs*`)`
Ensure a job is present in the schedule

name The unique name that is given to the scheduled job.
seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes The scheduled job will be executed after the specified number of minutes have passed.
hours The scheduled job will be executed after the specified number of hours have passed.
days The scheduled job will be executed after the specified number of days have passed.
when This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start Whether the job will run when Salt minion starts, or the job will be skipped **once** and run at the next scheduled run. Value should be a boolean.
function The function that should be executed by the scheduled job.
job_args The arguments that will be used by the scheduled job.
job_kwargs The keyword arguments that will be used by the scheduled job.
maxrunning Ensure that there are no more than N copies of a particular job running.
jid_include Include the job into the job cache.
splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.
range This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.
once This will schedule a job to run once on the specified date.
once_fmt The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.
enabled Whether the job should be enabled or disabled. Value should be a boolean.
return_job Whether to return information to the Salt master upon job completion.
metadata Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return_job parameter. The metadata parameter must be specified as a dictionary, othewise it will be ignored.
returner The returner to use to return the results of the scheduled job.
return_config The alternative configuration to use for returner configuration options.
return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.

persist Whether the job should persist between minion restarts, defaults to True.

skip_during_range This will ensure that the scheduled command does not run within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

run_after_skip_range Whether the job should run immediately after the skip_during_range time period ends.

21.19.250 salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
    selinux.mode

samba_create_home_dirs:
    selinux.boolean:
      - value: True
      - persist: True

nginx:
    selinux.module:
      - enabled: False
```

Note: Use of these states require that the `selinux` execution module is available.

`salt.states.selinux.`**`boolean`**`(`*name, value, persist=False*`)`

Set up an SELinux boolean

name The name of the boolean to set

value The value to set on the boolean

persist Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.`**`fcontext_policy_absent`**`(`*name, filetype='a', sel_type=None, sel_user=None, sel_level=None*`)`

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.

name filespec of the file or directory. Regex syntax is allowed.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_type The SELinux context type. There are many.

sel_user The SELinux user.

sel_level The SELinux MLS range.

`salt.states.selinux.`**`fcontext_policy_applied`**`(`*name, recursive=False*`)`

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

`salt.states.selinux.`**`fcontext_policy_present`**`(`*name, sel_type, filetype='a', sel_user=None, sel_level=None*`)`

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.

name filespec of the file or directory. Regex syntax is allowed.

sel_type SELinux context type. There are many.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_user The SELinux user.

sel_level The SELinux MLS range.

`salt.states.selinux.`**`mode`**`(`*name*`)`

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.`**`module`**`(`*name*, *module_state='Enabled'*, *version='any'*, ***opts*`)`

Enable/Disable and optionally force a specific version for an SELinux module

name The name of the module to control

module_state Should the module be enabled or disabled?

version Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

install Setting to True installs module

source Points to module source file, used only when install is True

remove Setting to True removes module

New in version 2016.3.0.

`salt.states.selinux.`**`module_install`**`(`*name*`)`

Installs custom SELinux module from given file

name Path to file with module to install

New in version 2016.11.6.

`salt.states.selinux.`**`module_remove`**`(`*name*`)`

Removes SELinux module

name The name of the module to remove

New in version 2016.11.6.

`salt.states.selinux.`**`port_policy_absent`**`(`*name*, *sel_type=None*, *protocol=None*, *port=None*`)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

name The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type The SELinux Type. Optional; can be used in determining if policy is present, ignored by `semanage port --delete`.

protocol The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port The port or port range. Required if name is not formatted.

`salt.states.selinux.`**`port_policy_present`**`(`*name*, *sel_type*, *protocol=None*, *port=None*, *sel_range=None*`)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.

name The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type The SELinux Type.

protocol The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port The port or port range. Required if name is not formatted.

sel_range The SELinux MLS/MCS Security Range.

21.19.251 salt.states.serverdensity_device

Monitor Server with Server Density

New in version 2014.7.0.

Server Density Is a hosted monitoring service.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

Note: Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

`salt.states.serverdensity_device.`**`monitored`**(*name, group=None, salt_name=True, salt_params=True, agent_version=1, **params*)

Device is monitored with Server Density.

name Device name in Server Density.

salt_name If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.

group Group name under with device will appear in Server Density dashboard. Default - *None*.

agent_version The agent version you want to use. Valid values are 1 or 2. Default - 1.

salt_params If `True` (default), needed config parameters will be sourced from grains and from *`status.all_status`*.

params Add parameters that you want to appear in the Server Density dashboard. Will overwrite the *salt_params* parameters. For more info, see the API docs.

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

21.19.252 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state uses whichever service module is loaded on the minion with the virtualname of `service`. Services can be defined as either running or dead.

If you need to know if your init system is supported, see the list of supported `service modules` for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the *Overriding Virtual Module Providers* section of Salt's module documentation to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```
httpd:
  service.running: []
```

The service can also be set to start at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

Note: More details regarding `watch` can be found in the *Requisites* documentation.

`salt.states.service.`**`dead`**(*name, enable=None, sig=None, init_delay=None, **kwargs*)

Ensure that the named service is dead by stopping the service if it is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

init_delay Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

no_block [False] **For systemd minions only**. Stops the service using `--no-block`.

New in version 2017.7.0.

`salt.states.service.`**`disabled`**`(`*name*, ***kwargs*`)`

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.`**`enabled`**`(`*name*, ***kwargs*`)`

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.`**`masked`**`(`*name*, *runtime=False*`)`

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is masked (i.e. prevented from being started).

name Name of the service to mask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a *`service.unmasked`* state, like so:

```
mask_runtime_foo:
  service.masked:
    - name: foo
    - runtime: True

unmask_indefinite_foo:
  service.unmasked:
    - name: foo
    - runtime: False
```

`salt.states.service.`**`mod_watch`**`(`*name*, *sfun=None*, *sig=None*, *reload=False*, *full_restart=False*, *init_delay=None*, *force=False*, ***kwargs*`)`

The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the watching service. (i.e. `service.running`)

name The name of the init or rc script used to manage the service

sfun The original function which triggered the mod_watch call (*service.running*, for example).

sig The string to search for when looking for the service process with ps

reload When set, reload the service instead of restarting it. (i.e. `service nginx reload`)

full_restart Perform a full stop/start of a service by passing `--full-restart`. This option is ignored if `reload` is set and is supported by only a few `service modules`.

force Use service.force_reload instead of reload (needs reload to be set to True)

init_delay Add a sleep command (in seconds) before the service is restarted/reloaded

`salt.states.service.`**`running`**`(`*name*, *enable=None*, *sig=None*, *init_delay=None*, ***kwargs*`)`

Ensure that the service is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

init_delay Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an 'init_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

no_block [False] **For systemd minions only**. Starts the service using `--no-block`.

New in version 2017.7.0.

unmask [False] **For systemd minions only**. Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

unmask_runtime [False] **For systemd minions only**. Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

wait [3] **For systemd minions only**. Passed through when using *`service.status`* to determine whether the service is running or not.

New in version 2019.2.3.

Note:

`watch` can be used with service.running to restart a service when another state changes (example: a file.managed state that creates the service's config file). More details regarding `watch` can be found in the *Requisites* documentation.

`salt.states.service.`**`unmasked`**`(`*name*, *runtime=False*`)`

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is unmasked

name Name of the service to unmask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask.

21.19.253 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.`**`post_message`**`(`*name*, ***kwargs*`)`

Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

api_key parameters:

name The unique name for this event.

channel The channel to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the "from" field.

message The message that is to be sent to the Slack channel.

The following parameters are optional:

api_key The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

icon URL to an image to use as the icon for this message

webhook parameters:

name The unique name for this event.

message The message that is to be sent to the Slack channel.

color The color of border of left side

short An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.

identifier The identifier of WebHook.

channel The channel to use instead of the WebHook default.

username Username to use instead of WebHook default.

icon_emoji Icon to use instead of WebHook default.

21.19.254 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends vmadm, imgadm

platform smartos

New in version 2016.3.0.

```
vmtest.example.org:

cleanup_images:
  smartos.image_vacuum
```

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, … they get removed via add_*, set_*, update_*, and remove_*. Properties must be manually reset to their default value. The same behavior as when using 'vmadm update'.

salt.states.smartos.**config_absent**(*name*)

Ensure configuration property is absent in /usbkey/config

name [string] name of property

`salt.states.smartos.`**`config_present`**`(`*name*, *value*`)`

Ensure configuration property is set to value in /usbkey/config

name [string] name of property

value [string] value of property

`salt.states.smartos.`**`image_absent`**`(`*name*`)`

Ensure image is absent on the computenode

name [string] uuid of image

Note: computenode.image_absent will only remove the image if it is not used by a vm.

`salt.states.smartos.`**`image_present`**`(`*name*`)`

Ensure image is present on the computenode

name [string] uuid of image

`salt.states.smartos.`**`image_vacuum`**`(`*name*`)`

Delete images not in use or installed via image_present

Warning: Only image_present states that are included via the top file will be detected.

`salt.states.smartos.`**`source_absent`**`(`*name*`)`

Ensure an image source is absent on the computenode

name [string] source url

`salt.states.smartos.`**`source_present`**`(`*name*, *source_type='imgapi'*`)`

Ensure an image source is present on the computenode

name [string] source url

source_type [string] source type (imgapi or docker)

`salt.states.smartos.`**`vm_absent`**`(`*name*, *archive=False*`)`

Ensure vm is absent on the computenode

name [string] hostname of vm

archive [boolean] toggle archiving of vm on removal

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.`**`vm_present`**`(`*name*, *vmconfig*, *config=None*`)`

Ensure vm is present on the computenode

name [string] hostname of vm

vmconfig [dict] options to set for the vm

config [dict] fine grain control over vm_present

Note:

The following configuration properties can be toggled in the config parameter.

- kvm_reboot (true) - reboots of kvm zones if needed for a config update
- auto_import (false) - automatic importing of missing images
- auto_lx_vars (true) - copy kernel_version and docker:* variables from image
- reprovision (false) - reprovision on image_uuid changes
- enforce_tags (true) - false = add tags only, true = add, update, and remove tags
- enforce_routes (true) - false = add tags only, true = add, update, and remove routes
- enforce_internal_metadata (true) - false = add metadata only, true = add, update, and remove metadata

  - enforce_customer_metadata (true) - false = add metadata only, true = add, update, and remove metadata

---

Note: State ID is used as hostname. Hostnames must be unique.

Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

Note:

The following instances should have a unique ID.

  - nic : mac
  - filesystem: target
  - disk : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

Changed in version 2019.2.0: Added support for docker image uuids, added auto_lx_vars configuration, documented some missing configuration options.

`salt.states.smartos.`**`vm_running`**`(`*name*`)`

Ensure vm is in the running state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.`**`vm_stopped`**`(`*name*`)`

Ensure vm is in the stopped state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

21.19.255 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - recipient: admins@example.com
```

`salt.states.smtp.`**`send_msg`**`(`*name, recipient, subject, sender=None, profile=None, use_ssl='True', attachments=None*`)`

Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
    - attachments:
        - /var/log/syslog
        - /var/log/messages
```

name The message to send via SMTP

21.19.256 salt.states.snapper module

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

my_baseline_external_storage:

snapper.baseline_snapshot:

- tag: my_custom_baseline_tag
- config: external
- ignore: - /mnt/tmp_files/

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache

hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

Warning: Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

Warning: Do not specify more than one baseline rule as only the last one will affect the result.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>

maturity new

platform Linux

`salt.states.snapper.`**`baseline_snapshot`**(*name*, *number=None*, *tag=None*, *include_diff=True*, *config='root'*, *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

number Number of selected baseline snapshot.

tag Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

include_diff Include a diff in the response (Default: True)

config Snapper config name (Default: root)

ignore List of files to ignore. (Default: None)

21.19.257 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

`salt.states.solrcloud.`**`alias`**(*name*, *collections*, ***kwargs*)

Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query
name The collection name
collections list of collections to include in the alias

`salt.states.solrcloud.`**`collection`**(*name*, *options=None*, ***kwargs*)

Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query
name The collection name
options [{}] options to ensure

21.19.258 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
    splunk.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
```

`salt.states.splunk.`**`absent`**(*email*, *profile='splunk'*, ***kwargs*)

Ensure a splunk user is absent

```
ensure example test user 1:
    splunk.absent:
        - email: 'example@domain.com'
        - name: 'exampleuser'
```

The following parameters are required:
email This is the email of the user in splunk
name This is the splunk username used to identify the user.

`salt.states.splunk.`**`present`**(*email*, *profile='splunk'*, ***kwargs*)

Ensure a user is present

```
ensure example test user 1:
    splunk.user_present:
        - realname: 'Example TestUser1'
        - name: 'exampleuser'
        - email: 'example@domain.com'
        - roles: ['user']
```

The following parameters are required:

email This is the email of the user in splunk

21.19.259 salt.states.splunk_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```
server-warning-message:
  splunk_search.present:
    - name: This is the splunk search name
    - search: index=main sourcetype=
```

`salt.states.splunk_search.`**`absent`**(*name*, *profile='splunk'*)

Ensure a search is absent

```
API Error Search:
  splunk_search.absent
```

The following parameters are required:

name This is the name of the search in splunk

`salt.states.splunk_search.`**`present`**(*name*, *profile='splunk'*, ***kwargs*)

Ensure a search is present

```
API Error Search:
  splunk_search.present:
    search: index=main sourcetype=blah
    template: alert_5min
```

The following parameters are required:

name This is the name of the search in splunk

21.19.260 salt.states.sqlite3

Management of SQLite3 databases

New in version 2016.3.0.

depends

- SQLite3 Python Module

configuration See `salt.modules.sqlite3` for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
↪`password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```
users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
      - email TEXT COLLATE NOCASE UNIQUE NOT NULL
      - firstname TEXT NOT NULL
      - lastname TEXT NOT NULL
      - company TEXT NOT NULL
      - password BLOB NOT NULL
      - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```
badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```
user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
    - data:
        email: john.doe@companyxyz.com
        lastname: doe
        firstname: john
        company: companyxyz.com
        password: abcdef012934125
        salt: abcdef012934125
    - require:
      - sqlite3: users
```

Here is an example of removing a row from a table:

```
user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users
```

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3's module functions and module.run:

```
zone-delete:
  module.run:
    - name: sqlite3.modify
    - db: {{ db }}
    - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_
↪id }}"
    - watch:
      - sqlite3: zone-insert-12
```

`salt.states.sqlite3.`**`row_absent`**(*name, db, table, where_sql, where_args=None*)

Makes sure the specified row is absent in db. If multiple rows match where_sql, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check

where_sql The sql to select the row to check

where_args The list parameters to substitute in where_sql

`salt.states.sqlite3.`**`row_present`**`(`*name, db, table, data, where_sql, where_args=None, update=False*`)`

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data. Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn't match data_check the state will fail. If the row doesn't exist then it will insert data into the table. If more than one row matches, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check the data

data The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

where_sql The sql to select the row to check

where_args The list parameters to substitute in where_sql

update True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

`salt.states.sqlite3.`**`table_absent`**`(`*name, db*`)`

Make sure the specified table does not exist

name The name of the table

db The name of the database file

`salt.states.sqlite3.`**`table_present`**`(`*name, db, schema, force=False*`)`

Make sure the specified table exists with the specified schema

name The name of the table

db The name of the database file

schema The dictionary containing the schema information

force If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

21.19.261 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user's SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss
```

(continues on next page)

(continued from previous page)

```
thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

sshkeys:
  ssh_auth.manage:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - ssh_keys:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment
```

`salt.states.ssh_auth.`**`absent`**(*name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None*)

Verifies that the specified SSH key is absent

name The SSH key to manage

user The user who owns the SSH authorized keys file to modify

enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

comment The comment to be placed with the SSH public key

options The options passed to the key, pass a list object

source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.7.

`salt.states.ssh_auth.`**`manage`**(*name, ssh_keys, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs*)

New in version 3000.

Ensures that only the specified ssh_keys are present for the specified user

ssh_keys The SSH key to manage

user The user who owns the SSH authorized keys file to modify

enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

comment The comment to be placed with the SSH public key

source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click `Load`, and select the *private* key file (not the public key), and click `Open`.
2. Copy the public key from the box labeled `Public key for pasting into OpenSSH authorized_keys file`.
3. Paste it into a new file.

---

options The options passed to the keys, pass a list object

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

`salt.states.ssh_auth.`**`present`**`(`*name*, *user*, *enc='ssh-rsa'*, *comment="*, *source="*, *options=None*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*, ***kwargs*`)`

Verifies that the specified SSH key is present for the specified user

name The SSH key to manage

user The user who owns the SSH authorized keys file to modify

enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

comment The comment to be placed with the SSH public key

source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click `Load`, and select the *private* key file (not the public key), and click `Open`.
2. Copy the public key from the box labeled `Public key for pasting into OpenSSH authorized_keys file`.
3. Paste it into a new file.

---

options The options passed to the key, pass a list object

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

21.19.262 salt.states.ssh_known_hosts

Control of SSH known_hosts entries

Manage the information stored in the known_hosts files.

```
github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48
    - fingerprint_hash_type: md5

example.com:
  ssh_known_hosts:
    - absent
    - user: root
```

`salt.states.ssh_known_hosts.`**`absent`**`(`*name*, *user=None*, *config=None*`)`

Verifies that the specified host is not known by the given user

name The host name Note that only single host names are supported. If foo.example.com and bar.example.com are the same machine and you need to exclude both, you will need one Salt state for each.

user The user who owns the ssh authorized keys file to modify

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

`salt.states.ssh_known_hosts.`**`present`**`(`*name*, *user=None*, *fingerprint=None*, *key=None*, *port=None*, *enc=None*, *config=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*`)`

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

name The name of the remote host (e.g. "github.com") Note that only a single hostname is supported, if foo.example.com and bar.example.com have the same host you will need two separate Salt States to represent them.

user The user who owns the ssh authorized keys file to modify

fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key The public key which must be present in the known_hosts file (optional if fingerprint specified)

port optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

21.19.263 salt.states.stateconf

Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

`salt.states.stateconf.`**`context`**`(`*name*, ***kwargs*`)`
No-op state to support state config via the stateconf renderer.

`salt.states.stateconf.`**`set`**`(`*name*, ***kwargs*`)`
No-op state to support state config via the stateconf renderer.

21.19.264 salt.states.status

Minion status monitoring

Maps to the *status* execution module.

`salt.states.status.`**`loadavg`**`(`*name*, *maximum=None*, *minimum=None*`)`
Return the current load average for the specified minion. Available values for name are *1-min*, *5-min* and *15-min*. *minimum* and *maximum* values should be passed in as strings.

`salt.states.status.`**`process`**`(`*name*`)`
Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

21.19.265 salt.states.statuspage

StatusPage

Manage the StatusPage configuration.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

`salt.states.statuspage.`**`create`**`(`*name*, *endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*`)`
Insert a new entry under a specific endpoint.

endpoint: incidents Insert under this specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

kwargs Other params.

SLS Example:

```
create-my-component:
    statuspage.create:
        - endpoint: components
        - name: my component
        - group_id: 993vgplshj12
```

`salt.states.statuspage.`**`delete`**(*name*, *endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*)

Remove an entry from an endpoint.

endpoint: **incidents** Request a specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: **1** API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
    statuspage.delete:
        - endpoint: components
        - id: ftgks51sfs2d
```

`salt.states.statuspage.`**`managed`**(*name*, *config*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, *pace=1*, *allow_empty=False*)

Manage the StatusPage configuration.

config Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: **1** API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

pace: **1** Max requests per second allowed by the API.

allow_empty: **False** Allow empty config.

SLS example:

```
my-statuspage-config:
    statuspage.managed:
        - config:
            components:
                - name: component1
                  group_id: uy4g37rf
                - name: component2
                  group_id: 3n4uyu4gf
            incidents:
                - name: incident1
                  status: resolved
                  impact: major
                  backfilled: false
                - name: incident2
                  status: investigating
                  impact: minor
```

`salt.states.statuspage.`**`update`**(*name*, *endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Update attribute(s) of a specific endpoint.

id The unique ID of the enpoint entry.

endpoint: **incidents** Endpoint name.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: **1** API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
update-my-incident:
    statuspage.update:
        - id: dz959yz2nd4l
        - status: resolved
```

21.19.266 salt.states.supervisord

Interaction with the Supervisor daemon

```
wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

`salt.states.supervisord.`**`dead`**(*name*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is dead (not running).

name Service name as defined in the supervisor configuration file

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.`**`mod_watch`**(*name*, *restart=True*, *update=False*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

The supervisord watcher, called to invoke the watch command. Always restart on watch

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.supervisord.`**`running`**(*name*, *restart=False*, *update=False*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is running.

name Service name as defined in the supervisor configuration file

restart Whether to force a restart

update Whether to update the supervisor configuration.

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

21.19.267 salt.states.svn

Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (`subversion` in most cases). Example:

```
subversion:
  pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
  svn.latest:
    - target: /tmp/swallow
```

`salt.states.svn.`**`dirty`**`(`*name, target, user=None, username=None, password=None, ignore_unversioned=False*`)`

Determine if the working directory has been changed.

`salt.states.svn.`**`export`**`(`*name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False, trust_failures=None*`)`

Export a file or directory from an SVN repository

name Address and path to the file or directory to be exported.

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable "force" if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

overwrite [False] Overwrite existing target

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's –trust-server-cert

trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN's –trust-server-cert-failures option as-is.

New in version 2019.2.0.

`salt.states.svn.`**`latest`**`(`*name, target=None, rev=None, user=None, username=None, password=None, force=False, externals=True, trust=False, trust_failures=None*`)`

Checkout or update the working directory to the latest revision from the remote repository.

name Address of the name repository as passed to "svn checkout"

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable "force" if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's –trust-server-cert

trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN's –trust-server-cert-failures option as-is.

New in version 2019.2.0.

21.19.268 salt.states.sysctl

Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

`salt.states.sysctl.`**`present`**`(`*name*, *value*, *config=None*`)`

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

name The name of the sysctl value to edit

value The sysctl value to apply

config The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

21.19.269 salt.states.syslog_ng

State module for syslog_ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd, ps, syslog_ng

platform all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

Details

The service module is not available on all system, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see *syslog-ng state usage*.

Syslog-ng configuration file format

The syntax of a configuration snippet in syslog-ng.conf:

object_type object_id {<options>};

These constructions are also called statements. There are options inside of them:

option(parameter1, parameter2); option2(parameter1, parameter2);

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5

`salt.states.syslog_ng.`**`config`**(*name*, *config*, *write=True*)

Builds syslog-ng configuration.

name : the id of the Salt document config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

`salt.states.syslog_ng.`**`reloaded`**(*name*)

Reloads syslog-ng.

`salt.states.syslog_ng.`**`started`**(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*, **args*, ***kwargs*)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

`salt.states.syslog_ng.`**`stopped`**(*name=None*)

Kills syslog-ng.

21.19.270 salt.states.sysrc

State to work with sysrc

`salt.states.sysrc.`**`absent`**(*name*, ***kwargs*)

Ensure a sysrc variable is absent.
name The variable name to set
file (optional) The rc file to add the variable to.
jail (option) the name or JID of the jail to set the value in.

`salt.states.sysrc.`**`managed`**(*name*, *value*, ***kwargs*)

Ensure a sysrc variable is set to a specific value.
name The variable name to set
value Value to set the variable to
file (optional) The rc file to add the variable to.
jail (option) the name or JID of the jail to set the value in.
Example:

```
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

21.19.271 salt.states.telemetry_alert

Manage Telemetry alert configurations

New in version 2016.3.0.

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
    telemetry_alert.present:
        - deployment_id: "rs-XXXXXX"
        - metric_name: "testMetric"
        - alert_config:
            max: 1
            filter:  SERVER_ROLE_MONGOD_PRIMARY
            escalate_to: "example@pagerduty.com"
        - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

`salt.states.telemetry_alert.`**`absent`**`(`*name, deployment_id, metric_name, api_key=None, profile='telemetry'*`)`

Ensure the telemetry alert config is deleted

name An optional description of the alarms (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

api_key Telemetry api key for the user

profile A dict with telemetry config data. If present, will be used instead of api_key.

`salt.states.telemetry_alert.`**`present`**`(`*name, deployment_id, metric_name, alert_config, api_key=None, profile='telemetry'*`)`

Ensure the telemetry alert exists.

name An optional description of the alarm (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

alert_config: Is a list of dictionaries where each dict contains the following fields:

- **filter** By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.
- **min** the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.
- **max** the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.
- **notify_all** Used to indicate if you want to alert both onCallEngineer and apiNotifications

api_key Telemetry api key for the user

profile A dict of telemetry config information. If present, will be used instead of api_key.

21.19.272 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```
always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:
```

(continues on next page)

(continued from previous page)

```
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz
    - warnings: A warning

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
        - foo
    - integer:
        - bar
```

`salt.states.test.`**`check_pillar`**(*name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False*)

Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```
is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
        - foo
    - integer:
        - bar
```

`salt.states.test.`**`configurable_test_state`**(*name, changes=True, result=True, comment=", warnings=None*)

A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.
name: A unique string.
changes: Do we return anything in the changes field? Accepts True, False, and 'Random' Default is True
result: Do we return successfully or not? Accepts True, False, and 'Random' Default is True If test is True and changes is True, this will be None. If test is True and and changes is False, this will be True.
comment: String to fill the comment field with. Default is "
New in version 3000.

Warning: A string (or a list of strings) to fill the warnings field with. Default is None

`salt.states.test.`**`fail_with_changes`**(*name, **kwargs*)

Returns failure and changes is not empty.

New in version 2014.7.0.
name: A unique string.

`salt.states.test.`**`fail_without_changes`**`(`*name*, ***kwargs*`)`
Returns failure.

New in version 2014.7.0.
name: A unique string.

`salt.states.test.`**`mod_watch`**`(`*name*, *sfun=None*, ***kwargs*`)`
Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```
this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes
```

`salt.states.test.`**`nop`**`(`*name*, ***kwargs*`)`
A no-op state that does nothing. Useful in conjunction with the *use* requisite, or in templates which could otherwise be empty due to jinja rendering

New in version 2015.8.1.

`salt.states.test.`**`show_notification`**`(`*name*, *text=None*, ***kwargs*`)`
Simple notification using text argument.

New in version 2015.8.0.
name A unique string.
text Text to return in the comment.

`salt.states.test.`**`succeed_with_changes`**`(`*name*, ***kwargs*`)`
Returns successful and changes is not empty

New in version 2014.7.0.
name: A unique string.

`salt.states.test.`**`succeed_without_changes`**`(`*name*, ***kwargs*`)`
Returns successful.

New in version 2014.7.0.
name A unique string.

21.19.273 salt.states.testinframod module

21.19.274 salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail here.

`salt.states.timezone.`**`system`**`(`*name*, *utc=True*`)`

Set the timezone for the system.

name The name of the timezone to use (e.g.: America/Denver)

utc Whether or not to set the hardware clock to UTC (default is True)

21.19.275 salt.states.tls

Enforce state for SSL/TLS

`salt.states.tls.`**`valid_certificate`**`(`*name*, *weeks=0*, *days=0*, *hours=0*, *minutes=0*, *seconds=0*`)`

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

21.19.276 salt.states.tomcat

Manage Apache Tomcat web applications

Note: This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
    user: 'tomcat-manager'
    passwd: 'Passw0rd'
```

Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 1: conf/tomcat-users.xml

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- **Last tested on**:

  Tomcat Version: Apache Tomcat/7.0.54

  JVM Vendor: Oracle Corporation

  JVM Version: 1.8.0_101-b13

  OS Architecture: amd64

  OS Name: Linux

  OS Version: 3.10.0-327.22.2.el7.x86_64

`salt.states.tomcat.`**`mod_watch`**(*name*, *url='http://localhost:8080/manager'*, *timeout=180*)

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

---

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.tomcat.`**`undeployed`**(*name*, *url='http://localhost:8080/manager'*, *timeout=180*)

Enforce that the WAR will be undeployed from the server

name The context path to undeploy.

url [http://localhost:8080/manager] The URL of the server with the Tomcat Manager webapp.

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

`salt.states.tomcat.`**`wait`**(*name*, *url='http://localhost:8080/manager'*, *timeout=180*)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the tomcat.war_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment.

url [http://localhost:8080/manager] The URL of the server with the Tomcat Manager webapp.
timeout [180] Timeout for HTTP request to the Tomcat Manager.
Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

`salt.states.tomcat.`**`war_deployed`**`(`*name, war, force=False, url='http://localhost:8080/manager', timeout=180, temp_war_location=None, version=True*`)`

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

Note: For more info about Tomcats file paths and context naming, please see http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming

---

name The context path to deploy (incl. forward slash) the WAR to.
war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.
force [False] Force deployment even if the version strings are the same. Disabled by default.
url [http://localhost:8080/manager] The URL of the Tomcat Web Application Manager.
timeout [180] Timeout for HTTP requests to the Tomcat Manager.
temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.
version [''] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-jenkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```

Note: Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set version to `False`.

21.19.277 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

`salt.states.trafficserver.`**`bounce_cluster`**`(`*name*`)`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

`salt.states.trafficserver.`**`bounce_local`**`(`*name, drain=False*`)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
    - drain: True
```

`salt.states.trafficserver.`**`clear_cluster`**`(`*name*`)`

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
  trafficserver.clear_cluster
```

`salt.states.trafficserver.`**`clear_node`**`(`*name*`)`

Clears accumulated statistics on the local node.

```
clear_ats_node:
  trafficserver.clear_node
```

`salt.states.trafficserver.`**`config`**`(`*name, value*`)`

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
```

(continues on next page)

(continued from previous page)

```
  trafficserver.config:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

`salt.states.trafficserver.offline(name, path)`

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```
offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache
```

`salt.states.trafficserver.refresh(name)`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```
refresh_ats:
  trafficserver.refresh
```

`salt.states.trafficserver.restart_cluster(name)`

Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```
restart_ats_cluster:
  trafficserver.restart_cluster
```

`salt.states.trafficserver.restart_local(name, drain=False)`

Restart the traffic_manager and traffic_server processes on the local node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
restart_ats_local:
  trafficserver.restart_local

restart_ats_local_drain:
  trafficserver.restart_local
    - drain: True
```

`salt.states.trafficserver.shutdown(name)`

Shut down Traffic Server on the local node.

```
shutdown_ats:
  trafficserver.shutdown
```

`salt.states.trafficserver.startup(name)`

Start Traffic Server on the local node.

```
startup_ats:
  trafficserver.startup
```

`salt.states.trafficserver.`**`zero_cluster`**`(`*name*`)`

Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

`salt.states.trafficserver.`**`zero_node`**`(`*name*`)`

Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

21.19.278 salt.states.tuned

Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>

maturity new

depends cmd.run

platform Linux

`salt.states.tuned.`**`off`**`(`*name=None*`)`

Turns 'tuned' off. Example tuned.sls file for turning tuned off:
tuned: tuned.off: []
To see a valid list of states call execution module: *`tuned.list`*

`salt.states.tuned.`**`profile`**`(`*name*`)`

This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest
tuned:
    tuned:
        - profile
        - name: virtual-guest

name tuned profile name to set the system to
To see a valid list of states call execution module: *`tuned.list`*

21.19.279 salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
     - polling: 600 # every hour
```

`salt.states.uptime.`**`monitored`**(*name*, ***params*)

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

21.19.280 salt.states.user

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

`salt.states.user.`**`absent`**(*name*, *purge=False*, *force=False*)

Ensure that the named user is absent

name The name of the user to remove

purge Set purge to True to delete all of the user's files as well as the user, Default is `False`.

force If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is `False`.

`salt.states.user.`**`present`**(*name*, *uid=None*, *gid=None*, *gid_from_name=False*, *groups=None*, *optional_groups=None*, *remove_groups=True*, *home=None*, *createhome=True*, *password=None*, *hash_password=False*, *enforce_password=True*, *empty_password=False*, *shell=None*, *unique=True*, *system=False*, *fullname=None*, *roomnumber=None*, *workphone=None*, *homephone=None*, *other=None*, *loginclass=None*, *date=None*, *mindays=None*, *maxdays=None*, *inactdays=None*, *warndays=None*, *expire=None*, *win_homedrive=None*, *win_profile=None*, *win_logonscript=None*, *win_description=None*, *nologinit=False*, *allow_uid_change=False*, *allow_gid_change=False*)

Ensure that the named user is present with the specified properties

name The name of the user to manage

uid The user id to assign. If not specified, and the user does not exist, then the next available uid will be assigned.

gid The id of the default group to assign to the user. Either a group name or gid can be used. If not specified, and the user does not exist, then the next available gid will be assigned.

gid_from_name [False] If `True`, the default group id will be set to the id of the group with the same name as the user. If the group does not exist the state will fail.

allow_uid_change [False] Set to `True` to allow the state to update the uid.

New in version 2018.3.1.

allow_gid_change [False] Set to `True` to allow the state to update the gid.

New in version 2018.3.1.

groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

optional_groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both "groups" and "optional_groups", then it will be assumed to be required and not optional.

remove_groups Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

home The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if createhome is set to True.

createhome [True] If set to `False`, the home directory will not be created if it doesn't already exist.

> **Warning:** Not supported on Windows or Mac OS.
>
> Additionally, parent directories will *not* be created. The parent directory for `home` must already exist.

nologinit [False] If set to `True`, it will not add the user to lastlog and faillog databases.

> **Note:** Not supported on Windows or Mac OS.

password A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

Changed in version 0.16.0: BSD support added.

hash_password Set to True to hash the clear text password. Default is `False`.

enforce_password Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the "password" field. This option will be ignored if "password" is not specified, Default is `True`.

empty_password Set to True to enable password-less login for user, Default is `False`.

shell The login shell, defaults to the system default shell

unique Require a unique UID, Default is `True`.

system Choose UID in the range of FIRST_SYSTEM_UID and LAST_SYSTEM_UID, Default is `False`.

loginclass The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname The user's full name

roomnumber The user's room number (not supported in MacOS)

workphone The user's work phone number (not supported in MacOS)

homephone The user's home phone number (not supported in MacOS)

other The user's other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of 'em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date Date of last change of password, represented in days since epoch (January 1, 1970).

mindays The minimum number of days between password changes.

maxdays The maximum number of days between password changes.

inactdays The number of days after a password expires before an account is locked.

warndays Number of days prior to maxdays to warn users.

expire Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

win_homedrive (Windows Only) The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: - win_homedrive: 'U:

Changed in version 2015.8.0.

win_profile (Windows Only) The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only) The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only) A brief description of the purpose of the users account.

Changed in version 2015.8.0.

21.19.281 salt.states.vagrant

Manage Vagrant VMs

Manange execution of Vagrant virtual machines on Salt minions.

Vagrant is a tool for building and managing virtual machine environments. It can use various providers, such as VirtualBox, Docker, or VMware, to run its VMs. Vagrant provides some of the functionality of a light-weight hypervisor. The combination of Salt modules, Vagrant running on the host, and a virtual machine provider, gives hypervisor-like functionality for developers who use Vagrant to quickly define their virtual environments.

New in version 2018.3.0.

The configuration of each virtual machine is defined in a file named `Vagrantfile` which must exist on the VM host machine. The essential parameters which must be defined to start a Vagrant VM are the directory where the `Vagrantfile` is located (argument `cwd:`), and the username which will own the `Vagrant box` created for the VM (argument `vagrant_runas:`).

A single `Vagrantfile` may define one or more virtual machines. Use the `machine` argument to chose among them. The default (blank) value will select the `primary` (or only) machine in the Vagrantfile.

[NOTE:] Each virtual machine host must have the following:

- a working salt-minion
- a Salt sdb database configured for `vagrant_sdb_data`.
- Vagrant installed and the `vagrant` command working
- a suitable VM provider

```
# EXAMPLE:
# file /etc/salt/minion.d/vagrant_sdb.conf on the host computer
#  -- this sdb database is required by the Vagrant module --
vagrant_sdb_data:  # The sdb database must have this name.
  driver: sqlite3  # Let's use SQLite to store the data ...
  database: /var/cache/salt/vagrant.sqlite  # ... in this file ...
  table: sdb  # ... using this table name.
  create_table: True  # if not present
```

`salt.states.vagrant.`**`destroyed`**`(`*name*`)`

Stops a VM (or VMs) and removes all references to it (them). (Runs `vagrant destroy`.)

Subsequent re-use of the same machine will requere another operation of `vagrant.running` or a call to the `vagrant.init` execution module.

Parameters **`name`** – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.destroyed
```

`salt.states.vagrant.`**`initialized`**`(`*name*, ***kwargs*`)`

Defines a new VM with specified arguments, but does not start it.

Parameters **`name`** – the Salt_id node name you wish your VM to have.

Each machine must be initialized individually using this function or the "vagrant.running" function, or the vagrant.init execution module call.

This command will not change the state of a running or paused machine.

Possible keyword arguments:

- cwd: The directory (path) containing the Vagrantfile
- machine: (") the name of the machine (in the Vagrantfile) if not default
- vagrant_runas: ('root') the username who owns the vagrantbox file
- vagrant_provider: the provider to run the VM (usually 'virtualbox')
- vm: ({}) a dictionary containing these or other keyword arguments

```
node_name1:
  vagrant.initialized
    - cwd: /projects/my_project
    - vagrant_runas: my_username
    - machine: machine1

node_name2:
  vagrant.initialized
    - cwd: /projects/my_project
    - vagrant_runas: my_username
    - machine: machine2

start_nodes:
  vagrant.start:
    - name: node_name?
```

`salt.states.vagrant.`**`paused`**`(`*name*`)`

Stores the state of a VM (or VMs) for fast restart. (Runs `vagrant suspend`.)

Parameters **`name`** – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.paused
```

`salt.states.vagrant.`**`powered_off`**`(`*name*`)`

Stops a VM (or VMs) by power off. (Runs `vagrant halt`.)

This method is provided for compatibility with other VM-control state modules. For Vagrant, the action is identical with `stopped`.

Parameters **`name`** – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.unpowered
```

`salt.states.vagrant.`**`rebooted`**`(`*name*`)`

Reboots a running, paused, or stopped VM (or VMs). (Runs `vagrant reload`.)

The will re-run the provisioning

Parameters **`name`** – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.reloaded
```

`salt.states.vagrant.`**`running`**`(`*name, **kwargs*`)`

Defines and starts a new VM with specified arguments, or restart a VM (or group of VMs). (Runs `vagrant up`.)

Parameters **`name`** – the Salt_id node name you wish your VM to have.

If `name` contains a "?" or "*" then it will re-start a group of VMs which have been paused or stopped.

Each machine must be initially started individually using this function or the vagrant.init execution module call.

[NOTE:] Keyword arguments are silently ignored when re-starting an existing VM.

Possible keyword arguments:

- cwd: The directory (path) containing the Vagrantfile
- machine: (") the name of the machine (in the Vagrantfile) if not default
- vagrant_runas: ('root') the username who owns the vagrantbox file
- vagrant_provider: the provider to run the VM (usually 'virtualbox')
- vm: ({}) a dictionary containing these or other keyword arguments

```
node_name:
  vagrant.running
```

```
node_name:
  vagrant.running:
    - cwd: /projects/my_project
    - vagrant_runas: my_username
    - machine: machine1
```

`salt.states.vagrant.`**`stopped`**`(`*name*`)`

Stops a VM (or VMs) by shutting it (them) down nicely. (Runs `vagrant halt`)

Parameters **`name`** – May be a Salt_id node, or a POSIX-style wildcard string.

```
node_name:
  vagrant.stopped
```

21.19.282 salt.states.vault module

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.

maintainer SaltStack

maturity new

platform all

New in version 2017.7.0.

`salt.states.vault.`**`policy_present`**`(`*name*, *rules*`)`

Ensure a Vault policy with the given name and rules is present.

name The name of the policy

rules Rules formatted as in-line HCL

```
demo-policy:
  vault.policy_present:
    - name: foo/bar
    - rules: |
      path "secret/top-secret/*" {
        policy = "deny"
      }
      path "secret/not-very-secret/*" {
        policy = "write"
      }
```

21.19.283 salt.states.vbox_guest

VirtualBox Guest Additions installer state

`salt.states.vbox_guest.`**`additions_installed`**`(`*name*, *reboot=False*, *upgrade_os=False*`)`

Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

name The name has no functional value and is only used as a tracking reference.

reboot [False] Restart OS to complete installation.

upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

`salt.states.vbox_guest.`**`additions_removed`**`(`*name*, *force=False*`)`

Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

name The name has no functional value and is only used as a tracking reference.

force Force VirtualBox Guest Additions removing.

`salt.states.vbox_guest.`**`grant_access_to_shared_folders_to`**`(`*name*, *users=None*`)`

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*.

name Name of the user to grant access to auto-mounted shared folders to.

users List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

21.19.284 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'
```

`salt.states.victorops.`**`create_event`**`(`*name*, *message_type*, *routing_key='everyone'*, ***kwargs*`)`

Create an event on the VictorOps service

```
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

database-server-warning-message:
  victorops.create_event:
    - message_type: 'WARNING'
    - entity_id: 'db_server/load'
    - state_message: 'Database Server load is high.'
    - entity_is_host: True
    - entity_display_name: 'dbdserver.example.com'
```

The following parameters are required:

name This is a short description of the event.

message_type One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

routing_key The key for where messages should be routed. By default, sent to 'everyone' route.

entity_id The name of alerting entity. If not provided, a random name will be assigned.

timestamp Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

timestamp_fmt The date format for the timestamp parameter. Defaults to "%Y-%m-%dT%H:%M:%S'.

state_start_time The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

state_start_time_fmt The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.

state_message Any additional status information from the alert item.

entity_is_host Used within VictorOps to select the appropriate display format for the incident.

entity_display_name Used within VictorOps to display a human-readable name for the entity.

ack_message A user entered comment for the acknowledgment.

ack_author The user that acknowledged the incident.

21.19.285 salt.states.virt module

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```
libvirt_keys:
  virt.keys
```

`salt.states.virt.`**`keys`**`(`*name*, *basepath='/etc/pki'*, ***kwargs*`)`

Manage libvirt keys.

name The name variable used to track the execution

basepath Defaults to `/etc/pki`, this is the root location used for libvirt keys on the hypervisor

The following parameters are optional:

country The country that the certificate should use. Defaults to US.

New in version 2018.3.0.

state The state that the certificate should use. Defaults to Utah.

New in version 2018.3.0.

locality The locality that the certificate should use. Defaults to Salt Lake City.

New in version 2018.3.0.

organization The organization that the certificate should use. Defaults to Salted.

New in version 2018.3.0.

expiration_days The number of days that the certificate should be valid for. Defaults to 365 days (1 year)

New in version 2018.3.0.

`salt.states.virt.`**`network_running`**`(`*name*, *bridge*, *forward*, *vport=None*, *tag=None*, *ipv4_config=None*, *ipv6_config=None*, *autostart=True*, *connection=None*, *username=None*, *password=None*`)`

Defines and starts a new network with specified arguments.

Parameters

- **`bridge`** – Bridge name
- **`forward`** – Forward mode(bridge, router, nat)
- **`vport`** – Virtualport type (Default: `'None'`)
- **`tag`** – Vlan tag (Default: `'None'`)
- **`ipv4_config`** – IPv4 network configuration. See the :py:func‘virt.network_define <salt.modules.virt.network_define>‘ function corresponding parameter documentation for more details on this dictionary. (Default: None).

  New in version 3000.
- **`ipv6_config`** – IPv6 network configuration. See the :py:func‘virt.network_define <salt.modules.virt.network_define>‘ function corresponding parameter documentation for more details on this dictionary. (Default: None).

  New in version 3000.
- **`autostart`** – Network autostart (default `'True'`)
- **`connection`** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **`username`** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **`password`** – password to connect with, overriding defaults

  New in version 2019.2.0.

```
domain_name:
  virt.network_define
```

```
network_name:
  virt.network_define:
    - bridge: main
    - forward: bridge
    - vport: openvswitch
    - tag: 180
    - autostart: True
```

```
network_name:
  virt.network_define:
    - bridge: natted
    - forward: nat
    - ipv4_config:
        cidr: 192.168.42.0/24
        dhcp_ranges:
          - start: 192.168.42.10
            end: 192.168.42.25
          - start: 192.168.42.100
            end: 192.168.42.150
    - autostart: True
```

`salt.states.virt.`**`pool_deleted`**(*name, purge=False, connection=None, username=None, password=None*)

Deletes a virtual storage pool.

Parameters

- **`name`** – the name of the pool to delete.
- **`purge`** – if `True`, the volumes contained in the pool will be deleted as well as the pool itself. Note that these will be lost for ever. If `False` the pool will simply be undefined. (Default: `False`)
- **`connection`** – libvirt connection URI, overriding defaults
- **`username`** – username to connect with, overriding defaults
- **`password`** – password to connect with, overriding defaults

In order to be purged a storage pool needs to be running to get the list of volumes to delete.

Some libvirt storage drivers may not implement deleting, those actions are implemented on a best effort idea. In any case check the result's comment property to see if any of the action was unsupported.

New in version 3000.

`salt.states.virt.`**`pool_running`**(*name, ptype=None, target=None, permissions=None, source=None, transient=False, autostart=True, connection=None, username=None, password=None*)

Defines and starts a new pool with specified arguments.

New in version 2019.2.0.

Parameters

- **`ptype`** – libvirt pool type
- **`target`** – full path to the target device or folder. (Default: `None`)
- **`permissions`** – target permissions. See *Permissions definition* for more details on this structure.
- **`source`** – dictionary containing keys matching the `source_*` parameters in function *`salt.modules.virt.pool_define()`*.
- **`transient`** – when set to `True`, the pool will be automatically undefined after being stopped. (Default: `False`)
- **`autostart`** – Whether to start the pool when booting the host. (Default: `True`)
- **`start`** – When `True`, define and start the pool, otherwise the pool will be left stopped.
- **`connection`** – libvirt connection URI, overriding defaults
- **`username`** – username to connect with, overriding defaults
- **`password`** – password to connect with, overriding defaults

```
pool_name:
  virt.pool_define
```

```
pool_name:
  virt.pool_define:
    - ptype: netfs
    - target: /mnt/cifs
    - permissions:
        - mode: 0770
        - owner: 1000
        - group: 100
    - source:
        dir: samba_share
        hosts:
          - one.example.com
          - two.example.com
        format: cifs
    - autostart: True
```

`salt.states.virt.`**`powered_off`**`(`*name, connection=None, username=None, password=None*`)`

Stops a VM by power off.

New in version 2016.3.0.

Parameters

- **`connection`** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **`username`** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **`password`** – password to connect with, overriding defaults

  New in version 2019.2.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.`**`rebooted`**`(`*name, connection=None, username=None, password=None*`)`

Reboots VMs

New in version 2016.3.0.

Parameters

- **`name`** –
- **`connection`** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **`username`** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **`password`** – password to connect with, overriding defaults

  New in version 2019.2.0.

`salt.states.virt.`**`reverted`**`(`*name, snapshot=None, cleanup=False*`)`

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
  virt.reverted:
    - cleanup: True
```

(continues on next page)

(continued from previous page)

```
domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False
```

`salt.states.virt.`**`running`**`(`*name, cpu=None, mem=None, image=None, vm_type=None, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, seed=True, install=True, pub_key=None, priv_key=None, update=False, connection=None, username=None, password=None, os_type=None, arch=None, boot=None*`)`

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

Parameters

- **`name`** – name of the virtual machine to run
- **`cpu`** – number of CPUs for the virtual machine to create
- **`mem`** – amount of memory in MiB for the new virtual machine
- **`image`** – disk image to use for the first disk of the new VM

  Deprecated since version 2019.2.0.
- **`vm_type`** – force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use `'qemu'` type instead of the `'kvm'` one.

  New in version 2019.2.0.
- **`disk_profile`** – Name of the disk profile to use for the new virtual machine

  New in version 2019.2.0.
- **`disks`** – List of disk to create for the new virtual machine. See *Disks Definitions* for more details on the items on this list.

  New in version 2019.2.0.
- **`nic_profile`** – Name of the network interfaces profile to use for the new virtual machine

  New in version 2019.2.0.
- **`interfaces`** – List of network interfaces to create for the new virtual machine. See *Network Interfaces Definitions* for more details on the items on this list.

  New in version 2019.2.0.
- **`graphics`** – Graphics device to create for the new virtual machine. See *Graphics Definition* for more details on this dictionary

  New in version 2019.2.0.
- **`saltenv`** – Fileserver environment (Default: `'base'`). See *`cp module for more details`*

  New in version 2019.2.0.
- **`seed`** –

  `True` to seed the disk image. Only used when the `image` parameter is provided.

  (Default: `True`)

  New in version 2019.2.0.
- **`install`** – install salt minion if absent (Default: `True`)

  New in version 2019.2.0.
- **`pub_key`** – public key to seed with (Default: `None`)

  New in version 2019.2.0.

- **`priv_key`** – public key to seed with (Default: `None`)

  New in version 2019.2.0.
- **`seed_cmd`** – Salt command to execute to seed the image. (Default: `'seed.apply'`)

  New in version 2019.2.0.
- **`update`** – set to `True` to update a defined module. (Default: `False`)

  New in version 2019.2.0.
- **`connection`** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **`username`** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **`password`** – password to connect with, overriding defaults

  New in version 2019.2.0.
- **`os_type`** – type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for `hvm`. Only used when creating a new virtual machine.

  New in version 3000.
- **`arch`** – architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is prefed over `i686`. Only used when creating a new virtual machine.

  New in version 3000.
- **`boot`** – Specifies kernel for the virtual machine, as well as boot parameters for the virtual machine. This is an optionl parameter, and all of the keys are optional within the dictionary. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote fild, and will modify the XML accordingly.

  ```
  {
      'kernel': '/root/f8-i386-vmlinuz',
      'initrd': '/root/f8-i386-initrd',
      'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/
  ↪'
  }
  ```

  New in version 3000.

Example States

Make sure an already-defined virtual machine called `domain_name` is running:

```
domain_name:
  virt.running
```

Do the same, but define the virtual machine if needed:

```
domain_name:
  virt.running:
    - cpu: 2
    - mem: 2048
    - disk_profile: prod
    - disks:
```

(continues on next page)

(continued from previous page)

```
      - name: system
        size: 8192
        overlay_image: True
        pool: default
        image: /path/to/image.qcow2
      - name: data
        size: 16834
    - nic_profile: prod
    - interfaces:
      - name: eth0
        mac: 01:23:45:67:89:AB
      - name: eth1
        type: network
        source: admin
    - graphics:
        type: spice
        listen:
            type: address
            address: 192.168.0.125
```

`salt.states.virt.`**`saved`**`(`*name*, *suffix=None*`)`

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic
```

`salt.states.virt.`**`snapshot`**`(`*name*, *suffix=None*, *connection=None*, *username=None*, *password=None*`)`

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

  New in version 2019.2.0.

```
domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic
```

`salt.states.virt.`**`stopped`**`(`*name*, *connection=None*, *username=None*, *password=None*`)`

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

Parameters

- **`connection`** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **`username`** – username to connect with, overriding defaults

  New in version 2019.2.0.
- **`password`** – password to connect with, overriding defaults

  New in version 2019.2.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.`**`unpowered`**`(`*name*`)`

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

21.19.286 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

`salt.states.virtualenv_mod.`**`managed`**`(`*name*, *venv_bin=None*, *requirements=None*, *system_site_packages=False*, *distribute=False*, *use_wheel=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *user=None*, *cwd=None*, *index_url=None*, *extra_index_url=None*, *pre_releases=False*, *no_deps=False*, *pip_download=None*, *pip_download_cache=None*, *pip_exists_action=None*, *pip_ignore_installed=False*, *proxy=None*, *use_vt=False*, *env_vars=None*, *no_use_wheel=False*, *pip_upgrade=False*, *pip_pkgs=None*, *pip_no_cache_dir=False*, *pip_cache_dir=None*, *process_dependency_links=False*, *no_binary=None*, ***kwargs*`)`

Create a virtualenv and optionally manage it with pip

name Path to the virtualenv.

venv_bin: virtualenv The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

requirements: None Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

use_wheel: False Prefer wheel archives (requires pip >= 1.4).

python [None] Python executable used to build the virtualenv

user: None The user under which to run virtualenv and pip.

cwd: None Path to the working directory where *pip install* is executed.

no_deps: False Pass *–no-deps* to *pip install.*

pip_exists_action: None Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

proxy: None Proxy address which is passed to *pip install*.

env_vars: None Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.

no_use_wheel: False Force to not use wheel archives (requires pip>=1.4)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

pip_upgrade: False Pass *–upgrade* to *pip install*.

pip_pkgs: None As an alternative to *requirements*, pass a list of pip packages that should be installed.

process_dependency_links: False Run pip install with the –process_dependency_links flag.

New in version 2017.7.0.

Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `- distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
        PATH_VAR: '/usr/local/bin/'
```

21.19.287 salt.states.webutil

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

`salt.states.webutil.`**`user_absent`**(*name*, *htpasswd_file=None*, *runas=None*)

Make sure the user is not in the specified htpasswd file

name User name

htpasswd_file Path to the htpasswd file

runas The system user to run htpasswd command with

`salt.states.webutil.`**`user_exists`**(*name*, *password=None*, *htpasswd_file=None*, *options=''*, *force=False*, *runas=None*, *update=False*)

Make sure the user is inside the specified htpasswd file

name User name

password User password

htpasswd_file Path to the htpasswd file

options See `salt.modules.htpasswd.useradd`

force Touch the file even if user already created

runas The system user to run htpasswd command with

update Update an existing user's password if it's different from what's in the htpasswd file (unlike force, which updates regardless)

21.19.288 salt.states.win_certutil module

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher
```

`salt.states.win_certutil.`**`add_store`**`(`*name*, *store*, *saltenv='base'*`)`

Store a certificate to the given store

name The certificate to store, this can use local paths or salt:// paths

store The store to add the certificate to

saltenv The salt environment to use, this is ignored if a local path is specified

`salt.states.win_certutil.`**`del_store`**`(`*name*, *store*, *saltenv='base'*`)`

Remove a certificate in the given store

name The certificate to remove, this can use local paths or salt:// paths

store The store to remove the certificate from

saltenv The salt environment to use, this is ignored if a local path is specified

21.19.289 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

parameters: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

parameters: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
removeAcl:
  win_dacl.absent:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an object is inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```
eInherit:
  win_dacl.enableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - clear_existing_acl: True
```

Ensure an object is not inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```
dInherit:
  win_dacl.disableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - copy_inherited_acl: False
```

`salt.states.win_dacl.`**`absent`**(*name*, *objectType*, *user*, *permission*, *acetype*, *propagation*)
Ensure an ACL does not exist

`salt.states.win_dacl.`**`disinherit`**(*name*, *objectType*, *copy_inherited_acl=True*)
Ensure an object is not inheriting ACLs from its parent

`salt.states.win_dacl.`**`inherit`**(*name*, *objectType*, *clear_existing_acl=False*)
Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.`**`present`**(*name*, *objectType*, *user*, *permission*, *acetype*, *propagation*)
Ensure an ACE is present

21.19.290 salt.states.win_dism module

Installing of Windows features using DISM

Install windows features/capabilties with DISM

```
Language.Basic~~~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed
```

`salt.states.win_dism.`**`capability_installed`**(*name*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)
Install a DISM capability

Parameters

- **name** (*str*) – The capability to install
- **source** (*str*) – The optional source of the capability
- **limit_access** (*bool*) – Prevent DISM from contacting Windows Update for online images
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.`**`capability_removed`**(*name*, *image=None*, *restart=False*)

Uninstall a DISM capability

Parameters

- **name** (*str*) – The capability to uninstall
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.`**`feature_installed`**(*name*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a DISM feature

Parameters

- **name** (*str*) – The feature in which to install
- **package** (*Optional[str]*) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) – The optional source of the feature
- **limit_access** (*bool*) – Prevent DISM from contacting Windows Update for online images
- **enable_parent** (*Optional[bool]*) – True will enable all parent features of the specified feature
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

`salt.states.win_dism.`**`feature_removed`**`(`*name, remove_payload=False, image=None, restart=False*`)`

Disables a feature.

Parameters

- **`name`** (*`str`*) – The feature to disable
- **`remove_payload`** (*`Optional[bool]`*) – Remove the feature's payload. Must supply source when enabling in the future.
- **`image`** (*`Optional[str]`*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (*`Optional[bool]`*) – Reboot the machine if required by the install

Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

`salt.states.win_dism.`**`package_installed`**`(`*name, ignore_check=False, prevent_pending=False, image=None, restart=False*`)`

Install a package.

Parameters

- **`name`** (*`str`*) – The package to install. Can be a .cab file, a .msu file, or a folder
- **`ignore_check`** (*`Optional[bool]`*) – Skip installation of the package if the applicability checks fail
- **`prevent_pending`** (*`Optional[bool]`*) – Skip the installation of the package if there are pending online actions
- **`image`** (*`Optional[str]`*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (*`Optional[bool]`*) – Reboot the machine if required by the install

Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.`**`package_removed`**`(`*name, image=None, restart=False*`)`

Uninstall a package

Parameters

- **`name`** (*`str`*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **`image`** (*`Optional[str]`*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (*`Optional[bool]`*) – Reboot the machine if required by the install

Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

21.19.291 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.`**`dns_dhcp`**(*name*, *interface='Local Area Connection'*)
Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.`**`dns_exists`**(*name*, *servers=None*, *interface='Local Area Connection'*, *replace=False*)
Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list, default is␣
↪False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

`salt.states.win_dns_client.`**`primary_suffix`**(*name*, *suffix=None*, *updates=False*)
New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

suffix [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

updates [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
    win_dns_client.primary_suffix:
        - suffix: sub.domain.tld
        - updates: True
```

21.19.292 salt.states.win_firewall

State for configuring Windows Firewall

`salt.states.win_firewall.`**`add_rule`**(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)
Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) – The name of the rule. Must be unique and cannot be "all". Required.

- **localport** (*int*) – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) – The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) – The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) – The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) – The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

  Can be combinations of the above separated by commas.

  New in version 2016.11.6.

Example:

```
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

`salt.states.win_firewall.`**`disabled`**(*name='allprofiles'*)

Disable all the firewall profiles (Windows only)

Parameters **profile** (*Optional[str]*) – The name of the profile to disable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
```

(continues on next page)

(continued from previous page)

```
disable_all:
  win_firewall.disabled:
    - name: allprofiles
```

`salt.states.win_firewall.`**`enabled`**(*name='allprofiles'*)

Enable all the firewall profiles (Windows only)

Parameters **`profile`** (`Optional[str]`) – The name of the profile to enable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To enable the domain profile
enable_domain:
  win_firewall.enabled:
    - name: domainprofile

# To enable all profiles
enable_all:
  win_firewall.enabled:
    - name: allprofiles
```

21.19.293 salt.states.win_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

`salt.states.win_iis.`**`container_setting`**(*name*, *container*, *settings=None*)

Set the value of the setting for an IIS container.

Parameters

- **`name`** (`str`) – The name of the IIS container.
- **`container`** (`str`) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **`settings`** (`str`) – A dictionary of the setting names and their values. Example of usage for the `AppPools` container:

```
site0-apppool-setting:
    win_iis.container_setting:
        - name: site0
        - container: AppPools
        - settings:
            managedPipelineMode: Integrated
            processModel.maxProcesses: 1
            processModel.userName: TestUser
            processModel.password: TestPassword
            processModel.identityType: SpecificUser
```

Example of usage for the `Sites` container:

```
site0-site-setting:
    win_iis.container_setting:
        - name: site0
        - container: Sites
        - settings:
            logFile.logFormat: W3C
            logFile.period: Daily
            limits.maxUrlSegments: 32
```

`salt.states.win_iis.`**`create_app`**(*name, site, sourcepath, apppool=None*)

Create an IIS application.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **apppool** (*str*) – The name of the IIS application pool.

Example of usage with only the required arguments:

```
site0-v1-app:
    win_iis.create_app:
        - name: v1
        - site: site0
        - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```
site0-v1-app:
    win_iis.create_app:
        - name: v1
        - site: site0
        - sourcepath: C:\inetpub\site0\v1
        - apppool: site0
```

`salt.states.win_iis.`**`create_apppool`**(*name*)

Create an IIS application pool.

Parameters **name** (*str*) – The name of the IIS application pool.

Usage:

```
site0-apppool:
    win_iis.create_apppool:
        - name: site0
```

`salt.states.win_iis.`**`create_binding`**(*name, site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=0*)

Create an IIS binding.

Parameters

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.
- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
    win_iis.create_binding:
```

(continues on next page)

(continued from previous page)

```
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
    win_iis.create_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
        - sslflags: 0
```

`salt.states.win_iis.`**`create_cert_binding`**(*name*, *site*, *hostheader=''*, *ipaddress='*'*, *port=443*, *sslflags=0*)

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **sslflags** (*str*) – Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
    win_iis.create_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
    win_iis.create_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
        - sslflags: 1
```

New in version 2016.11.0.

`salt.states.win_iis.`**`create_vdir`**(*name*, *site*, *sourcepath*, *app='/'*)

Create an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **app** (*str*) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
    win_iis.create_vdir:
```

(continues on next page)

(continued from previous page)

```
        - name: foo
        - site: site0
        - sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
    win_iis.create_vdir:
        - name: foo
        - site: site0
        - sourcepath: C:\inetpub\vdirs\foo
        - app: v1
```

`salt.states.win_iis.`**`deployed`**(*name*, *sourcepath*, *apppool=''*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*)

Ensure the website has been deployed.

Parameters

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
        - apppool: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
```

`salt.states.win_iis.`**`remove_app`**(*name*, *site*)

Remove an IIS application.

Parameters

- **name** (*str*) – The application name.
- **site** (*str*) – The IIS site name.

Usage:

```
site0-v1-app-remove:
    win_iis.remove_app:
        - name: v1
        - site: site0
```

`salt.states.win_iis.`**`remove_apppool`**(*name*)

Remove an IIS application pool.

Parameters **`name`** (*`str`*) – The name of the IIS application pool.

Usage:

```
defaultapppool-remove:
    win_iis.remove_apppool:
        - name: DefaultAppPool
```

`salt.states.win_iis.`**`remove_binding`**(*name, site, hostheader='', ipaddress='*', port=80*)

Remove an IIS binding.

Parameters

- **`site`** (*`str`*) – The IIS site name.
- **`hostheader`** (*`str`*) – The host header of the binding.
- **`ipaddress`** (*`str`*) – The IP address of the binding.
- **`port`** (*`str`*) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
```

`salt.states.win_iis.`**`remove_cert_binding`**(*name, site, hostheader='', ipaddress='*', port=443*)

Remove a certificate from an IIS binding.

Parameters

- **`name`** (*`str`*) – The thumbprint of the certificate.
- **`site`** (*`str`*) – The IIS site name.
- **`hostheader`** (*`str`*) – The host header of the binding.
- **`ipaddress`** (*`str`*) – The IP address of the binding.
- **`port`** (*`str`*) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
```

New in version 2016.11.0.

`salt.states.win_iis.`**`remove_site`**`(`*name*`)`

Delete a website from IIS.

Parameters **name** (*str*) – The IIS site name.

Usage:

```
defaultwebsite-remove:
    win_iis.remove_site:
        - name: Default Web Site
```

`salt.states.win_iis.`**`remove_vdir`**`(`*name, site, app='/'*`)`

Remove an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **app** (*str*) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
        - app: v1
```

`salt.states.win_iis.`**`set_app`**`(`*name, site, settings=None*`)`

New in version 2017.7.0.

Set the value of the setting for an IIS web application.

Note: This function only configures existing app. Params are case sensitive.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **settings** (*str*) – A dictionary of the setting names and their values.

Available settings:

- `physicalPath` - The physical path of the webapp
- `applicationPool` - The application pool for the webapp
- `userName` "connectAs" user
- `password` "connectAs" password for user

Return type bool

Example of usage:

```
site0-webapp-setting:
    win_iis.set_app:
        - name: app0
        - site: Default Web Site
```

(continues on next page)

(continued from previous page)

```
        - settings:
            userName: domain\\user
            password: pass
            physicalPath: c:\inetpub\wwwroot
            applicationPool: appPool0
```

`salt.states.win_iis.`**`webconfiguration_settings`**`(`*name*, *settings=None*`)`

Set the value of webconfiguration settings.

Parameters

- **name** (*str*) – The name of the IIS PSPath containing the settings. Possible PSPaths are : MACHINE, MACHINE/WEBROOT, IIS:, IIS:Sitessitename, …
- **settings** (*dict*) – Dictionaries of dictionaries. You can match a specific item in a collection with this syntax inside a key: 'Collection[{name: site0}].logFile.directory'

Example of usage for the `MACHINE/WEBROOT` PSPath:

```
MACHINE-WEBROOT-level-security:
  win_iis.webconfiguration_settings:
    - name: 'MACHINE/WEBROOT'
    - settings:
        system.web/authentication/forms:
          requireSSL: True
          protection: "All"
          credentials.passwordFormat: "SHA1"
        system.web/httpCookies:
          httpOnlyCookies: True
```

Example of usage for the `IIS:\Sites\site0` PSPath:

```
site0-IIS-Sites-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\Sites\site0'
    - settings:
        system.webServer/httpErrors:
          errorMode: "DetailedLocalOnly"
        system.webServer/security/requestFiltering:
          allowDoubleEscaping: False
          verbs.Collection:
            - verb: TRACE
              allowed: False
          fileExtensions.allowUnlisted: False
```

Example of usage for the `IIS:\` PSPath with a collection matching:

```
site0-IIS-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\'
    - settings:
        system.applicationHost/sites:
          'Collection[{name: site0}].logFile.directory': 'C:\logs\iis\site0'
```

21.19.294 salt.states.win_lgpo module

Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

```
Ensure Account Lockout Duration:
  lgpo.set:
    - name: Account lockout duration
    - setting: 90
    - policy_class: Machine
```

```
Account lockout duration:
  lgpo.set:
    - setting: 120
    - policy_class: Machine
```

Multiple policy configuration

```
Company Local Group Policy:
    lgpo.set:
        - computer_policy:
            Deny log on locally:
              - Guest
            Account lockout duration: 120
            Account lockout threshold: 10
            Reset account lockout counter after: 120
            Enforce password history: 24
            Maximum password age: 60
            Minimum password age: 1
            Minimum password length: 14
            Password must meet complexity requirements: Enabled
            Store passwords using reversible encryption: Disabled
            Configure Automatic Updates:
                Configure automatic updating: 4 - Auto download and schedule the␣
↪intsall
                Scheduled install day: 7 - Every Saturday
                Scheduled install time: 17:00
            Specify intranet Microsoft update service location:
                Set the intranet update service for detecting updates: http://mywsus
                Set the intranet statistics server: http://mywsus
        - user_policy:
            Do not process the legacy run list: Enabled
```

```
server_policy:
  lgpo.set:
    - computer_policy:
        Maximum password age: 60
        Minimum password age: 1
        Minimum password length: 14
        Account lockout duration: 120
        Account lockout threshold: 10
        Reset account lockout counter after: 120
        Manage auditing and security log:
          - "BUILTIN\Administrators"
        Replace a process level token:
```

(continues on next page)

(continued from previous page)

```
         - "NT AUTHORITY\NETWORK SERVICE"

       "Windows Components\Windows Update\Reschedule Automatic Updates scheduled
↪installations": Disabled
       "Windows Components\Windows Update\Specify intranet Microsoft update service
↪location":
           "Set the intranet update service for detecting updates": http://mywsus
           "Set the intranet statistics server": http://mywsus
   - cumulative_rights_assignments: True
```

`salt.states.win_lgpo.`**`set_`**(*name*, *setting=None*, *policy_class=None*, *computer_policy=None*, *user_policy=None*, *cumulative_rights_assignments=True*, *adml_language='en-US'*)

Ensure the specified policy is set.

> **Warning:** The `setting` argument cannot be used in conjunction with the `computer_policy` or `user_policy` arguments

Parameters

- **`name`** (*`str`*) – The name of a single policy to configure
- **`setting`** (*`str, dict, list`*) – The configuration setting for the single named

policy. If this argument is used the `computer_policy` / `user_policy` arguments will be ignored

- **policy_class** (*str*) – The policy class of the single named policy to configure. This can `machine`, `user`, or `both`
- **computer_policy** (*dict*) – A dictionary of containing the policy name and key/value pairs of a set of computer policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **user_policy** (*dict*) – A dictionary of containing the policy name and key/value pairs of a set of user policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **cumulative_rights_assignments** (*bool*) – If user rights assignments are being configured, determines if any user right assignment policies specified will be cumulative or explicit
- **adml_language** (*str*) – The adml language to use for AMDX policy data/display conversions. Default is `en-US`

21.19.295 salt.states.win_license module

Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
  license.activate
```

`salt.states.win_license.`**`activate`**(*name*)

Install and activate the given product key

name The 5x5 product key given to you by Microsoft

21.19.296 salt.states.win_network

Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the `network` state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: dhcp
    - ip_proto: dhcp
```

Note: Both the `dns_proto` and `ip_proto` arguments are required.

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
```

(continues on next page)

(continued from previous page)

```
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
```

Note: IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called *`ip.get_subnet_length`* to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
    - gateway: 10.2.3.1
```

`salt.states.win_network.`**`managed`**(*name*, *dns_proto=None*, *dns_servers=None*, *ip_proto=None*, *ip_addrs=None*, *gateway=None*, *enabled=True*, ***kwargs*)

Ensure that the named interface is configured properly.

Parameters

- **name** (*str*) – The name of the interface to manage
- **dns_proto** (*str*) – None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. set to `dhcp` to use DHCP to get the DNS servers.
- **dns_servers** (*list*) – None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). `None` will make no changes.
- **ip_proto** (*str*) – None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **ip_addrs** (*list*) – None A list of static IP addresses with netmask flag, ie: 192.168.0.11/24
- **gateway** (*str*) – None The gateway to set for the interface
- **enabled** (*bool*) – True Set to `False` to ensure that this interface is disabled.

Returns A dictionary of old and new settings

Return type dict

Example:

```
Ethernet1:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 192.168.0.100/24
```

Clear DNS entries example:

```
Ethernet1:
  network.managed:
    - dns_proto: static
    - dns_servers: []
    - ip_proto: dhcp
```

21.19.297 salt.states.win_path

Manage the Windows System PATH

`salt.states.win_path.`**`absent`**`(`*name*`)`

Remove the directory from the SYSTEM path

Example:

```
'C:\sysinternals':
  win_path.absent
```

`salt.states.win_path.`**`exists`**`(`*name, index=None*`)`

Add the directory to the system PATH at index location

index Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

> **Note:** If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

```
'C:\python27':
  win_path.exists

'C:\sysinternals':
  win_path.exists:
    - index: 0

'C:\mystuff':
  win_path.exists:
    - index: -1
```

21.19.298 salt.states.win_pki module

Microsoft certificate management via the Pki PowerShell module.

platform Windows

New in version 2016.11.0.

`salt.states.win_pki.`**`import_cert`**`(`*name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base'*`)`

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) – The path of the certificate file to import.

- **cert_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **exportable** (*bool*) – Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) – The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
    win_pki.import_cert:
        - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
    win_pki.import_cert:
        - name: salt://win/webserver/certs/site0.pfx
        - cert_format: pfx
        - context: LocalMachine
        - store: My
        - exportable: True
        - password: TestPassword
        - saltenv: base
```

`salt.states.win_pki.`**`remove_cert`**(*name*, *thumbprint*, *context='LocalMachine'*, *store='My'*)

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
    win_pki.remove_cert:
        - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
    win_pki.remove_cert:
        - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - context: LocalMachine
        - store: My
```

21.19.299 salt.states.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set timeout to 30 minutes on battery power
monitor:
    powercfg.set_timeout:
```

(continues on next page)

(continued from previous page)

```
      - value: 30
      - power: dc
```

`salt.states.win_powercfg.`**`set_timeout`**(*name*, *value*, *power='ac'*, *scheme=None*)

Set the sleep timeouts of specific items such as disk, monitor, etc.

Parameters

- **name** (*str*) – The setting to change, can be one of the following:
  - `monitor`
  - `disk`
  - `standby`
  - `hibernate`
- **value** (*int*) – The amount of time in minutes before the item will timeout
- **power** (*str*) – Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) – The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

CLI Example:

```
# Set monitor timeout to 30 minutes on Battery
monitor:
  powercfg.set_timeout:

  powercfg.set_timeout:
    - value: 10
    - power: ac
```

21.19.300 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>

platform Windows Server 2008R2 or greater

depends win_servermanager.install

depends win_servermanager.remove

`salt.states.win_servermanager.`**`installed`**(*name*, *features=None*, *recurse=False*, *restart=False*, *source=None*, *exclude=None*, ***kwargs*)

Install the windows feature. To install a single feature, use the `name` parameter. To install multiple features, use the `features` parameter.

Note: Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

Parameters

- **name** (*str*) – Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma delimited list (no spaces)

  Note: A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

  ---

- **features** (*Optional[list]*) – A list of features to install. If this is passed it will be used instead of the `name` parameter.

  New in version 2018.3.0.
- **recurse** (*Optional[bool]*) – Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features. This argument was previously renamed from `force`. To ensure backwards compatibility `force` will continue to work but please update your states to use the preferred `recurse` arg.
- **source** (*Optional[str]*) – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) – Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  > **Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in ``exclude`` is not a sub-feature of one of the installed items it will still be removed.**

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
  win_servermanager.installed:
    - recurse: True
    - name: Web-Server

# Install multiple features, exclude the Web-Service
install_multiple_features:
  win_servermanager.installed:
    - recurse: True
    - features:
      - RemoteAccess
```

(continues on next page)

(continued from previous page)

```
    - XPS-Viewer
    - SNMP-Service
  - exclude:
    - Web-Server
```

`salt.states.win_servermanager.`**`removed`**(*name*, *features=None*, *remove_payload=False*, *restart=False*)

Remove the windows feature To remove a single feature, use the `name` parameter. To remove multiple features, use the `features` parameter.

Parameters

- **`name`** (*`str`*) – Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma-delimited list (no spaces)

  Note: A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

  ---

- **`features`** (*`Optional[list]`*) – A list of features to remove. If this is passed it will be used instead of the `name` parameter.

  New in version 2018.3.0.
- **`remove_payload`** (*`Optional[bool]`*) – True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the `source`
- **`restart`** (*`Optional[bool]`*) – Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

---

Note: Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
  win_servermanager.removed:
    - name: Web-Server

# Uninstall multiple features, reboot if required
uninstall_multiple_features:
  win_servermanager.removed:
    - features:
      - RemoteAccess
      - XPX-Viewer
      - SNMP-Service
    - restart: True
```

21.19.301 salt.states.win_smtp_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.`**`active_log_format`**(*name, log_format, server='SmtpSvc/1'*)

Manage the active log format for the SMTP server.

Parameters

- **`log_format`** (*`str`*) – The log format name.
- **`server`** (*`str`*) – The SMTP server name.

Example of usage:

```
smtp-log-format:
    win_smtp_server.active_log_format:
        - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.`**`connection_ip_list`**(*name, addresses=None, grant_by_default=False, server='SmtpSvc/1'*)

Manage IP list for SMTP connections.

Parameters

- **`addresses`** (*`str`*) – A dictionary of IP + subnet pairs.
- **`grant_by_default`** (*`bool`*) – Whether the addresses should be a blacklist or whitelist.
- **`server`** (*`str`*) – The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
    win_smtp_server.connection_ip_list:
        - addresses:
            127.0.0.1: 255.255.255.255
            172.16.1.98: 255.255.255.255
            172.16.1.99: 255.255.255.255
        - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
    win_smtp_server.connection_ip_list:
        - addresses:
            172.16.1.100: 255.255.255.255
            172.16.1.101: 255.255.255.255
        - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
    win_smtp_server.connection_ip_list:
        - addresses: {}
        - grant_by_default: True
```

`salt.states.win_smtp_server.`**`relay_ip_list`**(*name, addresses=None, server='SmtpSvc/1'*)

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
  '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
  '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
  '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** (*str*) – A list of the relay IPs. The order of the list is important.
- **server** (*str*) – The SMTP server name.

Example of usage:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
        - 24.0.0.128
        - 32.0.0.128
        - 60.0.0.128
        - 1.0.0.0
        - 76.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 1.0.0.0
        - 1.0.0.0
        - 2.0.0.0
        - 2.0.0.0
        - 4.0.0.0
        - 0.0.0.0
        - 76.0.0.128
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 255.255.255.255
        - 127.0.0.1
```

Example of usage for disabling relaying:

```
smtp-relay-list:
    win_smtp_server.relay_ip_list:
        - addresses: None
```

Example of usage for allowing relaying from any source:

```
smtp-relay-list:
    win_smtp_server.relay_ip_list:
        - addresses: []
```

`salt.states.win_smtp_server.`**`server_setting`**(*name, settings=None, server='SmtpSvc/1'*)

Ensure the value is set for the specified setting.

Note: The setting names are case-sensitive.

Parameters
- **settings** (*str*) – A dictionary of the setting names and their values.
- **server** (*str*) – The SMTP server name.

Example of usage:

```
smtp-settings:
    win_smtp_server.server_setting:
        - settings:
            LogType: 1
            LogFilePeriod: 1
            MaxMessageSize: 16777216
            MaxRecipients: 10000
            MaxSessionSize: 16777216
```

21.19.302 salt.states.win_snmp module

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.`**`agent_settings`**(*name*, *contact*, *location*, *services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters
- **contact** (*str*) – The SNMP contact.
- **location** (*str*) – The SNMP location.
- **services** (*str*) – A list of selected services.

Example of usage:

```
snmp-agent-settings:
    win_snmp.agent_settings:
        - contact: Test Contact
        - location: Test Location
        - services:
            - Physical
            - Internet
```

`salt.states.win_snmp.`**`auth_traps_enabled`**(*name*, *status=True*)

Manage the sending of authentication traps.

Parameters **status** (*bool*) – The enabled status.

Example of usage:

```
snmp-auth-traps:
    win_snmp.auth_traps_enabled:
        - status: True
```

`salt.states.win_snmp.`**`community_names`**(*name*, *communities=None*)

Manage the SNMP accepted community names and their permissions.

Parameters **communities** (*str*) – A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
    win_snmp.community_names:
        - communities:
```

(continues on next page)

(continued from previous page)

```
            TestCommunity: Read Only
            OtherCommunity: Read Write
```

21.19.303 salt.states.win_system

Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
  system.computer_name: []

This is Erik's computer, don't touch!:
  system.computer_desc: []
```

`salt.states.win_system.`**`computer_desc`**`(`*name*`)`

Manage the computer's description field

name The desired computer description

`salt.states.win_system.`**`computer_name`**`(`*name*`)`

Manage the computer's name

name The desired computer name

`salt.states.win_system.`**`hostname`**`(`*name*`)`

New in version 2016.3.0.

Manage the hostname of the computer

name The hostname to set

`salt.states.win_system.`**`join_domain`**`(`*name, username=None, password=None, account_ou=None, account_exists=False, restart=False*`)`

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

Parameters

- **name** (*str*) – The name of the Domain.
- **username** (*str*) – Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like user@domain.tld or simply user.
- **password** (*str*) – Password of the account to add the computer to the Domain.
- **account_ou** (*str*) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers,ou=departm_432,dc=my-company,dc=com.
- **account_exists** (*bool*) – Needs to be set to `True` to allow re-using an existing computer account.
- **restart** (*bool*) – Needs to be set to `True` to restart the computer after a successful join.

Example:

```
join_to_domain:
  system.join_domain:
    - name: mydomain.local.com
    - username: myaccount@mydomain.local.com
    - password: mysecretpassword
    - restart: True
```

`salt.states.win_system.`**`reboot`**(*name*, *message=None*, *timeout=5*, *force_close=True*, *in_seconds=False*, *only_on_pending_reboot=True*)

Reboot the computer

Parameters

- **`message`** (*`str`*) – An optional message to display to users. It will also be used as a comment in the event log entry.

  The default value is None.
- **`timeout`** (*`int`*) – The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

  The default value is 5.
- **`in_seconds`** (*`bool`*) – If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

  The default value is False.
- **`force_close`** (*`bool`*) – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

  The default value is True.
- **`only_on_pending_reboot`** (*`bool`*) – If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur.

  The default value is True.

`salt.states.win_system.`**`shutdown`**(*name*, *message=None*, *timeout=5*, *force_close=True*, *reboot=False*, *in_seconds=False*, *only_on_pending_reboot=False*)

Shutdown the computer

Parameters

- **`message`** (*`str`*) – An optional message to display to users. It will also be used as a comment in the event log entry.

  The default value is None.
- **`timeout`** (*`int`*) – The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

  The default value is 5.
- **`in_seconds`** (*`bool`*) – If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

  The default value is False.
- **`force_close`** (*`bool`*) – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

  The default value is True.
- **`reboot`** (*`bool`*) – If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.

  The default value is False.
- **`only_on_pending_reboot`** (*`bool`*) – If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.

The default value is False.

21.19.304 salt.states.win_wua module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
# Install a single update using the KB
KB3194343:
  wua.installed

# Install a single update using the name parameter
install_update:
  wua.installed:
    - name: KB3194343

# Install multiple updates using the updates parameter and a combination of
# KB number and GUID
install_updates:
  wua.installed:
   - updates:
     - KB3194343
     - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
# Remove a single update using the KB
KB3194343:
  wua.removed

# Remove a single update using the name parameter
remove_update:
  wua.removed:
    - name: KB3194343

# Remove multiple updates using the updates parameter and a combination of
# KB number and GUID
remove_updates:
  wua.removed:
   - updates:
     - KB3194343
     - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

`salt.states.win_wua.`**`installed`**(*name*, *updates=None*)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

Parameters

- **name** (*str*) – The identifier of a single update to install.
- **updates** (*list*) – A list of identifiers for updates to be installed. Overrides `name`. Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're installing the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being installed.

Returns A dictionary containing the results of the update

Return type dict

CLI Example:

```
# using a GUID
install_update:
  wua.installed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
install_update:
  wua.installed:
    - name: KB3194343

# using the full Title
install_update:
  wua.installed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
↪(for x64-based Systems) (KB3194343)

# Install multiple updates
install_updates:
  wua.installed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.`**`removed`**(*name*, *updates=None*)

Ensure Microsoft Updates are uninstalled.

Parameters

- **name** (*str*) – The identifier of a single update to uninstall.
- **updates** (*list*) – A list of identifiers for updates to be removed. Overrides `name`. Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're uninstalling the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being removed.

Returns A dictionary containing the results of the removal

Return type dict

CLI Example:

```
# using a GUID
uninstall_update:
  wua.removed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

(continues on next page)

(continued from previous page)

```
# using a KB
uninstall_update:
  wua.removed:
    - name: KB3194343

# using the full Title
uninstall_update:
  wua.removed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607␣
↪(for x64-based Systems) (KB3194343)

# Install multiple updates
uninstall_updates:
  wua.removed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.`**`uptodate`**(*name, software=True, drivers=False, skip_hidden=False, skip_mandatory=False, skip_reboot=True, categories=None, severities=None*)

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

Parameters

- **name** (*str*) – The name has no functional value and is only used as a tracking reference
- **software** (*bool*) – Include software updates in the results (default is True)
- **drivers** (*bool*) – Include driver updates in the results (default is False)
- **skip_hidden** (*bool*) – Skip updates that have been hidden. Default is False.
- **skip_mandatory** (*bool*) – Skip mandatory updates. Default is False.
- **skip_reboot** (*bool*) – Skip updates that require a reboot. Default is True.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical

    - Important

Returns A dictionary containing the results of the update

Return type dict

CLI Example:

```
# Update the system using the state defaults
update_system:
  wua.uptodate

# Update the drivers
update_drivers:
  wua.uptodate:
    - software: False
    - drivers: True
    - skip_reboot: False

# Apply all critical updates
update_critical:
  wua.uptodate:
    - severities:
      - Critical
```

21.19.305 salt.states.win_wusa module

Microsoft Updates (KB) Management

This module provides the ability to enforce KB installations from files (.msu), without WSUS or Windows Update

New in version 2018.3.4.

`salt.states.win_wusa.`**`installed`**(*name*, *source*)

Ensure an update is installed on the minion

Parameters

- **name** (*str*) – Name of the Windows KB ("KB123456")
- **source** (*str*) – Source of .msu file corresponding to the KB

Example:

```
KB123456:
  wusa.installed:
    - source: salt://kb123456.msu
```

`salt.states.win_wusa.`**`uninstalled`**(*name*)

Ensure an update is uninstalled from the minion

Parameters **name** (*str*) – Name of the Windows KB ("KB123456")

Example:

```
KB123456:
  wusa.uninstalled
```

21.19.306 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.`**`genrepo`**(*name*, *force=False*, *allow_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If `force` is `True` no checks will be made and the repository will be generated if `allow_empty` is `True` then the state will not return an error if there are 0 packages,

---

Note: This state only loads on minions that have the `roles: salt-master` grain set.

Example:

```
winrepo:
  winrepo.genrepo
```

21.19.307 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

depends M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the *`sign_remote_certificate`* function.

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
```

(continues on next page)

(continued from previous page)

```
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory

/etc/pki/issued_certs:
  file.directory

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - managed_private_key:
        name: /etc/pki/ca.key
        bits: 4096
        backup: True
    - require:
      - file: /etc/pki

mine.send:
  module.run:
    - func: x509.get_pem_entries
    - kwargs:
        glob_path: /etc/pki/ca.crt
    - onchanges:
      - x509: /etc/pki/ca.crt
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/signing_policies.conf

```
x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered YAML, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```
/usr/local/share/ca-certificates:
  file.directory

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
↪']|replace('\n', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

```
/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
    - managed_private_key:
        name: /etc/pki/www.key
        bits: 4096
        backup: True
```

`salt.states.x509.`**`certificate_managed`**(*name*, *days_remaining=90*, *managed_private_key=None*, *append_certs=None*, ***kwargs*)

Manage a Certificate

name Path to the certificate

days_remaining [90] The minimum number of days remaining when the certificate should be recreated. A value of 0 disables automatic renewal.

managed_private_key Manages the private key corresponding to the certificate. All of the arguments supported by *`x509.private_key_managed`* are supported. If *name* is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.

append_certs: A list of certificates to be appended to the managed file.

kwargs: Any arguments supported by *`x509.create_certificate`* or *`file.managed`* are supported.

Examples:

```
/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

```
/etc/ssl/www.crt:
  x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True
```

`salt.states.x509.`**`crl_managed`**(*name, signing_private_key, signing_private_key_passphrase=None, signing_cert=None, revoked=None, days_valid=100, digest='', days_remaining=30, include_expired=False, **kwargs*)

Manage a Certificate Revocation List

name Path to the certificate

signing_private_key The private key that will be used to sign the CRL. This is usually your CA's private key.

signing_private_key_passphrase Passphrase to decrypt the private key.

signing_cert The certificate of the authority that will be used to sign the CRL. This is usually your CA's certificate.

revoked A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

days_valid [100] The number of days the certificate should be valid for.

digest The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.

days_remaining [30] The CRL should be automatically recreated if there are less than `days_remaining` days until the CRL expires. Set to 0 to disable automatic renewal.

include_expired [False] If `True`, include expired certificates in the CRL.

kwargs Any arguments supported by *`file.managed`* are supported.

Example:

```
/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromized_Web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation
```

`salt.states.x509.`**`csr_managed`**(*name, **kwargs*)

Manage a Certificate Signing Request

name: Path to the CSR

properties: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

kwargs: Any arguments supported by *`file.managed`* are supported.

Example:

```
/etc/pki/mycert.csr:
  x509.csr_managed:
```

(continues on next page)

(continued from previous page)

```
      - private_key: /etc/pki/mycert.key
      - CN: www.example.com
      - C: US
      - ST: Utah
      - L: Salt Lake City
      - keyUsage: 'critical dataEncipherment'
```

`salt.states.x509.`**`pem_managed`**`(`*name*, *text*, *backup=False*, ***kwargs*`)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

name: The path to the file to manage

text: The PEM formatted text to write.

kwargs: Any arguments supported by *`file.managed`* are supported.

`salt.states.x509.`**`private_key_managed`**`(`*name*, *bits=2048*, *passphrase=None*, *cipher='aes_128_cbc'*, *new=False*, *overwrite=False*, *verbose=True*, ***kwargs*`)`

Manage a private key's existence.

name: Path to the private key

bits: Key length in bits. Default 2048.

passphrase: Passphrase for encrypting the private key.

cipher: Cipher for encrypting the private key.

new: Always create a new key. Defaults to `False`. Combining new with `prereq`, or when used as part of a *managed_private_key* can allow key rotation whenever a new certificate is generated.

overwrite: Overwrite an existing private key if the provided passphrase cannot decrypt it.

verbose: Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

kwargs: Any kwargs supported by file.managed are supported.

Example:

The JINJA templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True
    {% if salt['file.file_exists']('/etc/pki/www.key') -%}
    - prereq:
      - x509: /etc/pki/www.crt
    {%- endif %}
```

21.19.308 salt.states.xml

XML Manager

State managment of XML files

`salt.states.xml.`**`value_present`**`(`*name*, *xpath*, *value*, ***kwargs*`)`

New in version 3000.

Manages a given XML file

name [string] The location of the XML file to manage, as an absolute path.

xpath [string] xpath location to manage

value [string] value to ensure present

```
ensure_value_true:
  xml.value_present:
    - name: /tmp/test.xml
    - xpath: .//playwright[@id='1']
    - value: William Shakespeare
```

21.19.309 salt.states.xmpp

Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.`**`send_msg`**`(`*name, recipient, profile*`)`

Send a message to an XMPP user

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

name The message to send to the XMPP user

`salt.states.xmpp.`**`send_msg_multi`**`(`*name, profile, recipients=None, rooms=None*`)`

Send a message to an list of recipients or rooms

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
      - admins@xmpp.example.com/salt
    - rooms:
      - qa@conference.xmpp.example.com
```

name The message to send to the XMPP user

21.19.310 salt.states.zabbix_action

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_action.`**`absent`**`(`*name, **kwargs*`)`

Makes the Zabbix Action to be absent (either does not exist or delete it).

Parameters

- **name** – Zabbix Action name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-action-absent:
    zabbix_action.absent:
        - name: Action name
```

salt.states.zabbix_action.**present**(*name*, *params*, ***kwargs*)

Creates Zabbix Action object or if differs update it according defined parameters

Parameters

- **name** – Zabbix Action name
- **params** – Definition of the Zabbix Action
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query_object" and "query_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

```
zabbix-action-present:
    zabbix_action.present:
        - name: VMs
        - params:
            eventsource: 2
            status: 0
            filter:
                evaltype: 2
                conditions:
                    - conditiontype: 24
                      operator: 2
                      value: 'virtual'
                    - conditiontype: 24
                      operator: 2
                      value: 'kvm'
            operations:
                - operationtype: 2
                - operationtype: 4
                  opgroup:
                      - groupid:
                          query_object: hostgroup
                          query_name: Virtual machines
                      - groupid:
                          query_object: hostgroup
                          query_name: Databases
```

21.19.311 salt.states.zabbix_host module

Management of Zabbix hosts.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_host.`**`absent`**(*name*, ***kwargs*)

Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

Param name: technical name of the host

Parameters

- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
TestHostWithInterfaces:
    zabbix_host.absent
```

`salt.states.zabbix_host.`**`assign_templates`**(*host*, *templates*, ***kwargs*)

Ensures that templates are assigned to the host.

New in version 2017.7.0.

Parameters

- **`host`** – technical name of the host
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
add_zabbix_templates_to_host:
    zabbix_host.assign_templates:
        - host: TestHost
        - templates:
            - "Template OS Linux"
            - "Template App MySQL"
```

`salt.states.zabbix_host.`**`present`**(*host*, *groups*, *interfaces*, ***kwargs*)

Ensures that the host exists, eventually creates new host. NOTE: please use argument visible_name instead of name to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host

New in version 2016.3.0.

Parameters

- **`host`** – technical name of the host
- **`groups`** – groupids of host groups to add the host to
- **`interfaces`** – interfaces to be created for the host
- **`proxy_host`** – Optional proxy name or proxyid to monitor host
- **`inventory`** – Optional list of inventory names and values
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** – Optional - string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```
create_test_host:
    zabbix_host.present:
        - host: TestHostWithInterfaces
        - proxy_host: 12345
        - groups:
            - 5
            - 6
            - 7
        - interfaces:
            - test1.example.com:
                - ip: '192.168.1.8'
                - type: 'Agent'
                - port: 92
            - testing2_create:
                - ip: '192.168.1.9'
                - dns: 'test2.example.com'
                - type: 'agent'
                - main: false
            - testovaci1_ipmi:
                - ip: '192.168.100.111'
                - type: 'ipmi'
        - inventory:
            - alias: some alias
            - asset_tag: jlm3937
```

21.19.312 salt.states.zabbix_hostgroup module

Management of Zabbix host groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_hostgroup.`**`absent`**`(`*name*, ***kwargs*`)`

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_testing_host_group:
    zabbix_hostgroup.absent:
        - name: 'My hostgroup name'
```

`salt.states.zabbix_hostgroup.`**`present`**`(`*name*, ***kwargs*`)`

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
create_testing_host_group:
    zabbix_hostgroup.present:
        - name: 'My hostgroup name'
```

21.19.313 salt.states.zabbix_mediatype module

Management of Zabbix mediatypes.

codeauthor Raymond Kuiper <qix@the-wired.net>

`salt.states.zabbix_mediatype.`**`absent`**`(`*name*, ***kwargs*`)`

Ensures that the mediatype does not exist, eventually deletes the mediatype.

Parameters

- **name** – name of the mediatype
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_mediatype:
    zabbix_mediatype.absent:
        - name: 'Email'
```

`salt.states.zabbix_mediatype.`**`present`**`(`*name*, *mediatype*, ***kwargs*`)`

Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory

Parameters

- **name** – name of the mediatype
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_mediatype:
    zabbix_mediatype.present:
        - name: 'Email'
        - mediatype: 0
        - smtp_server: smtp.example.com
        - smtp_hello: zabbix.example.com
        - smtp_email: zabbix@example.com
```

21.19.314 salt.states.zabbix_template

New in version 2017.7.

Management of Zabbix Template object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_template.`**`absent`**`(`*name*, ***kwargs*`)`

Makes the Zabbix Template to be absent (either does not exist or delete it).

Parameters

- **`name`** – Zabbix Template name
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-template-absent:
    zabbix_template.absent:
        - name: Ceph OSD
```

`salt.states.zabbix_template.`**`is_present`**`(`*name*, ***kwargs*`)`

Check if Zabbix Template already exists.

Parameters

- **`name`** – Zabbix Template name
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
does_zabbix-template-exist:
    zabbix_template.is_present:
        - name: Template OS Linux
```

`salt.states.zabbix_template.`**`present`**`(`*name*, *params*, *static_host_list=True*, ***kwargs*`)`

Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

Parameters

- **`name`** – Zabbix Template name
- **`params`** – Additional parameters according to Zabbix API documentation
- **`static_host_list`** – If hosts assigned to the template are controlled only by this state or can be also assigned externally
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Note: If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query_object" and "query_name" instead of the value.

In this example we want to create template named "Testing Template", assign it to hostgroup Templates, link it to two ceph nodes and create a macro.

Note: IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new ID !!!

Note:

NOT SUPPORTED FEATURES:

- linked templates
- trigger dependencies
- groups and group prototypes for host prototypes

SLS Example:

```
zabbix-template-present:
    zabbix_template.present:
        - name: Testing Template
        # Do not touch existing assigned hosts
        # True will detach all other hosts than defined here
        - static_host_list: False
        - params:
          description: Template for Ceph nodes
          groups:
              # groups must already exist
              # template must be at least in one hostgroup
              - groupid:
                  query_object: hostgroup
                  query_name: Templates
          macros:
              - macro: "{$CEPH_CLUSTER_NAME}"
                value: ceph
          hosts:
              # hosts must already exist
              - hostid:

21.19.315 salt.states.zabbix_user module

Management of Zabbix users.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_user.`**`absent`**`(`*name*, ***kwargs*`)`

Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

Parameters

- **`name`** – user alias
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
George:
    zabbix_user.absent
```

`salt.states.zabbix_user.`**`admin_password_present`**`(`*name*, *password=None*, ***kwargs*`)`

Initial change of Zabbix Admin password to password taken from one of the sources (only the most prioritized one):

1. 'password' parameter
2. '_connection_password' parameter
3. pillar 'zabbix.password' setting

1) Tries to log in as Admin with password found in state password parameter or _connection_password or pillar or default zabbix password in this precise order, if any of them is present.
2) If one of above passwords matches, it tries to change the password to the most prioritized one.
3) If not able to connect with any password then it fails.

Parameters

- **`name`** – Just a name of state
- **`password`** – Optional - desired password for Admin to be set
- **`_connection_user`** – Optional - Ignored in this state (always assumed 'Admin')
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
# password taken from pillar or _connection_password
zabbix-admin-password:
    zabbix_user.admin_password_present

# directly set password
zabbix-admin-password:
    zabbix_user.admin_password_present:
        - password: SECRET_PASS
```

`salt.states.zabbix_user.`**`present`**`(`*alias*, *passwd*, *usrgrps*, *medias=None*, *password_reset=False*, ***kwargs*`)`

Ensures that the user exists, eventually creates new user. NOTE: use argument firstname instead of name to not mess values with name from salt sls.

New in version 2016.3.0.

Parameters

- **`alias`** – user alias
- **`passwd`** – user's password
- **`usrgrps`** – user groups to add the user to

- **medias** – Optional - user's medias to create
- **password_reset** – whether or not to reset password at update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```
make_user:
    zabbix_user.present:
        - alias: George
        - passwd: donottellanyonE@456x
        - password_reset: True
        - usrgrps:
            - 13
            - 7
        - medias:
            - me@example.com:
                - mediatype: mail
                - period: '1-7,00:00-24:00'
                - severity: NIWAHD
            - make_jabber:
                - active: true
                - mediatype: jabber
                - period: '1-5,08:00-19:00'
                - sendto: jabbera@example.com
            - text_me_morning_disabled:
                - active: false
                - mediatype: sms
                - period: '1-5,09:30-10:00'
                - severity: D
                - sendto: '+42032132588568'
```

21.19.316 salt.states.zabbix_usergroup module

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.**absent**(*name*, ***kwargs*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

Parameters

- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_thai_monks_usrgrp:
    zabbix_usergroup.absent:
        - name: 'Thai monks'
```

`salt.states.zabbix_usergroup.`**`present`**`(`*name*, ***kwargs*`)`

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

Parameters

- **`name`** – name of the user group
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_thai_monks_usergroup:
    zabbix_usergroup.present:
        - name: 'Thai monks'
        - gui_access: 1
        - debug_mode: 0
        - users_status: 0
```

21.19.317 salt.states.zabbix_valuemap

New in version 2017.7.

Management of Zabbix Valuemap object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_valuemap.`**`absent`**`(`*name*, ***kwargs*`)`

Makes the Zabbix Value map to be absent (either does not exist or delete it).

Parameters

- **`name`** – Zabbix Value map name
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-valuemap-absent:
    zabbix_valuemap.absent:
        - name: Value map name
```

`salt.states.zabbix_valuemap.`**`present`**`(`*name*, *params*, ***kwargs*`)`

Creates Zabbix Value map object or if differs update it according defined parameters

Parameters

- **`name`** – Zabbix Value map name
- **`params`** – Definition of the Zabbix Value map
- **`_connection_user`** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

  - **`_connection_password`** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
  - **`_connection_url`** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-valuemap-present:
    zabbix_valuemap.present:
        - name: Number mapping
        - params:
          mappings:
              - value: 1
                newvalue: one
              - value: 2
                newvalue: two
```

21.19.318 salt.states.zcbuildout

Management of zc.buildout

This module is inspired from minitage's buildout maker (https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py)

New in version 2016.3.0.

Note: This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

---

Available Functions

- built

```
installed1
  buildout.installed:
    - name: /path/to/buildout

installed2
  buildout.installed:
    - name: /path/to/buildout
    - parts:
      - a
      - b
    - python: /path/to/pythonpath/bin/python
    - unless: /bin/test_something_installed
    - onlyif: /bin/test_else_installed
```

`salt.states.zcbuildout.`**`installed`**(*name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, test_release=False, distribute=None, new_st=None, offline=False, newest=False, python='/builds/saltstack/open/docs/builddocs/venv/bin/python', debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs*)

Install buildout in a specific directory

It is a thin wrapper to modules.buildout.buildout

name directory to execute in

quiet

do not output console & logs

config buildout config to use (default: buildout.cfg)

parts specific buildout parts to run

user user used to run buildout as

New in version 2014.1.4.

env environment variables to set when running

buildout_ver force a specific buildout version (1 | 2)

test_release buildout accept test release

new_st Forcing use of setuptools >= 0.7

distribute use distribute over setuptools if possible

offline does buildout run offline

python python to use

debug run buildout with -D debug flag

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

newest run buildout in newest mode

verbose run buildout in verbose mode (-vvvvv)

use_vt Use the new salt VT to stream output [experimental]

loglevel loglevel for buildout commands

21.19.319 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the 'zenoss' Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

`salt.states.zenoss.`**`monitored`**(*name*, *device_class=None*, *collector='localhost'*, *prod_state=None*)

Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

21.19.320 salt.states.zk_concurrency

Control concurrency of steps within state execution using zookeeper

depends kazoo

configuration See `salt.modules.zookeeper` for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will bock while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than max_concurrency steps are executing with a single path.

```
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
        - service: trafficserver

trafficserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficserver
    - require:
        - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

`salt.states.zk_concurrency.`**`lock`**(*name, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None*)

Block state execution until you are able to get the lock (or hit the timeout)

`salt.states.zk_concurrency.`**`min_party`**(*name, zk_hosts, min_nodes, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None*)

Ensure that there are *min_nodes* in the party at *name*, optionally blocking if not available.

`salt.states.zk_concurrency.`**`unlock`**(*name, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None*)

Remove lease from semaphore.

21.19.321 salt.states.zfs

States for managing zfs datasets

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.utils.zfs, salt.modules.zfs

platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type converions and improved consistancy in output.

```
test/shares/yuki:
  zfs.filesystem_present:
    - create_parent: true
    - properties:
        quota: 16G

test/iscsi/haruhi:
  zfs.volume_present:
    - create_parent: true
    - volume_size: 16M
    - sparse: true
    - properties:
        readonly: on

test/shares/yuki@frozen:
  zfs.snapshot_present

moka_origin:
  zfs.hold_present:
    - snapshot: test/shares/yuki@frozen

test/shares/moka:
  zfs.filesystem_present:
    - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
  zfs.snapshot_absent
```

`salt.states.zfs.`**`bookmark_absent`**(*name*, *force=False*, *recursive=False*)

ensure bookmark is absent on the system

name [string] name of snapshot

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

`salt.states.zfs.`**`bookmark_present`**(*name*, *snapshot*)

ensure bookmark exists

name [string] name of bookmark

snapshot [string] name of snapshot

`salt.states.zfs.`**`filesystem_absent`**(*name*, *force=False*, *recursive=False*)

ensure filesystem is absent on the system

name [string] name of filesystem

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

> **Warning:** If a volume with `name` exists, this state will succeed without destroying the volume specified by `name`. This module is dataset type sensitive.

`salt.states.zfs.`**`filesystem_present`**(*name*, *create_parent=False*, *properties=None*, *cloned_from=None*)

ensure filesystem exists and has properties set

name [string] name of filesystem

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

cloned_from [string] name of snapshot to clone

properties [dict] additional zfs properties (-o)

> **Note:** `cloned_from` is only use if the filesystem does not exist yet, when `cloned_from` is set after the filesystem exists it will be ignored.

> **Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`salt.states.zfs.`**`hold_absent`**(*name*, *snapshot*, *recursive=False*)

ensure hold is absent on the system

name [string] name of hold

snapshot [string] name of snapshot

recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

`salt.states.zfs.`**`hold_present`**(*name*, *snapshot*, *recursive=False*)

ensure hold is present on the system

name [string] name of holdt

snapshot [string] name of snapshot

recursive [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

`salt.states.zfs.`**`promoted`**(*name*)

ensure a dataset is not a clone

name [string] name of fileset or volume

> **Warning:** only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset

`salt.states.zfs.`**`scheduled_snapshot`**(*name*, *prefix*, *recursive=True*, *schedule=None*)

maintain a set of snapshots based on a schedule

name [string] name of filesystem or volume

prefix [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-yyyymmdd_hhmm'

recursive [boolean] create snapshots for all children also

schedule [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

> **Warning:** snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

`salt.states.zfs.`**`snapshot_absent`**`(`*name*, *force=False*, *recursive=False*`)`

ensure snapshot is absent on the system

name [string] name of snapshot

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

`salt.states.zfs.`**`snapshot_present`**`(`*name*, *recursive=False*, *properties=None*`)`

ensure snapshot exists and has properties set

name [string] name of snapshot

recursive [boolean] recursively create snapshots of all descendent datasets

properties [dict] additional zfs properties (-o)

`salt.states.zfs.`**`volume_absent`**`(`*name*, *force=False*, *recursive=False*`)`

ensure volume is absent on the system

name [string] name of volume

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

Warning: If a filesystem with `name` exists, this state will succeed without destroying the filesystem specified by `name`. This module is dataset type sensitive.

`salt.states.zfs.`**`volume_present`**`(`*name*, *volume_size*, *sparse=False*, *create_parent=False*, *properties=None*, *cloned_from=None*`)`

ensure volume exists and has properties set

name [string] name of volume

volume_size [string] size of volume

sparse [boolean] create sparse volume

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

cloned_from [string] name of snapshot to clone

properties [dict] additional zfs properties (-o)

Note: `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The sparse parameter is ignored when using `cloned_from`.

21.19.322 salt.states.zone

Management of Solaris Zones

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.modules.zoneadm, salt.modules.zonecfg

platform solaris

New in version 2017.7.0.

Below are some examples of how to use this state. Lets start with creating a zone and installing it.

```
omipkg1_configuration:
  zone.present:
    - name: omipkg1
    - brand: ipkg
    - zonepath: /zones/omipkg1
    - properties:
      - autoboot: true
      - ip-type: exclusive
      - cpu-shares: 50
    - resources:
      - attr:
        - name: owner
        - value: Jorge Schrauwen
        - type: string
      - attr:
        - name: description
        - value: OmniOS ipkg zone for testing
        - type: string
      - capped-memory:
        - physical: 64M
omipkg1_installation:
  zone.installed:
    - name: omipkg1
    - require:
        - zone: omipkg1_configuration
omipkg1_running:
  zone.booted:
    - name: omipkg1
    - require:
        - zone: omipkg1_installation
```

A zone without network access is not very useful. We could update the zone.present state in the example above to add a network interface or we could use a separate state for this.

```
omipkg1_network:
  zone.resource_present:
    - name: omipkg1
    - resource_type: net
    - resource_selector_property: mac-addr
    - resource_selector_value: "02:08:20:a2:a3:10"
    - physical: znic1
    - require:
        - zone: omipkg1_configuration
```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

Note: The following state run the omipkg1_configuration state will add it again! If the entire configuration is managed it would be better to add resource_prune and optionally the resource_selector_property properties to the resource.

```
omipkg1_strip_owner:
  zone.resource_present:
    - name: omipkg1
    - resource_type: attr
    - resource_selector_property: name
    - resource_selector_value: owner
    - require:
        - zone: omipkg1_configuration
```

Let's bump the zone's CPU shares a bit.

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

```
omipkg1_more_cpu:
  zone.property_present:
    - name: omipkg1
    - property: cpu-shares
    - value: 100
```

Or we can remove the limit altogether!

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

```
omipkg1_no_cpu:
  zone.property_absent:
    - name: omipkg1
    - property: cpu-shares
```

`salt.states.zone.`**`absent`**`(`*name, uninstall=False*`)`

Ensure a zone is absent

name [string] name of the zone

uninstall [boolean] when true, uninstall instead of detaching the zone first.

`salt.states.zone.`**`attached`**`(`*name, force=False*`)`

Ensure zone is attached

name [string] name of the zone

force [boolean] force attach the zone

`salt.states.zone.`**`booted`**`(`*name, single=False*`)`

Ensure zone is booted

name [string] name of the zone

single [boolean] boot in single usermode

`salt.states.zone.`**`detached`**`(`*name*`)`

Ensure zone is detached

name [string] name of the zone

`salt.states.zone.`**`export`**`(`*name, path, replace=False*`)`

Export a zones configuration

name [string] name of the zone

path [string] path of file to export too.

replace [boolean] replace the file if it exists `salt.states.zone.`**`halted`**`(`*name*, *graceful=True*`)`

Ensure zone is halted

name [string] name of the zone

graceful [boolean] use shutdown instead of halt if true

`salt.states.zone.`**`import_`**`(`*name*, *path*, *mode='import'*, *nodataset=False*, *brand_opts=None*`)`

Import a zones configuration

name [string] name of the zone

path [string] path of the configuration file to import

mode [string] either import, install, or attach

nodataset [boolean] do not create a ZFS file system

brand_opts [boolean] brand specific options to pass

Note: The mode argument can be set to `import`, `install`, or `attach`. `import`: will only import the configuration `install`: will import and then try to install the zone `attach`: will import and then try to attach of the zone

```
omipkg1:
  zone.import:
    - path: /foo/bar/baz
```

`salt.states.zone.`**`installed`**`(`*name*, *nodataset=False*, *brand_opts=None*`)`

Ensure zone is installed

name [string] name of the zone

nodataset [boolean] do not create a ZFS file system

brand_opts [boolean] brand specific options to pass

`salt.states.zone.`**`present`**`(`*name*, *brand*, *zonepath*, *properties=None*, *resources=None*`)`

Ensure a zone with certain properties and resources

name [string] name of the zone

brand [string] brand of the zone

zonepath [string] path of the zone

properties [list of key-value pairs] dict of properties

resources [list of key-value pairs] dict of resources

Note: If the zone does not exist it will not be installed. You can use the ``zone.installed`` state for this.

Note:

Default resource selectors:

- fs: dir
- net: mac-addr
- device: match
- rctl: name
- attr: name
- dataset: name
- admin: user

Warning: Properties and resource will not be removed when they are absent from the state!

For properties, simple set them to ``None``.

For resources, add the `` `resource_prune` `` property and set it to `` `True` ``. Also specify the `` `resource_selector_property` `` if the default is not the one you want.

`salt.states.zone.`**`property_absent`**`(`*name*, *property*`)`

Ensure property is absent

name [string] name of the zone

property [string] name of property

Note: This does a zoneacfg clear call. So the property may be reset to a default value! Does has the side effect of always having to be called.

`salt.states.zone.`**`property_present`**`(`*name*, *property*, *value*`)`

Ensure property has a certain value

name [string] name of the zone

property [string] name of property

value [string] value of property

`salt.states.zone.`**`resource_absent`**`(`*name*, *resource_type*, *resource_selector_property*, *resource_selector_value*`)`

Ensure resource is absent

name [string] name of the zone

resource_type [string] type of resource

resource_selector_property [string] unique resource identifier

resource_selector_value [string] value for resource selection

Warning: Both resource_selector_property and resource_selector_value must be provided, some properties like `` `name` `` are already reserved by salt in there states.

Note: You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

`salt.states.zone.`**`resource_present`**`(`*name*, *resource_type*, *resource_selector_property*, *resource_selector_value*, ***kwargs*`)`

Ensure resource exists with provided properties

name [string] name of the zone

resource_type [string] type of resource

resource_selector_property [string] unique resource identifier

resource_selector_value [string] value for resource selection

kwargs [string|int|...] resource properties

Warning: Both resource_selector_property and resource_selector_value must be provided, some properties like `name` are already reserved by salt in states.

Note: You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

`salt.states.zone.`**`uninstalled`**`(`*name*`)`

Ensure zone is uninstalled

name [string] name of the zone

21.19.323 salt.states.zookeeper

depends kazoo

configuration See `salt.modules.zookeeper` for setup instructions.

ACLS

For more information about acls, please checkout the kazoo documentation.

http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl

The following options can be included in the acl dictionary:

param username Username to use for the ACL.

param password A plain-text password to hash.

param write Write permission.

type write bool

param create Create permission.

type create bool

param delete Delete permission.

type delete bool

param admin Admin permission.

type admin bool

param all All permissions.

type all bool

`salt.states.zookeeper.`**`absent`**`(`*name, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*`)`

Make sure znode is absent
name path to znode
version Specify the version which should be deleted Default: -1 (always match)
recursive Boolean to indicate if children should be recursively deleted Default: False
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

```
delete znode:
  zookeeper.absent:
    - name: /test
    - recursive: True
```

`salt.states.zookeeper.`**`acls`**`(`*name, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*`)`

Update acls on a znode

name path to znode
acls list of acl dictionaries to set on znode
version Specify the version which should be deleted Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

```
update acls:
  zookeeper.acls:
    - name: /test/name
    - acls:
      - username: daniel

        all: True
      - username: gtmanfred
        password: test
        all: True
```

`salt.states.zookeeper.`**`present`**`(`*name, value, acls=None, ephemeral=False, sequence=False, makepath=False, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*`)`

Make sure znode is present in the correct state with the correct acls
name path to znode
value value znode should be set to
acls list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None
ephemeral Boolean to indicate if ephemeral znode should be created Default: False
sequence Boolean to indicate if znode path is suffixed with a unique index Default: False
makepath Boolean to indicate if the parent paths should be created Default: False
version For updating, specify the version which should be updated Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

```
add znode:
  zookeeper.present:
    - name: /test/name
    - value: gtmanfred
    - makepath: True

update znode:
  zookeeper.present:
    - name: /test/name
    - value: daniel
    - acls:
      - username: daniel
        password: test
        read: true
      - username: gtmanfred
```

(continues on next page)

(continued from previous page)

```
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    - makepath: True
```

21.19.324 salt.states.zpool

States for managing zpools

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.utils.zfs, salt.modules.zpool

platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
oldpool:
  zpool.absent:
    - export: true

newpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: salty storage pool
    - layout:
        - mirror:
          - /dev/disk0
          - /dev/disk1
        - mirror:
          - /dev/disk2
          - /dev/disk3

partitionpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: disk partition salty storage pool
        ashift: '12'
        feature@lz4_compress: enabled
    - filesystem_properties:
        compression: lz4
        atime: on
        relatime: on
```

(continues on next page)

(continued from previous page)

```
    - layout:
        - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cdbb0b0f41b

simplepool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: another salty storage pool
    - layout:
        - /dev/disk0
        - /dev/disk1
```

> **Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.
>
> Filesystem properties are also not updated, this should be managed by the zfs state module.

`salt.states.zpool.`**`absent`**`(`*name*, *export=False*, *force=False*`)`

ensure storage pool is absent on the system

name [string] name of storage pool

export [boolean] export instead of destroy the zpool if present

force [boolean] force destroy or export

`salt.states.zpool.`**`present`**`(`*name*, *properties=None*, *filesystem_properties=None*, *layout=None*, *config=None*`)`

ensure storage pool is present on the system

name [string] name of storage pool

properties [dict] optional set of properties to set for the storage pool

filesystem_properties [dict] optional set of filesystem properties to set for the storage pool (creation only)

layout: dict disk layout to use if the pool does not exist (creation only)

config [dict] fine grain control over this state

Note:

The following configuration properties can be toggled in the config parameter.

- import (true) - try to import the pool before creating it if absent
- import_dirs (None) - specify additional locations to scan for devices on import (comma-seperated)
- device_dir (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
- force (false) - try to force the import or creation

Note: It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

```
- mirror:
  - /tmp/vdisk3
  - /tmp/vdisk2
- mirror:
  - /tmp/vdisk0
  - /tmp/vdisk1
```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

Warning: The legacy format is also still supported but not recommended, because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
  /tmp/vdisk3
  /tmp/vdisk2
mirror-1:
  /tmp/vdisk0
  /tmp/vdisk1
```

Warning: Pay attention to the order of your dict!

```
- mirror:
  - /tmp/vdisk0
  - /tmp/vdisk1
- /tmp/vdisk2
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

21.20 thorium modules

calc	Used to manage the thorium register.
check	The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.
file	Writes matches to disk to verify activity, helpful when testing
key	The key Thorium State is used to apply changes to the accepted/rejected/pending keys
local	Run remote execution commands via the local client
reg	Used to manage the thorium register.
runner	React by calling asynchronous runners
status	This thorium state is used to track the status beacon events and keep track of the active status of minions
timer	Allow for flow based timers.
wheel	React by calling asynchronous runners

21.20.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

depends statistics PyPi module

`salt.thorium.calc.`**`add`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Adds together the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.add:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`calc`**`(`*name, num, oper, minimum=0, maximum=0, ref=None*`)`

Perform a calculation on the `num` most recent values. Requires a list. Valid values for `oper` are:

- add: Add last `num` values together
- mul: Multiple last `num` values together
- mean: Calculate mean of last `num` values
- median: Calculate median of last `num` values
- median_low: Calculate low median of last `num` values
- median_high: Calculate high median of last `num` values
- median_grouped: Calculate grouped median of last `num` values
- mode: Calculate mode of last `num` values

USAGE:

```
foo:
  calc.calc:
    - name: myregentry
    - num: 5
    - oper: mean
```

`salt.thorium.calc.`**`mean`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mean:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median_grouped`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the grouped mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_grouped:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median_high`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the high mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_high:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median_low`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the low mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_low:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`mode`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Calculates the mode of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mode:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`mul`**`(`*name, num, minimum=0, maximum=0, ref=None*`)`

Multiplies together the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mul:
    - name: myregentry
    - num: 5
```

21.20.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.`**`contains`**`(`*name, value, count_lt=None, count_lte=None, count_eq=None, count_gte=None, count_gt=None, count_ne=None*`)`

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`eq`**`(`*name*, *value*`)`

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`event`**`(`*name*`)`

Chekcs for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar
```

`salt.thorium.check.`**`gt`**`(`*name*, *value*`)`

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`gte`**`(`*name*, *value*`)`

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:
  check.gte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`len_eq`**`(`*name*, *value*`)`

Only succeed if the length of the given register location is equal to the given value.

USAGE:

```
foo:
  check.len_eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`len_gt`**`(`*name*, *value*`)`

Only succeed if length of the given register location is greater than the given value.

USAGE:

```
foo:
  check.len_gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.`**`len_gte`**`(`*name*, *value*`)`

Only succeed if the length of the given register location is greater or equal than the given value

USAGE:

```
foo:
  check.len_gte:
    - value: 42

run_remote_ex:
  local.cmd:
```

(continues on next page)

(continued from previous page)

```
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_lt**(*name*, *value*)

Only succeed if the length of the given register location is less than the given value.

USAGE:

```
foo:
  check.len_lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_lte**(*name*, *value*)

Only succeed if the length of the given register location is less than or equal the given value

USAGE:

```
foo:
  check.len_lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_ne**(*name*, *value*)

Only succeed if the length of the given register location is not equal to the given value.

USAGE:

```
foo:
  check.len_ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**lt**(*name*, *value*)

Only succeed if the value in the given register location is less than the given value

USAGE:

```
foo:
  check.lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**lte**(*name*, *value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**ne**(*name*, *value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

21.20.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

```
foo:
  file.save
```

Then the file will be saved to:

```
<salt cachedir>/thorium/saves/foo
```

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
    file.save
```

Files will be saved in JSON format. However, JSON does not support `set()``s. If you are saving a register entry that contains a ``set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.`**`save`**`(`*name, filter=False*`)`

Save the register to <salt cachedir>/thorium/saves/<name>, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn't exist.

USAGE:

```
foo:
  file.save

/tmp/foo:
  file.save
```

21.20.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.`**`timeout`**`(`*name, delete=0, reject=0*`)`

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
  status.reg

clean_keys:
  key.timeout:
    - require:
      - status: statreg
    - delete: 300
```

21.20.5 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.`**`cmd`**`(`*name, tgt, func, arg=(), tgt_type='glob', ret='', kwarg=None, **kwargs*`)`

Execute a remote execution command

USAGE:

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg:
      - 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30
```

21.20.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.`**`clear`**`(`*name*`)`

Clear the namespace from the register

USAGE:

```
clearns:
  reg.clear:
    - name: myregister
```

`salt.thorium.reg.`**`delete`**`(`*name*`)`

Delete the namespace from the register

USAGE:

```
deletens:
  reg.delete:
    - name: myregister
```

`salt.thorium.reg.`**`list_`**`(`*name, add, match, stamp=False, prune=0*`)`

Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than `0`, then only the last `prune` values will be kept in the list.

USAGE:

```
foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```

`salt.thorium.reg.`**`mean`**`(`*name*, *add*, *match*`)`

Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

`salt.thorium.reg.`**`set_`**`(`*name*, *add*, *match*`)`

Add a value to the named set

USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

21.20.7 salt.thorium.runner module

React by calling asynchronous runners

`salt.thorium.runner.`**`cmd`**`(`*name*, *func=None*, *arg=()*, ***kwargs*`)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
  runner.cmd:
    - func: cloud.create
    - arg:
        - my-ec2-config
        - myinstance

run_cloud:
  runner.cmd:
    - func: cloud.create
    - kwargs:
        provider: my-ec2-config
        instances: myinstance
```

21.20.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.`**`reg`**`(`*name*`)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

21.20.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.`**`hold`**`(`*name, seconds*`)`

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
  timer.hold:
    - seconds: 30
```

21.20.10 salt.thorium.wheel module

React by calling asynchronous runners

`salt.thorium.wheel.`**`cmd`**`(`*name, fun=None, arg=(), **kwargs*`)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
  wheel.cmd:
    - fun: key.delete
    - match: minion_id
```

21.21 auth modules

`localfs`	Stores eauth tokens in the filesystem of the master.
`rediscluster`	Provide token storage in Redis cluster.

21.21.1 salt.tokens.localfs

Stores eauth tokens in the filesystem of the master. Location is configured by the master config option 'token_dir'

`salt.tokens.localfs.`**`get_token`**`(`*opts, tok*`)`

Fetch the token data from the store.

Parameters
- **`opts`** – Salt master config options
- **`tok`** – Token value to get

Returns Token data if successful. Empty dict if failed.

`salt.tokens.localfs.`**`list_tokens`**`(`*opts*`)`

List all tokens in the store.

Parameters **`opts`** – Salt master config options

Returns List of dicts (tokens)

`salt.tokens.localfs.`**`mk_token`**`(`*opts, tdata*`)`

Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

Parameters

- **`opts`** – Salt master config options
- **`tdata`** – Token data to be stored with 'token' attribute of this dict set to the token.

Returns tdata with token if successful. Empty dict if failed.

`salt.tokens.localfs.`**`rm_token`**`(`*opts*, *tok*`)`

Remove token from the store.

Parameters

- **`opts`** – Salt master config options
- **`tok`** – Token to remove

Returns Empty dict if successful. None if failed.

21.21.2 salt.tokens.rediscluster

Provide token storage in Redis cluster.

To get started simply start a redis cluster and assign all hashslots to the connected nodes. Add the redis hostname and port to master configs as eauth_redis_host and eauth_redis_port. Default values for these configs are as follow:

```
eauth_redis_host: localhost
eauth_redis_port: 6379
```

depends

- redis-py-cluster Python package

`salt.tokens.rediscluster.`**`get_token`**`(`*opts*, *tok*`)`

Fetch the token data from the store.

Parameters

- **`opts`** – Salt master config options
- **`tok`** – Token value to get

Returns Token data if successful. Empty dict if failed.

`salt.tokens.rediscluster.`**`list_tokens`**`(`*opts*`)`

List all tokens in the store.

Parameters **`opts`** – Salt master config options

Returns List of dicts (token_data)

`salt.tokens.rediscluster.`**`mk_token`**`(`*opts*, *tdata*`)`

Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

Parameters

- **`opts`** – Salt master config options
- **`tdata`** – Token data to be stored with 'token' attribute of this dict set to the token.

Returns tdata with token if successful. Empty dict if failed.

`salt.tokens.rediscluster.`**`rm_token`**`(`*opts*, *tok*`)`

Remove token from the store.

Parameters

- **`opts`** – Salt master config options
- **`tok`** – Token to remove

Returns Empty dict if successful. None if failed.

21.22 master tops modules

cobbler	Cobbler Tops
ext_nodes	External Nodes Classifier
mongo	Read tops data from a mongodb collection
reclass_adapter	Read tops data from a reclass database
saltclass	Saltclass Configuration
varstack_top	Use Varstack to provide tops data

21.22.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

`salt.tops.cobbler.`**`top`**`(`***kwargs*`)`
Look up top data in Cobbler for a minion.

21.22.2 salt.tops.ext_nodes

External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The cobbler-ext-nodes command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to 'cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard 'cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
  '*':
    - basepackages
    - database

base:
  '*':
    - basepackages
    - database
```

`salt.tops.ext_nodes.`**`top`**`(`***kwargs*`)`

Run the command configured

21.22.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as *`salt.returners.mongo_return`*. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to `'salt'`.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to `'salt'`.
- `mongo.port` - The port that the mongo database is running on. Defaults to `27017`.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.

Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ""
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment
```

Module Documentation

`salt.tops.mongo.`**`top`**`(`***kwargs*`)`

Connect to a mongo database and read per-node tops data.

Parameters

- **`collection`** (**) – The mongodb collection to read data from. Defaults to `'tops'`.

- **id_field** (*) – The field in the collection that represents an individual minion id. Defaults to `'_id'`.
- **re_pattern** (*) – If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re_replace** (*) – Use as the replacement value in node ids matched with *re_pattern*. Defaults to ". Feel free to use backreferences here.
- **states_field** (*) – The name of the field providing a list of states.
- **environment_field** (*) – The name of the field providing the environment. Defaults to `environment`.

21.22.4 salt.tops.reclass_adapter

Read tops data from a reclass database

This *master_tops* plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

`salt.tops.reclass_adapter.`**`top`**`(`*`**kwargs`*`)`

Query **reclass** for the top data (states of the minions).

21.22.5 salt.tops.saltclass

Saltclass Configuration

```
master_tops:
  saltclass:
    path: /srv/saltclass
```

Description

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple `yaml` files (`.yml`) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- **Reuse your reclass datas with minimal modifications**
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- **Access to the following Salt objects in Jinja**
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables ${} with possibility to escape them if needed \${} (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: http://git.mauras.ch/salt/saltclass/src/master/examples

Terms usable in yaml files	Description
classes	A list of classes that will be processed in order
states	A list of states that will be returned by master_tops function
pillars	A yaml dictionnary that will be returned by the ext_pillar function
environment	Node saltenv that will be used by master_tops

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.

Class names

Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

Saltclass file hierachy

A saltclass tree would look like this:

```
<saltclass_path>
├── classes
│   ├── app
│   │   ├── borgbackup.yml
│   │   └── ssh
│   │       └── server.yml
│   ├── default
│   │   ├── init.yml
│   │   ├── motd.yml
│   │   └── users.yml
│   ├── roles
│   │   ├── app.yml
│   │   └── nginx
│   │       ├── init.yml
│   │       └── server.yml
│   └── subsidiaries
│       ├── gnv.yml
│       ├── qls.yml
│       └── zrh.yml
└── nodes
    ├── geneva
    │   └── gnv.node1.yml
    ├── lausanne
    │   ├── qls.node1.yml
    │   └── qls.node2.yml
    ├── node127.yml
    └── zurich
        ├── zrh.node1.yml
        ├── zrh.node2.yml
        └── zrh.node3.yml
```

Saltclass Examples

`<saltclass_path>/nodes/lausanne/qls.node1.yml`

```
environment: base

classes:
{% for class in ['default'] %}
```

(continues on next page)

(continued from previous page)

```
  - {{ class }}
{% endfor %}
  - subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

`<saltclass_path>/classes/default/init.yml`

```
classes:
  - default.users
  - default.motd

states:
  - openssh

pillars:
  default:
    network:
      dns:
        srv1: 192.168.0.1
        srv2: 192.168.0.2
        domain: example.com
    ntp:
      srv1: 192.168.10.10
      srv2: 192.168.10.20
```

`<saltclass_path>/classes/subsidiaries/gnv.yml`

```
pillars:
  default:
    network:
      sub: Geneva
      dns:
        srv1: 10.20.0.1
        srv2: 10.20.0.2
        srv3: 192.168.1.1
        domain: gnv.example.com
    users:
      adm1:
        uid: 1210
        gid: 1210
        gecos: 'Super user admin1'
        homedir: /srv/app/adm1
      adm3:
        uid: 1203
        gid: 1203
        gecos: 'Super user adm
```

Variable expansions

Escaped variables are rendered as is: `${test}`

Missing variables are rendered as is: `${net:dns:srv2}`

```
pillars:
  app:
  config:
```

(continues on next page)

(continued from previous page)

```
    dns:
      srv1: ${default:network:dns:srv1}
      srv2: ${net:dns:srv2}
    uri: https://application.domain/call?\${test}
    prod_parameters:
      - p1
      - p2
      - p3
  pkg:
    - app-core
    - app-backend
```

List override

Not using ^ as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Note: Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - '${xx}' will stay as is instead of being rendered as '${xx}'

`salt.tops.saltclass.`**`top`**`(`***kwargs*`)`
Compile tops

21.22.6 salt.tops.varstack_top

Use Varstack to provide tops data

This *master_tops* plugin provides access to the **varstack** hierarchical yaml files, so you can user **varstack** as a full *`external node classifier`* and store state information (top data) in it.

Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use /path/to/the/config/file/varstack.yaml (usually /etc/varstack.yaml) to determine which configuration data to return as adapter information. From there you can take a look at the README of varstack to learn how this file is evaluated. The ENC part will just return the 'states' dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as {'base': ['sudo', 'openssh', 'apache', 'salt.minion']} and managed by salt as if given from a top.sls file.

`salt.tops.varstack_top.`**`top`**`(`*`**kwargs`*`)`
Query **varstack** for the top data (states of the minions).

21.23 wheel modules

`config`	Manage the master configuration file
`error`	Error generator to enable integration testing of salt wheel error handling
`file_roots`	Read in files from the file_root and save files to the file root
`key`	Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.
`minions`	Wheel system wrapper for connected minions
`pillar_roots`	The *pillar_roots* wheel module is used to manage files under the pillar roots directories on the master server.

21.23.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.`**`apply`**`(`*`key, value`*`)`
Set a single key

Note: This will strip comments from your config file

`salt.wheel.config.`**`update_config`**`(`*`file_name, yaml_contents`*`)`
Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
    'username': 'salt',
    'password': 'salt',
    'fun': 'config.update_config',
    'file_name': 'gui',
    'yaml_contents': {'id': 1},
    'client': 'wheel',
```

(continues on next page)

(continued from previous page)

```
    'eauth': 'pam',
}
```

`salt.wheel.config.`**`values`**`()`

Return the raw values of the config file

21.23.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.`**`error`**`(`*name=None, message=''*`)`

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

21.23.3 salt.wheel.file_roots

Read in files from the file_root and save files to the file root

`salt.wheel.file_roots.`**`find`**`(`*path, saltenv='base'*`)`

Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.`**`list_env`**`(`*saltenv='base'*`)`

Return all of the file paths found in an environment

`salt.wheel.file_roots.`**`list_roots`**`()`

Return all of the files names in all available environments

`salt.wheel.file_roots.`**`read`**`(`*path, saltenv='base'*`)`

Read the contents of a text file, if the file is binary then

`salt.wheel.file_roots.`**`write`**`(`*data, path, saltenv='base', index=0*`)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

21.23.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the `WheelClient` must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless *`external_auth`* is configured and the user is authorized to execute wheel functions.

The function documentation starts with the `wheel` reference from the code sample above and use the `WheelClient` functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a `salt` command at the CLI using the *`saltutil execution module`*.

`salt.wheel.key.`**`accept`**(*match*, *include_rejected=False*, *include_denied=False*)

Accept keys based on a glob match. Returns a dictionary.

match The glob match of keys to accept.

include_rejected To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.`**`accept_dict`**(*match*, *include_rejected=False*, *include_denied=False*)

Accept keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to accept.

include_rejected To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('key.accept_dict',
{
    'minions_pre': [
        'jerry',
        'stuart',
        'bob',
    ],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

`salt.wheel.key.`**`delete`**(*match*)

Delete keys based on a glob match. Returns a dictionary.

match The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`delete_dict`**(*match*)

Delete keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
```

(continues on next page)

(continued from previous page)

```
        'bob',
    ],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`finger`**(*match*, *hash_type=None*)

Return the matching key fingerprints. Returns a dictionary.

match The key for with to retrieve the fingerprint.

hash_type The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.`**`finger_master`**(*hash_type=None*)

Return the fingerprint of the master's public key

hash_type The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.`**`gen`**(*id_=None*, *keysize=2048*)

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the `pub` and `priv` keys with their generated values.

id_ Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

keysize The size of the key pair to generate. The size must be `2048`, which is the default, or greater. If set to a value less than `2048`, the key size will be rounded up to `2048`.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

`salt.wheel.key.`**`gen_accept`**(*id_*, *keysize=2048*, *force=False*)

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

id_ The name of the minion for which to generate a key pair.

keysize The size of the key pair to generate. The size must be `2048`, which is the default, or greater. If set to a value less than `2048`, the key size will be rounded up to `2048`.

force If a public key has already been accepted for the given minion on the master, then the gen_accept function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
```

(continues on next page)

(continued from previous page)

```
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`gen_keys`**(*keydir=None*, *keyname=None*, *keysize=None*, *user=None*)

Generate minion RSA public keypair

`salt.wheel.key.`**`gen_signature`**(*priv*, *pub*, *signature_path*, *auto_create=False*, *keysize=None*)

Generate master public-key-signature

`salt.wheel.key.`**`key_str`**(*match*)

Return information about the key. Returns a dictionary.

match The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}
```

`salt.wheel.key.`**`list_`**(*match*)

List all the keys under a named status. Returns a dictionary.

match The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`list_all`**()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`name_match`**(*match*)

List all the keys based on a glob match

`salt.wheel.key.`**`reject`**(*match*, *include_accepted=False*, *include_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

match The glob match of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`reject_dict`**(*match*, *include_accepted=False*, *include_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

21.23.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.`**`connected`**`()`
List all connected minions on a salt-master

21.23.6 salt.wheel.pillar_roots

The *pillar_roots* wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.`**`find`**`(`*path, saltenv='base'*`)`
Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.`**`list_env`**`(`*saltenv='base'*`)`
Return all of the file paths found in an environment

`salt.wheel.pillar_roots.`**`list_roots`**`()`
Return all of the files names in all available environments

`salt.wheel.pillar_roots.`**`read`**`(`*path, saltenv='base'*`)`
Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.`**`write`**`(`*data, path, saltenv='base', index=0*`)`
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

CHAPTER

TWENTYTWO

APIS

22.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's *outputter system* to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the `state.event` runner to utilize Salt's event bus from shell scripts.

Salt's netapi module provides access to Salt externally via a REST interface. Review the netapi module documentation for more information.

22.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the *master* or *minion* config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

`salt.config.`**`client_config`**(*path*, *env_var='SALT_CLIENT_CONFIG'*, *defaults=None*)

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like `LocalClient`.

`salt.config.`**`minion_config`**(*path, env_var='SALT_MINION_CONFIG', defaults=None, cache_minion_id=False, ignore_config_errors=True, minion_id=None, role='minion'*)

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the *Caller* class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

22.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the *mine*, *publish*, and `peer` execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the *Caller* class to execute those modules instead.

Each module type has a corresponding loader function.

`salt.loader.`**`minion_mods`**(*opts, context=None, utils=None, whitelist=None, initial_load=False, loaded_base_name=None, notify=False, static_modules=None, proxy=None*)

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the __virtual__() function in each module.

Parameters

- **`opts`** (*dict*) – The Salt options dictionary
- **`context`** (*dict*) – A Salt context that should be made present inside generated modules in __context__
- **`utils`** (*dict*) – Utility functions which should be made available to Salt modules in __utils__. See *utils_dirs* in salt.config for additional information about configuration.
- **`whitelist`** (*list*) – A list of modules which should be whitelisted.
- **`initial_load`** (*bool*) – Deprecated flag! Unused.
- **`loaded_base_name`** (*str*) – A string marker for the loaded base name.
- **`notify`** (*bool*) – Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

`salt.loader.`**`raw_mod`**(*opts, name, functions, mod='modules'*)

Returns a single module loaded raw and bypassing the __virtual__ function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.`**`states`**(*opts, functions, utils, serializers, whitelist=None, proxy=None, context=None*)

Returns the state modules

Parameters

- **opts** (*dict*) – The Salt options dictionary
- **functions** (*dict*) – A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.`**`grains`**(*opts, force_refresh=False, proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have __salt__ or __proxy__ available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.`**`grain_funcs`**(*opts, proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

22.1.3 Salt's Client Interfaces

LocalClient

class `salt.client.`**`LocalClient`**(*c_path='/etc/salt/master', mopts=None, skip_perm_errors=False, io_loop=None, keep_loop=False, auto_reconnect=False*)

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless *`external_auth`* is configured and authentication credentials are included in the execution).

Note: The LocalClient uses a Tornado IOLoop, this can create issues when using the LocalClient inside an existing IOLoop. If creating the LocalClient in partnership with another IOLoop either create the IOLoop before creating the LocalClient, or when creating the IOLoop use ioloop.current() which will return the ioloop created by LocalClient.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

cmd(*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', jid='', full_return=False, kwarg=None, **kwargs*)

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
        'grains.items',
        'sys.doc',
        'cmd.run',
    ],
    [
        [],
        [],
        ['uptime'],
    ])
```

Parameters

- **tgt** (*string or list*) – Which minions to target for the execution. Default is shell glob. Modified by the `tgt_type` option.
- **fun** (*string or list of strings*) – The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

  Compound commands Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

  This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take arguments must still have a corresponding empty list at the expected index.

- **arg** (*list or list-of-lists*) – A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except when executing a compound command.
- **timeout** – Seconds to wait after the last minion returns but before all minions return.
- **tgt_type** – The type of `tgt`. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `grain_pcre` - Grain comparison with a regex
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string
  - `ipcidr` - Match based on Subnet (CIDR notation) or IPv4 address.

  Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`
- **ret** – The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** – A dictionary with keyword arguments for the function.
- **full_return** – Output the job return only (default) or the full return including exit code and other job metadata.
- **kwargs** – Optional keyword arguments. Authentication credentials may be passed when using *external_auth*.

  For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam')`. Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

Returns A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

cmd_async(*tgt, fun, arg=(), tgt_type='glob', ret='', jid='', kwarg=None, **kwargs*)

Asynchronously send a command to connected minions

The function signature is the same as *cmd()* with the following exceptions.

Returns A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

cmd_batch(*tgt, fun, arg=(), tgt_type='glob', ret='', kwarg=None, batch='10%', **kwargs*)

Iteratively execute a command on subsets of minions at a time

The function signature is the same as *cmd()* with the following exceptions.

Parameters **batch** – The batch identifier of systems to execute on

Returns A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

cmd_iter(*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, **kwargs*)
Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

Normally `cmd_iter()` does not yield results for minions that are not connected. If you want it to return results for disconnected minions set *expect_minions=True* in *kwargs*.

Returns A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

cmd_iter_no_block(*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, show_jid=False, verbose=False, **kwargs*)
Yields the individual minion returns as they come in, or None when no returns are available.
The function signature is the same as `cmd()` with the following exceptions.

Returns A generator yielding the individual minion returns, or None when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

cmd_subset(*tgt, fun, arg=(), tgt_type='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, full_return=False, **kwargs*)
Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

Parameters

- **sub** – The number of systems to execute on
- **cli** – When this is set to True, a generator is returned, otherwise a dictionary of the minion returns is returned

```
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

get_cli_returns(*jid, minions, timeout=None, tgt='*', tgt_type='glob', verbose=False, show_jid=False, **kwargs*)
Starts a watcher looking at the return data for a specified JID

Returns all of the information for the JID

get_event_iter_returns(*jid, minions, timeout=None*)
Gather the return data from the event system, break hard when timeout is reached.

run_job(*tgt, fun, arg=(), tgt_type='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, **kwargs*)
Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

Returns A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

Salt Caller

class `salt.client.`**`Caller`**(*c_path='/etc/salt/minion', mopts=None*)

`Caller` is the same interface used by the **`salt-call`** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets *`file_client`* to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

cmd(*fun, *args, **kwargs*)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
    data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

Salt Proxy Caller

class `salt.client.`**`ProxyCaller`**(*c_path='/etc/salt/proxy', mopts=None*)

`ProxyCaller` is the same interface used by the **`salt-call`** with the args `--proxyid <proxyid>` command-line tool on the Salt Proxy Minion.

Importing and using `ProxyCaller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets *`file_client`* to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

```
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

Note: To use this for calling proxies, the `is_proxy functions` requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

`cmd`(*fun*, **args*, ***kwargs*)
Call an execution module with the given arguments and keyword arguments

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
    data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

RunnerClient

class `salt.runner.`**`RunnerClient`**(*opts*, *context=None*)
The interface used by the **`salt-run`** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's *`external_auth`* can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (`@runner`). Only the `master_call()` below supports eauth.

`asynchronous`(*fun*, *low*, *user='UNKNOWN'*, *pub=None*)
Execute the function in a multiprocess and return the event tag to use to watch for the return

`cmd`(*fun*, *arg=None*, *pub_data=None*, *kwarg=None*, *print_event=True*, *full_return=False*)
Execute a function

`cmd_async`(*low*)
Execute a runner function asynchronously; eauth is respected

This function requires that *`external_auth`* is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
```

(continues on next page)

(continued from previous page)

```
    'eauth': 'pam',
})
```

cmd_sync(*low*, *timeout=None*, *full_return=False*)

Execute a runner function synchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

WheelClient

class `salt.wheel.`**WheelClient**(*opts=None*)

An interface to Salt's wheel modules

Wheel modules interact with various parts of the Salt Master.

Importing and using `WheelClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless *external_auth* is configured and the user is authorized to execute wheel functions: (`@wheel`).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

asynchronous(*fun*, *low*, *user='UNKNOWN'*, *pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

cmd(*fun*, *arg=None*, *pub_data=None*, *kwarg=None*, *print_event=True*, *full_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

cmd_async(*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

cmd_sync(*low, timeout=None, full_return=False*)
Execute a wheel function synchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized to execute runner functions: (`@wheel`).

```
>>> wheel.cmd_sync({
'fun': 'key.finger',
'match': 'jerry',
'eauth': 'auto',
'username': 'saltdev',
'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

CloudClient

class salt.cloud.**CloudClient**(*path=None, opts=None, config_dir=None, pillars=None*)
The client class to wrap cloud interactions

action(*fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None*)
Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'}
)
```

create(*provider, names, **kwargs*)
Create the named VMs, without using a profile

Example:

```
client.create(provider='my-ec2-config', names=['myinstance'],
    image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
    securitygroup='default', delvol_on_destroy=True)
```

destroy(*names*)
Destroy the named VMs

extra_action(*names, provider, action, **kwargs*)
Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000}
)
client.extra_action(names=['salt-net'], action='network_create',
    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'}
)
```

full_query(*query_type='list_nodes_full'*)
Query all instance information

list_images(*provider=None*)
List all available images in configured cloud systems

list_locations(*provider=None*)
List all available locations in configured cloud systems

list_sizes(*provider=None*)
List all available sizes in configured cloud systems

low(*fun, low*)
Pass the cloud function and low data structure to run

map_run(*path=None, **kwargs*)
To execute a map

min_query(*query_type='list_nodes_min'*)
Query select instance information

profile(*profile, names, vm_overrides=None, **kwargs*)
Pass in a profile to create, names is a list of vm names to allocate
vm_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
        'created_at': '2014-09-04T18:10:15Z',
        'droplet': {'event_id': 31000502,
                     'id': 2530006,
                     'image_id': 5140006,
                     'name': 'minion01',
                     'size_id': 66},
        'id': '2530006',
        'image_id': '5140006',
        'ip_address': '107.XXX.XXX.XXX',
        'locked': 'True',
        'name': 'minion01',
        'private_ip_address': None,
        'region_id': '4',
        'size_id': '66',
        'status': 'new'}}
```

query(*query_type='list_nodes'*)
Query basic instance information

select_query(*query_type='list_nodes_select'*)
Query select instance information

SSHClient

class salt.client.ssh.client.**SSHClient**(*c_path='/etc/salt/master', mopts=None, disable_custom_roster=False*)
Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

cmd(*tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None, **kwargs*)
Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

cmd_iter(*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, **kwargs*)
Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

22.2 `netapi` modules

22.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **`salt-api`** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

---

salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

See also:

The full list of netapi modules

22.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

class salt.netapi.**NetapiClient**(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

local(**args*, ***kwargs*)

Run *execution modules* synchronously

See *`salt.client.LocalClient.cmd()`* for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

Returns Returns the result from the execution module

local_async(**args*, ***kwargs*)

Run *execution modules* asynchronously

Wraps *`salt.client.LocalClient.run_job()`*.

Returns job ID

local_subset(**args*, ***kwargs*)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

runner(*fun*, *timeout=None*, *full_return=False*, ***kwargs*)

Run *runner modules <all-salt.runners>* synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the runner module

runner_async(*fun*, ***kwargs*)

Run *runner modules <all-salt.runners>* asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns event data and a job ID for the executed function.

ssh(**args*, ***kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

Returns Returns the result from the salt-ssh command

wheel(*fun*, ***kwargs*)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the wheel module

wheel_async(*fun*, ***kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the wheel module

Writing netapi modules

`netapi` modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

The full list of netapi modules

Configuration

All `netapi` configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherrypy:
  port: 8000
  debug: True
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

The `__virtual__` function

Like all module types in Salt, `netapi` modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

The `start` function

The `start()` function will be called for each `netapi` module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

`rest_cherrypy` and `rest_tornado` support running multiple instances by copying and renaming entire directory of those. To start the copied multiple `netapi` modules, add configuration blocks for the copied `netapi` modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied `netapi` module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your `netapi` module.

Loader "magic" methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

CHAPTER

TWENTYTHREE

ARCHITECTURE

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

23.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

23.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well

A tutorial on setting up multimaster with "hot" masters is here:

Multimaster Tutorial

23.1.2 Multimaster with Failover

Changing the `master_type` parameter from `str` to `failover` will cause minions to connect to the first responding master in the list of masters. Every *`master_alive_interval`* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *`master_alive_interval`* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial* `master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

23.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in *Salt Syndic*.

23.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in *Salt Syndic*.

23.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

23.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)

(continued from previous page)

```
# on the Syndic node
id: my_syndic
```

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The *syndic_master* option tells the Syndic node where to find the Master node in the same way that the *master* option tells a Minion node where to find a Master node.

The *id* option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The *order_masters* option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

Note: Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

23.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See *Multimaster Tutorial*.

On the syndic, the *syndic_master* option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

23.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.version
minion_1:
    2018.3.4
minion_2:
    2018.3.4
minion_4:
    2018.3.4
minion_3:
    2018.3.4
```

23.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

23.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to `5` seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the *`syndic_wait`* value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is `5`, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the *`syndic_wait`* config option and has a default of five seconds.

23.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- *`id`*: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- *`syndic_master`*: Master node IP address or hostname
- *`syndic_master_port`*: Master node ret_port
- *`syndic_log_file`*: path to the logfile (absolute or not)
- *`syndic_pidfile`*: path to the pidfile (absolute or not)
- *`syndic_wait`*: time in seconds to wait on returns from this syndic

23.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

CHAPTER

TWENTYFOUR

MINION DATA CACHE

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

24.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

24.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

CHAPTER

TWENTYFIVE

SLOTS

New in version 2018.3.0.

Changed in version 3000.

Note: This functionality is under development and could be changed in the future releases

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the *highstate* or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

25.1 Execution functions

Note: Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

For the 3000 release, this syntax has been updated to support parsing functions which return dictionaries and for appending text to the slot result.

```
__slot__:salt:<module>.<function>(<args>..., <kwargs...>, ...).dictionary ~ append
```

There are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don't need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return */tmp/some_file* and */etc/hosts* strings that will be used as a target and source arguments in the state function *file.copy*.

Here is an example of result parsing and appending:

```
file-in-user-home:
  file.copy:
    - name: __slot__:salt:user.info(someuser).home ~ /subdirectory
    - source: salt://somefile
```

CHAPTER

TWENTYSIX

WINDOWS

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

26.1 Windows Software Repository

Note: In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from HTTP(S) or FTP URLs.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

26.1.1 Configuration

Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```

Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

Note: Use `pkg.refresh_db` from 2016.11 when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

26.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

Install a Package

You can query the available version of a package using the Salt pkg module.

```
salt winminion pkg.list_available firefox

winminion:
    - 15.0.1
    - 16.0.2
    - 17.0.1
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its `name` or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

26.1.3 Uninstall Windows Software

Uninstall software using the pkg module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```

Note: `pkg.purge` just executes `pkg.remove` on Windows. At some point in the future `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

26.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: https://github.com/saltstack/salt-winrepo-ng
- Earlier releases: https://github.com/saltstack/salt-winrepo

By default, these repositories are mirrored to `/srv/salt/win/repo-ng` and `/srv/salt/win/repo`.

This location can be changed in the master config file by setting the *`winrepo_dir_ng`* and *`winrepo_dir`* options.

26.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: salt-winrepo salt-winrepo-ng

Note: The newer software definition files are run through the salt's parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the *`winrepo_remotes`* and *`winrepo_remotes_ng`* options.

Important: `winrepo_remotes` was called `win_gitrepos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online git repository by running the *`winrepo.update_git_repos`* runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (`salt-winrepo`) and new minions (`salt-winrepo-ng`). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

Important: If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the meta database file.

The next step (if you have older minions) is to create the meta database file for the repo (`winrepo.p`). This is done by running the *`winrepo.genrepo`* runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

Note: If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

Finally, you need to refresh the minion database by running the *`pkg.refresh_db`* command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

On older minions (older than 2015.8.0) this will copy the winrepo.p file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (.sls) down to the minion and then create the meta database file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

Important: Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

Note: If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the meta database file to be created successfully.

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable *`winrepo_remotes`* set the following in the master config file:

```
winrepo_remotes: []
```

26.1.6 Creating a Package Definition SLS File

The package definition file is a YAML file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
    full_name: Mozilla Firefox 17.0.1 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
  '16.0.2':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
    full_name: Mozilla Firefox 16.0.2 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
  '15.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
    full_name: Mozilla Firefox 15.0.1 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
```

Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

Warning: The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

Warning: The version must be enclosed in quotes, otherwise the YAML parser will remove trailing zeros.

Note: There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one URL provided for a standalone installation of Google Chrome.

(https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi)

When a new version is released, the URL just points to the new version. To handle situations such as these, set the version to *latest*. Salt will install the version of Chrome at the URL and report that version. Here's an example:

```
chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'
```

(continues on next page)

(continued from previous page)

```
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    locale: en_US
    reboot: False
```

Available parameters are as follows:

param str full_name The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
    ----------
    7-Zip 9.20 (x64 edition):
        9.20.00.0
    Microsoft .NET Framework 4 Client Profile:
        4.0.30319,4.0.30319
    Microsoft .NET Framework 4 Extended:
        4.0.30319,4.0.30319
    Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
        9.0.21022
    Mozilla Firefox 17.0.1 (x86 en-US):
        17.0.1
    Mozilla Maintenance Service:
        17.0.1
    NSClient++ (x64):
        0.3.8.76
    Notepad++:
        6.4.2
    Salt Minion 0.16.0:
        0.16.0
```

Notice the Full Name for Firefox: `Mozilla Firefox 17.0.0 (x86 en-US)`. That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository, the full_name will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```
test-2008:
    ----------
    7zip:
        9.20.00.0
    Microsoft .NET Framework 4 Client Profile:
        4.0.30319,4.0.30319
    Microsoft .NET Framework 4 Extended:
        4.0.30319,4.0.30319
    Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
        9.0.21022
    Mozilla Maintenance Service:
        17.0.1
    Notepad++:
        6.4.2
```

(continues on next page)

(continued from previous page)

```
    Salt Minion 0.16.0:
        0.16.0
    firefox:
        17.0.1
    nsclient:
        0.3.9.328
```

Important: The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the status can be verified when running a highstate.

Note: It is still possible to successfully install packages using `pkg.install`, even if the `full_name` or the version number don't match. However, this can make troubleshooting issues difficult, so be careful.

Tip: To force salt to display the full name when there's already an existing package definition file on the system, you can pass a bogus `saltenv` parameter to the command like so: `pkg.list_pkgs saltenv=NotARealEnv`

---

param str installer The path to the `.exe` or `.msi` to use to install the package. This can be a path or a URL. If it is a URL or a salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

Note: If storing software in the same location as the winrepo it is best practice to place each installer in its own directory rather than the root of winrepo. Then you can place your package definition file in the same directory. It is best practice to name the file `init.sls`. This will be picked up by `pkg.refresh_db` and processed properly.

param str install_flags Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's wiki:

Warning: Salt will not return if the installer is waiting for user input so it is imperative that the software package being installed has the ability to install silently.

param str uninstaller The path to the program used to uninstall this software. This can be the path to the same *exe* or *msi* used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- Software\Microsoft\Windows\CurrentVersion\Uninstall
- Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall

param str uninstall_flags Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's wiki:

> **Warning:** Salt will not return if the uninstaller is waiting for user input so it is imperative that the software package being uninstalled has the ability to uninstall silently.

Here are some examples of installer and uninstaller settings:

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
    uninstall_flags: '/qn /norestart'
```

Alternatively the `uninstaller` can also simply repeat the URL of an msi file:

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: salt://win/repo/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
```

param msiexec This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations. Possible options are: True, False or the path to `msiexec.exe` on your system

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: 'C:\Windows\System32\msiexec.exe'
    uninstaller: salt://win/repo/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
```

param bool allusers This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is `True`.

param bool cache_dir If `True` and the installer URL begins with `salt://`, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

> **Warning:** Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your installer file in the root of winrepo (`/srv/salt/win/repo-ng`) and `cache_dir: True` the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

param str cache_file When the installer URL begins with `salt://`, this indicates a single file to copy down for use with the installer. It is copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don't want to cache additional files that may reside in the installer directory.

Here's an example for a software package that has dependent files:

```
sqlexpress:
  '12.0.2000.8':
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

param bool use_scheduler If `True`, Windows will use the task scheduler to run the installation. This is useful for running the Salt installation itself as the installation process kills any currently running instances of Salt.

param str source_hash This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the hashlib documentation.

Here's an example of source_hash usage:

```
messageanalyzer:
  '4.0.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

param bool reboot Not implemented

param str locale Not implemented

Examples can be found at https://github.com/saltstack/salt-winrepo-ng

26.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an `execution module` exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

Custom Location for Repository SLS Files

If *`file_roots`* has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The `winrepo.genrepo` function from the `winrepo` execution module will by default look for the filename specified by *`winrepo_cachefile`* within `C:\salt\srv\salt\win\repo`.

If the *`file_roots`* parameter has been modified, then *`winrepo_dir`* must be modified to fall within that path, at the proper relative path. For example, if the `base` environment in *`file_roots`* points to `D:\foo`, and *`winrepo_source_dir`* is `salt://win/repo`, then *`winrepo_dir`* must be set to `D:\foo\win\repo` to ensure that `winrepo.genrepo` puts the cachefile into right location.

26.1.8 Configuration options for Minions 2015.8.0 and later

On newer minions (2015.8.0 and later), the *`winrepo_source_dir`* config parameter (default: `salt://win/repo-ng`) controls where *`pkg.refresh_db`* looks for the software definition files that will be downloaded to the minion and used to generate the local database file (`winrepo.p`).

Software package definitions are automatically refreshed if stale after *`winrepo_cache_expire_max`*. Running a highstate normal forces the refresh of the package definition and generation of the meta database, unless the meta database is younger than *`winrepo_cache_expire_max`*. Refreshing the package definitions can take some time, these options were introduced to allow more control of when it occurs.

It's important use *`pkg.refresh_db`* to check for errors and ensure the latest package definition is on any minion your testing new definitions on.

26.1.9 Configuration options for Minions before 2015.8.0

On older minions (before 2015.8.0), the *`winrepo_source_dir`* config parameter (default: `salt://win/repo`) controls where *`pkg.refresh_db`* looks for the cachefile (default: `winrepo.p`). This means that the default location for the winrepo cachefile would be `salt://win/repo/winrepo.p`. Both :conf_minion: winrepo_source_dir' and *`winrepo_cachefile`* can be adjusted to match the actual location of this file on the Salt fileserver.

If connected to a master, the minion will by default look for the winrepo cachefile (the file generated by the *`winrepo.genrepo runner`*) at `salt://win/repo/winrepo.p`. If the cachefile is in a different path on the salt fileserver, then *`win_repo_cachefile`* will need to be updated to reflect the proper location.

26.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see *here* for master config options, and *here* for configuration options for masterless Windows minions.

On the master, the *`winrepo.update_git_repos`* runner has been updated to use either pygit2 or GitPython to checkout the git repositories containing repo data. If pygit2 or GitPython is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running *`winrepo.update_git_repos`*.

If neither GitPython nor pygit2 are installed, then Salt will fall back to the pre-existing behavior for *`winrepo.update_git_repos`*, and a warning will be logged in the master log.

Note: Standalone Windows minions do not support the new GitPython/pygit2 functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found *here*.

Config Parameters Renamed

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

Master Config

Old Name	New Name
win_repo	`winrepo_dir`
win_repo_mastercachefile	`winrepo_cachefile`
win_gitrepos	`winrepo_remotes`

Note: `winrepo_cachefile` is no longer used by 2015.8.0 and later minions, and the `winrepo_dir` setting is replaced by `winrepo_dir_ng` for 2015.8.0 and later minions.

See *here* for detailed information on all master config options for the Windows Repo.

Minion Config

Old Name	New Name
win_repo	`winrepo_dir`
win_repo_cachefile	`winrepo_cachefile`
win_gitrepos	`winrepo_remotes`

See *here* for detailed information on all minion config options for the Windows Repo.

pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner (and the corresponding `remote execution function` for standalone minions) now makes use of the same underlying code used by the *Git Fileserver Backend* and `Git External Pillar` to maintain and update its local clones of git repositories. If a compatible version of either pygit2 (0.20.3 and later) or GitPython (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the `git.latest` state).

Note: If compatible versions of both pygit2 and GitPython are installed, then Salt will prefer pygit2, to override this behavior use the `winrepo_provider` configuration parameter:

```
winrepo_provider: gitpython
```

The `winrepo execution module` (discussed above in the *Managing Windows Software on a Standalone Windows Minion* section) does not yet officially support the new pygit2/GitPython functionality, but if either pygit2 or GitPython is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run *`winrepo.update_git_repos`* to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (**NOTE**: pygit2 only), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
  - https://github.com/saltstack/salt-winrepo.git
  - git@github.com:myuser/myrepo.git:
    - pubkey: /path/to/key.pub
    - privkey: /path/to/key
    - passphrase: myaw3s0m3pa$$phr4$3
  - https://github.com/myuser/privaterepo.git:
    - user: mygithubuser
    - password: CorrectHorseBatteryStaple
```

Note: Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting *`winrepo_passphrase`* would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See *here* for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using pygit2/GitPython. First of all, a `clean` argument has been added to the *`winrepo.update_git_repos`* runner, which (if set to `True`) will tell the runner to dispose of directories under the *`winrepo_dir`* which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the *`winrepo.update_git_repos`* runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git
  - https://github.com/foobar/baz
```

The *`winrepo.update_git_repos`* runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git:
    - name: baz_junior
  - https://github.com/foobar/baz:
    - name: baz_the_third
```

26.1.11 Troubleshooting

Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component ”wmi Windows installer provider” to have full list of installed packages. If you don’t have this, salt-minion can’t report some installed software.

How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

26.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

26.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

26.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow issue #11801 for any changes to this behavior.

26.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue #11801 for any changes to this behavior.

26.2.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating 'nothing', similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chpgrp C:\path\to\file "'None'"`.

26.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

CHAPTER

TWENTYSEVEN

DEVELOPING SALT

27.1 Overview

In its most typical use, Salt is a software application in which clients, called ”minions” can be commanded and controlled from a central command server called a ”master”.

Commands are normally issued to the minions (via the master) by calling a client script simply called, ’salt’.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

27.2 Salt Client

27.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called ’LocalClient’.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master’s ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

27.3 Salt Master

27.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the ’salt’ CLI.

27.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called ’salt-master’ in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

27.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

27.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

27.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

27.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

  - TCP: 4506
  - IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

27.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1) A command is issued on the CLI. For example, 'salt my_minion test.version'.
2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().
5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.
6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.
7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.
8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)
10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().
11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

27.4 Salt Minion

27.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect *back* to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.
- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

27.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

27.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the 'salt-call' script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a 'salt' command is as follows:

1) A master publishes a job that is received by a minion as outlined by the master's job flow above. 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it. 3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message. 4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job. 5) The requested function runs and returns a result. [Still in thread.] 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.] 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

27.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange. 2) AESFuncs is used everywhere else.

27.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development, including (but not limited to):

- filing well-written bug reports
- enhancing the documentation
- providing workarounds, patches, and other code without tests
- engaging in constructive discussion

- helping out in #salt on Freenode, the Community Slack, the salt-users mailing list, a SaltStack meetup, or Server Fault.
- telling others about problems you solved with Salt

If this or other Salt documentation is unclear, please review *Writing Salt Documentation*. PRs are welcome!

27.6.1 Quickstart

If you just want to get started before reading the rest of this guide, you can get the process started by running the following:

```
python3 -m pip install --user pre-commit
git clone --origin upstream https://github.com/saltstack/salt.git
cd salt
pre-commit install
```

While those commands are running, finish reading the rest of this guide.

27.6.2 Pre-commit

To reduce friction during the development process, SaltStack uses pre-commit. This tool adds pre-commit hooks to git to automate several processes that used to be manual. Rather than having to remember to run several different tools before you commit, you only have to run `git commit`, and you will be notified about style and lint issues before you ever open a PR.

27.6.3 Salt Coding Style

After the 3000 release, SaltStack is joining the ranks of projects in adopting the Black code formatter in order to ease the adoption of a unified code formatting style.

Where Black is silent, SaltStack has its own coding style guide that informs contributors on various style points. Please review the *Salt Coding Style* documentation for information about Salt's particular coding patterns.

Within the *Salt Coding Style* documentation, there is a section about running Salt's `.testing.pylintrc` file. SaltStack recommends running the `.testing.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository.

If you've installed `pre-commit`, this will automatically happen before each commit. Otherwise, see the *Linting* documentation for more information.

27.6.4 Copyright Headers

Copyright headers are not needed for files in the Salt project. Files that have existing copyright headers should be considered legacy and not an example to follow.

27.6.5 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors GitHub's own guide and is well worth reading.

1. Fork saltstack/salt on GitHub.
2. Make a local clone of your fork. (Skip this step if you followed the Quickstart)

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add saltstack/salt as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

If you followed the Quickstart, you'll add your own remote instead

```
git remote add my-account git@github.com:my-account/salt.git
```

4. Create a new branch in your clone.

Note: A branch should have one purpose. For example, "Fix bug X," or "Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.

```
git fetch upstream
git checkout -b fix-broken-thing upstream/master
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2 tests/test_file1.py tests/test_file2.py
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary. Use an imperative style for the title.

GOOD

```
Fix broken things in file1 and file2

Fixes #31337

We needed to make this change because the underlying dependency
changed. Now this uses the up-to-date API.

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#       modified:   path/to/file1
#       modified:   path/to/file2
```

BAD

```
Fixes broken things

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#       modified:   path/to/file1
#       modified:   path/to/file2
```

Taking a few moments to explain *why* you made a change will save time and effort in the future when others come to investigate a change. A clear explanation of why something changed can help future developers avoid introducing bugs, or breaking an edge case.

Note: If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

If you get stuck, there are many introductory Git resources on http://help.github.com.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

Note: You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/master fix-broken-thing
git push -u origin fix-broken-thing
```

If you do rebase, and the push is rejected with a `(non-fast-forward)` comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
  (use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force-with-lease` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-forward issue, will likely add extra commits to the pull request which were not part of your changes.

---

7. Find the branch on your GitHub salt fork.

   https://github.com/my-account/salt/branches/fix-broken-thing

8. Open a new pull request.

   Click on `Pull Request` on the right near the top of the page,

   https://github.com/my-account/salt/pull/new/fix-broken-thing

   1. Choose `master` as the base Salt branch.
   2. Review that the proposed changes are what you expect.
   3. Write a descriptive comment. If you added good information to your git commit message, they will already be present here. Include links to related issues (e.g. 'Fixes #31337.') in the comment field.
   4. Click `Create pull request`.

9. Salt project members will review your pull request and automated tests will run on it.

   If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

1. Make the new changes in your local clone on the same local branch.
2. Push the branch to GitHub again using the same commands as before.
3. New and updated commits will be added to the pull request automatically.
4. Feel free to add a comment to the discussion.

Note: Jenkins

Pull request against saltstack/salt are automatically tested on a variety of operating systems and configurations. On average these tests take a couple of hours. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at http://jenkins.saltstack.com/.

27.6.6 Salt's Branch Topology

Salt will only have one active branch - `master`. This will include bug fixes, features and CVE "Common Vulnerabilities and Exposures".

The release will be cut from the master when the time comes for a new release, which should be every 3 to 4 months.

To be able to merge code:

1. The code must have a well-written test. Note that you are only expected to write tests for what you did, not the whole modules or function.
2. All tests must pass.

The SaltStack employee that reviews your pull request might request changes or deny the pull request for various reasons.

Salt uses a typical branch strategy - `master` is the next expected release. Code should only make it to `master` once it's production ready. This means that typical changes (fixes, features) should have accompanying tests.

Closing GitHub issues from commits

SaltStack encourages using the magic keywords to close a GitHub issue. These should appear in the commit message text directly.

27.6.7 Release Naming Convention

A new convention will start when Salt releases Salt 3000. Every new release name will increment by one 'Salt last_release_number + 1'.

This naming convention is very different from past releases, which was 'YYYY.MM.PATCH'.

27.6.8 Handling CVE

If a CVE is discovered, Salt will create a new release that **only** contains the tests and patch for the CVE. This method should improve the upgrade process by reducing the chances of breaking something.

27.6.9 Backporting Pull Requests

On rare occasions, a serious bug will be found in the middle of a release cycle. These bugs will require a point release. Contributors should still submit fixes directly to `master`, but they should also call attention to the fact that it addresses a critical issue and will need to be back-ported.

27.6.10 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

GitHub Fork a Repo Guide

The following assumes `origin` is the name of your fork and `upstream` is the name of the main saltstack/salt repository.

1. View existing remotes.

   ```
   git remote -v
   ```

2. Add the `upstream` remote.

   ```
   # For ssh github
   git remote add upstream git@github.com:saltstack/salt.git

   # For https github
   git remote add upstream https://github.com/saltstack/salt.git
   ```

3. Pull upstream changes into your clone.

   ```
   git fetch upstream
   ```

4. Update your copy of the `master` branch.

   ```
   git checkout master
   git merge --ff-only upstream/master
   ```

   If Git complains that a fast-forward merge is not possible, you have local commits.

   - Run `git pull --rebase origin master` to rebase your changes on top of the upstream changes.
   - Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `master` branch before updating it with the changes from upstream.

   If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

   ```
   git push origin master
   ```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

27.6.11 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using git format-patch and send them to the salt-users mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

27.6.12 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

27.6.13 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

27.6.14 Bootstrap Script Changes

Salt's Bootstrap Script, known as bootstrap-salt.sh in the Salt repo, has it's own repository, contributing guidelines, and release cadence.

All changes to the Bootstrap Script should be made to salt-bootstrap repo. Any pull requests made to the bootstrap-salt.sh file in the Salt repository will be automatically overwritten upon the next stable release of the Bootstrap Script.

For more information on the release process or how to contribute to the Bootstrap Script, see the Bootstrap Script's Contributing Guidelines.

27.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is `Sodium`, the deprecated code and associated warnings should remain in place and warn for at least `Aluminum`.

To help in this deprecation task, salt provides `salt.utils.versions.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.versions.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```python
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.versions.warn_until(
            'Aluminum',
            'The \'foo\' argument has been deprecated and its '
            'functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the `Aluminum` release when the `Magnesium` branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting `Aluminum`, along with the code they are warning about should be removed from the code.

27.8 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

Note: tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git ’fetch’ utility:

```
git fetch --tags upstream
```

Create a new virtualenv:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage_config functionality

---

Note: Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

Note: Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt   # the path to the salt git clone from above
```

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See *macOS Installation*

Warning: Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

27.8.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.

3. Uncomment and change the `pki_dir: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`
4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. Uncomment and change the `pki_dir: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
4. Uncomment and change the `master: salt` value to point at `localhost`.
5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

Note: Using *salt-call* with a *Standalone Minion*

If you plan to run *salt-call* with this self-contained development environment in a masterless setup, you should invoke *salt-call* with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in */etc/salt*.

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.version
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

Note: Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcfd7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.

2. Edit the *`sock_dir`* minion config variable and reduce its length. Remember that this path is relative to the value you set in *`root_dir`*.

`NOTE:` The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

Note: File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, refer to the *macOS Installation* instructions.

Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/
↪virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

Additional Options

If you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-
↪root-dir=/path/to/your/virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/
↪virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

27.8.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a **USE_SETUPTOOLS** environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

27.8.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include **html**, **man**, and **text**.
- The docs then are built within the **docs/_build/** folder. To update the docs after making changes, run `make` again.
- The docs use reStructuredText for markup. See a live demo at http://rst.ninjs.org/.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the **python2-sphinx** package is required. Additionally, it is necessary to tell **make** where to find the proper **sphinx-build** binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the **python-sphinx10** package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

27.8.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See *here* for more information regarding the test suite.

27.8.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

27.9 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

27.9.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- `Approved` - The issue has been validated and has all necessary information.
- `Blocked` - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

27.9.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

- `Feature` - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- `Bug` - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.
- `Duplicate` - The issue is a duplicate of another feature request or bug report.
- `Upstream Bug` - The issue is a result of an upstream issue.
- `Question` - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- `Expected Behavior` - The issue is a bug report of intended functionality.

Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a `P1` label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- `P1` - The issue will be seen by all users.
- `P2` - The issue will be seen by most users.
- `P3` - The issue will be seen by about half of users.
- `P4` - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled `Bug`.

- `Blocker` - The issue is blocking an impending release.
- `Critical` - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- `High Severity` - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- `Medium Severity` - The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- `Execution Module`
- `File Servers`
- `Grains`
- `Multi-Master`
- `Packaging` Related to packaging of Salt, not Salt's support for package management.
- `Pillar`
- `RAET`
- `Returners`
- `Runners`
- `SPM`
- `Salt-API`
- `Salt-Cloud`
- `Salt-SSH`
- `Salt-Syndic`
- `State Module`
- `Tests`

- `Transport`
- `Windows`
- `ZMQ`

Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- `Core` - The issue or pull request relates to code that is central or existential to Salt itself.
- `Platform` - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.
- `RIoT` - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.
- `Console` - The issue or pull request relates to the SaltStack enterprise console.
- `Documentation` - The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the `Blocked` milestone, it is very likely that it will only have a status label.

- `Bugfix - back-port` The pull request needs to be back-ported to an older release branch. This is done by *recreating the pull request* against that branch. Once the back-port is completed, this label is replaced with a `Bugfix - [Done] back-ported` label. Normally, new features should go into the develop and bug fixes into the oldest supported release branch, see *here*.
- `Bugfix - [Done] back-ported` - The pull request has been back-ported to an older branch.
- `Cannot Reproduce` - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.
- `Confirmed` - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.
- `Fixed Pending Verification` - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.
- `Info Needed` - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.
- `Pending Changes` - The pull request needs additional changes before it can be merged.
- `Pending Discussion` - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a `Pending Changes` label.

- `Won't Fix for Now` - The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

- `Minor Change`
  - Less than 64 lines changed, or
  - Less than 8 core lines changed
- `Medium Change`
  - Less than 256 lines changed, or
  - Less than 64 core lines changed
- `Master Change`
  - More than 256 lines changed, or
  - More than 64 core lines changed
- `Expert Change`
  - Needs specialized, in-depth review

Test Status

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

- `Lint` - The pull request has passed all tests except for the code lint checker.
- `Tests Passed` - The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- `Awesome` - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- `Help Wanted` - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- `Needs Testcase` - The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.
- `Regression` - The issue is a bug that breaks functionality known to work in previous releases.
- `Story` - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- `Stretch` - The issue is an optional goal for the current sprint but may not be delivered.
- `ZD` - The issue is related to a Zendesk customer support ticket.
- `<Release>` - The issue is scheduled to be implemented by `<Release>`. See here for a discussion of Salt's release codenames.

27.10 Logging Internals

TODO

27.11 Package Providers

This page contains guidelines for writing package providers.

27.11.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

list_pkgs

This function should declare an empty dict, and then add packages to it by calling *`pkg_resource.add_pkg`*, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute *`pkg_resource.sort_pkglist`*. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

latest_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept `**kwargs`, in order to receive the `fromrepo` and `repo` keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

version

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

upgrade_available

Deprecated and destined to be removed. For now, should just do the following:

```
return __salt__['pkg.latest_version'](name) != ''
```

install

The following arguments are required and should default to `None`:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call *`pkg_resource.parse_targets`* (see below). This function will convert the SLS input into a more easily parsed data structure. *`pkg_resource.parse_targets`* may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name,
                                                               pkgs,
                                                               sources)
```

Two values will be returned to the **install** function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If **name** was provided (and **pkgs** was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the **version** keyword argument was provided, then it should replace the `None` value in the dictionary.
- If **pkgs** was provided, then **name** is ignored, and the dictionary will contain one entry for each package in the **pkgs** list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the *`pkg.installed`* state for more info.
- If **sources** was provided, then **name** is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The **install** function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run **list_pkgs** to obtain a list of the installed packages. You should then return the output of `salt.utils.data.compare_dicts()`:

```
return salt.utils.data.compare_dicts(old, new)
```

remove

Removes the passed package and return a list of the packages removed.

27.11.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a basedir option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

list_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
             'config_key_2': 'config value 2',
             'config_key_3': ['list item 1 (when appropriate)',
                              'list item 2 (when appropriate)]}
```

get_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as list_repos, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

del_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

27.11.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkgs`, but `lowpkg` must never make calls to `pkg`. This is affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
                                'type': 'config'}}
```

file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the *file_list* function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],
  'files': ['/etc/httpd',
            '/etc/httpd/conf',
            '/etc/httpd/conf.d',
            '...SNIP...']}
```

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike *file_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file_list*.

```
{'errors': ['package apache is not installed'],
 'packages': {'httpd': ['/etc/httpd',
                        '/etc/httpd/conf',
                        '...SNIP...'],
              'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',
                         '/boot/System.map-2.6.32-279.el6.x86_64',
                         '...SNIP...']}}
```

27.12 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven't contributed to a large software project before we encourage you to consider the following questions when preparing a pull request.

This isn't an exhaustive list and these aren't necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?
- Will this code work on versions of all Python we support? Will it work on future versions?
- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what's going on?
- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?
- Is it readable? Does it conform to our style guide? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?
- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?
- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools.) Will it be easy to profile this change if it might be a problem?
- Are caveats considered and documented in the change?
- Will the code scale? More critically, will it scale in *both* directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.
- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn't work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?
- Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?
- How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?
- If it's asynchronous code, what is the potential for a race condition?
- Is this code an original work? If it's borrowed from another project or found online are the appropriate licensing/attribution considerations handled?
- Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.
- Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?
- Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?

- If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?
- Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?
- Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?
- Are resources such as file-handles cleaned-up after they are used?
- Is it possible that a reference-cycle exists between objects that will leak memory?
- Has the code been linted and does it pass all tests?
- Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?
- Will the code throw errors/warnings/stacktraces to the console during normal operation?
- Has all the debugging been removed?
- Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?
- Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?
- What's hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?
- Are utility functions used where appropriate? Does this change re-implement something we already have code for?
- Is the right thing being fixed? There are cases where it's appropriate to fix a test and cases where it's appropriate to fix the code that's under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?
- How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?
- Does this PR try to fix too many bugs/problems at once?
- Should this be split into multiple PRs to make them easier to test and reason about?

27.13 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.

- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!

27.14 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

27.14.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port `4505` and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port `4506` and can be configured via the `ret_port` option in the master.

27.14.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

27.14.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

27.15 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (`<my_account>`)

- a command line (CLI)
- git
- a text editor

27.15.1 Fork

In your browser, navigate to the `saltstack/salt` GitHub repository.

Click on `Fork` (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

27.15.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from `upstream`.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `master` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/master` so that we will get all upstream changes when they happen.

```
$ git checkout master
$ git branch --set-upstream-to upstream/master
```

27.15.3 Fetch

Fetch any `upstream` changes on the `master` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

Note: For an explanation on `pull` vs `pull --rebase` and other excellent points, see this article by Mislav Marohnić.

27.15.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `master`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

27.15.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
```

```
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
         '''
         if os.path.isdir('/etc/alternatives'):
                 return True
-        return False
+        return (False, 'Cannot load alternatives module: /etc/alternatives dir not
↪found')

 def _get_cmd():
```

27.15.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

27.15.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

Note: If authentication over https does not work, you can alternatively setup ssh keys. Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

27.15.8 Merge

In your browser, navigate to the new pull request page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `master` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

Note: Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:

  `https://github.com/saltstack/salt/compare/master...<my_account>:virt_ret`

27.15.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

https://help.github.com/

There are many topics covered by the Salt Developer documentation:

https://docs.saltstack.com/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:

https://docs.saltstack.com/en/latest/topics/development/contributing.html

27.16 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

27.16.1 Developing New Modules

Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

Special Module Contents

These are things that may be defined by the module to influence various things.

__virtual__

__virtual_aliases__

__virtualname__

__init__

Called before `__virtual__()`

__proxyenabled__

grains and proxy modules

__proxyenabled__ as a list containing the names of the proxy types that the module supports.

__load__

__func_alias__

__outputter__

Dunder Dictionaries

Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty

- `__context__`
- `__grains__`
- `__pillar__`
- `__opts__`

__opts__

Defined in: All modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt *get* functions such as config.get, aka - `__salt__['config.get']('foo:bar')` The *get* functions also allow for dict traversal via the *:* delimiter. Consider using get functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

__salt__

Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

Note: When used in runners or outputters, `__salt__` references other runner/outputter modules, and not execution modules.

__grains__

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

While `__grains__` is defined for every module, it's only filled in for some.

__pillar__

Filled in for: Execution, Renderer, Returner, SSH Wrapper, State

The `__pillar__` dictionary contains the pillar for the respective minion.

While `__pillar__` is defined for every module, it's only filled in for some.

__ext_pillar__

Filled in for: Pillar

The `__ext_pillar__` dictionary contains the external pillar modules.

__context__

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when *`saltutil.sync_all`* or *`state.apply`* are executed.

A great place to see how to use `__context__` is in the cp.py module in salt/modules/cp.py. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from salt/modules/cp.py:

```
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

Note: Because __context__ may or may not have been destroyed, always be sure to check for the existence of the key in __context__ and generate the key before using it.

__utils__

Defined in: Cloud, Engine, Execution, File Server, Grain, Pillar, Proxy, Roster, Runner, SDB, State

__proxy__

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

__runner__

Defined in: Engine, Roster, Thorium

Note: When used in engines, it should be called __runners__ (plural)

__executors__

Defined in: Executor

__ret__

Defined in: Proxy

__thorium__

Defined in: Thorium

__states__

Defined in: Renderers, State

__serializers__

Defined in: State

__sdb__

Defined in: SDB

Additional Globals

Defined for: Runners, Execution Modules, Wheels

- `__jid__`: The job ID
- `__user__`: The user
- `__tag__`: The jid tag
- `__jid_event__`: A `salt.utils.event.NamespacedEvent`.

`NamespacedEvent` defines a single method `fire_event`, that takes data and tag. The *Runner docs* has examples.

27.16.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules` (*Minion*)
- `cython_enable` (*Minion*, *Master*)
- `disable_modules` (*Minion*)
- `disable_returners` (*Minion*)
- `enable_zip_modules` (*Minion*)
- `extension_modules` (*Master*)
- `extmod_whitelist` (*Minion*, *Master*)
- `extmod_blacklist` (*Minion*, *Master*)
- `whitelist_modules` (*Minion*)
- `grains_dirs` (*Minion*)
- `module_dirs` (*Minion*, *Master*)
- `outputter_dirs` (*Minion*, *Master*)
- `providers` (*Minion*)
- `render_dirs` (*Minion*)
- `returner_dirs` (*Minion*)
- `runner_dirs` (*Master*)
- `states_dirs` (*Minion*)
- `utils_dirs` (*Minion*)

27.16.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed

Using one source to override another is not supported.

The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don't require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

The Salt File Server

The user may add modules by simply placing them in special directories in their *fileserver*.

The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- `_grains`
- `_modules`
- `_states`

Modules must be synced before they can be used. This can happen a few ways, discussed below.

Note: Using saltenvs besides `base` may not work in all contexts.

Sync Via States

The minion configuration contains an option `autoload_dynamic_modules` which defaults to `True`. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set *`autoload_dynamic_modules`* to `False` in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenvs as the states currently being run.

Also it is possible to use the explicit `saltutil.sync_*` *`state functions`* to sync the modules (previously it was necessary to use the `module.run` state):

Sync Via the saltutil Module

The saltutil module has a number of functions that can be used to sync all or specific dynamic modules. The `saltutil.sync_*` *`execution functions`* and *`runner functions`* can be used to sync modules to minions and the master, respectively.

The extmods Directory

Any files places in the directory set by `extension_modules` settings (`minion`, *`master`*, default `/var/cache/salt/*/extmods`) can also be loaded as modules. Note that these directories are also used by the `saltutil.sync_*` functions (mentioned above) and files may be overwritten.

Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```
setup(
    # ...
    entry_points={
        'salt.loader': [
            'module_dirs=spirofs.loader:module',
        ],
    },
    # ...
)
```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

27.16.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

Module Type	Salt Package Name	FS/Directory Name	Entry Point
Auth	`salt.auth` (*index*)	`auth`[1]	`auth_dirs`
Beacon	`salt.beacons` (*index*)	`beacons`	`beacons_dirs`
Cache	`salt.cache` (*index*)	`cache`	`cache_dirs`
Cloud	`salt.cloud.clouds` (*index*)	`clouds`	`cloud_dirs`
Engine	`salt.engines` (*index*)	`engines`	`engines_dirs`
Execution	`salt.modules` (*index*)	`modules`	`module_dirs`
Executor	`salt.executors` (*index*)	`executors`	`executor_dirs`
File Server	`salt.fileserver` (*index*)	`fileserver`	`fileserver_dirs`
Grain	`salt.grains` (*index*)	`grains`	`grains_dirs`
Log Handler	`salt.log.handlers` (*index*)	`log_handlers`	`log_handlers_dirs`
Matcher	`salt.matchers`	`matchers`	`matchers_dirs`
Metaproxy	`salt.metaproxy`	`metaproxy`[1]	`metaproxy_dirs`
Net API	`salt.netapi` (*index*)	`netapi`[1]	`netapi_dirs`
Outputter	`salt.output` (*index*)	`output`	`outputter_dirs`
Pillar	`salt.pillar` (*index*)	`pillar`	`pillar_dirs`
Proxy	`salt.proxy` (*index*)	`proxy`	`proxy_dirs`
Queue	`salt.queues` (*index*)	`queues`	`queue_dirs`
Renderer	`salt.renderers` (*index*)	`renderers`	`render_dirs`
Returner	`salt.returners` (*index*)	`returners`	`returner_dirs`
Roster	`salt.roster` (*index*)	`roster`	`roster_dirs`

Continued on next page

Table 1 – continued from previous page

Module Type	Salt Package Name	FS/Directory Name	Entry Point
Runner	`salt.runners` (*index*)	`runners`	`runner_dirs`
SDB	`salt.sdb` (*index*)	`sdb`	`sdb_dirs`
Serializer	`salt.serializers` (*index*)	`serializers`[1]	`serializers_dirs`
SPM pkgdb	`salt.spm.pkgdb`	`pkgdb`[1]	`pkgdb_dirs`
SPM pkgfiles	`salt.spm.pkgfiles`	`pkgfiles`[1]	`pkgfiles_dirs`
SSH Wrapper	`salt.client.ssh.wrapper`	`wrapper`[1]	`wrapper_dirs`
State	`salt.states` (*index*)	`states`	`states_dirs`
Thorium	`salt.thorium` (*index*)	`thorium`	`thorium_dirs`
Tokens	`salt.tokens`	`tokens`	`tokens_dirs`
Top	`salt.tops` (*index*)	`tops`	`top_dirs`
Util	`salt.utils`	`utils`	`utils_dirs`
Wheel	`salt.wheels` (*index*)	`wheel`	`wheel_dirs`

Note: While it is possible to import modules directly with the import statement, it is strongly recommended that the appropriate *dunder dictionary* is used to access them instead. This is because a number of factors affect module names, module selection, and module overloading.

Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the `pam` module as an example.

See *External Authentication System* for more about authentication in Salt.

Beacon

- *Writing Beacons*

Beacons are polled by the Salt event loop to monitor non-salt processes. See *Beacons* for more information about the beacon system.

Cache

The minion cache is used by the master to store various information about minions. See *Minion Data Cache* for more information.

Cloud

Cloud modules are backend implementations used by *Salt Cloud*.

Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See *Salt Engines* for complete details.

---

[1] These modules cannot be loaded from the Salt File Server.

Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

Executor

Executors control how execution modules get called. The default is to just call them, but this can be customized.

File Server

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example.

See *File Server Backends* for more information.

Grains

- *Writing Grains*

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

See *Grains* for more.

Log Handler

Log handlers allows the logs from salt (master or minion) to be sent to log aggregation systems.

Matcher

Matcher modules are used to define the *minion targeting expressions*. For now, it is only possible to override the *existing matchers* (the required CLI plumbing for custom matchers is not implemented yet).

Metaproxy

Metaproxy is an abstraction layer above the existing proxy minion. It enables adding different types of proxy minions that can still load existing proxymodules.

Net API

Net API modules are the actual server implementation used by Salt API.

Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the `nested` module.

Pillar

External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an ext_pillar module.

Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
  - example_a: some argument
  - example_b:
    - argumentA
    - argumentB
  - example_c:
      keyA: valueA
      keyB: valueB
```

The Module

Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__( __opts__ ):
    # Do init work here
```

Note: The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

__virtual__

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

ext_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )                   # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' )          # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' )    # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note**: this function is called once for each minion that fetches its pillar data.

```
def ext_pillar( minion_id, pillar, *args, **kwargs ):

    my_pillar = {'external_pillar': {}}

    my_pillar['external_pillar'] = get_external_pillar_dictionary()

    return my_pillar
```

You can call pillar with the dictionary's top name to retrieve its data. From above example, 'external_pillar' is the top dictionary name. Therefore:

```
salt '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

__opts__ A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.

__salt__ A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` **Note**, runs on the *master*

__grains__ A dictionary of the grains of the minion making this pillar call.

Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {\"arg\":\"value\"}'
```

Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

Proxy

Proxy Minions are a way to manage devices that cannot run a full minion directly.

Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the `py` renderer and as complex as `stateconf` and `pydsl`.

Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

Roster

The *Roster system* is used by Salt SSH to enumerate devices.

Runners

Runners are purely master-side execution sequences.

SDB

- *Writing SDB Modules*

SDB is a way to store data that's not associated with a minion. See *Storing Data in Other Databases*.

Serializer

Primarily used with `file.serialize`.

State

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

Note: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

SPM pkgdb

- *SPM Development Guide: Package Database*

pkgdb modules provides storage backends to the package database.

SPM pkgfiles

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.

SSH Wrapper

Replacement execution modules for *Salt SSH*.

Thorium

Modules for use in the *Thorium* event reactor.

Tokens

Token stores for *External Authentication*. See the `salt.tokens` docstring for details.

Note: The runner to load tokens modules is *`saltutil.sync_eauth_tokens`*.

Tops

Tops modules are used to convert external data sources into top file data for the state system.

Util

Just utility modules to use with other modules via `__utils__` (see *Dunder Dictionaries*).

Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

27.17 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

27.17.1 Command line usage

See salt-extend

27.17.2 Choosing a template

The following templates are available:

module

Creates a new execution module within salt/modules/{{module_name}}.py

module_unit

Creates a new execution module unit test suite within tests/unit/modules/test_{{module_name}}.py

state

Creates a new state module within salt/states/{{module_name}}.py

state_unit

Creates a new state module unit test suite within tests/unit/states/test_{{module_name}}.py

27.17.3 Adding templates

1. Create a directory under <src>/templates
2. Create a file `template.yml` containing properties for

- `description` - a description of the template
- `questions` - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
  - `question` - The question to ask the user, as a string
  - `default` - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

Example template.yml

```
description: "Execution module"
questions:
    depending_libraries:
        question: "What libraries does this module depend upon?"
    virtual_name:
        question: "What module virtual name to use?"
        default: "{{module_name}}"
```

3. Create the files within <src>/templates/<your template> to match the target

---

Note: File names can contain Jinja 2 template syntax, e.g. *'{{module_name}}.py}}'*

Example file in the template directory

```
print('Hello {{module_name}}')
__virtual__ = '{{__virtual_name__}}'
```

Default context properties

The default context provides the following properties

- `description` - A description of the template
- `short_description` - A short description of the module as entered by the user
- `version` - The version name of the next release
- `module_name` - The module name as entered by the user
- `release_date` - The current date in the format *YYYY-MM-DD*
- `year` - The current year in the format *YYYY*

As well as any additional properties entered from the questions section of `template.yml`

27.17.4 API

salt.utils.extend module

SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using *salt-extend*

codeauthor Anthony Shaw <anthonyshaw@apache.org>

`salt.utils.extend.`**`apply_template`**(*template_dir*, *output_dir*, *context*)

Apply the template from the template directory to the output using the supplied context dict.

Parameters

- **`src`** (`str`) – The source path

- **dst** (`str`) – The destination path
- **context** (`dict`) – The dictionary to inject into the Jinja template as context

`salt.utils.extend.`**`run`**(*extension=None*, *name=None*, *description=None*, *salt_dir=None*, *merge=False*, *temp_dir=None*)

A template factory for extending the salt ecosystem

Parameters

- **extension** (`str`) – The extension type, e.g. 'module', 'state', if omitted, user will be prompted
- **name** (`str`) – Python-friendly name for the module, if omitted, user will be prompted
- **description** (`str`) – A description of the extension, if omitted, user will be prompted
- **salt_dir** (`str`) – The targeted Salt source directory
- **merge** (`bool`) – Merge with salt directory, *False* to keep separate, *True* to merge trees.
- **temp_dir** (`str`) – The directory for generated code, if omitted, system temp will be used

27.18 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt's test suite works, be sure to check out the *Salt's Test Suite: An Introduction* tutorial.

27.18.1 Test Directory Structure

Salt's test suite is located in the `tests` directory in the root of Salt's codebase. The test suite is divided into two main groups:

- *Integration Tests*
- *Unit Tests*

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

Note: Salt's test framework provides for the option to only run tests which correspond to a given file (or set of files), via the `--from-filenames` argument to `runtests.py`:

```
python /path/to/runtests.py --from-filenames=salt/modules/foo.py
```

Therefore, where possible, test files should be named to match the source files they are testing. For example, when writing tests for `salt/modules/foo.py`, unit tests should go into `tests/unit/modules/test_foo.py`, and integration tests should go into `tests/integration/modules/test_foo.py`.

However, integration tests are organized differently from unit tests, and this may not always be plausible. In these cases, to ensure that the proper tests are run for these files, they must be mapped in tests/filename_map.yml.

The filename map is used to supplement the test framework's filename matching logic. This allows one to ensure that states correspnding to an execution module are also tested when `--from-filenames` includes that execution module. It can also be used for those cases where the path to a test file doesn't correspond directly to the file which is being tested (e.g. the `shell`, `spm`, and `ssh` integration tests, among others). Both glob expressions and regular expressions are permitted in the filename map.

Important: Test modules which don't map directly to the source file they are testing (using the naming convention described above), **must** be added to the `ignore` tuple in `tests/unit/test_module_names.py`, in the `test_module_name_source_match` function. This unit test ensures that we maintain the naming convention for test files.

Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- *Integration Test Documentation*

Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- *Unit Test Documentation*

27.18.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python27.txt
pip install -r requirements/dev_python34.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run *unit tests only*: `python tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py -n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `python tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the *Test Selection Options* documentation or the *Running Specific Tests* section of the *Salt's Test Suite: An Introduction* tutorial.

Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the `runtests.py` script with `--unit` argument:

```
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

Note: Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the `--run-destructive` flag:

```
python tests/runtests.py --run-destructive
```

Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digitalocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
  location: New York 1
```

Note: When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

Running The Tests In A Docker Container

The test suite can be executed under a docker container using the `--docked` option flag. The docker container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
python tests/runtests.py --docked=ubuntu-12.04 -v
```

The full docker container repository can also be provided:

```
python tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt's docker repository.

Custom docker containers can be provided by submitting a pull request against Salt's docker Salt test containers repository.

27.18.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to http://jenkins.saltstack.com.

Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: https://github.com/saltstack/salt/blob/master/tests/jenkins.py

27.18.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- *Writing integration tests*
- *Writing unit tests*

Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `master` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `master` branch, then the tests should be added there as well. However, if the feature was added to `master` some time ago and is already present in one or more release branches, please refer to the *Tests for Entire Files or Functions* section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the *Which Salt Branch?* documentation in Salt's *Contributing* guide.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `master` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

Note: If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested.It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported in *tests.support.helpers*.

@expensiveTest – Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.

@destructiveTest – Marks a test as potentially destructive. It will not be run by the test runner unless the `-run-destructive` test is expressly passed.

@requires_network – Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.

@requires_salt_modules – Requires all the modules in a list of modules in order for the test to be executed. Otherwise, the test is skipped.

@requires_system_grains – Loads and passes the grains on the system as an keyword argument to the test function with the name *grains*.

@skip_if_binaries_missing(['list', 'of', 'binaries']) – If called from inside a test, the test will be skipped if the binaries are not all present on the system.

@skip_if_not_root – If the test is not executed as root, it will be skipped.

@with_system_user – Creates and optionally destroys a system user within a test case. See implementation details in *tests.support.helpers* for details.

@with_system_group – Creates and optionally destroys a system group within a test case. See implementation details in *tests.support.helpers* for details.

@with_system_user_and_group – Creates and optionally destroys a system user and group within a test case. See implementation details in *tests.support.helpers* for details.

27.19 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.

The integration system is all located under `tests/integration` in the Salt source tree. Each directory within `tests/integration` corresponds to a directory in Salt's tree structure. For example, the integration tests for the `test.py` Salt module that is located in `salt/modules` should also be named `test.py` and reside in `tests/integration/modules`.

27.19.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *test subsections*, and running a single integration test file, class, or individual test.

27.19.2 Best Practices

Integration tests should be written to the following specifications.

What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Individual tests should test against a single behavior.
- Since it occasionally takes some effort to "set up" an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output.

The setUp and tearDown Functions

There are two special functions that can be utilized in the integration side of Salt's test suite: `setUp` and `tearDown`. While these functions are not required in all test files, there are many examples in Salt's integration test suite illustrating the broad usefulness of each function.

The `setUp` function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the `mac_*` integration tests should only run on macOS machines. The `setUp` function can be used to test for the presence of the `Darwin` kernel. If the `Darwin` kernel is not present, then the test should be skipped.

```
def setUp(self):
    '''
    Sets up test requirements
    '''
    os_grain = self.run_function('grains.item', ['kernel'])
    if os_grain['kernel'] not in 'Darwin':
        self.skipTest(
            'Test not applicable to \'{kernel}\' kernel'.format(
                **os_grain
            )
        )
```

The `setUp` function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The `tearDown` function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

Note: The `setUp` and `tearDown` functions run before and after each test in the test class that the `setUp` and `tearDown` functions are defined.

Be sure to read the *Destructive vs Non-Destructive Tests* section when using any kind of destructive functions that might alter the system running the test suite in either the `setUp` or `tearDown` function definitions.

Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any `setUp` or `tearDown` functions are defined in the class, those functions will run before (for `setUp`) or after (for `tearDown`) each test case.

27.19.3 Integration Classes

The integration classes are located in `tests/integration/__init__.py` and can be extended therein. There are four classes available to extend:

- *ModuleCase*
- *ShellCase*
- *SSHCase*
- *SyndicCase*

ModuleCase

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

run_state

Run the state.single command and return the state return structure.

minion_run

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

run_cp

Execute salt-cp. Pass in the argument string as it would be passed on the command line.

run_call

Execute salt-call, pass in the argument string as it would be passed on the command line.

run_cloud

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

run_key

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

run_run

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

run_run_plus

Execute the runner function the and return the return data and output in a dict

run_salt

Execute the salt command. Pass in the argument string as it would be passed on the command line.

run_script

Execute a salt script with the given argument string.

run_ssh

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

SSHCase

Used to execute remote commands via salt-ssh. The available methods are as follows:

run_function

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

SyndicCase

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

27.19.4 Examples

The following sections define simple integration tests present in Salt's integration test suite for each type of testing class.

Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the `integration.ModuleCase` class.

Now the workhorse method `run_function` can be used to test a module:

```
import os
import tests.integration as integration

class TestModuleTest(integration.ModuleCase):
    '''
    Validate the test module
    '''
    def test_ping(self):
        '''
        test.ping
        '''
        self.assertTrue(self.run_function('test.ping'))

    def test_echo(self):
        '''
        test.echo
        '''
        self.assertEqual(self.run_function('test.echo', ['text']), 'text')
```

The fist example illustrates the testing master issuing a `test.ping` call to a testing minion. The test asserts that the minion returned with a `True` value to the master from the `test.ping` call.

The second example similarly verifies that the minion executed the `test.echo` command with the `text` argument. The `assertEqual` call maintains that the minion ran the function and returned the data as expected to the master.

Shell Example via ShellCase

Validating the shell commands can be done via shell tests:

```
import sys
import shutil
import tempfile

import tests.integration as integration

class KeyTest(integration.ShellCase):
    '''
    Test salt-key script
    '''

    _call_binary_ = 'salt-key'

    def test_list(self):
        '''
        test salt-key -L
        '''
        data = self.run_key('-L')
        expect = [
                'Unaccepted Keys:',
                'Accepted Keys:',
                'minion',
                'sub_minion',
                'Rejected:', '']
        self.assertEqual(data, expect)
```

This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key` method.

SSH Example via SSHCase

Testing salt-ssh functionality can be done using the SSHCase test class:

```
import tests.integration as integration

class SSHGrainsTest(integration.SSHCase):
'''
Test salt-ssh grains functionality
Depend on proper environment set by integration.SSHCase class
'''

def test_grains_id(self):
    '''
    Test salt-ssh grains id work for localhost.
    '''
    cmd = self.run_function('grains.get', ['id'])
    self.assertEqual(cmd, 'localhost')
```

Testing Event System via SaltMinionEventAssertsMixin

The fundamentially asynchronous nature of Salt makes testing the event system a challenge. The `SaltMinionEventAssertsMixin` provides a facility for testing that events were received on a minion event bus.

```
import tests.integration as integration
import salt.utils.event

class TestEvent(integration.SaltEventAssertsMixin):
    '''
    Example test of firing an event and receiving it
    '''

    def test_event(self):
        e = salt.utils.event.get_event('minion', sock_dir=self.minion_opts['sock_dir
↪'], opts=self.minion_opts)

        e.fire_event({'a': 'b'}, '/test_event')

        self.assertMinionEventReceived({'a': 'b'})
```

Syndic Example via SyndicCase

Testing Salt's Syndic can be done via the SyndicCase test class:

```
import tests.integration as integration

class TestSyndic(integration.SyndicCase):
    '''
    Validate the syndic interface by testing the test module
    '''
    def test_ping(self):
```

(continues on next page)

(continued from previous page)

```
        '''
        test.ping
        '''
        self.assertTrue(self.run_function('test.ping'))
```

This example verifies that a `test.ping` command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the `run_function` located with in the `SyndicCase` test class.

27.19.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named `files` to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within `tests/integration/files` contain files that accomplish different tasks, based on the needs of the integration tests using those files. For example, `tests/integration/files/ssh` is used to bootstrap the test runner for salt-ssh testing, while `tests/integration/files/pillar` contains files storing data needed to test various pillar functions.

The `tests/integration/files` directory also includes an integration state tree. The integration state tree can be found at `tests/integration/files/file/base`.

The following example demonstrates how integration files can be used with ModuleCase to test states:

```
# Import python libs
from __future__ import absolute_import
import os
import shutil

# Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin

# Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, 'hosts')

class HostTest(ModuleCase, SaltReturnAssertsMixin):
    '''
    Validate the host state
    '''

    def setUp(self):
        shutil.copyfile(os.path.join(FILES, 'hosts'), HFILE)
        super(HostTest, self).setUp()

    def tearDown(self):
        if os.path.exists(HFILE):
            os.remove(HFILE)
        super(HostTest, self).tearDown()

    def test_present(self):
```

(continues on next page)

(continued from previous page)

```
        '''
        host.present
        '''
        name = 'spam.bacon'
        ip = '10.10.10.10'
        ret = self.run_state('host.present', name=name, ip=ip)
        self.assertSaltTrueReturn(ret)
        with salt.utils.files.fopen(HFILE) as fp_:
            output = fp_.read()
            self.assertIn('{0}\t\t{1}'.format(ip, name), output)
```

To access the integration files, a variable named `FILES` points to the `tests/integration/files` directory. This is where the referenced `host.present` sls file resides.

In addition to the static files in the integration state tree, the location `TMP` can also be used to store temporary files that the test system will clean up when the execution finishes.

27.19.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the `@destructive` decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:

```
import tests.integration as integration
from tests.support.helpers import destructiveTest, skip_if_not_root

class DestructiveExampleModuleTest(integration.ModuleCase):
    '''
    Demonstrate a destructive test
    '''

    @destructiveTest
    @skip_if_not_root
    def test_user_not_present(self):
        '''
        This is a DESTRUCTIVE TEST it creates a new user on the minion.
        And then destroys that user.
        '''
        ret = self.run_state('user.present', name='salt_test')
        self.assertSaltTrueReturn(ret)
        ret = self.run_state('user.absent', name='salt_test')
        self.assertSaltTrueReturn(ret)
```

27.19.7 Cloud Provider Tests

Cloud provider integration tests are used to assess *Salt-Cloud*'s ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the `tests/integration/cloud/providers/` directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at `tests/integration/files/conf/cloud.*.d/`.

The following is an example of the default profile configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.profiles.d/digitalocean.conf`:

```
digitalocean-test:
  provider: digitalocean-config
  image: Ubuntu 14.04 x64
  size: 512MB
```

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.providers.d/digitalocean.conf`:

```
digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class's `setUp` function:

```
from tests.support.case import ShellCase
from tests.support.paths import FILES

class LinodeTest(ShellCase):
'''
Integration tests for the Linode cloud provider in Salt-Cloud
'''

def setUp(self):
    '''
    Sets up the test requirements
    '''
    super(LinodeTest, self).setUp()

    # check if appropriate cloud provider and profile files are present
    profile_str = 'linode-config:'
    provider = 'linode'
    providers = self.run_cloud('--list-providers')
    if profile_str not in providers:
        self.skipTest(
            'Configuration file for {0} was not found. Check {0}.conf files '
            'in tests/integration/files/conf/cloud.*.d/ to run these tests.'
            .format(provider)
        )
```

(continues on next page)

(continued from previous page)

```
    # check if apikey and password are present
    path = os.path.join(FILES,
                        'conf',
                        'cloud.providers.d',
                        provider + '.conf')
    config = cloud_providers_config(path)
    api = config['linode-config']['linode']['apikey']
    password = config['linode-config']['linode']['password']
    if api == '' or password == '':
        self.skipTest(
            'An api key and password must be provided to run these tests. Check '
            'tests/integration/files/conf/cloud.providers.d/{0}.conf'.format(
                provider
            )
        )
```

Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are off by default and do not run automatically. To run the cloud provider tests, the `--cloud-provider-tests` flag must be provided:

```
./tests/runtests.py --cloud-provider-tests
```

Since cloud provider tests do not run automatically, all provider tests must be preceded with the `@expensiveTest` decorator. The expensive test decorator is necessary because it signals to the test suite that the `--cloud-provider-tests` flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the expensiveTest decorator for the test function:

```
from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
    '''
    Test creating an instance on Linode
    '''
    name = 'linode-testing'

    # create the instance
    instance = self.run_cloud('-p linode-test {0}'.format(name))
    str = '        {0}'.format(name)

    # check if instance with salt installed returned as expected
    try:
        self.assertIn(str, instance)
    except AssertionError:
        self.run_cloud('-d {0} --assume-yes'.format(name))
        raise

    # delete the instance
    delete = self.run_cloud('-d {0} --assume-yes'.format(name))
    str = '            True'
    try:
        self.assertIn(str, delete)
    except AssertionError:
        raise
```

27.19.8 Adding New Directories

If the corresponding Salt directory does not exist within `tests/integration`, the new directory must be created along with the appropriate test file to maintain Salt's testing directory structure.

In order for Salt's test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to `tests/runtests.py`. Examples of the necessary options that must be added can be found here: https://github.com/saltstack/salt/blob/master/tests/runtests.py. The functions that need to be edited are `setup_additional_options`, `validate_options`, and `run_integration_tests`.

27.20 Writing Unit Tests

27.20.1 Introduction

Like many software projects, Salt has two broad-based testing approaches – integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function's logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.

Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.

27.20.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *unit test subsection*, running the unit tests *without testing daemons* to speed up development wait times, and running a unit test file, class, or individual test.

27.20.3 Best Practices

Unit tests should be written to the following specifications.

What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function's logic. The following guidelines should be followed when writing unit tests for Salt's test suite:

- Each `raise` and `return` statement needs to be independently tested.
- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Test functions should contain only one assertion.
- Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn't any logic present in a simple execution module, consider writing an *integration test* instead of heavily mocking a call to an external dependency.

Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.

- Test functions should contain only one assertion and all necessary mock code and data for that assertion.
- External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn't mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
- Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.
- Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function's logic.

Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, `__salt__`, `__opts__`, `__pillar__`, etc. To facilitate testing these modules a mixin class was created, `LoaderModuleMockMixin` which can be found in `tests/support/mixins.py`. The reason for the existence of this class is because historically one would add these dunder variables directly on the imported module. This, however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that's exactly what this mixin class does.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```
import salt.modules.somemodule as somemodule

class SomeModuleTest(TestCase, LoaderModuleMockMixin):

    def setup_loader_modules(self):
        return {
            somemodule: {
                '__opts__': {'test': True}
            }
        }
```

Consider this more extensive example from `tests/unit/modules/test_libcloud_dns.py`:

```
# Import Python Libs
from __future__ import absolute_import

# Import Salt Testing Libs
```

(continues on next page)

(continued from previous page)

```
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase
from tests.support.mock import (
    patch,
    MagicMock,
)
import salt.modules.libcloud_dns as libcloud_dns

class MockDNSDriver(object):
    def __init__(self):
        pass

def get_mock_driver():
    return MockDNSDriver()

@patch('salt.modules.libcloud_dns._get_driver',
       MagicMock(return_value=MockDNSDriver()))
class LibcloudDnsModuleTestCase(TestCase, LoaderModuleMockMixin):

    def setup_loader_modules(self):
        module_globals = {
            '__salt__': {
                'config.option': MagicMock(return_value={
                    'test': {
                        'driver': 'test',
                        'key': '2orgk34kgk34g'
                    }
                })
            }
        }
        if libcloud_dns.HAS_LIBCLOUD is False:
            module_globals['sys.modules'] = {'libcloud': MagicMock()}

        return {libcloud_dns: module_globals}
```

What happens in the above example is we mock a call to *__salt__['config.option']* to return the configuration needed for the execution of the tests. Additionally, if the `libcloud` library is not available, since that's not actually part of what's being tested, we mocked that import by patching `sys.modules` when tests are running.

Mocking Filehandles

Note: This documentation applies to the 2018.3 release cycle and newer. The extended functionality for `mock_open` described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using `salt.utils.files.fopen()`. When testing code that reads from files, the `mock_open` helper can be used to mock filehandles. Note that is not the same `mock_open` as `unittest.mock.mock_open()` from the Python standard library, but rather a separate implementation which has additional functionality.

```
from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)

import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):

    def test_something(self):
        fopen_mock = mock_open(read_data='foo\nbar\nbaz\n')
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True
```

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

Important: String Types

When running tests on Python 2, `mock_open` will convert any `unicode` types to `str` types to more closely reproduce Python 2 behavior (file reads are always `str` types in Python 2, irrespective of mode).

However, when configuring your read_data, make sure that you are using bytestrings (e.g. `b'foo\nbar\nbaz\n'`) when the code you are testing is opening a file for binary reading, otherwise the tests will fail on Python 3. The mocked filehandles produced by `mock_open` will raise a `TypeError` if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be ”written” if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

More Complex Scenarios

Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass `read_data` as a dictionary:

```
import textwrap

from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)

import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):

    def test_something(self):
        contents = {
            '/etc/foo.conf': textwrap.dedent('''\
```

(continues on next page)

(continued from previous page)

```
                foo
                bar
                baz
                '''),
            '/etc/b*.conf': textwrap.dedent('''\
                one
                two
                three
                '''),
        }
        fopen_mock = mock_open(read_data=contents)
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True
```

This would make `salt.utils.files.fopen()` produce filehandles with different contents depending on which file was being opened by the code being tested. `/etc/foo.conf` and any file matching the pattern `/etc/b*.conf` would work, while opening any other path would result in a `FileNotFoundError` being raised (in Python 2, an `IOError`).

Since file patterns are supported, it is possible to use a pattern of `'*'` to define a fallback if no other patterns match the filename being opened. The below two `mock_open` calls would produce identical results:

```
mock_open(read_data='foo\n')
mock_open(read_data={'*': 'foo\n'})
```

Note: Take care when specifying the `read_data` as a dictionary, in cases where the patterns overlap (e.g. when both `/etc/b*.conf` and `/etc/bar.conf` are in the `read_data`). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of `*` which is used when no other pattern matches. If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an `OrderedDict` can be used to ensure matching is handled in the desired way:

```
contents = OrderedDict()
contents['/etc/bar.conf'] = 'foo\nbar\nbaz\n'
contents['/etc/b*.conf'] = IOError(errno.EACCES, 'Permission denied')
contents['*'] = 'This is a fallback for files not beginning with "/etc/b"\n'
fopen_mock = mock_open(read_data=contents)
```

Raising Exceptions

Instead of a string, an exception can also be used as the `read_data`:

```
import errno

from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)

import salt.modules.mymod as mymod

```

(continues on next page)

(continued from previous page)

```
class MyAwesomeTestCase(TestCase):

    def test_something(self):
        exc = IOError(errno.EACCES, 'Permission denied')
        fopen_mock = mock_open(read_data=exc)
        with patch('salt.utils.files.fopen', fopen_mock):
            mymod.myfunc()
```

The above example would raise the specified exception when any file is opened. The expectation would be that `mymod.myfunc()` would gracefully handle the IOError, so a failure to do that would result in it being raised and causing the test to fail.

Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function's behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the the contents for that file as a list. Each time the file is opened, `mock_open` will cycle through the list and produce a mocked filehandle with the specified contents. For example:

```
import errno
import textwrap

from tests.support.unit import TestCase
from tests.support.mock import (
    patch
    mock_open,
)

import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):

    def test_something(self):
        contents = {
            '/etc/foo.conf': [
                textwrap.dedent('''\
                    foo
                    bar
                    '''),
                textwrap.dedent('''\
                    foo
                    bar
                    baz
                    '''),
            ],
            '/etc/b*.conf': [
                IOError(errno.ENOENT, 'No such file or directory'),
                textwrap.dedent('''\
                    one
                    two
                    three
                    '''),
            ],
        }
        fopen_mock = mock_open(read_data=contents)
```

(continues on next page)

(continued from previous page)

```
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True
```

Using this example, the first time `/etc/foo.conf` is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file's contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a `RuntimeError`. In the example above, if `/etc/foo.conf` were to be opened a third time, a `RuntimeError` would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if `/etc/bar.conf` were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

Note: Notice that the second path in the `contents` dictionary above (`/etc/b*.conf`) contains an asterisk. The items in the list are cycled through for each match of a given pattern (*not* separately for each individual file path), so this means that only two files matching that pattern could be opened before the next one would raise a `RuntimeError`.

Accessing the Mocked Filehandles in a Test

Note: The code for the `MockOpen`, `MockCall`, and `MockFH` classes (referenced below) can be found in `tests/support/mock.py`. There are extensive unit tests for them located in `tests/unit/test_mock.py`.

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```
fopen_mock = mock_open(read_data='foo\nbar\nbaz\n')
with patch('salt.utils.files.fopen', fopen_mock) as m_open:
    # do testing here
    ...
    ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- **read_data** - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that *multiple file paths* are not used, then this will be a dictionary mapping `*` to the `read_data` passed to `mock_open`.
- **call_count** - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.
- **calls** - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.

  ```
  from tests.support.unit import TestCase
  from tests.support.mock import (
      patch
      mock_open,
      MockCall,
  ```

(continues on next page)

(continued from previous page)

```
)

import salt.modules.mymod as mymod

class MyAwesomeTestCase(TestCase):

    def test_something(self):

        with patch('salt.utils.files.fopen', mock_open(read_data=b'foo\n')) as m_
↪open:
            mymod.myfunc()
            # Assert that only two opens attempted
            assert m_open.call_count == 2
            # Assert that only /etc/foo.conf was opened
            assert all(call.args[0] == '/etc/foo.conf' for call in m_open.calls)
            # Asser that the first open was for binary read, and the
            # second was for binary write.
            assert m_open.calls == [
                MockCall('/etc/foo.conf', 'rb'),
                MockCall('/etc/foo.conf', 'wb'),
            ]
```

Note that `MockCall` is imported from `tests.support.mock` in the above example. Also, the second assert above is redundant since it is covered in the final assert, but both are included simply as an example.

- **filehandles** - A dictionary mapping the unique file paths opened, to lists of `MockFH` objects. Each open creates a unique `MockFH` object. Each `MockFH` object itself has a number of useful attributes:
  - **filename** - The path to the file which was opened using `salt.utils.files.fopen()`
  - **call** - A `MockCall` object representing the arguments passed to `salt.utils.files.fopen()`. Note that this `MockCall` is also available in the parent `MockOpen` instance's **calls** list.
  - The following methods are mocked using `unittest.mock.Mock` objects, and Mock's built-in asserts (as well as the call data) can be used as you would with any other Mock object:
    - **.read()**
    - **.readlines()**
    - **.readline()**
    - **.close()**
    - **.write()**
    - **.writelines()**
    - **.seek()**
  - The read functions (**.read()**, **.readlines()**, **.readline()**) all work as expected, as does iterating through the file line by line (i.e. `for line in fh:`).
  - The **.tell()** method is also implemented in such a way that it updates after each time the mocked filehandle is read, and will report the correct position. The one caveat here is that **.seek()** doesn't actually work (it's simply mocked), and will not change the position. Additionally, neither **.write()** or **.writelines()** will modify the mocked filehandle's contents.
  - The attributes **.write_calls** and **.writelines_calls** (no parenthesis) are available as shorthands and correspond to lists containing the contents passed for all calls to **.write()** and **.writelines()**, respectively.

Examples

```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that only the expected file was opened, and that it was opened
    # only once.
    assert m_open.call_count == 1
    assert list(m_open.filehandles) == ['/etc/foo.conf']
    # "opens" will be a list of all the mocked filehandles opened
    opens = m_open.filehandles['/etc/foo.conf']
    # Check that we wrote the expected lines ("expected" here is assumed to
    # be a list of strings)
    assert opens[0].write_calls == expected
```

```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that .readlines() was called (remember, it's a Mock)
    m_open.filehandles['/etc/foo.conf'][0].readlines.assert_called()
```

```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that we read the file and also wrote to it
    m_open.filehandles['/etc/foo.conf'][0].read.assert_called_once()
    m_open.filehandles['/etc/foo.conf'][1].writelines.assert_called_once()
```

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the `raise` or `return` being tested.

Unit tests for `salt/.../<module>.py` are contained in a file called `tests/unit/.../test_<module>.py`, e.g. the tests for `salt/modules/fib.py` are in `tests/unit/modules/test_fib.py`.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with `test_` and each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the `test_*.py` naming syntax. This test file naming convention is how the test runner recognizes that a test file contains unit tests.

Imports

Most commonly, the following imports are necessary to create a unit test:

```
from tests.support.unit import TestCase
```

If you need mock support to your tests, please also import:

```
from tests.support.mock import MagicMock, patch, call
```

27.20.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading Python's documentation on unit testing.

27.20.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it's necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as "blocking the exits" for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.

To achieve this behavior, Salt makes heavy use of the MagicMock package.

To understand how one might integrate Mock into writing a unit test for Salt, let's imagine a scenario in which we're testing an execution module that's designed to operate on a database. Furthermore, let's imagine two separate methods, here presented in pseduo-code in an imaginary execution module called 'db.py'.

```
def create_user(username):
    qry = 'CREATE USER {0}'.format(username)
    execute_query(qry)

def execute_query(qry):
    # Connect to a database and actually do the query...
```

Here, let's imagine that we want to create a unit test for the *create_user* function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear – to write a unit test which tests the functionality of *create_user* while also replacing 'execute_query' with a mocked function.

To begin, we set up the skeleton of our class much like we did before, but with additional imports for MagicMock:

```
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
from salt.modules import db

# Import Mock libraries
from tests.support.mock import MagicMock, patch, call

# Create test case class and inherit from Salt's customized TestCase
# Skip this test case if we don't have access to mock!
class DbTestCase(TestCase):
    def test_create_user(self):
        # First, we replace 'execute_query' with our own mock function
        with patch.object(db, 'execute_query', MagicMock()) as db_exq:

            # Now that the exits are blocked, we can run the function under test.
            db.create_user('testuser')

            # We could now query our mock object to see which calls were made
            # to it.
            ## print db_exq.mock_calls
```

(continues on next page)

(continued from previous page)

```
            # Construct a call object that simulates the way we expected
            # execute_query to have been called.
            expected_call = call('CREATE USER testuser')

            # Compare the expected call with the list of actual calls.  The
            # test will succeed or fail depending on the output of this
            # assertion.
            db_exq.assert_has_calls(expected_call)
```

27.20.6 Modifying `__salt__` In Place

At times, it becomes necessary to make modifications to a module's view of functions in its own `__salt__` dictionary. Luckily, this process is quite easy.

Below is an example that uses MagicMock's `patch` functionality to insert a function into `__salt__` that's actually a MagicMock instance.

```
def show_patch(self):
    with patch.dict(my_module.__salt__,
                    {'function.to_replace': MagicMock()}):
        # From this scope, carry on with testing, with a modified __salt__!
```

27.20.7 A Simple Example

Let's assume that we're testing a very basic function in an imaginary Salt execution module. Given a module called `fib.py` that has a function called `calculate(num_of_results)`, which given a `num_of_results`, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called `tests/unit/modules/test_fib.py`. The convention is to place unit tests for Salt execution modules in `test/unit/modules/` and to name the tests module prefixed with `test_*.py`.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. Test cases are created as Python classes in the unit test module. To return to our example, here's how we might write the skeleton for testing `fib.py`:

```
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
import salt.modules.fib as fib

# Create test case class and inherit from Salt's customized TestCase
class FibTestCase(TestCase):
    '''
    This class contains a set of functions that test salt.modules.fib.
    '''
    def test_fib(self):
        '''
        To create a unit test, we should prefix the name with `test_' so
        that it's recognized by the test runner.
        '''
```

(continues on next page)

(continued from previous page)

```
        fib_five = (0, 1, 1, 2, 3)
        self.assertEqual(fib.calculate(5), fib_five)
```

At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```
tests/runtests.py -v -n unit.modules.test_fib
```

This will report the status of the test: success, failure, or error. The `-v` flag increases output verbosity.

```
tests/runtests.py -n unit.modules.test_fib -v
```

To review the results of a particular run, take a note of the log location given in the output for each test:

```
Logging tests on /var/folders/nl/d809xbq577l3qrbj3ymtpbq80000gn/T/salt-runtests.log
```

27.20.8 A More Complete Example

Consider the following function from salt/modules/linux_sysctl.py.

```
def get(name):
    '''
    Return a single sysctl parameter for this minion

    CLI Example:

    .. code-block:: bash

        salt '*' sysctl.get net.ipv4.ip_forward
    '''
    cmd = 'sysctl -n {0}'.format(name)
    out = __salt__['cmd.run'](cmd)
    return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']()`, both of which need to be appropriately mocked.

Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of MagicMock. For added isolation, we will also redefine the `__salt__` dictionary such that it only contains `'cmd.run'`.

```
# Import Salt Libs
import salt.modules.linux_sysictl as linux_sysctl

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase
from tests.support.mock import (
    MagicMock,
    patch,
)

class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
```

(continues on next page)

(continued from previous page)

```
    '''
    TestCase for salt.modules.linux_sysctl module
    '''

    def test_get(self):
        '''
        Tests the return of get function
        '''
        mock_cmd = MagicMock(return_value=1)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run': mock_cmd}):
            self.assertEqual(linux_sysctl.get('net.ipv4.ip_forward'), 1)
```

Since `get()` has only one raise or return statement and that statement is a success condition, the test function is simply named `test_get()`. As described, the single function call parameter, `name` is mocked with `net.ipv4.ip_forward` and `__salt__['cmd.run']` is replaced by a MagicMock function object. We are only interested in the return value of `__salt__['cmd.run']`, which MagicMock allows us by specifying via `return_value=1`. Finally, the test itself tests for equality between the return value of `get()` and the expected return of `1`. This assertion is expected to succeed because `get()` will determine its return value from `__salt__['cmd.run']`, which we have mocked to return `1`.

27.20.9 A Complex Example

Now consider the `assign()` function from the same salt/modules/linux_sysctl.py source file.

```
def assign(name, value):
    '''
    Assign a single sysctl parameter for this minion

    CLI Example:

    .. code-block:: bash

        salt '*' sysctl.assign net.ipv4.ip_forward 1
    '''
    value = str(value)
    sysctl_file = '/proc/sys/{0}'.format(name.replace('.', '/'))
    if not os.path.exists(sysctl_file):
        raise CommandExecutionError('sysctl {0} does not exist'.format(name))

    ret = {}
    cmd = 'sysctl -w {0}="{1}"'.format(name, value)
    data = __salt__['cmd.run_all'](cmd)
    out = data['stdout']
    err = data['stderr']

    # Example:
    #    # sysctl -w net.ipv4.tcp_rmem="4096 87380 16777216"
    #    net.ipv4.tcp_rmem = 4096 87380 16777216
    regex = re.compile(r'^{0}\s+=\s+{1}$'.format(re.escape(name),
                                                  re.escape(value)))

    if not regex.match(out) or 'Invalid argument' in str(err):
        if data['retcode'] != 0 and err:
            error = err
        else:
```

(continues on next page)

(continued from previous page)

```
            error = out
        raise CommandExecutionError('sysctl -w failed: {0}'.format(error))
    new_name, new_value = out.split(' = ', 1)
    ret[new_name] = new_value
    return ret
```

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-builtin functions. In the tests below you will see that MagicMock's `patch()` method may be used as a context manager or as a decorator. When patching the salt dunders however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.

```
# Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase
from tests.support.mock import (
    MagicMock,
    patch,
)

class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
    '''
    TestCase for salt.modules.linux_sysctl module
    '''

    @patch('os.path.exists', MagicMock(return_value=False))
    def test_assign_proc_sys_failed(self):
        '''
        Tests if /proc/sys/<kernel-subsystem> exists or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': '',
               'stdout': 'net.ipv4.ip_forward = 1'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertRaises(CommandExecutionError,
                              linux_sysctl.assign,
                              'net.ipv4.ip_forward', 1)

    @patch('os.path.exists', MagicMock(return_value=True))
    def test_assign_cmd_failed(self):
        '''
        Tests if the assignment was successful or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr':
               'sysctl: setting key "net.ipv4.ip_forward": Invalid argument',
               'stdout': 'net.ipv4.ip_forward = backward'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
```

(continues on next page)

(continued from previous page)

```
        self.assertRaises(CommandExecutionError,
                          linux_sysctl.assign,
                          'net.ipv4.ip_forward', 'backward')

@patch('os.path.exists', MagicMock(return_value=True))
def test_assign_success(self):
    '''
    Tests the return of successful assign function
    '''
    cmd = {'pid': 1337, 'retcode': 0, 'stderr': '',
           'stdout': 'net.ipv4.ip_forward = 1'}
    ret = {'net.ipv4.ip_forward': '1'}
    mock_cmd = MagicMock(return_value=cmd)
    with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
        self.assertEqual(linux_sysctl.assign(
            'net.ipv4.ip_forward', 1), ret)
```

27.21 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

27.21.1 New Code Entry

All new SaltStack code should be submitted against either the `develop` branch or a point release branch, depending on the nature of the submission. Please see the *Which Salt Branch?* section of Salt's *Contributing* documentation or the Release Branching section below for more information.

27.21.2 Release Branching

SaltStack maintains two types of releases, `Feature Releases` and `Point Releases` (also commonly referred to as `Bugfix Releases`. A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the develop branch
# git push origin 2015.8
```

Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the *Which Salt Branch?* section of Salt's *Contributing* documentation.

Generally point releases are made every 2 months or if there is a security fix they can be made sooner.

The point release is designated by branching (ex 2019.2.1) and then tagging (v2019.2.1) from that newly created release branch when its determined the release is stable. From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

27.22 Salt Conventions

27.22.1 Writing Salt Documentation

Salt's documentation is built using the Sphinx documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the https://github.com/saltstack/salt/blob/master/doc subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the IEEE style guide as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The NCBI style guide is another very approachable resource.

Point-of-view

Use third-person perspective and avoid "I", "we", "you" forms of address. Identify the addressee specifically e.g., "users should", "the compiler does", etc.

Active voice

Use active voice and present-tense. Avoid filler words.

Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

```
This is a main heading
======================

Paragraph.

This is an exciting sub-heading!
--------------------------------

Paragraph.
```

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually "and", "or", or "nor") in a series of three or more terms. For example, a list of three countries might be punctuated either as "France, Italy, and Spain" (with the serial comma), or as "France, Italy and Spain" (without the serial comma)."

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```python
def my_function(value):
    '''
    Upper-case the given value

    Usage:

    .. code-block:: python

        val = 'a string'
        new_val = myfunction(val)
        print(new_val) # 'A STRING'

    :param value: a string
    :return: a copy of ``value`` that has been upper-cased
    '''
    return value.upper()
```

Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```
def my_function(value):
    '''
    Upper-case the given value

    .. versionadded:: 2014.7.0

    <...snip...>
    '''
    return value.upper()
```

For changes to a function:

```
def my_function(value, strip=False):
    '''
    Upper-case the given value

    .. versionchanged:: 2016.3.0
        Added a flag to also strip whitespace from the string.

    <...snip...>
    '''
    if strip:
        return value.upper().strip()
    return value.upper()
```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: *execution modules*, *state modules*, *renderer modules*. New modules must be added to the index manually.

1. Edit the file for the module type: execution modules, state modules, renderer modules, etc.
2. Add the new module to the alphebetized list.
3. *Build the documentation* which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

Glossary entries

Link to *glossary entries* using the term role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a
custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```

Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the index directive above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
    see: Reactor; Event
```

Another method is to use the index role inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
-------------------------------------------

Paragraph.
```

Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:

My page
=======

Paragraph.
```

Unique labels can be linked using the ref role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should *not* be used to link documents together.

Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the
:py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful
functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the
:py:func:`file.managed <salt.states.file.managed>` function.
```

Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master`, and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a
single minion.
```

Documentation Changes and Fixes

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt's main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt's *Contributing* page. You can read more about how to choose where to submit documentation fixes by reading the *Salt's Branch Topology* section.

For an explanation of how to submit changes against various branches, see the *Sending a GitHub pull request* section. Specifically, see the section describing how to `Create a new branch` and the steps that follow.

Building the documentation

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.
2. Build the documentation using the provided Makefile or `.bat` file on Windows.

   ```
   cd /path/to/salt/doc
   make html
   ```

3. The generated documentation will be written to the `doc/_build/<format>` directory.
4. A useful method of viewing the HTML documentation locally is to start Python's built-in HTTP server:

   Python 3:

   ```
   cd /path/to/salt/doc/_build/html
   python3 -m http.server
   ```

   Python 2:

   ```
   cd /path/to/salt/doc/_build/html
   python -m SimpleHTTPServer
   ```

   Then pull up the documentation in a web browser at http://localhost:8000/.

27.22.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub:

https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the apache-formula from a top file:

```
base:
  'web*':
    - apache
```

Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install any necessary dependencies and configure GitFS*.
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

   ```
   gitfs_remotes:
     - https://github.com/saltstack-formulas/apache-formula
     - https://github.com/saltstack-formulas/memcached-formula
   ```

   We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

   Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!
3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileserver environments (i.e. saltenvs). Using the *all_saltenvs* parameter, files from a single git branch/tag will appear in all environments. See *here* for more information on this feature.

Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

   ```
   mkdir -p /srv/formulas
   cd /srv/formulas
   git clone https://github.com/saltstack-formulas/apache-formula.git

   # or

   mkdir -p /srv/formulas
   ```

(continues on next page)

(continued from previous page)

```
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to *`file_roots`*:

```
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the epel-formula in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the openstack-standalone-formula directly from a `top.sls` file:

```
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
  'storage-*':
    - openstack.swift
```

Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using `extend`, they can made to watch other states with *The _in versions of requisites*.

The following example uses the stock apache-formula alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don't be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the saltstack-formulas organization on GitHub.

Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the saltstack-formulas organization and help you transfer the repository over. Ping a SaltStack employee on IRC (`#salt` on Freenode), join the `#formulas` channel on the salt-slack or send an email to the salt-users mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: https://github.com/watching.

Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to at-mention other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to "selfie-merge" your own pull request.

Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in *requisites*. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

Use `module.function` notation

So-called "short-declaration" notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
```

(continues on next page)

(continued from previous page)

```
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform "short-decs" into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

Specify the `name` parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
        touch /path/to/file_last_updated
        sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```
# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}
```

Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *`renderer`* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt's state system finally starts and executes on each "chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the "running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}

{# or #}

{% import_yaml 'path/to/file.yaml' as some_data %}

{# or #}

{% import_json 'path/to/file.json' as some_data %}

{# or #}

{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

{# or #}

{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt.pillar.get('list_of_users', []) %}

{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
```

(continues on next page)

(continued from previous page)

```
    - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```
{# ---- Bad example ---- #}

apache:
  pkg.installed:
    {% if grains.os_family == 'RedHat' %}
    - name: httpd
    {% elif grains.os_family == 'Debian' %}
    - name: apache2
    {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

 apache:
  pkg.installed:
    - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
    'RedHat': 'httpd',
    'Debian': 'apache2',
}.get(grains.os_family) %}

 apache:
  pkg.installed:
    - name: {{ name }}
```

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```
{# ---- Bad example ---- #}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
```

(continues on next page)

(continued from previous page)

```
    - context:
        {% if 'external_loadbalancer' in grains.roles %}
        ssl_termination: True
        {% elif 'internal_loadbalancer' in grains.roles %}
        ssl_termination: False
        {% endif %}

{# ---- Better example ---- #}

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}
```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for abitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated – long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets – instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain – switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's "she-bang" syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

`/srv/salt/top.sls`:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

`/srv/salt/common_configuration.sls`:

```
common_users:
  user.present:
    - names:
      - larry
      - curly
      - moe
```

`/srv/salt/roles_configuration`:

```
#!py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']

    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')

    return {
        'set_roles_grains': {
            'grains.present': [
                {'name': 'roles'},
                {'value': list(list_of_roles)},
            ],
        },
    }
```

Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

`/srv/salt/php.sls`:

```
php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
        php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

`/srv/pillar/php.sls`:

```
php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

`/srv/salt/php.ini.tmpl`:

```
{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increases the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The *`grains.filter_by`* function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}
```

Organizing Pillar data

It is considered a best practice to make formulas expect **all** formula-related parameters to be placed under second-level `lookup` key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
  lookup:
    version: 5.7.11
```

Collecting common values

Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
    'default': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'Debian': {
    },
    'RedHat': {
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'python': 'dev-python/mysql-python',
    },
},
merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in *`filter_by`* specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```
mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf
```

Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```
{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty".' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```
foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""
```

The *`filter_by`* function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml`:

```
Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
  GlobalNamingResources:
    Resource:
      '@auth': Container
      '@description': User database that can be updated and saved
      '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
      '@name': UserDatabase
      '@pathname': conf/tomcat-users.xml
      '@type': org.apache.catalina.UserDatabase
  # <...snip...>
```

`/srv/pillar/tomcat.sls`:

```
appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
        Connector:
          '@port': '8009'
          '@protocol': AJP/1.3
          '@redirectPort': '8443'
          # <...snip...>
```

`/srv/salt/tomcat/server_xml.sls`:

```
{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True)
%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish
```

The *`file.serialize`* state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the'Nginx vhosts'_ states or the php.ini file template.

Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

`/srv/salt/app/deploy.sls`:

```
{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
   machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt.grains.get('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
   table. #}
{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
        version: {{ app.version }}
    - onchanges:
      - git: deploy_application
```

`/srv/salt/app/defaults.yaml`:

```
appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master
appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can `include` and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full apache-formula for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
    - require:
      - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
    - watch_in:
      - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

Formulas should be reusable. Avoid coupling unrelated actions together.

Parameterization

Parameterization is a key feature of Salt Formulas and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere – it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
```

(continues on next page)

(continued from previous page)

```
    {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
{{ user.name }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

Scripting

Remember that both State files and Pillar files can easily call out to Salt *execution modules* and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
|   |-- map.jinja
|   |-- init.sls
|   `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

template-formula

The template-formula repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

`README.rst`

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===

Install and configure the FOO service.

**NOTE**

See the full `Salt Formulas installation and usage instructions
<https://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`_.
```

(continues on next page)

(continued from previous page)

```
Available states
================

.. contents::
    :local:

``foo``
-------

Install the ``foo`` package and enable the service.

``foo.bar``
-----------

Install the ``bar`` package.
```

`CHANGELOG.rst`

The `CHANGELOG.rst` file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the *CHANGELOG.rst* file:

`CHANGELOG.rst`:

```
foo formula
===========

0.0.2 (2013-01-01)

- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

Versioning

Formula are versioned according to Semantic Versioning, http://semver.org/.

Note: Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the `VERSION` file in the formula repository. The `VERSION` file should contain the currently released version of the particular formula.

Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

27.22.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The *salt-common* or *salt* package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.

Name

- *salt* OR *salt-common*

Files

- *salt/**
- *man/salt.7*
- *scripts/salt-call*
- *tests/**
- *man/salt-call.1*

Depends

- *Python 2.6-2.7*
- *PyYAML*
- *Jinja2*

Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

Name

- *salt-master*

Files

- *scripts/salt-master*
- *scripts/salt*
- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*
- *pkg/<master init data>*
- *man/salt.1*
- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- *salt-syndic*

Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

Name

- *salt-minion*

Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- *salt-ssh*

Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud**

Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- *salt-cloud*

Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

Name

- *salt-doc*

Files

- *doc/**

Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

27.22.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 2019.2.0 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Notify salt-users and salt-announce google groups when the feature freeze branch creation will occur so they can try to get their work merged.
4. Create QA test plan. Review features planned for the release and determine if there is sufficient test coverage.
5. Ensure all required features are merged.
6. Complete one last merge forward from the previous branch.
7. Create feature release branch with the name of the release. (ex. fluorine)
8. Create issue to start the process of deprecating for the next feature release.
9. Create jenkins jobs to test the new feature release branch.
10. Inform salt-users and salt-announce google groups feature branch and freeze is complete.
11. Add new feature branch to salt-jenkins repo and the kitchen yaml file.
12. Fix tests failing in jenkins test runs.
13. Finalize QA test plan and add all required tests.
14. Run through a manual test run based off of the head of the feature branch.
15. Convert the feature release branch to the version number. For example (v2019.2) This is based off of the year and month that is planned to release.
16. Migrate both the jenkins test jobs and salt-jenkins repo to the new branch number.
17. Notify salt-users and salt-announce google groups of the new version branch number and migrate any PRs to the new branch.
18. Delete old feature release branch name (ex. fluorine)
19. Update all name references to version number in the docs. For example all fluorine references in the docs needs to be moved to v2019.2.0
20. Create RC release branch. (ex. 2019.2.0.rc)
21. Create new jenkins test jobs with new RC release branch
22. Notify salt-users and salt-announce google groups of the new RC branch.
23. Fix tests failing in jenkins test runs.
24. Review the release notes with major features.
25. Generate the new man pages for the release.
26. Create internal RC tag for testing.
27. Build latest windows, mac, ubuntu, debian and redhat packages.
28. Run manual and package tests against new RC packages.
29. Update release candidate docs with the new version. (ex. 2019.2.0rc1)
30. Push the internal tag live to salt's repo.

31. Publish release archive to pypi based off tag.
32. Push the RC packages live.
33. Announce new RC to salt-users and salt-announce google groups.
34. Triage incoming issues based on the new RC release.
35. Fix RC issues once they are categorized as a release blocker.
36. Depending on the issues found during the RC process make a decesion on whether to release based off the RC or go through another RC process, repeating the steps starting at ensuring the tests are not failing.
37. If a RC is categorized as stable, build all required packages.
38. Test all release packages.
39. Test links from repo.saltstack.com.
40. Update installation instructions with new release number at repo.saltstack.com.
41. Update and build docs to include new version (2019.2) as the latest.
42. Pre-announce on salt-users google group that we are about to update our repo.
43. Publish release (v2019.2.0) archive to pypi based off tag.
44. Publish all packages live to repo.
45. Publish the docs.
46. Create release at github
47. Update win-repo-ng with new salt versions.
48. Announce release is live to irc, salt-users, salt-announce and release slack community channel.

Maintenance and Bugfix Releases

Once a feature release branch has been cut from `develop`, the branch moves into a "feature freeze" state. The new release branch enters the `merge-forward` chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. Ensure all required bug fixes are merged.
2. Inform salt-users and salt-announce we are going to branch for the release.
3. Complete one last merge forward from the previous branch.
4. Create release branch with the version of the release. (ex. 2019.2.1)
5. Create jenkins jobs that test the new release branch.
6. Fix tests failing in jeknins test runs.
7. Run through a manual test run based off of the head of the branch.
8. Generate the new man pages for the release.
9. Create internal tag for testing.(ex v2019.2.1)
10. Build all release packages.
11. Run manual and package tests against new packages.
12. Update installation instructions with new release number at repo.saltstack.com.
13. Update and build docs to include new version. (ex. 2019.2.1)

14. Pre-announce on salt-users google groups that we are about to update our repo.
15. Push the internal tag live to salt's repo.
16. Publish release archive to pypi based off tag.
17. Push the packages live.
18. Publish release (v2019.2.1) archive to pypi based off tag.
19. Publish all packages live to repo.
20. Publish the docs.
21. Create release at github
22. Update win-repo-ng with new salt versions.
23. Announce release is live to irc, salt-users, salt-announce and release slack channel.

For more information about the difference between the `develop` branch and bugfix release branches, please refer to the *Which Salt Branch?* section of Salt's *Contributing* documentation.

27.22.5 Salt Coding Style

To make it easier to contribute and read Salt code, SaltStack has adopted Black as its code formatter. There are a few places where Black is silent, and this guide should be used in those cases.

Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!

Linting

Most Salt style conventions are codified in Salt's `.testing.pylintrc` file. Salt's pylint file has two dependencies: pylint and saltpylint. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.testing.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the pylint program as follows:

```
pylint --rcfile=/path/to/salt/.testing.pylintrc salt/dir/to/lint
```

Note: There are two pylint files in the `salt` directory. One is the `.pylintrc` file and the other is the `.testing.pylintrc` file. The tests that run in Jenkins against GitHub Pull Requests use `.testing.pylintrc`. The `testing.pylintrc` file is a little less strict than the `.pylintrc` and is used to make it easier for contributors to submit changes. The `.pylintrc` file can be used for linting, but the `testing.pylintrc` is the source of truth when submitting pull requests.

Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Formatting Strings

All strings which require formatting should use the *.format* string method:

```
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6.

Please do NOT use printf formatting.

Docstring Conventions

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function, state, or parameter was added.

```
def new_func(msg=''):
    '''
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed.
    '''
    print(msg)
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your *pull request* and a core developer will let you know what version to add. Typically this will be the next element in the periodic table.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg='', signature=''):
    '''
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed. Will be prepended with 'Greetings! '.

    .. versionchanged:: 0.17.1

    signature : None
        An optional signature.

    .. versionadded 0.17.0
```

(continues on next page)

(continued from previous page)

```
    '''
    print('Greetings! {0}\n\n{1}'.format(msg, signature))
```

Dictionaries

Dictionaries should be initialized using *{}* instead of *dict()*.

See here for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```
import os

def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is *DISCOURAGED*:

```
from os.path import join

def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```
from salt.exceptions import CommandExecutionError
```

Absolute Imports

Although absolute imports seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

Note: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is **strongly discouraged**. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (http://legacy.python.org/dev/peps/pep-0008/) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

27.23 Salt code and internals

Reference documentation on Salt's internal code.

27.23.1 Contents

salt.aggregation

salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

Note: The following examples with be expressed in YAML for convenience's sake:

- !aggr-scalar will refer to Scalar python function
- !aggr-map will refer to Map python object
- !aggr-seq will refer for Sequence python object

How to instructs merging

This yaml document has duplicate keys:

```
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

Introspection

TODO: write this part

`salt.utils.aggregation.`**`aggregate`**`(`*obj_a, obj_b, level=False, map_class=<class 'salt.utils.aggregation.Map'>, sequence_class=<class 'salt.utils.aggregation.Sequence'>*`)`

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

`class` `salt.utils.aggregation.`**`Aggregate`**

Aggregation base.

class `salt.utils.aggregation.`**`Map`**

Map aggregation.

`salt.utils.aggregation.`**`Scalar`**(*obj*)

Shortcut for Sequence creation

```
>>> Scalar('foo') == Sequence(['foo'])
True
```

class `salt.utils.aggregation.`**`Sequence`**

Sequence aggregation.

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

`salt.exceptions`	This module is a central location for all salt exceptions

salt.exceptions

This module is a central location for all salt exceptions

exception `salt.exceptions.`**`ArgumentValueError`**(*message=”, info=None*)

Used when an invalid argument was passed to a command execution

exception `salt.exceptions.`**`AuthenticationError`**(*message=”*)

If sha256 signature fails during decryption

exception `salt.exceptions.`**`AuthorizationError`**(*message=”*)

Thrown when runner or wheel execution fails due to permissions

exception `salt.exceptions.`**`CheckError`**(*message=”, info=None*)

Used when a check fails

exception `salt.exceptions.`**`CommandExecutionError`**(*message=”, info=None*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception `salt.exceptions.`**`CommandNotFoundError`**(*message=”*)

Used in modules or grains when a required binary is not available

exception `salt.exceptions.`**`EauthAuthenticationError`**(*message=”*)

Thrown when eauth authentication fails

exception `salt.exceptions.`**`FileLockError`**(*message, time_start=None, *args, **kwargs*)

Used when an error occurs obtaining a file lock

exception `salt.exceptions.`**`FileserverConfigError`**(*message=”*)

Used when invalid fileserver settings are detected

exception `salt.exceptions.`**`GitLockError`**(*errno, message, *args, **kwargs*)

Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the errno param similar to an OSError, this exception class is *not* as subclass of OSError. This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.

exception `salt.exceptions.`**`GitRemoteError`**(*message=''*)
Used by GitFS to denote a problem with the existence of the "origin" remote or part of its configuration

exception `salt.exceptions.`**`InvalidConfigError`**(*message='', info=None*)
Used when the config is invalid

exception `salt.exceptions.`**`InvalidEntityError`**(*message='', info=None*)
Used when an entity fails validation

exception `salt.exceptions.`**`LoaderError`**(*message=''*)
Problems loading the right renderer

exception `salt.exceptions.`**`LoggingRuntimeError`**
Raised when we encounter an error while logging

exception `salt.exceptions.`**`MasterExit`**
Rise when the master exits

exception `salt.exceptions.`**`MinionError`**(*message=''*)
Minion problems reading uris such as salt:// or http://

exception `salt.exceptions.`**`MissingSmb`**(*message=''*)
Raised when no smb library is found.

exception `salt.exceptions.`**`NotImplemented`**(*message=''*)
Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception `salt.exceptions.`**`PkgParseError`**(*message=''*)
Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude, etc)

exception `salt.exceptions.`**`PublishError`**(*message=''*)
Problems encountered when trying to publish a command

exception `salt.exceptions.`**`SaltCacheError`**(*message=''*)
Thrown when a problem was encountered trying to read or write from the salt cache

exception `salt.exceptions.`**`SaltClientError`**(*message=''*)
Problem reading the master root key

exception `salt.exceptions.`**`SaltClientTimeout`**(*message, jid=None, *args, **kwargs*)
Thrown when a job sent through one of the Client interfaces times out

Takes the `jid` as a parameter

exception `salt.exceptions.`**`SaltCloudConfigError`**(*message=''*)
Raised when a configuration setting is not found and should exist.

exception `salt.exceptions.`**`SaltCloudException`**(*message=''*)
Generic Salt Cloud Exception

exception `salt.exceptions.`**`SaltCloudExecutionFailure`**(*message=''*)
Raised when too much failures have occurred while querying/waiting for data.

exception `salt.exceptions.`**`SaltCloudExecutionTimeout`**(*message=''*)
Raised when too much time has passed while querying/waiting for data.

exception `salt.exceptions.`**`SaltCloudNotFound`**(*message=''*)
Raised when some cloud provider function cannot find what's being searched.

exception `salt.exceptions.`**`SaltCloudPasswordError`**(*message=''*)
Raise when virtual terminal password input failed

exception salt.exceptions.**SaltCloudSystemExit**(*message*, *exit_code=1*)

This exception is raised when the execution should be stopped.

exception salt.exceptions.**SaltConfigurationError**(*message=”*)

Configuration error

exception salt.exceptions.**SaltDaemonNotRunning**(*message=”*)

Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

exception salt.exceptions.**SaltDeserializationError**(*message=”*)

Thrown when salt cannot deserialize data.

exception salt.exceptions.**SaltException**(*message=”*)

Base exception class; all Salt-specific exceptions should subclass this

pack()

Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception salt.exceptions.**SaltInvocationError**(*message=”*)

Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

exception salt.exceptions.**SaltMasterError**(*message=”*)

Problem reading the master root key

exception salt.exceptions.**SaltMasterUnresolvableError**(*message=”*)

Problem resolving the name of the Salt master

exception salt.exceptions.**SaltNoMinionsFound**(*message=”*)

An attempt to retrieve a list of minions failed

exception salt.exceptions.**SaltRenderError**(*message*, *line_num=None*, *buf=”*, *marker=’ <======================’*, *trace=None*)

Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, get_context will be invoked to get the location of the error.

exception salt.exceptions.**SaltReqTimeoutError**(*message=”*)

Thrown when a salt master request call fails to return within the timeout

exception salt.exceptions.**SaltRunnerError**(*message=”*)

Problem in runner

exception salt.exceptions.**SaltSyndicMasterError**(*message=”*)

Problem while proxying a request in the syndication master

exception salt.exceptions.**SaltSystemExit**(*code=0*, *msg=None*)

This exception is raised when an unsolvable problem is found. There’s nothing else to do, salt should just exit.

exception salt.exceptions.**SaltWheelError**(*message=”*)

Problem in wheel

exception salt.exceptions.**TemplateError**(*message=”*)

Used when a custom error is triggered in a template

exception salt.exceptions.**TimedProcTimeoutError**(*message=”*)

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

exception salt.exceptions.**TimeoutError**(*message=”*)

Thrown when an opration cannot be completet within a given time limit.

exception salt.exceptions.**TokenAuthenticationError**(*message=”*)

Thrown when token authentication fails

exception `salt.exceptions.`**`VMwareApiError`**(*message=”, info=None*)
Used when representing a generic VMware API error

exception `salt.exceptions.`**`VMwareConnectionError`**(*message=”, info=None*)
Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

exception `salt.exceptions.`**`VMwareFileNotFoundError`**(*message=”, info=None*)
Used when representing a generic VMware error if a file not found

exception `salt.exceptions.`**`VMwareMultipleObjectsError`**(*message=”, info=None*)
Used when multiple objects were retrieved (and one was expected)

exception `salt.exceptions.`**`VMwareNotFoundError`**(*message=”, info=None*)
Used when a VMware object was not found

exception `salt.exceptions.`**`VMwareObjectExistsError`**(*message=”, info=None*)
Used when a VMware object already exists

exception `salt.exceptions.`**`VMwareObjectNotFoundError`**(*message=”, info=None*)
Used when a VMware object was not found

exception `salt.exceptions.`**`VMwareObjectRetrievalError`**(*message=”, info=None*)
Used when a VMware object cannot be retrieved

exception `salt.exceptions.`**`VMwarePowerOnError`**(*message=”, info=None*)
Used when error occurred during power on

exception `salt.exceptions.`**`VMwareRuntimeError`**(*message=”, info=None*)
Used when a runtime error is encountered when communicating with the vCenter

exception `salt.exceptions.`**`VMwareSaltError`**(*message=”, info=None*)
Used when a VMware object cannot be retrieved

exception `salt.exceptions.`**`VMwareSystemError`**(*message=”, info=None*)
Used when representing a generic VMware system error

exception `salt.exceptions.`**`VMwareVmCreationError`**(*message=”, info=None*)
Used when a configuration parameter is incorrect

exception `salt.exceptions.`**`VMwareVmRegisterError`**(*message=”, info=None*)
Used when a configuration parameter is incorrect

`salt.exceptions.`**`get_error_message`**(*error*)
Get human readable message from Python Exception

The Salt Fileserver and Client

Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a developer's reference, to help explain how the fileserver and clients both work.

Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense. Instead, the fileserver is simply a class (`salt.fileserver.Fileserver`), located in salt/fileserver/__init__.py. This class has access to the configured fileserver backends via a loader instance, referenced as `self.servers`. When a request comes in from the fileclient, it will ultimately result in a `Fileserver` class function being run.

The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request…
2. which triggers the fileserver to run a function…
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the `find_file` function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won't proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the `salt.fileserver.Fileserver` class. For instance, there is a function called `update`, which exists to update remote fileservers such as the `git`, `hg`, and `svn` backends. This action has no use however in the `roots` backend, so it is simply not implemented there, and thus the `roots` backend will be skipped if the `update` function is run on the fileserver.

Backends for the fileserver are located in salt/fileserver/ (the files not named `__init__.py`).

Fileclient

There are three fileclient classes:

salt.fileclient.RemoteClient

This client is used when *`file_client`* is set to `remote`. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the minion to do other things, such as updating and requesting data from the mine. The payload will be a dictionary with a key called `cmd`, and other values as needed.

Payloads sent via the transport channel are processed my an MWorker instance on the master, and the MWorker's `_handle_aes()` function will execute the command. The command will be a function attribute of the `salt.master.AESFuncs` class. The AESFuncs class' `__setup_fileserver()` function instantiates a `salt.fileserver.Fileserver` instance and maps its member functions to AESFuncs attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transporting files is done in chunks, the size of which is decided by the `file_buffer_size` config option. If you look at the `serve_file()` function in any of the fileserver backends, you can see how the `loc` value in the payload determines the offset so that an intermediate chunk of the file can be served. The RemoteClient's `get_file()` function will loop until the end of the file is reached, retrieving one chunk at a time.

salt.fileclient.FSClient

This client is used when *`file_client`* is set to `local`. This is how masterless minions request files.

This class inherits from the RemoteClient, but instead of using a transport channel (zmq, tcp, etc.), it uses a "fake" transport channel (`salt.fileserver.FSChan`), which implements its own `send()` function. Thus, when a function that the FSClient inherits from the RemoteClient runs `self.channel.send()`, it's actually calling `salt.fileserver.FSChan.send()`, which calls corresponding functions in the `salt.fileserver.Fileserver()` class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the FSChan's Fileserver instance.

salt.fileclient.LocalClient

This client is now used exclusively by Pillar. This used to be used when *`file_client`* was set to `local`, but the `FSChan` class was written to allow minions with `file_client: local` to access the full set of backends. This class will probably be renamed at some point as it is often confused with `salt.client.LocalClient`.

The `cp` Module

Most of the user-facing interaction with the fileclient happens via the *`cp`* module. The functions in this module instantiate a fileclient instance (if one is not already saved to the `__context__` dunder) and run fileclient functions.

Updating the Fileserver

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of `salt.master.Maintenance`, which loops forever, running a series of functions and then sleeping for a length of time determined by the *`loop_interval`* config option. One of the maintenance tasks is to update the fileserver, and it essentially runs `salt.fileserver.Fileserver.update()`, which as we know from above will run all configured backends' `update()` functions, if present. This is now remote fileservers like `git`, `hg`, and `svn` stay up-to-date.

For the local file_client (FSClient), since it does not interact with the master, upon spawning of its FSChan it will update the fileserver.

Salt opts dictionary

It is very common in the Salt codebase to see *opts* referred to in a number of contexts.

For example, it can be seen as __*opts*__ in certain cases, or simply as *opts* as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of *opts* from scratch in order to have it available for a given function.

To do so, use the utility functions available in *salt.config*.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```python
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display *opts* for a master, the process is similar:

```python
import salt.config
opts = salt.config.master_config('/etc/salt/master')
print(opts)
```

Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's *excellent intoroduction to the topic <http://nedbatchelder.com/text/unipain/unipain.html>*.

Salt's basic workflow for Unicode handling is as follows:

1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.

2) Modules and various Salt pluggable systems use incoming data assuming Unicode.

   2.1) For Salt modules that query an API; the module should convert the data received from the API into Unicode.

   2.2) For Salt modules that shell out to get output; the module should convert data received into Unicode. (This does not apply if using the *cmd* execution module, which should handle this for you.

   2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.

3) When a function in a Salt module returns a string, it should return a `unicode` type in Python 2.

4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

27.24 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

27.24.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

http://hubblestack.io/

27.24.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

https://github.com/zulily/alkali

27.24.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

https://github.com/zulily/buoyant

27.24.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

https://github.com/elasticdog/salt-sandbox

27.24.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo

CHAPTER

TWENTYEIGHT

RELEASE NOTES

See the version numbers page for more information about the version numbering scheme.

28.1 Latest Branch Release

Release Candidate

28.2 Previous Releases

28.2.1 Salt 3000 Release Notes - Codename Neon

Security Advisory

For historical reasons, Salt requires PyCrypto as a "lowest common denominator". However, PyCrypto is unmaintained and best practice is to manually upgrade to use a more maintained library such as PyCryptodome. See Issue #52674 and Issue #54115 for more info

New Versioning

The neon release has removed the date versioning. Going forward we will use a non-date based version schema beginning at 3000. The version will be MAJOR.PATCH. For a planned release containing features and/or bug fixes the MAJOR version will be incremented. Please review the approved SEP for further details.

The new versioning scheme is PEP 440 compliant, but distutils.StrictVersion will result in an error `invalid version number`. If using StrictVersion to compare Salt's versions, please use LooseVersion. There is also the packaging library you can use to compare versions. Another alternative is using the *`salt version module`*

Python 3.8 Not Supported

Please note that running Salt with Python 3.8 is currently not supported. It is recommended to not use a version higher than 3.7.

Vendored Tornado Code Base

The Tornado code base has been included as `salt.ext.tornado`. This was done to provide a consistent version of Tornado across all operating systems while we continue to work on upgrading Tornado to a recent version. New code that uses Tornado should import the module from `salt.ext.tornado` instead of importing the system version of Tornado.

Msgpack 1.0.0rc1 Incompatibility

Salt is currently incompatible with mgspack 1.0.0rc1. We recommend using versions < 1.0.0 . This impacts the Salt Master's ability to run commands against minions. Please see Issue 56007 for more details and updates.

Pip Installing Salt On Windows

This release will not install correctly on windows when using pip to install salt. This issue is addressed in PR 56099. The workaround for this issue is:

```
pip install "pywin32==224" "WMI==1.4.9"
```

Those using the Salt Windows Installer are not affected by this issue.

Saltcheck Updates

Available since 2018.3, the *`saltcheck module`* has been enhanced to:

- Support saltenv environments
- Associate tests with states by naming convention
- Adds report_highstate_tests function
- Adds empty and notempty assertions
- Adds skip keyword
- Adds print_result keyword
- Adds assertion_section keyword
- Use saltcheck.state_apply to run state.apply for test setup or teardown
- Changes output to display test time
- Works with salt-ssh

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

Usage

Example file system layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    saltcheck-tests/
        init.tst
        config.tst
        deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Example Tests

```
{# will run the common salt state before further testing #}
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
jinja_test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}

validate_user_present_and_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected-return: /bin/bash

  args:
    - apache2
  assertion: assertFalse
  skip: True
```

Output Format Changes

Saltcheck output has been enhanced to display the time taken per test. This results in a change to the output format.

Previous Output:

```
local:
  |_
    ----------
    ntp:
        ----------
        ntp-client-installed:
            Pass
        ntp-service-status:
            Pass
  |_
    ----------
    TEST RESULTS:
        ----------
        Failed:
            0
        Missing Tests:
            0
        Passed:
            2
```

New output:

```
local:
  |_
    ----------
    ntp:
        ----------
        ntp-client-installed:
            ----------
            duration:
                1.0408
            status:
                Pass
        ntp-service-status:
            ----------
            duration:
                1.464
            status:
                Pass
  |_
    ----------
    TEST RESULTS:
        ----------
        Execution Time:
            2.5048
        Failed:
            0
        Missing Tests:
            0
        Passed:
            2
        Skipped:
```

(continues on next page)

(continued from previous page)

```
            0
```

Unless and onlyif Enhancements

The `unless` and `onlyif` requisites can now be operated with salt modules. The dictionary must contain an argument `fun` which is the module that is being run, and everything else must be passed in under the args key or will be passed as individual kwargs to the module function.

Note: Certain states have an `unless`/`onlyif` implementation that predates this feature, and may not work as expected:

- states.git
- states.cmd
- states.macpackage
- states.file
- states.docker_container

Examples:

```
check external ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - fun: file.file_exists
        path: /usr/local/bin/whatever
```

is equivalent to

```
check another ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - test -f /tmp/fnord.txt
```

Another example:

```
set mysql root password:
  debconf.set:
    - name: mysql-server-5.7
    - data:
        'mysql-server/root_password': {'type': 'password', 'value': {{pillar['mysql.
↪pass']}} }
    - unless:
      - fun: pkg.version
        args:
          - mysql-server-5.7
```

Keystore State and Module

A new *state* and *execution module* for manaing Java Keystore files is now included. It allows for adding/removing/listing as well as managing keystore files.

```
# salt-call keystore.list /path/to/keystore.jks changeit
local:
  |_
    ----------
    alias:
        hostname1
    expired:
        True
    sha1:
        CB:5E:DE:50:57:99:51:87:8E:2E:67:13:C5:3B:E9:38:EB:23:7E:40
    type:
        TrustedCertEntry
    valid_start:
        August 22 2012
    valid_until:
        August 21 2017
```

```
define_keystore:
  keystore.managed:
    - name: /tmp/statestore.jks
    - passphrase: changeit
    - force_remove: True
    - entries:
      - alias: hostname1
        certificate: /tmp/testcert.crt
      - alias: remotehost
        certificate: /tmp/512.cert
        private_key: /tmp/512.key
      - alias: stringhost
        certificate: |
          -----BEGIN CERTIFICATE-----
          MIICEjCCAX
          Hn+GmxZA
          -----END CERTIFICATE-----
```

XML Module

A new state and execution module for editing XML files is now included. Currently it allows for editing values from an xpath query, or editing XML IDs.

```
# salt-call xml.set_attribute /tmp/test.xml ".//actor[@id='3']" editedby "Jane Doe"
local:
    True
# salt-call xml.get_attribute /tmp/test.xml ".//actor[@id='3']"
local:
    ----------
    editedby:
        Jane Doe
    id:
        3
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
```

(continues on next page)

(continued from previous page)

```
local:
    Liam Neeson
# salt-call xml.set_value /tmp/test.xml ".//actor[@id='2']" "Patrick Stewart"
local:
    True
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
local:
    Patrick Stewart
```

```
ensure_value_true:
  xml.value_present:
    - name: /tmp/test.xml
    - xpath: .//actor[@id='1']
    - value: William Shatner
```

LGPO Execution Module

Multiple fixes were made to the *win_lgpo* to expand support for additional policies and improve performance. Issues with encoding and unsupported characters (smart-quotes, em-dash, etc) found in the ADML files as well as whitespace in some policies have been addressed.

Speed enhancements include:

- Caching the compiled xml from ADMX/ADML files in `__context__`
- Lowercasing all keys before compiling XML to remove an expensive XPath lookup

Additional functionality:

- Adds the *lgpo.get_policy* function that allows you to get the current settings for a single policy.
- Changes some policy names that were overly long

LGPO State Module

Multiple changes were made to the *win_lgpo* state to improve performance.

It now uses the *lgpo.get_policy* function instead of the *lgpo.get* to avoid reloading all settings on the machine at the beginning and end of each state run.

Supports the new shorter policy names but also attempts to resolve the older, longer policy names.

Win_network Salt Util

Now uses .NET libraries to obtain Interface information on Windows systems that support it. Unsupported systems fall back to the more expensive WMI calls. This is important as this data is gathered for grains and occurs each time a process is forked.

Jinja enhancements

Troubleshooting Jinja map files

A new *execution module* for `map.jinja` troubleshooting has been added.

Assuming the map is loaded in your formula SLS as follows:

```
{% from "myformula/map.jinja" import myformula with context %}
```

The following command can be used to load the map and check the results:

```
salt myminion jinja.load_map myformula/map.jinja myformula
```

The module can be also used to test `json` and `yaml` maps:

```
salt myminion jinja.import_yaml myformula/defaults.yaml

salt myminion jinja.import_json myformula/defaults.json
```

json_query filter

A port of Ansible *`json_query`* Jinja filter has been added. It allows making queries against JSON data using JMESPath language. Could be used to filter `pillar` data, `yaml` maps, and also useful with *`http_query`*.

Depends on the jmespath Python module.

Slot Syntax Updates

The slot syntax has been updated to support parsing dictionary responses and to append text.

```
demo dict parsing and append:
  test.configurable_test_state:
    - name: slot example
    - changes: False
    - comment: __slot__:salt:test.arg(shell="/bin/bash").kwargs.shell ~ /appended
```

```
local:
  ----------
        ID: demo dict parsing and append
  Function: test.configurable_test_state
      Name: slot example
    Result: True
   Comment: /bin/bash/appended
   Started: 09:59:58.623575
  Duration: 1.229 ms
   Changes:
```

Also, slot parsing is now supported inside of nested state data structures (dicts, lists, unless/onlyif args):

```
demo slot parsing for nested elements:
  file.managed:
    - name: /tmp/slot.txt
    - source: salt://slot.j2
    - template: jinja
    - context:
        # Slot inside of the nested context dictionary
        variable: __slot__:salt:test.echo(a_value)
    - unless:
      - fun: file.search
        args:
          # Slot as unless argument
```

(continues on next page)

(continued from previous page)

```
        - __slot__:salt:test.echo(/tmp/slot.txt)
        - "DO NOT OVERRIDE"
      ignore_if_missing: True
```

State Changes

- The *file.symlink* state was fixed to remove existing file system entries other than files, directories and symbolic links properly.
- The `onchanges` and `prereq` *requisites* now behave properly in test mode, due to removing `pchanges`.
- Added new *ssh_auth.manage* state to ensure only the specified ssh keys are present for the specified user.
- Added new *saltutil* state to use instead of `module.run` to more easily handle change.

Module Changes

- Added new `boto_ssm` module to set and query secrets in AWS SSM parameters.
- The *file.remove* module was fixed to remove file system entries other than files, directories and symbolic links properly.

Enhancements to Engines

Multiple copies of a particular Salt engine can be configured by including the `engine_module` parameter in the engine configuration.

```
engines:
  - production_logstash:
      host: production_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
  - develop_logstash:
      host: develop_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
```

- A new `fluent engine` has been added to export Salt events to fluentd.

  ```
  engines:
    - fluent
        host: localhost
        port: 24224
  ```

  ```
  <source>
    @type forward
    port 24224
  </source>
  <match saltstack.**>
    @type file
    path /var/log/td-agent/saltstack
  </match>
  ```

Enhancements to Beacons

Multiple copies of a particular Salt beacon can be configured by including the `beacon_module` parameter in the beacon configuration.

```
beacons:
  watch_importand_file:
    - files:
        /etc/important_file: {}
    - beacon_module: inotify
  watch_another_file:
    - files:
        /etc/another_file: {}
    - beacon_module: inotify
```

Enhancements to chroot

- New functions added to chroot `apply`, `sls`, and `highstate` that allow executing states in sls files or running apply/highstate inside of a chroot.

Minion-side ACL

Salt has had master-side ACL for the salt mine for some time, where the master configuration contained *mine_get* that specified which minions could request which functions. However, now you can specify which minions can access a function in the salt mine function definition itself (or when calling *`mine.send`*). This targeting works the same as the generic minion targeting as specified *here*. The parameters used are `allow_tgt` and `allow_tgt_type`. See also *the documentation of the Salt Mine*. Please note that if you want to use this new feature both your minion and masters will need to be on atleast version 3000.

Deprecations

Raet Deprecated

- The Raet transport has been deprecated. Please use the supported transport protocols tcp or zeromq.

Module Deprecations

- The hipchat module has been removed due to the service being retired. *`Google Chat`*, *`MS Teams`*, or *`Slack`* may be suitable replacements.
- The *`dockermod`* module has been changed as follows:
  - Support for the `tags` kwarg has been removed from the *`dockermod.resolve_tag`* function.
  - Support for the `network_id` kwarg has been removed from the *`dockermod.connect_container_to_network`* function. Please use `net_id` instead.
  - Support for the `name` kwarg has been removed from the *`dockermod.sls_build`* function. Please use `repository` and `tag` instead.
  - Support for the `image` kwarg has been removed from the following functions. In all cases, please use both the `repository` and `tag` options instead:
    - *`dockermod.build`*

    - *dockermod.commit*
    - *dockermod.import*
    - *dockermod.load*
    - *dockermod.tag*

- The heat module has removed the `enviroment` kwarg from the *heat.create_stack* and *heat.update_stack* functions due to a spelling error. Please use `environment` instead.
- The *ssh* execution module has been changed as follows:
  - Support for the `ssh.get_known_host` function has been removed. Please use the *ssh.get_known_host_entries* function instead.
  - Support for the `ssh.recv_known_host` function has been removed. Please use the *ssh.recv_known_host_entries* function instead.
- The :py:mod‘firewalld <salt.modules.firewalld>‘ module has been changed as follows:
  - The default setting for the `force_masquerade` option in the `firewalld.add_port <salt.module.firewalld.add_port()` function has changed from `True` to `False`.
  - Support for the `force_masquerade` option in the `firewalld.add_port_fwd <salt.module.firewalld.add_port_fwd()` function has been changed from `True` to `False`.

State Deprecations

- The hipchat state has been removed due to the service being retired. *MS Teams* or *Slack* may be suitable replacements.
- The cmd state module has removed the `quiet` kwarg from the *cmd.run* function. Please set `output_loglevel` to `quiet` instead.
- The heat state module has removed the `enviroment` kwarg from the *heat.deployed* function due to a spelling error. Please use `environment` instead.
- The :py:mod‘firewalld <salt.states.firewalld>‘ state has been changed as follows:
  - The default setting for the `prune_services` option in the *firewalld.present* function has changed from `True` to `False`.

Fileserver Deprecations

- The hgfs fileserver had the following config options removed:
  - The `hgfs_env_whitelist` config option has been removed in favor of `hgfs_saltenv_whitelist`.
  - The `hgfs_env_blacklist` config option has been removed in favor of `hgfs_saltenv_blacklist`.
- The svnfs fileserver had the following config options removed:
  - The `svnfs_env_whitelist` config option has been removed in favor of `svnfs_saltenv_whitelist`.
  - The `svnfs_env_blacklist` config option has been removed in favor of `svnfs_saltenv_blacklist`.
- The gitfs fileserver had the following config options removed:

  - The `gitfs_env_whitelist` config option has been removed in favor of `gitfs_saltenv_whitelist`.
  - The `gitfs_env_blacklist` config option has been removed in favor of `gitfs_saltenv_blacklist`.

Engine Removal

- The hipchat engine has been removed due to the service being retired. For users migrating to Slack, the *`slack`* engine may be a suitable replacement.

Returner Removal

- The hipchat returner has been removed due to the service being retired. For users migrating to Slack, the *`slack`* returner may be a suitable replacement.

Grain Deprecations

For `smartos` some grains have been deprecated. These grains have been removed.

- The `hypervisor_uuid` has been replaced with `mdata:sdc:server_uuid` grain.
- The `datacenter` has been replaced with `mdata:sdc:datacenter_name` grain.

Cloud Deprecations

- The nova cloud driver has been removed in favor of the openstack cloud driver.

Jinja Filter Deprecations

- The following jinja filters are set to be removed in the Aluminium release:
  - *`json_decode_dict`* in favor of *`tojson`*
  - *`json_decode_list`* in favor of *`tojson`*

Utils Deprecations

- All of the functions in salt.utils.__init__.py have been removed. These include:
  - *salt.utils.option*
  - *salt.utils.required_module_list*
  - *salt.utils.required_modules_error*
  - *salt.utils.get_accumulator_dir*. Please use `salt.state.get_accumulator_dir()` instead.
  - *salt.utils.fnmatch_multiple*. Please use `salt.utils.itertools.fnmatch_multiple()` instead.
  - *salt.utils.appendproctitle*. Please use `salt.utils.process.appendproctitle()` instead.
  - *salt.utils.daemonize*. Please use `salt.utils.process.daemonize()` instead.

- *salt.utils.daemonize_if.* Please use `salt.utils.process.daemonize_if()` instead.
- *salt.utils.reinit_crypto.* Please use `salt.utils.crypt.reinit_crypto()` instead.
- *salt.utils.pem_finger.* Please use `salt.utils.crypt.pem_finger()` instead.
- *salt.utils.to_bytes.* Please use `salt.utils.stringutils.to_bytes()` instead.
- *salt.utils.to_str.* Please use `salt.utils.stringutils.to_str()` instead.
- *salt.utils.to_unicode.* Please use `salt.utils.stringutils.to_unicode()` instead.
- *salt.utils.str_to_num.* Please use `salt.utils.stringutils.to_num()` instead.
- *salt.utils.is_quoted.* Please use `salt.utils.stringutils.is_quoted()` instead.
- *salt.utils.dequote.* Please use `salt.utils.stringutils.dequote()` instead.
- *salt.utils.is_hex.* Please use `salt.utils.stringutils.is_hex()` instead.
- *salt.utils.is_bin_str.* Please use `salt.utils.stringutils.is_binary()` instead.
- *salt.utils.rand_string.* Please use `salt.utils.stringutils.random()` instead.
- *salt.utils.contains_whitespace.* Please use `salt.utils.stringutils.contains_whitespace()` instead.
- *salt.utils.build_whitespace_split_regex.* Please use `salt.utils.stringutils.build_whitespace_split_regex()` instead.
- *salt.utils.expr_match.* Please use `salt.utils.stringutils.expr_match()` instead.
- *salt.utils.check_whitelist_blacklist.* Please use `salt.utils.stringutils.check_whitelist_blacklist()` instead.
- *salt.utils.check_include_exclude.*Please use `salt.utils.stringutils.check_include_exclude()` instead.
- *salt.utils.print_cli.*Please use `salt.utils.stringutils.print_cli()` instead.
- *salt.utils.clean_kwargs.*Please use `salt.utils.args.clean_kwargs()` instead.
- *salt.utils.invalid_kwargs.*Please use `salt.utils.args.invalid_kwargs()` instead.
- *salt.utils.shlex_split.*Please use `salt.utils.args.shlex_split()` instead.
- *salt.utils.arg_lookup.*Please use `salt.utils.args.arg_lookup()` instead.
- *salt.utils.argspec_report.*Please use `salt.utils.args.argspec_report()` instead.
- *salt.utils.split_input.*Please use `salt.utils.args.split_input()` instead.
- *salt.utils.test_mode.*Please use `salt.utils.args.test_mode()` instead.
- *salt.utils.format_call.*Please use `salt.utils.args.format_call()` instead.
- *salt.utils.which.*Please use `salt.utils.path.which()` instead.
- *salt.utils.which_bin.*Please use `salt.utils.path.which_bin()` instead.
- *salt.utils.path_join.*Please use `salt.utils.path.join()` instead.
- *salt.utils.check_or_die.*Please use `salt.utils.path.check_or_die()` instead.
- *salt.utils.sanitize_win_path_string.*Please use `salt.utils.path.sanitize_win_path()` instead.
- *salt.utils.rand_str.*Please use `salt.utils.hashutils.random_hash()` instead.
- *salt.utils.get_hash.*Please use `salt.utils.hashutils.get_hash()` instead.

- *salt.utils.is_windows.*Please use `salt.utils.platform.is_windows()` instead.
- *salt.utils.is_proxy.*Please use `salt.utils.platform.is_proxy()` instead.
- *salt.utils.is_linux.*Please use `salt.utils.platform.is_linux()` instead.
- *salt.utils.is_darwin.*Please use `salt.utils.platform.is_darwin()` instead.
- *salt.utils.is_sunos.*Please use `salt.utils.platform.is_sunos()` instead.
- *salt.utils.is_smartos.*Please use `salt.utils.platform.is_smartos()` instead.
- *salt.utils.is_smartos_globalzone.*Please use `salt.utils.platform.is_smartos_globalzone()` instead.
- *salt.utils.is_smartos_zone.*Please use `salt.utils.platform.is_smartos_zone()` instead.
- *salt.utils.is_freebsd.*Please use `salt.utils.platform.is_freebsd()` instead.
- *salt.utils.is_netbsd.*Please use `salt.utils.platform.is_netbsd()` instead.
- *salt.utils.is_openbsd.*Please use `salt.utils.platform.is_openbsd()` instead.
- *salt.utils.is_aix.*Please use `salt.utils.platform.is_aix()` instead.
- *salt.utils.safe_rm.*Please use `salt.utils.files.safe_rm()` instead.
- *salt.utils.is_empty.*Please use `salt.utils.files.is_empty()` instead.
- *salt.utils.fopen.*Please use `salt.utils.files.fopen()` instead.
- *salt.utils.flopen.*Please use `salt.utils.files.flopen()` instead.
- *salt.utils.fpopen.*Please use `salt.utils.files.fpopen()` instead.
- *salt.utils.rm_rf.*Please use `salt.utils.files.rm_rf()` instead.
- *salt.utils.mkstemp.*Please use `salt.utils.files.mkstemp()` instead.
- *salt.utils.istextfile.*Please use `salt.utils.files.is_text_file()` instead.
- *salt.utils.is_bin_file.*Please use `salt.utils.files.is_binary()` instead.
- *salt.utils.list_files.*Please use `salt.utils.files.list_files()` instead.
- *salt.utils.safe_walk.*Please use `salt.utils.files.safe_walk()` instead.
- *salt.utils.st_mode_to_octal.*Please use `salt.utils.files.st_mode_to_octal()` instead.
- *salt.utils.normalize_mode.*Please use `salt.utils.files.normalize_mode()` instead.
- *salt.utils.human_size_to_bytes.*Please use `salt.utils.files.human_size_to_bytes()` instead.
- *salt.utils.backup_minion.*Please use `salt.utils.files.backup_minion()` instead.
- *salt.utils.str_version_to_evr.*Please use `salt.utils.pkg.rpm.version_to_evr()` instead.
- *salt.utils.parse_docstring.*Please use `salt.utils.doc.parse_docstring()` instead.
- *salt.utils.compare_versions.*Please use `salt.utils.versions.compare()` instead.
- *salt.utils.version_cmp.*Please use `salt.utils.versions.version_cmp()` instead.
- *salt.utils.warn_until.*Please use `salt.utils.versions.warn_until()` instead.
- *salt.utils.kwargs_warn_until.*Please use `salt.utils.versions.kwargs_warn_until()` instead.
- *salt.utils.get_color_theme.*Please use `salt.utils.color.get_color_theme()` instead.

- *salt.utils.get_colors*.Please use `salt.utils.color.get_colors()` instead.
- *salt.utils.gen_state_tag*.Please use `salt.utils.state.gen_tag()` instead.
- *salt.utils.search_onfail_requisites*.Please use `salt.utils.state.search_onfail_requisites()` instead.
- *salt.utils.check_onfail_requisites*.Please use `salt.utils.state.check_onfail_requisites()` instead.
- *salt.utils.check_state_result*.Please use `salt.utils.state.check_result()` instead.
- *salt.utils.get_user*.Please use `salt.utils.user.get_user()` instead.
- *salt.utils.get_uid*.Please use `salt.utils.user.get_uid()` instead.
- *salt.utils.get_specific_user*.Please use `salt.utils.user.get_specific_user()` instead.
- *salt.utils.chugid*.Please use `salt.utils.user.chugid()` instead.
- *salt.utils.chugid_and_umask*.Please use `salt.utils.user.chugid_and_umask()` instead.
- *salt.utils.get_default_group*.Please use `salt.utils.user.get_default_group()` instead.
- *salt.utils.get_group_list*.Please use `salt.utils.user.get_group_list()` instead.
- *salt.utils.get_group_dict*.Please use `salt.utils.user.get_group_dict()` instead.
- *salt.utils.get_gid_list*.Please use `salt.utils.user.get_gid_list()` instead.
- *salt.utils.get_gid*.Please use `salt.utils.user.get_gid()` instead.
- *salt.utils.enable_ctrl_logoff_handler*.Please use `salt.utils.win_functions.enable_ctrl_logoff_handler()` instead.
- *salt.utils.traverse_dict*.Please use `salt.utils.data.traverse_dict()` instead.
- *salt.utils.traverse_dict_and_list*.Please use `salt.utils.data.traverse_dict_and_list()` instead.
- *salt.utils.filter_by*.Please use `salt.utils.data.filter_by()` instead.
- *salt.utils.subdict_match*.Please use `salt.utils.data.subdict_match()` instead.
- *salt.utils.substr_in_list*.Please use `salt.utils.data.substr_in_list()` instead.
- *salt.utils.is_dictlist*.Please use `salt.utils.data.is_dictlist()` instead.
- *salt.utils.repack_dictlist*.Please use `salt.utils.data.repack_dictlist()` instead.
- *salt.utils.compare_dicts*.Please use `salt.utils.data.compare_dicts()` instead.
- *salt.utils.compare_lists*.Please use `salt.utils.data.compare_lists()` instead.
- *salt.utils.decode_dict*.Please use `salt.utils.data.encode_dict()` instead.
- *salt.utils.decode_list*.Please use `salt.utils.data.encode_list()` instead.
- *salt.utils.exactly_n*.Please use `salt.utils.data.exactly_n()` instead.
- *salt.utils.exactly_one*.Please use `salt.utils.data.exactly_one()` instead.
- *salt.utils.is_list*.Please use `salt.utils.data.is_list()` instead.
- *salt.utils.is_iter*.Please use `salt.utils.data.is_iter()` instead.
- *salt.utils.isorted*.Please use `salt.utils.data.sorted_ignorecase()` instead.
- *salt.utils.is_true*.Please use `salt.utils.data.is_true()` instead.

  - *salt.utils.mysql_to_dict*.Please use `salt.utils.data.mysql_to_dict()` instead.
  - *salt.utils.simple_types_filter*.Please use `salt.utils.data.simple_types_filter()` instead.
  - *salt.utils.ip_bracket*.Please use `salt.utils.zeromq.ip_bracket()` instead.
  - *salt.utils.gen_mac*.Please use `salt.utils.network.gen_mac()` instead.
  - *salt.utils.mac_str_to_bytes*.Please use `salt.utils.network.mac_str_to_bytes()` instead.
  - *salt.utils.refresh_dns*.Please use `salt.utils.network.refresh_dns()` instead.
  - *salt.utils.dns_check*.Please use `salt.utils.network.dns_check()` instead.
  - *salt.utils.get_context*.Please use `salt.utils.stringutils.get_context()` instead.
  - *salt.utils.get_master_key*.Please use `salt.utils.master.get_master_key()` instead.
  - *salt.utils.get_values_of_matching_keys*.Please use `salt.utils.master.get_values_of_matching_keys()` instead.
  - *salt.utils.date_cast*.Please use `salt.utils.dateutils.date_cast()` instead.
  - *salt.utils.date_format*.Please use `salt.utils.dateutils.strftime()` instead.
  - *salt.utils.total_seconds*.Please use `salt.utils.dateutils.total_seconds()` instead.
  - *salt.utils.find_json*.Please use `salt.utils.json.find_json()` instead.
  - *salt.utils.import_json*.Please use `salt.utils.json.import_json()` instead.
  - *salt.utils.namespaced_function*.Please use `salt.utils.functools.namespaced_function()` instead.
  - *salt.utils.alias_function*.Please use `salt.utils.functools.alias_function()` instead.
  - *salt.utils.profile_func*.Please use `salt.utils.profile.profile_func()` instead.
  - *salt.utils.activate_profile*.Please use `salt.utils.profile.activate_profile()` instead.
  - *salt.utils.output_profile*.Please use `salt.utils.profile.output_profile()` instead.

salt.auth.Authorize Class Removal

- The salt.auth.Authorize Class inside of the *salt/auth/__init__.py* file has been removed and the *any_auth* method inside of the file *salt/utils/minions.py*. These method and classes were not being used inside of the salt code base.

28.2.2 Salt 3000.1 Release Notes

Version 3000.1 is a bugfix release for *3000*.

Changelog for v3000..v3000.1

Generated at: 2020-03-27 16:48:41 UTC

- **PR** #56455: (s0undt3ch) Fix gitpython windows requirement @ *2020-03-27 16:31:57 UTC*
  - c5a700e01e Merge pull request #56455 from s0undt3ch/hotfix/gitpython
  - d9791c393f Revert and fix windows requirements
  - 4b573c1c94 Revert "Fix win deps"
- **PR** #56446: (frogunder) 3000.1 releasenotes updates @ *2020-03-24 20:28:23 UTC*
  - 7ba36325d9 Merge pull request #56446 from frogunder/releasenotes_3000.1_updates
  - 6b47f474af 3000.1 releasenotes updates
- **PR** #56435: (twangboy) Update mac build scripts @ *2020-03-24 19:47:40 UTC*
  - 4d2bc7004d Merge pull request #56435 from twangboy/update_mac_build_scripts
  - 5d244b0aa6 Merge branch 'master' into update_mac_build_scripts
  - 8fdf52a243 Update gitpython to 2.1.15
  - afcedc5232 Remove –ignore-installed
  - e6cc2a6192 Separate pyobjc requirements
  - 262ad2e98a Compile static requirements
  - 224f72d0f2 Update noxfile and .precommit
  - 68a36f2e37 Add req_ext.txt
  - 5851a5c2cd Roll back changes, fix dependencies
- **ISSUE** #56433: (Ch3LL) integration.states.test_pip_state.PipStateTest.test_pip_installed_specific_env failing on MAC (refs: #56436)
- **PR** #56436: (Ch3LL) Fix #56433 - test_pip_installed_specific_env @ *2020-03-24 19:47:20 UTC*
  - 8a8ae8ebe4 Merge pull request #56436 from Ch3LL/pip_custom_pypi
  - 55655ff96c Merge branch 'master' into pip_custom_pypi
- **PR** #56423: (Ch3LL) Update changelog with package fixes @ *2020-03-24 16:42:17 UTC*
  - 3a993d73a9 Merge pull request #56423 from Ch3LL/changelog_again
  - 963c16e1a7 update pr number for mac build changes in changelog
  - 83e22b77c7 Update changelog with package fixes
- **PR** #56417: (twangboy) Update mac build scripts @ *2020-03-23 18:45:34 UTC*
  - d2a5bd8add Merge pull request #56417 from twangboy/update_mac_build_scripts
  - 3bda8ddb82 Update noxfile and pre-commit
  - de58c52d66 Merge branch 'update_mac_build_scripts' of https://github.com/twangboy/salt into update_mac_build_scripts
    - e7f08d5349 Update static requirements
    - a53977de5b Merge branch 'update_mac_build_scripts' of github.com:twangboy/salt into update_mac_build_scripts
    - 04e5cde9dd *pkg/osx/req_ext.txt* no longer exists

    - be4a272d07 Update static requirements
  - 02dfe4119c Add pyobjc in its own requirements file
  - 6b2ac2be64 Remove pyobjc, enforce pip install location
  - 30ca5d04ec Remove cryptography, it gets installed by pyopenssl
  - fda8abf4a8 Update static requirements
  - 732ecc83c1 Update pre-commit config
  - 1fa9864e3d Don't set a version for pyopenssl
  - 461b198978 Update dependencies, remove req_ext.txt
- **PR** #56418: (Ch3LL) Ensure version.py included before we install @ *2020-03-23 18:27:46 UTC*
  - 74575a6993 Merge pull request #56418 from Ch3LL/egg_version
  - 85d7c784ef Fix integration setup egg test
  - a8a22a4040 Ensure version.py included before we install
  - 86fe450c82 Fix #56433 - test_pip_installed_specific_env
- **PR** #56403: (frogunder) update 3000.1 releasenotes @ *2020-03-17 23:50:21 UTC*
  - 249367b462 Merge pull request #56403 from frogunder/update_releasenotes_3000.1
  - 9d972c96e8 update 3000.1 releasenotes
- **PR** #56398: (Ch3LL) Add additional PRs to 3000.1 changelog @ *2020-03-17 18:08:15 UTC*
  - 0de5c1e136 Merge pull request #56398 from Ch3LL/change_3000.1
  - 79c337b3db Add additional PRs to 3000.1 changelog
- **PR** #56376: (twangboy) Fix win deps @ *2020-03-17 17:02:46 UTC*
  - 5ac09decb9 Merge pull request #56376 from twangboy/fix_win_deps
  - 6c83beeb9e Fix win deps
- **PR** #56378: (Ch3LL) Include _version.py if building wheel @ *2020-03-17 17:01:33 UTC*
  - e72a8d2cbc Merge pull request #56378 from Ch3LL/wheel_version
  - 22cccd2107 Use virtualenv test helper that already exists and fix setup.py
  - 293b1fddf2 cleanup code
  - ddfb065bfb add bdist_wheel test
  - fceff0287c ensure name is included in new version
  - 0cbf6d3246 Ensure SaltStackVersion attributes in _version.py correct
  - 39cdf5382d Include _version.py if building wheel
- **PR** #56387: (bryceml) update gpg key expiration date @ *2020-03-17 16:59:30 UTC*
  - 6a9326fb70 Merge pull request #56387 from bryceml/update_gpg_key
  - b74b26ccf3 update gpg key expiration date
- **PR** #55822: (cmcmarrow) fix_Indefinitely_code @ *2020-03-16 17:34:11 UTC*
  - fcee692c4a Merge pull request #55822 from cmcmarrow/win_task_repeat
  - e257fb2804 Merge branch 'master' into win_task_repeat

  - 07cada0f8f Merge branch 'master' into win_task_repeat
  - 4b80301338 Merge branch 'master' into win_task_repeat
  - 9df94569c4 Merge branch 'master' into win_task_repeat
  - 22a2d0b9ec Merge branch 'master' into win_task_repeat
  - dee9c134e7 Merge branch 'master' into win_task_repeat
  - beaf05d514 Update test_win_task.py
  - 6e923f75fc Merge branch 'master' into win_task_repeat
  - 5839da81ee add test
  - 2aa6338ed0 fix Indefinitely code
- **PR** #56373: (frogunder) update 3000.1 releasenotes @ *2020-03-13 18:58:43 UTC*
  - c11ef89200 Merge pull request #56373 from frogunder/releasenotes_3000.1
  - a5ca8b5277 Fix doc test errors
  - 47e483187e update 3000.1 releasenotes
- **PR** #56365: (Ch3LL) Update 3000.1 changelog @ *2020-03-13 17:21:02 UTC*
  - 62857a9f0e Merge pull request #56365 from Ch3LL/changelog_3000.1
  - 851d7d8fc7 Update 3000.1 changelog
- **PR** #56360: (Ch3LL) Use virtualenv 20.0.10 for macosx tests @ *2020-03-13 16:39:57 UTC*
  - a660e96fb2 Merge pull request #56360 from Ch3LL/mac_virtual
  - abda125086 Update static requirements files
  - dca3390c0c skip zcbuildout state test when virtualenv 20.0.0
  - fdeae1f0e1 Use virtualenv 20.0.10 for macosx tests
- **ISSUE** #56324: (kiemlicz) Cannot use Saltcheck module (refs: #56327)
- **PR** #56327: (mchugh19) keep cache_copied_files variable a list @ *2020-03-13 16:39:32 UTC*
  - d8fc07274c Merge pull request #56327 from mchugh19/56324
  - e1e2df2b1d Merge branch 'master' into 56324
  - 6d7572706d use includes for saltcheck integration test
  - 5b7073b01d keep cache_copied_files variable a list
- **PR** #56023: (cmcmarrow) add fix for bin_env @ *2020-03-13 16:39:09 UTC*
  - 2d31d61ab9 Merge pull request #56023 from cmcmarrow/binary_fix_pip_bin_env
  - f780fd013e Merge branch 'master' into binary_fix_pip_bin_env
  - d642c7c270 Merge branch 'master' into binary_fix_pip_bin_env
  - 82b39d26f8 Merge branch 'binary_fix_pip_bin_env' of https://github.com/cmcmarrow/salt into binary_fix_pip_bin_env
    - a5fa22528a Merge branch 'master' into binary_fix_pip_bin_env
  - 10ca0fa5d6 fix space
  - 22fff6c180 fix _pip_bin_env

  - d5425e6630 Merge branch 'master' into binary_fix_pip_bin_env
  - ceda3fde00 add full support for when missing kwargs or args
  - cf4ab215b5 add fix for bin_env
- **PR** #56310: (twangboy) Only process ADMX files when loading policies @ *2020-03-11 23:47:50 UTC*
  - 19bb6aae0c Merge pull request #56310 from twangboy/fix_lgpo_admx
  - 4bc5b05586 Fix some lint
  - ce282f9754 Mark destructive test
  - 8af09c31ca Add test case
  - 547d35cf4c Only process ADMX files when loading policies
- **PR** #56272: (twangboy) Properly resolve the policy name @ *2020-03-11 22:11:02 UTC*
  - 2d78931eaf Merge pull request #56272 from twangboy/fix_lgpo_names
  - 233ed12472 Add comments to helper function
  - a7369e41d7 Remove redundent code… some more
  - 1db3052b94 Consolidate duplicate code
  - b25b56299d Fix failing PY2 tests
  - 36a24ac28f Only load adml data once
  - bc13be6850 Add some tests
  - 2e9be6e461 Properly resolve the policy name
- **PR** #56358: (s0undt3ch) Fix version instantiation when minor is an empty string @ *2020-03-11 22:10:04 UTC*
  - c6c6e2e3d9 Merge pull request #56358 from s0undt3ch/hotfix/version-parsing
  - cb22e78502 Fix version instantiation when minor is an empty string
- **PR** #56160: (twangboy) Fix issue with existing reg_dword entries @ *2020-03-11 22:09:21 UTC*
  - b33047c574 Merge pull request #56160 from twangboy/fix_reg_dword
  - 80650c2a8c Make test more explicit
  - 67dd1c18c7 Fix issue with existing reg_dword entries
- **PR** #56337: (twangboy) Handle Adapter Type 53 and Undefined Types @ *2020-03-11 22:08:19 UTC*
  - 8f23706871 Merge pull request #56337 from twangboy/fix_win_network_type
  - 18a31a0b22 Merge branch 'master' into fix_win_network_type
  - d92914ad91 Merge branch 'master' into fix_win_network_type
  - 224629bdeb Handle Adapter Type 53 and Undefined Types
- **PR** #56060: (twangboy) Fix regex string for **Del and **DelVals @ *2020-03-11 22:05:43 UTC*
  - e551ff6a31 Merge pull request #56060 from twangboy/fix_lgpo_regex
  - ca260ef582 Use byte-strings in the test
  - 7c81874a5b Add some tests
  - 944b022f33 Fix regex string for **Del and **DelVals
- **ISSUE** #56131: (thusoy) Salt v3000 crashes with unless clause if pip is missing (refs: #56215)

- **PR** #56215: (dwoz) Fix for unless requisite when pip is not installed @ *2020-03-11 22:04:30 UTC*
  - c9bc9431c1 Merge pull request #56215 from dwoz/issue-56131
  - 5dd8f8eabe Fix linter
  - 7492c2f7c7 Remove crufty prints from test
  - 8ceaa6e6f3 Only remove pip relasted modules
  - 69b21e5e68 Add regression test for issue 56131
  - 9d23f55adc Fix for unless requisite when pip is not installed
- **PR** #56339: (twangboy) Fix win_dns_client when used with scheduler @ *2020-03-11 22:01:32 UTC*
  - 74b67ea741 Merge pull request #56339 from twangboy/fix_win_dns_client
  - d6a4fbe85d Fix bad test (lint)
  - 47bd67373f Add some tests
  - 995975649a Add missing import, improve docs
- **ISSUE** #56288: (lorengordon) win_lgpo: *lgpo.set* with secedit policy always generates *KeyError: u'lgpo.secedit_data'* (refs: #56290)
- **PR** #56290: (lorengordon) Ensures popping lgpo.secedit_data does not throw KeyError @ *2020-03-11 17:27:04 UTC*
  - 7701e8762d Merge pull request #56290 from lorengordon/pop-secdata
  - 62453bb6ce Merge branch 'master' into pop-secdata
  - 95d5cea9ff Merge branch 'master' into pop-secdata
  - 2979158a8b Tests the *if _secedits:* logic path in *lgpo.set_*
  - d1f776178c Ensures popping lgpo.secedit_data does not throw KeyError
- **ISSUE** #56119: (finalduty) Release notes for v3000 do not mention changes to *slspath* variable (refs: #56341)
- **PR** #56341: (dwoz) Revert "Don't remove one directory level from slspath" @ *2020-03-11 17:03:33 UTC*
  - 84c60708cd Merge pull request #56341 from dwoz/issue-56119
  - afe6e84c36 Clarify slspath documentation
  - 6dfc098fd1 Add debug for test asserts
  - 9fa9dab8b2 Fix linter warts
  - fd702bdd44 Add regression test for #56119
  - 3d3b673cec Revert "Don't remove one directory level from slspath"
- **PR** #56185: (terminalmage) Fix regression in service states with reload argument @ *2020-03-11 16:45:58 UTC*
  - 4f9813a49c Merge pull request #56185 from terminalmage/issue56167
  - 65b3f4c9a0 Merge branch 'master' into issue56167
  - 7b41a00b4f Merge branch 'master' into issue56167
  - 8f7034d946 Merge branch 'master' into issue56167
  - e9fbb634e1 Skip on OSX for now
  - 5996280241 Add __opts__ and __grains__ just in case
  - af3e841d08 Fix failing test

  - 586f21aedc Add functional test
  - 1afb9c10f0 Fix regression in service states with reload argument
- **PR** #56068: (s0undt3ch) Update the bootstrap script to latest version, v2020.02.24 @ *2020-03-11 16:44:23 UTC*
  - 74f8b2a926 Merge pull request #56068 from s0undt3ch/hotfix/update-bootstrap
  - ce83b190ed Merge branch 'master' into hotfix/update-bootstrap
  - ccd231d82d Merge branch 'master' into hotfix/update-bootstrap
  - 88a52f88ff Update the bootstrap script to latest version, v2020.02.24
  - 012fb5bc4b Update the bootstrap script to latest version, v2020.02.04
- **PR** #56321: (oeuftete) Tidy up formatting in boto_secgroup docs @ *2020-03-11 08:14:48 UTC*
  - 154257e2e9 Merge pull request #56321 from oeuftete/tidy-boto-secgroup-docs
  - 616f11b33e Merge branch 'master' into tidy-boto-secgroup-docs
  - 412bb4d62d Tidy up formatting in boto_secgroup docs
- **PR** #56336: (Ch3LL) Fix test_issue_2594_non_invalidated_cache test (update zope.interface) @ *2020-03-11 00:08:43 UTC*
  - 11d33e3d90 Merge pull request #56336 from Ch3LL/fix_56330
  - bbf37e090b Fix test_issue_2594_non_invalidated_cache test (update zope.interface)
- **PR** #56346: (frogunder) Update man pages to 3000.1 @ *2020-03-11 00:07:31 UTC*
  - a640bd30fc Merge pull request #56346 from frogunder/man_pages_3000_1
  - 6d7c1b6482 Update man pages to 3000.1
- **PR** #56099: (s0undt3ch) Fix Windows and macOS requirements handling in setup.py @ *2020-03-11 00:04:37 UTC*
  - 2f783d247e Merge pull request #56099 from s0undt3ch/hotfix/requirements
  - c19f4a3fae Merge branch 'master' into hotfix/requirements
  - 1e7bc8fc8f Also take into account macOS requirements
  - 7eef14952c Also include req_win.txt
- **PR** #56218: (raddessi) Changed StrictVersion checking of setuptools to LooseVersion @ *2020-03-10 23:59:54 UTC*
  - 7c4d879073 Merge pull request #56218 from raddessi/master.v3000-conda
  - 44556f6d57 Merge branch 'master' into master.v3000-conda
  - 566c03b786 Merge branch 'master' into master.v3000-conda
  - 82773a9799 Removed now-unused StrictVersion import from setup.py
  - 31bb0f7cd1 Changed StrictVersion checking of setuptools to LooseVersion
- **PR** #56128: (waynew) Update CHANGELOG with release date and unreleased. @ *2020-03-10 23:58:15 UTC*
  - acbd3556e5 Merge pull request #56128 from waynew/master
  - e3216db3e5 Update CHANGELOG with release date and unreleased.
- **PR** #55937: (twangboy) Update windows build scripts @ *2020-03-10 23:55:55 UTC*
  - 12140545ab Merge pull request #55937 from twangboy/update_deps

  - f00a504a48 Add back the pylauncher
  - 30b9c32356 Revert changes to req and req_win
  - 98dc0e970c Fix some warts in the build_env scripts
  - 8404141f65 Update dependencies
- **PR** #55906: (sjorge) smartos.vm_present could not handle nics with vrrp_vrid property @ *2020-03-10 23:54:44 UTC*
  - 485a47cdf1 Merge pull request #55906 from sjorge/smartos_vrrp
  - 5bd7dd009a Merge branch 'master' into smartos_vrrp
  - f77719c179 smartos state should handle vrrp config
- **ISSUE** #55185: (sjorge) salt.modules.pdbedit doesn't work on samba older than 4.8 (refs: #55894)
- **PR** #55894: (sjorge) #55185 pdbedit module should check for version 4.8.x or newer @ *2020-03-10 23:54:21 UTC*
  - 1fa8555360 Merge pull request #55894 from sjorge/pdbedit_55185
  - 9dc7b71122 Merge branch 'master' into pdbedit_55185
- **ISSUE** #56195: (lorengordon) Windows: Using inline powershell in args with *cmd.script* and *shell: powershell* (refs: #56197)
- **PR** #56197: (lorengordon) Allows use of inline powershell for cmd.script args @ *2020-03-10 23:52:47 UTC*
  - 3e57d58db2 Merge pull request #56197 from lorengordon/file-or-no-file
  - fcd1699f5e Allows use of inline powershell for cmd.script args
  - be2e67c0a0 Tests that powershell processes inline powershell in args
- **ISSUE** #53152: (jbeaird) daily highstate fails after 2019.2 upgrade (refs: #56149)
- **PR** #56149: (garethgreenaway) [master] Fix to scheduler for use of when and splay @ *2020-03-10 23:52:16 UTC*
  - 547c73e4cc Merge pull request #56149 from garethgreenaway/53152_fix_schedule_when_splay
  - 8f068f6f9b Fix for when using a combination of when and splay. Previously comparing the wrong value when determining if the job should be run and next_fire_time updated. This resulted in multiple job runs when *when* and *splay* were used together. Code updated and test updated to ensure only one run at the specific time. Skip eval tests is dateutil.parser is unavailable.
- **PR** #56345: (s0undt3ch) Bump Windows Py3 builds timeout to 10 hours @ *2020-03-10 20:43:41 UTC*
  - 192ce76a95 Merge pull request #56345 from s0undt3ch/hotfix/win-py3-timeouts

  - 95d46d6cc8 #55185 pdbedit module should check for version 4.8.x or newer

28.2.3 Salt 3000.2 Release Notes

Version 3000.2 is a CVE-fix release for *3000*.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitlisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module's runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive and empty reply from the salt master.

This will be addressed in the Sodium release of Salt set for mid-June 2020.

28.2.4 Salt 3000.3 Release Notes

Version 3000.3 is a bug-fix release for *3000*.

- **ISSUE** #57027: (ecarson) [BUG] Master running 2019.2.4 or 3000.2 unable to synchronize files using saltutil.sync_all to 2017.7.1 minion due to CVE fix (refs: #57100)
- **ISSUE** #57016: (idontwanttosignin) [BUG] Requested method not exposed: minion_runner (refs: #57100)
- **PR** #57100: (dwoz) Address Issues in CVE Release @ *2020-05-05 22:09:25 UTC*

28.2.5 Salt 2019.2.0 Release Notes - Codename Fluorine

Python 2.7 Deprecation

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the Sodium release, that is either the Sodium release or a later release. This decision is pending further community discussion.

Non-Backward-Compatible Change to YAML Renderer

In earlier releases, this was considered valid usage in Python 2, assuming that `data` was a list or dictionary containing keys/values which are `unicode` types:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data }}
```

One common use case for this is when using one of Salt's *custom Jinja filters* which return lists or dictionaries, such as the *ipv4* filter.

In Python 2, Jinja will render the `unicode` string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the tojson Jinja filter:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data|tojson }}
```

Another example where the new filter needs to be used is the following state example:

```
grafana_packages:
  pkg.installed:
  - names: {{ server.pkgs }}
```

This will fail when pkgs is a list or dictionary. You will need to update the state:

```
grafana_packages:
  pkg.installed:
  - names: {{ server.pkgs|tojson }}
```

This test case has also been tested with the `yaml` and `json` filters successfully.

Note: This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a `tojson` filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

Important: The *json_encode_dict* and *json_encode_list* filters do not actually dump the results to JSON. Since `tojson` accomplishes what those filters were designed to do, they are now deprecated and will be removed in the 3000 release. The `tojson` filter should be used in all cases where *json_encode_dict* and *json_encode_list* would have been used.

Ansible Playbook State and Execution Modules

Along with the including the `ansible modules` in the Oxygen release, running playbooks has been added in 2019.2.0 with the *playbooks function*. This also includes an *ansible playbooks state module* which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

```
install nginx:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gtmanfred/playbook.git
    - git_kwargs:
